

# BRITISH CHEMICAL ABSTRACTS

## A.—PURE CHEMISTRY

JANUARY, 1936.

### General, Physical, and Inorganic Chemistry.

Intensity of the hydrogen  $\alpha$ - and  $\beta$ -lines as determined by the frequency of the electrical field in electrodeless discharge. O. STUHLMAN, jun., and M. S. McCAY (Physical Rev., 1934, [ii], 45, 750—751; cf. A., 1935, 799). L. S. T.

Striation of the positive column in the glow discharge of hydrogen. H. H. PAUL (Z. Physik, 1935, 97, 330—354).—Probe measurements in the positive column suggest that striations are due to an electric double layer formed by positive and negative ions; this explains the increasing difficulty of obtaining striations with increasing purity of H<sub>2</sub>. A. B. D. C.

Reproducibility of the relative energy distribution of the continuous H<sub>2</sub> spectrum emitted by a hydrogen discharge tube. V. E. GONSALVES (Physica, 1935, 2, 1003—1015).—The H discharge tube may be used as an ultra-violet standard. The intensity of the total emission between 1850 and 3200 Å. is const. between 3.0 and 3.4 mm. if the current is const. The relative energy distribution is independent of the current between 150 and 250 m. amp. if the pressure is const., and does not change in the region 1—3.5 mm. for currents between 150 and 250 m. amp. T. G. P.

Nuclear moments of lithium, potassium, and sodium. M. FOX and I. I. RABl (Physical Rev., 1935, [ii], 48, 746—751).—The at. beam method of "zero moments" gave, for the hyperfine structure separations of the normal <sup>2</sup>S<sub>1/2</sub> state of Li, K, and Na, the vals.  $0.0268 \pm 0.0003$ ,  $0.0154 \pm 0.0002$ , and  $0.0596 \pm 0.0006$  cm.<sup>-1</sup>, respectively. The calc. nuclear magnetic moments are Li<sup>7</sup> 3.20, K<sup>39</sup> 0.397, and Na<sup>23</sup> 2.08 nuclear magnetons. The nuclear spin was 3/2 for Li; a higher resolution arrangement gave an upper limit of 5/2 for the spin of the K<sup>41</sup> nucleus, and 2/2, or greater, for Li<sup>6</sup>, the magnetic moment of the nucleus being of the order of that of the deuteron. N. M. B.

Vacuum arc spectra of rubidium and lithium. S. DATTA and P. C. BOSE (Z. Physik, 1935, 97, 321—329). A. B. D. C.

Rotation structure of the b'x band system of the nitrogen molecule in the Schumann region. V. M. TSCHULANOVSKI (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 155—156; cf. A., 1934, 575, 935).—A preliminary report of new data. J. W. S.

Ultra-violet absorption spectrum of oxygen. L. HERMAN and (MME.) R. HERMAN (Compt. rend., 1935, 201, 714—716; cf. A., 1934, 828).—Data for

the low- and high-pressure absorption bands of O<sub>2</sub> at  $\lambda\lambda$  2400—2800 Å. are compared and discussed.

H. J. E.

Far ultra-violet absorption spectrum of oxygen. W. C. PRICE and G. COLLINS (Physical Rev., 1935, [ii], 48, 714—719).—The spectrum was photographed under high dispersion in the region 1300—650 Å., and frequencies of the vibrational progressions are tabulated. The bands are explained as going to the various excited states of O<sub>2</sub><sup>+</sup> as limits. Results support Mulliken's assignment of the visible O<sub>2</sub><sup>+</sup> bands to the transition  $4\Sigma_g^- \rightarrow 4\Pi_u$ . The distances of these states of O<sub>2</sub><sup>+</sup> from the ground state of O<sub>2</sub> are 18.2 and 16.1 volts. N. M. B.

Influence of an electric field on the absorption spectrum of sodium. N. T. ZE and W. W. PO (Compt. rend., 1935, 201, 716—718).—The no. of members of the principal series observed decreases with increasing field strength. Certain of the forbidden S—D and S—S transitions were observed.

H. J. E.

Nuclear moment of aluminium. F. W. BROWN and R. K. COOK (Physical Rev., 1934, [ii], 45, 731).—A tentative val. of 4.8 for the  $g(I)$  factor has been calc. L. S. T.

New absorption spectrum of diatomic sulphur vapour in the Schumann region. K. WIELAND, W. MEHLI, and E. MIESCHER (Helv. phys. Acta, 1934, 7, 843—849; Chem. Zentr., 1935, i, 1978).—Data are given for two band systems between 1600 and 1870 Å., both originating from the S<sub>2</sub> mol. The heat of dissociation of S<sub>2</sub> in the <sup>3</sup> $\Sigma$  state is 1.68 volts. J. S. A.

Deep terms in the isoelectronic sequence VI to Cu VII. P. G. KRÜGER and (MISS) H. T. GILROY (Physical Rev., 1935, [ii], 48, 720—721; cf. A., 1932, 208).—The  $3d^3\ ^6S_{5/2}$  and  $3d^4 4p\ ^6P^0$  terms of this sequence have been identified by the use of const. second differences in the radiated frequencies from terms involving an electron transition to the ground state. N. M. B.

New terms in the spectrum of Fe II. J. C. DOBBIE (Proc. Roy. Soc., 1935, A, 151, 703—726).—An analysis of the spectrum of Fe II between 2327 and 9000 Å. has resulted in the discovery of numerous new terms, many of which belong to the doublet system; >900 lines, not previously classified, have been accounted for by the new terms. A fairly close approximation to Russell-Saunders coupling is found in the spectrum. The separations between the terms of higher and lower multiplicity derived

from the same parent terms are nearly all large compared with the intervals between the levels of these terms. L. L. B.

**Absolute intensity of the zinc resonance line 2139 Å. and life of  $2^1P_1$  state of zinc.** W. BILLER (Helv. phys. Acta, 1934, 7, 841—842; Chem. Zentr., 1935, i, 1979—1980).—The abs. intensity is calc. as  $f(2139)=1.17$ , and the life of the  $2^1P_1$  state as  $1.78 \times 10^{-9}$  sec. J. S. A.

**Ionisation potentials of Ge V, As VI, Se VII, Sb VI, and Te VII.** P. G. KRUGER and W. E. SHOUPP (Physical Rev., 1934, [ii], 45, 759).—Radiations represented by  $d^{10}1S_0$ — $3P_1^0$ ,  $1P_1^0$ ,  $3D_1^0$  have been found in the above. Term vals. of the  $d^{10}1S_0$  terms are given and ionisation potentials are 93, 127, 166, 107, and 137 volts, respectively. L. S. T.

**Influence of pressure on the discharge radiation of cadmium vapour.** V. A. FABRIKANT and A. S. KANEL (Compt. rend. Acad. Sci., U.R.S.S., 1935, 3, 257—258).—Preliminary notice. W. R. A.

**Hyperfine structure and the gross structure analysis of the spectrum of doubly-ionised antimony.** J. S. BADAMI (Nature, 1935, 136, 836). L. S. T.

**Ultra-violet fluorescence spectra of iodine vapour.** F. DUSCHINSKY and P. PRINGSHEIM (Physica, 1935, 2, 923—932).—The fluorescence bands at 3400 Å. (Oldenberg, A., 1924, ii, 579) occurring in I vapour in presence of  $N_2$  have been studied. I in presence of He gives a different spectrum in the same region, which is also obtained with  $N_2$  at higher temp. The bands may also be obtained as a sensitised fluorescence in presence of Hg, accompanied by HgI bands. Modification of the usual energy level system of I is necessary if the bands are to be explained by transference. The 4400 Å. band of HgI has been investigated. T. G. P.

**Hyperfine structure and nuclear magnetic moment of Cs I.** L. P. GRANATH and R. K. STRANATHAN (Physical Rev., 1935, [ii], 48, 725—731).—The hyperfine structure of the lines  $\lambda\lambda$  8761, 4593, 4555, 3889, and 3877 of the arc spectrum of Cs was observed. The interval factors for the  $6^2S_{1/2}$ ,  $6^2P_{1/2}$ ,  $7^2P_{1/2}$ , and  $8^2P_{1/2}$  states were 0.0767, 0.00925, 0.00329, and 0.0017  $\text{cm}^{-1}$ , respectively. Assuming a nuclear spin of 7/2, the calc. nuclear magnetic moments are 2.66, 2.38, 2.62, and 3.01 nuclear magnetons for the respective states. N. M. B.

**Additional terms in the spectrum of La III.** R. C. GIBBS and G. K. SCHOEPFLE (Physical Rev., 1934, [ii], 45, 747).—The  $ns^2S$  and  $nd^2D$  series have been extended, one more pair of  $2P$  terms has been located, and certain of the  $2F$  and  $2G$  terms have been determined. L. S. T.

**Temperature classification of samarium lines.** A. S. KING (Astrophys. J., 1935, 82, 140—191).—A temp. classification for 4477 Sm lines between 2900 and 8700 Å. is given. L. S. T.

**Luminosity in the mercury discharge.** R. D. RUSK and A. L. PECKHAM (Physical Rev., 1934, [ii], 45, 751).—Recombination of slow electrons

and positive ions is a negligible factor in producing luminosity. L. S. T.

**Intensification by drying of Hg lines in a mercury-hydrogen discharge.** H. BECK (Z. Physik, 1935, 97, 382—389).—Protons are most likely the source of increased intensity of the Hg lines on drying of the Hg- $H_2$  mixture. A. B. D. C.

**Determination of the absorption coefficient,  $K(\lambda_0)$ , of the mercury resonance line, 2536.5 Å., by the resonance scattering method.** G. P. BALIN (Physikal. Z. Sovietunion, 1935, 8, 93—99).—The theory of the method of Goos and Meyer (A., 1926, 334) for determining absorption coeffs. by resonance scattering is discussed and extended. If the density of the saturated vapour used is not too great, the vals. of  $K(\lambda_0)$  are in good agreement with those obtained by other methods. A. J. M.

**Paschen-Back effect with Bellevue electromagnet supplied with supplementary coils.** P. JACQUINOT and T. BELLING (Compt. rend., 1935, 201, 778—779).—The effect has been studied with the Hg lines 5789—5790 and 5770 Å., and a field of 65,800 gauss. Displacements and doubling agree with theory. R. S. B.

**Line absorption of thallium doublet = 3519.29 Å. during thermal excitation of the metastable  $6^2P_{3/2}$  level.** F. MÜLLER (Helv. phys. Acta, 1934, 7, 813—840; Chem. Zentr., 1935, i, 1979).—Determination of the line absorption as a function of the TI pressure confirms the application of the Maxwell-Boltzmann partition law to metastable states. J. S. A.

**Term values in the spectrum of lead v.** G. K. SCHOEPFLE (Physical Rev., 1934, [ii], 45, 747).—65 terms, involving approx. 200 lines, have now been established. L. S. T.

**Absorption spectrum of lead vapour in the Schumann region.** N. V. KREMENEVSKI (Compt. rend. Acad. Sci., U.R.S.S., 1935, 3, 251—252).—The absorption spectrum of Pb vapour was examined between 2200 and 1350 Å. and between 420° and 1070°; the results are discussed. W. R. A.

**Determination of the temperatures of gases from the intensities of band spectra.** O. OLDENBERG (Physical Rev., 1934, [ii], 45, 738; cf. A., 1934, 1153).—Processes leading to normal and to abnormal rotation, i.e., rotation > the thermal val., are discussed. L. S. T.

**Intensity measurements in the ultra-violet with the aid of the photon counter.** I. L. ROICH (Physikal. Z. Sovietunion, 1935, 8, 223—226).—The Planck-Wien formula for black-body radiation has been confirmed in the ultra-violet using Schein's photon counter. T. G. P.

**Mechanism of high-frequency discharges.** H. BECK (Z. Physik, 1935, 97, 355—375).—Electrical and optical observations on high-frequency discharges have shown that spectral intensity, no. of excited levels, and electron temp. are very similar to those in the positive column of d.-c. discharges. A. B. D. C.

**Cathode head-like discharge.** H. BECK (Z. Physik, 1935, 97, 376—381).—This discharge, in

appearance similar to the symmetrical striations of anode columns, has been observed in Hg, Zn, and Cd; current-voltage characteristics are given together with conditions of its formation.

A. B. D. C.

**Nature of luminous streamers from the condensed spark *in vacuo*.** C. F. BAREFORD (Phil. Mag., 1935, [vii], 20, 825—834).—In the condensed spark in high vac. sharply defined luminous streamers, occurring in both the positive and negative phases of the oscillating current of the spark, pass through a hole bored in one of the electrodes and extend into the exhausted space beyond it. The spectra of the streamers show lines due to neutral and ionised atoms of the metal of the electrode opposite the hole. There is some evidence that aggregates rather than single atoms are concerned in the formation of the streamers.

N. M. B.

**Spectroscopic observation of recurrent phenomena in discharge tubes.** R. H. SLOANE and C. M. MINNIS (Proc. Physical Soc., 1935, 47, 1019—1028).—Irregular moving striations are photographed synchronously by forming an image of the positive column of a discharge tube along a spectrograph slit which is covered and uncovered by a mechanical shutter synchronised with the striations by a photo-electric device. The photographs for pure A show no appreciable recombination in the dark phase, and those for A-Hg mixtures show excitation of only the Hg lines in the dark phase; an explanation is proposed.

N. M. B.

**Pre-discharge currents and striking conditions in gas-filled hot-cathode tubes.** I. RUNGE (Z. tech. Phys., 1935, 16, 38—42; Chem. Zentr., 1935, i, 2140).

J. S. A.

**Air afterglow.** F. H. NEWMAN (Phil. Mag., 1935, [vii], 20, 777—781).—A detailed study of the spectra of air and O<sub>2</sub> afterglows shows that poisoning of the discharge-tube walls is necessary for glow formation; the effect persists after the discharge has ceased, but is eliminated by heating the tube. The bands in air are superposed on a continuous spectrum; band positions are given. Traces of H<sub>2</sub>O, COMe<sub>3</sub>, and C<sub>6</sub>H<sub>6</sub> vapour quenched the afterglows, but CS<sub>2</sub> gave the characteristic blue flame. The afterglows are attributed to the oxidation of NO by O<sub>3</sub>, both these gases being formed in the discharge tube.

N. M. B.

**Pressure effects of foreign gases on spectral lines.** H. MARGENAU (Physical Rev., 1935, [ii], 48, 755—765; cf. A., 1933, 201).—Mathematical. The effect of pressure on the shape and position of a spectral line is examined.

N. M. B.

**Spectro-photometric comparison of the zodiacal light and the light of the night sky.** J. CABANNES and J. DUFAY (Compt. rend., 1935, 201, 696—699).—The spectrum of the zodiacal light does not contain the line  $\lambda$  5577 or the bands  $\lambda\lambda$  4838, 4825 Å.

H. J. E.

**Fine structure of the *K* edges of magnesium and aluminium.** J. VELDKAMP (Physica, 1935, 2, 933—934).—Sandstrom's explanation (Diss., Upsala,

1935) of the fine structure of the *K* edges of Mg and Al is incorrect. Another interpretation is given.

T. G. P.

**Atomic scattering factors of nickel, copper, and zinc.** G. W. BRINDLEY and F. W. SPIERS (Phil. Mag., 1935, [vii], 20, 865—881; cf. A., 1935, 16).—At. scattering factors of Ni, Cu, and Zn for Cu *K* $\alpha$  radiation have been measured. Abs. vals. of the reflected intensities were obtained by comparison with reflexions from KCl. The results are compared with those of previous workers.

T. G. P.

**Width of *K* $\alpha$  lines of gaseous krypton and of elements in chemical compounds.** E. WILHELMY (Z. Physik, 1935, 97, 312—320).—Results are given for Kr, Rb in RbCl, Br in KBr, and Cu in CuO and CuF<sub>2</sub>; that for Kr shows state of aggregation to have no effect, whilst the others show effects due to chemical combination.

A. B. D. C.

***K*-Series spectrum of thorium.** J. C. HUDSON, H. G. VOGT, and A. H. ARMSTRONG (Physical Rev., 1934, [ii], 45, 755).

L. S. T.

***L*-Emission spectrum of argon.** M. BAČKOVSKY and V. DOLEJSEK (Nature, 1935, 136, 643).—Vals. for the *L*-series of A, measured directly by means of the ionic tube, agree with those calc. by interpolation of the data of Siegbahn and Magnusson (A., 1935, 909).

L. S. T.

**Relative energy of the *L* $\alpha$  satellites excited by cathode rays in the atomic number range 47—52.** F. R. HIRSH, jun. (Physical Rev., 1935, [ii], 48, 722—724; cf. A., 1934, 233).—Measurement of the integrated relative energy of the *L* $\alpha$  satellites with respect to their parent *L* $\alpha_1$  line have been extended photographically from Ag (47) to Te (52). In this range the satellites decrease rapidly in relative energy with increasing at. no., in agreement with the Coster-Kronig theory.

N. M. B.

***L* $\alpha$  [X-ray] emission of mercury, platinum, and tungsten.** (MLLE.) Y. CAUCHOIS (Compt. rend., 1935, 201, 721—722; cf. A., 1935, 800).—Data for the satellites to the *L* $\alpha$  radiation of Hg, Pt, and W are recorded.

H. J. E.

**Occurrence of the reversed absorption edges of the long wave-lengths of X-rays.** M. BAČKOVSKY and V. DOLEJSEK (Nature, 1935, 136, 836—837).

L. S. T.

**Enhancement of X-ray satellites by the Auger effect.** F. R. HIRSH, jun. (Physical Rev., 1935, [ii], 48, 776—777).

N. M. B.

**Soft X-ray spectra of aluminium and magnesium: wave-length measurements.** T. H. OSGOOD (Physical Rev., 1934, [ii], 45, 753).—Vals. are given for the  $\lambda$  of the sharp edge of the wide line in the *L* spectrum of Mg and Al.

L. S. T.

**Photo-electric emission and surface chemistry.** C. OUELLET (Natural. Canad., 1935, 62, 271—281; cf. A., 1935, 697).—A general survey of the relation of photo-electric emission to surface phenomena, and the use of the photo-electric counter.

N. M. B.

**Photo-electric properties of pure and gas-contaminated magnesium.** R. J. CASHMAN and W. S. HUXFORD (Physical Rev., 1935, [ii], 48, 734—741;

cf. A., 1933, 662).—The threshold characteristic of all gas-free surfaces obtained by successive distillations is at  $3430 \pm 20$  Å. The val. at 5100 Å., previously ascribed to pure Mg, is attributed to Mg contaminated with  $H_2$ . A trace of  $O_2$  causes a max. excursion of the long-wave limit to about 5700 Å. The formation of polar mols. on the Mg surface will account for the threshold shift observed when  $H_2$  or  $O_2$  is present. A method of purifying Mg by multiple distillations is described. N. M. B.

**Positive and negative thermionic emission from molybdenum.** H. B. WAHLIN and J. A. REYNOLDS (Physical Rev., 1935, [ii], 48, 751–754).—In view of discordant results reported, an investigation under rigorous outgassing gave the val. 4.17 volts for the electron work function and 8.35 volts for that of the positive ion. The positive ion emission agrees with the Saha theory of ion formation (cf. Moon, A., 1932, 1185). N. M. B.

**Potential drop and ionisation at mercury arc cathode.** E. S. LAMAR and K. T. COMPTON (Physical Rev., 1935, [ii], 48, 777; cf. A., 1931, 780).—A correction. N. M. B.

**Electron temperatures in the positive column in mixtures of neon and argon or mercury.** H. B. DORGELO, H. ALTING, and C. J. BOERS (Physica, 1935, 2, 959–967).—The electron temp. falls rapidly during the increase in partial pressure of A up to 15% in Ne-A mixtures at const. total pressure (5 mm.) and const. current (2 amp.). In Ne-Hg mixtures the electron temp. falls with increasing partial pressure of Hg. The results are explained on a development of Schottky's diffusion theory. T. G. P.

**Ion optical images with electrical lenses.** J. KOCH and W. WALCHER (Z. Physik, 1935, 97, 131–137).—Images have been obtained with K ion rays. A. B. D. C.

**Sudden losses of energy undergone by high-energy electrons.** L. LEPRINCE-RINGUET (Compt. rend., 1935, 201, 712–714; cf. A., 1935, 801).—Electrons of approx.  $2 \times 10^6$  e.v. suffer large energy losses in traversing A or Pb, 5–10 times as frequently as would be expected from theory. H. J. E.

**Quantum-like loss of velocity of slow electrons and effective cross-section in molecular gases.** H. LOHNER (Ann. Physik, 1935, [v], 24, 349–360).—Measurements of the loss of velocity of electrons by Lenard's counter-potential method indicate that inelastic collision begins at 4.25, 2.45, 2.45, 3.65, 7.2, and 7.1 volts for  $H_2$ ,  $N_2$ , NO, CO,  $N_2O$ , and  $CO_2$ , respectively. A relationship exists between the loss of velocity and the effective cross-section of the mol. J. W. S.

**Total ionisation produced by electron collisions in nitrogen.** G. A. ANSLOW (Physical Rev., 1934, [ii], 45, 750).—The total ionisation produced in  $N_2$  by electrons with energies up to 1500 volts has been measured. L. S. T.

**Double excitation of helium by electron impact.** H. S. W. MASSEY (Proc. Camb. Phil. Soc., 1935, 31, 604–608).—The calc. probability of ex-

citation of helium by electron impact to doubly excited levels agrees qualitatively with experimental data. Reasons are given for the lack of quant. agreement. W. R. A.

**Velocity distribution of electrons moving in an electric field.** B. DAVIDOV (Physikal. Z. Sovietunion, 1935, 8, 59–70).—Theoretical. The velocity distribution of electrons moving in a gas under a const. electric field is calc. taking into account only elastic collisions between mols. and electrons. The distributions of velocities with regard to magnitude and direction, and formulæ for the mean energy and motion of the electrons are obtained. A. J. M.

**Paths of electrons in magnetons when space-charge effects are considered.** I. H. AVENDER, A. THOMA, and D. M. TOMBS (Z. Physik, 1935, 97, 202–210).—Theoretical. A. B. D. C.

**The positive electron.** A. T. WATERMAN (Amer. J. Sci., 1935, [v], 30, 541–548).—A review.

**Excitation function of mercury for atomic collision.** K. GAILER (Ann. Physik, 1935, [v], 24, 421–439).—The mutual excitation of H and Hg was investigated by the use of positive rays. In the case of H positive rays passed through Hg, only the Hg becomes excited. The excitation of the Hg at higher potentials is brought about almost entirely by neutral H atoms, excitation by  $H^+$  being at least 20 times smaller. The excitation function of Hg for collision with H is determined and compared with that for electron collision. The results are discussed from the viewpoint of "transferable energy." A. J. M.

**Electron collisions in mercury vapour: the 9.8 volt loss.** C. L. CROSS and J. A. ELDRIDGE (Proc. Iowa Acad. Sci., 1934, 41, 257).—Data for the magnetic analysis of electrons which have passed through Hg vapour are given. CH. ABS. (e)

**Homogeneous dissociation of hydrogen molecules by collision with positive ions.** A. SCHECHTER (J. Chem. Physics, 1935, 3, 433–434).—Special experimental conditions are given of work previously described (cf. A., 1934, 977) in view of reported failure of later investigators to obtain similar results (cf. Kunsman, A., 1935, 4). N. M. B.

**Disappearance of hydrogen in presence of positive ions.** C. H. KUNSMAN and R. A. NELSON (J. Chem. Physics, 1935, 3, 754).—A reply to Schechter (preceding abstract). F. L. U.

**Collisions of slow electrons with methane molecules.** H. L. BROSE and J. E. KEYSTON (Phil. Mag., 1935, [vii], 20, 902–912).—The effective cross-sections of  $CH_4$  mols. with respect to slow electrons of different velocities have been determined and are discussed. T. G. P.

**Effective cross-section and charging cross-section of helium with respect to  $He^+$ .** A. ROSTAGNI (Ann. Physik, 1935, [v], 24, 543–544).—The results of Wolf (A., 1935, 1294) give the charging cross-section > total effective cross-section. This may be due to inconstancy of field along the collector, and to the neglect of secondary electron emission. A. J. M.

**At. wt. of germanium. I. Analysis of germanium tetrabromide.** O. HONIGSCHMID, K. WINTERSBERGER, and F. WITTNER (*Z. anorg. Chem.*, 1935, 225, 81—89; cf. A., 1934, 1053).—The mean of 10 analyses of  $\text{GeBr}_4$  by nephelometric titration with  $\text{AgNO}_3$  gives  $\text{Ge } 72.588 \pm 0.008$ , and the mean of 10 gravimetric analyses  $72.586 \pm 0.012$ . The final val., 72.59, agrees with that of Baxter and Cooper (A., 1924, ii, 690; 1926, 5), but not with Aston's  $72.65 \pm 0.05$  (A., 1931, 1208). F. L. U.

**Rare earths. XLVI. At. wt. of gadolinium.** C. R. NAESER [with B. S. HOPKINS] (*J. Amer. Chem. Soc.*, 1935, 57, 2183—2184).—From the ratio  $\text{GdCl}_3 : \text{Ag}$  the at. wt. of Gd is  $156.85 \pm 0.011$ . E. S. H.

**At. wt. of tantalum. Analysis of tantalum pentachloride.** O. HONIGSCHMID and R. SCHLEE (*Z. anorg. Chem.*, 1935, 225, 64—68).—The prep. of pure  $\text{TaCl}_5$  from tantalite is described. The mean of 6 determinations of the Cl content of  $\text{TaCl}_5$  by nephelometric titration with  $\text{AgNO}_3$  gave  $\text{Ta } 180.88 \pm 0.01$ , agreeing with the val. previously obtained by analysis of  $\text{TaBr}_5$  (A., 1935, 140). F. L. U.

**Properties of the hydrogen isotopes as revealed by the mass-spectrograph.** W. BLEAKNEY (*Physical Rev.*, 1934, [ii], 45, 762).—A mass-spectrograph dealing with gases at very low pressure shows that no exchange takes place nor is equilibrium established when a non-equilibrium mixture is in contact with  $\text{H}_2\text{O}$ , Hg, soft glass, Pyrex glass, or stopcock grease. Certain catalysts, however, e.g., Ni and  $\text{Cr}_2\text{O}_3$ , established equilibrium at temp. as low as that of liquid air. L. S. T.

**Relative abundance of the silicon isotopes.** A. MCKELLAR (*Physical Rev.*, 1934, [ii], 45, 761).—Measurements of the violet bands of SiN indicate an approx. abundance ratio  $\text{Si}^{28} : \text{Si}^{29} : \text{Si}^{30} = 89.6 : 6.2 : 4.2$ . The abundance of  $\text{Si}^{29}$  and  $\text{Si}^{30}$  relative to  $\text{Si}^{28}$  is slightly > that estimated by Aston. An at. wt. > the accepted val. is obtained. L. S. T.

**Isotopes of nickel.** J. DE GIER and P. ZEEMAN (*Proc. K. Akad. Wetensch. Amsterdam*, 1935, 38, 810—813).— $\text{Ni}^{64}$  has been detected by the parabola method, but  $\text{Ni}^{61}$  (Aston, A., 1935, 802) was not found. The abundance figures are  $\text{Ni}^{58}$  68.1%,  $\text{Ni}^{60}$  27.2%,  $\text{Ni}^{62}$  3.8%, and  $\text{Ni}^{64}$  0.9%. R. S.

**Interference-spectroscopic examination of the gold hydride band spectrum in search of the isotope effect due to the suspected gold isotopes.** S. IMANISHI (*Sci. Papers Inst. Phys. Chem. Res. Tokyo*, 1935, 28, 129—134).—No evidence for the existence of  $\text{Au}^{199}$  could be obtained. This is in agreement with Dempster (A., 1935, 677). R. S.

**Periodic classification of the rare earths.** H. YAGODA (*J. Amer. Chem. Soc.*, 1935, 57, 2329—2330).—The tendency of the rare earths to form stable tervalent compounds is said to mask the fact that the properties of these elements in other valency states are a periodic function of at. no. Examples are given. E. S. H.

**New periodic table.** P. VAN RYSELBERGHE (*J. Chem. Educ.*, 1935, 12, 474—475).—The new table emphasises the importance of the azimuthal quantum

no. of the last electron added in the building up of the successive elements. L. S. T.

**Radioactive fluctuations.** A. E. RUARK and I. DEVOL (*Physical Rev.*, 1935, [ii], 48, 772).—Mathematical. Expressions are found for the fluctuations in the emission of sources which decay appreciably during the time of a single experiment, and for fluctuations in the counts recorded by a detector which receives only a fraction of the particles or rays emitted by a source. N. M. B.

**Renewed activity of radium bromide after heating.** C. T. KNIPP (*Trans. Illinois State Acad. Sci.*, 1934, 27, 128—129).—A minute amount of  $\text{RaBr}_2$  was sealed on the end of a rod by means of very thin Pyrex glass. The no. and length of the tracks in a Wilson chamber due to the specimen increased to a max. in 6—10 days. CH. ABS. (e)

**$^{43}\text{K}$  and the radioactivity of potassium.** H. J. WALKER (*Nature*, 1935, 136, 755).—Recent evidence supports the view (A., 1935, 275, 558) that  $^{40}\text{K}$  and not  $^{43}\text{K}$  (*ibid.*, 1185) is the source of the natural  $\beta$ -radioactivity of K. L. S. T.

**Temporal sequence of  $\alpha$ - and  $\gamma$ -radiation of radium.** W. JOHNER and E. STAHEL (*Helv. phys. Acta*, 1934, 7, 638—639; *Chem. Zentr.*, 1935, i, 2132—2133).—It is proposed to determine the relative order of  $\alpha$ - and  $\gamma$ -ray emission from Ra by examination of the absorption of the K lines, excited by inner absorption of the  $\gamma$ -radiation, in Tl, Au, and Hg filters. Absorption corresponding with the Ra spectrum would indicate emission of  $\gamma$ -radiation after loss of the  $\alpha$ -particle. Preliminary results indicate emission of Ra K radiation. J. S. A.

**Absorption of  $\gamma$ -rays by barium sulphate, gypsum, water, and flesh.** J. S. ROGERS (*Brit. J. Radiol.*, 1934, [ii], 7, 176—186; *Chem. Zentr.*, 1935, i, 2133).—The absorption has been determined photographically, and conclusions have been reached as to gypsum thicknesses for protection from  $\gamma$ -rays, and radiation intensities for penetration of varying flesh thicknesses. J. S. A.

**$\gamma$ -Ray emission of various targets under bombardment by deuterium ions.** L. R. HAFSTAD, M. A. TUVÉ, and C. F. BROWN (*Physical Rev.*, 1934, [ii], 45, 746—747).—Powerful  $\gamma$ -ray emission from Be, C, and  $\text{CaF}_2$  bombarded by deuterons is described. There is faint or doubtful emission from  $\text{SiO}_2$  and Al, but none from Ag. L. S. T.

**Experiments with neutrons slowed down at different temperatures.** C. H. WESTCOTT and H. NIEWODNICZANSKI (*Proc. Camb. Phil. Soc.*, 1935, 31, 617—624).—Neutrons were slowed down by paraffin wax at the temp. of liquid  $\text{N}_2$  and liquid  $\text{H}_2$ . The absorption produced by certain substances increased as the temp. was lowered. The no. of transformations also increased, the increase depending on the thickness of the paraffin layer. When liquid  $\text{H}_2$  was substituted for paraffin similar effects were produced. W. R. A.

**Disintegration by slow neutrons.** J. CHADWICK and M. GOLDBABER (*Proc. Camb. Phil. Soc.*, 1935, 31, 612—616).—Details of work (A., 1935, 277) are

given and a different interpretation of the results observed with B. The reaction between B and slow neutrons is  $B^{10} + n^1 \rightarrow Li^7 + He^4$ . The disintegration process with nitrogen is  $N^{14} + n^1 \rightarrow B^{11} + He^4$ . No increase was found for H, D, He, Be, C, O, F, Ne, Na, Mg, Al, Cl, A, Ca, Ni, Cu, Zn, In, and U. W. R. A.

**Excitation of secondary  $\gamma$ -rays by neutrons.** I. General; phenomena in paraffin. II. Measurements with iron, copper, cadmium, and lead. R. FLEISCHMANN (Z. Physik, 1935, 97, 242—264, 265—267).—Nuclear  $\gamma$ -rays have been excited by slow neutrons in H, Fe, Cu, Cd, and Pb, and absorption of the  $\gamma$ -rays by paraffin, Al, and Pb has been determined. The mass of the neutron is 1.0083. A. B. D. C.

**Absorption and detection of slow neutrons.** D. P. MITCHELL, J. R. DUNNING, E. SEGRÈ, and G. B. PEGRAM (Physical Rev., 1935, [ii], 48, 774—775; cf. A., 1935, 1441).—The disintegrations of B and Li were examined in terms of the absorption observed in B, Li, and Cd. Absorption-transmission curves show slight departure from the exponential.

N. M. B.

**Scattering of slow neutrons by iron and other substances.** D. BUDNITZKI and I. KURTSCHATOV (Physikal. Z. Sovietunion, 1935, 8, 170—178).—The free paths of slow neutrons in C, Fe, Cu, and Pb have been found by using their reflexion, and are compared with vals. obtained by Dunning *et al.* (Physical Rev., 1935, [ii], 47, 416) for fast and slow neutrons. In calculating paths the selective sensitivity of the indicator and the absorption of neutrons by  $H_2O$  must be considered. T. G. P.

**Absorption of slow neutrons by iron.** I. KARA, L. ROSENKEVITSCH, C. SINELNIKOV, and A. WALTHER (Physikal. Z. Sovietunion, 1935, 8, 215—218).—Absorption in Fe and Cu is < recorded by Fermi (A., 1935, 910). T. G. P.

**Selective absorption of neutrons.** I. KARA, L. ROSENKEVITSCH, C. SINELNIKOV, and A. WALTHER (Physikal. Z. Sovietunion, 1935, 8, 219—222; cf. preceding abstract).—Absorption of neutrons by Cu is independent of the change in concn. of  $B_2O_3$  in  $H_2O$  surrounding the indicator. This is explained by the selective absorption of B. The average vals. of sensitivity increase in the order B, Ag, Cu. The cross-section for absorption decreases rapidly with increased velocity of neutrons. T. G. P.

**Evaluation of the accuracy of Bethe and Peierls' formula concerning the decomposition of the deuteron with  $\gamma$ -radiation.** V. J. MAMASACHLISOV (Physikal. Z. Sovietunion, 1935, 8, 206—207; cf. A., 1935, 279). T. G. P.

**Disintegration of lithium by deuterons.** T. W. BONNER and W. M. BRUBAKER (Physical Rev., 1935, [ii], 48, 742—746; cf. A., 1935, 1049).—The energy distribution of the neutrons from the disintegration of Li by 0.85 m.e.v. deuterons was determined by the method of recoil protons in a high-pressure cloud chamber. Results indicate that the neutrons come from the reactions  ${}_3Li^7 + {}_1H^2 \rightarrow {}_2He^4 + {}_0n^1$ , the neutrons (95% of the disintegrations) having a continuous energy distribution; and  ${}_3Li^7 + {}_1H^2 \rightarrow$

${}_4Be^8 + {}_0n^1$ , the neutrons (5% of the disintegrations) being nearly homogeneous, with a max. energy of  $13.3 \pm 0.5$  m.e.v. The calc. mass of  ${}_4Be^8$  is  $0.3 \pm 0.75$  m.e.v. > that of two  $\alpha$ -particles. N. M. B.

**Transmutation of deuterium by deuterons.** K. D. ALEXOPOULOUS (Naturwiss., 1935, 23, 817).—Experiments are described which indicate that no  $\gamma$ -radiation is emitted in the nuclear reaction between deuterons. A. J. M.

**Disintegration of lithium by lithium ions.** V. PETUHOV, C. SINELNIKOV, and A. WALTHER (Physikal. Z. Sovietunion, 1935, 8, 212—214).—The excitation function and abs. yield of the transmutation  ${}_3Li^6 + {}_3Li^6 \rightarrow {}_3Li^6 + {}_2He^4$  are > vals. predicted by Gamow's formula. The contrary result of Whitmer and Pool (Physical Rev., 1935, [ii], 47, 795) is probably due to protons in the ionic beam. T. G. P.

**Artificial radioactivity.** II. D. VAN DER VEEN (Chem. Weekblad, 1935, 32, 667—671).—A further review (see A., 1934, 826).

**Synthesis of radio-elements with deuterons accelerated by an impulse generator.** F. JOLIO, A. LAZARD, and P. SAVEL (Compt. rend., 1935, 201, 826—828).—Preliminary results for the conversion  ${}_6C^{12} + {}_1D^2 = {}_7N^{13} + {}_0n^1$  are recorded. Production of  ${}_7N^{13}$  becomes measurable with accelerating voltages >  $0.95 \times 10^6$  volts. H. J. E.

**Induced radioactivity by bombarding magnesium with  $\alpha$ -particles.** C. D. ELLIS and W. J. HENDERSON (Nature, 1935, 136, 755).—In addition to  $Al^{28}$  ( $\beta$ -ray period 137 sec.) two other radioactive bodies, probably  $Al^{29}$  and  $Si^{27}$ , emitting  $\beta$ -rays with a period of approx. 11 min. and positrons with a period of 5—7 min., respectively, are produced. Relative yields indicate that  $Mg^{25}$  has a strong resonance level for  $\alpha$ -particles of energy <  $5.4 \times 10^6$  volts, and that  $Mg^{24}$  and/or  $Mg^{26}$  have one for  $\alpha$ -particles of energies between 5.4 and  $6.1 \times 10^6$  volts. L. S. T.

**Radio-elements produced by neutrons.** P. PREISWERK and H. VON HALBAN (Compt. rend., 1935, 201, 722—724).—The induced activities of half-periods 97 and 4 min. observed on bombarding Tl with neutrons are attributed to  ${}_{81}Tl^{204}$  and  ${}_{81}Tl^{206}$ , respectively. No activity was observed on irradiating Bi with neutrons. P gave a product of half-period 15+1.5 days, attributed to  ${}_{15}P^{32}$ . H. J. E.

**Radioactivity of some rare-earths induced by neutron bombardment.** (SIR) J. C. McLENNAN and W. H. RANN (Nature, 1935, 136, 831—832; cf. A., 1935, 1049, 1050).—Bombardment of rare-earth oxides or oxalates by retarded neutrons from a Be+Ra source gave the following vals. for the half-periods: Nd  $35 \pm 5$  min., Gd  $6.4 \pm 0.3$  hr., Dy  $2.5 \pm 0.1$  hr., Er  $5.8 \pm 0.2$  min.,  $2.7 \pm 0.2$  hr., Ho 2.6 hr., and Lu  $3.6 \pm 0.4$  hr. L. S. T.

**Nature of the high-energy particles of penetrating radiation and the status of ionisation and radiation formulæ.** E. J. WILLIAMS (Physical Rev., 1934, [ii], 45, 729—730).—A discussion. L. S. T.

Alterations of intensity of cosmic radiation on the Hafelekar (2300 metres). V. F. HESS, H. T. GRAZLADEI, and R. STEINMAURER (Sitzungsber. Akad. Wiss. Wien, 1934, IIa, 143, 313—338; *Helv. phys. Acta*, 1934, 7, 669—670; *Chem. Zentr.*, 1935, i, 2134). J. S. A.

Frequency and intensity of cosmic-ray bursts from lead. H. GEIGER and O. ZEILLER (*Z. Physik*, 1935, 97, 300—311). A. B. D. C.

Shower production in small thicknesses of lead and other elements. J. E. MORGAN and W. M. NIELSEN (*Physical Rev.*, 1935, [ii], 48, 773—774).—The increase in counting rate, for dual and triple coincident discharge of the counters, as a function of Pb thickness is examined. N. M. B.

System of masses of light atoms deduced from nuclear reactions alone. L. ISAKOV (*Compt. rend. Acad. Sci. U.R.S.S.*, 1935, 3, 301—304).—19 equations of nuclear reactions of light nuclei have been collected, together with their uncertainties. Solution of these equations by the method of least squares, the individual equations being weighted according to their uncertainties, gives a system of at. mass vals. for  $H^1$  to  $Be^{11}$ . Vals. for  $H^1$ ,  $H^2$ ,  $He^4$ ,  $Li^6$ , and  $Li^7$  are in good agreement with mass-spectrograph vals. corr. for the error in the ratio  $He:O$  (1.8 parts in 10,000). It is shown that  $Be^8$  should be radioactive, although direct observation of its activity is difficult. A. J. M.

Nuclear theory. K. NAKABAYASI (*Z. Physik*, 1935, 97, 211—220).—Mass defects and nuclear radii are calc. A. B. D. C.

Pair production by magnetic multipole radiation. J. C. JAEGER (*Proc. Camb. Phil. Soc.*, 1935, 31, 609—611).—Pair production by magnetic multipole radiation has been calc. for dipoles, quadrupoles, and octopoles. The probability of pair production decreases with the order of the multipole. W. R. A.

Neutrino theory of light. III. R. DE L. KRONIG (*Physica*, 1935, 2, 968—980; cf. A., 1935, 1187).—Characteristics of neutrino-fields in relation to radiation-fields are deduced. T. G. P.

Properties of ultimate particles. G. WATAGHIN (*Ann. Acad. Brasil. Sci.*, 1935, 7, 273—276).—Modern views on the constitution of matter are discussed and the development of the conception of the electron, positron, photon, etc. is traced historically. D. R. D.

Evidence for a resonance level in the  $B^{10}$  nucleus. E. POLLARD (*Physical Rev.*, 1934, [ii] 45, 555—556). L. S. T.

Atomic frequencies in alkali metals. B. N. SEN (*Gazzetta*, 1935, 65, 907—908; cf. A., 1934, 719).—The calc. at. frequencies ( $\nu$ ) of the alkali metals (except Li) are in good agreement with experimental and other calc. vals. Since these elements have marked photo-electric properties, it seems likely that the discrepancy in the calc. val. of  $\nu$  for S and Se is due to the existence of allotropic forms and not to their photo-electric property, which in the case of S is very weak. O. J. W.

Permutation degeneration in vector models of atoms. M. MARKOV (*Compt. rend. Acad. Sci., U.R.S.S.*, 1935, 3, 103—104).—From the general permutation theory identities of the kind derived by Van Vleck for two equiv. *p* electrons arise for other kinds of electrons. W. R. A.

Calculation of the self-consistent field with exchange for lithium. V. A. FOOK and M. I. PETRASHEN (*Compt. rend. Acad. Sci. U.R.S.S.*, 1935, 3, 295—296).—The difference between the observed and calc. term vals. for Li largely disappears when the self-consistent field method is used with quantum exchange instead of without it. The use of wave functions of the generalised self-consistent field gives the intensity of the principal line of each series with great precision. A. J. M.

Electromagnetic field theory. T. LEWIS (*Phil. Mag.*, 1935, [vii], 20, 1000—1025).—Theoretical. Pure field theory based on Maxwell's equations and the principle of least action leads to a satisfactory theory of the electron. T. G. P.

$\gamma$ -Transformation of electromagnetic fields. W. H. WATSON (*Physical Rev.*, 1935, [ii], 48, 776; cf. Schrödinger, A., 1935, 912).—Mathematical. N. M. B.

Elements of the quantum theory. V. B. The rigid rotator (concluded). S. DUSHMAN (*J. Chem. Educ.*, 1935, 12, 485—491; cf. A., 1935, 1298). L. S. T.

Collision problems and the conservation laws. (A) J. L. SYNGE. (B) B. HOFFMANN (*Physical Rev.*, 1934, [ii], 45, 500—501, 734—735).—Theoretical. L. S. T.

Ultra-violet radiation of chemical reactions. O. VIKTORIN (*Chem. Listy*, 1935, 29, 245—249).—Ultra-violet radiation is shown by means of an Al or CuI photocathode to accompany the reactions of oxidation of pyrogallol by atm.  $O_2$ , of  $K_2C_2O_4$  by Br, of EtOH by  $CrO_3$ , of glucose by  $KMnO_4$ , of  $Na_2S_2O_4$  in alkaline media, and of Al at the anode, and of neutralisation of  $HNO_3$  by NaOH. R. T.

Variation of spectra of detonations with the nature of the surrounding gas. A. MICHEL-LÉVY and H. MURAOUR (*Compt. rend.*, 1935, 201, 828—830).—With  $C(NO_2)_4 + PhMe$  in A, Kr,  $O_2$ ,  $CO_2$ , air, and  $Cl_2$  continuous emission predominated. In  $N_2$ , He, and  $H_2$  bands were observed. The luminosity is attributed to excitation of the surrounding gas by the shock wave. H. J. E.

Colour of smoky quartz. N. M. MOHLER (*Physical Rev.*, 1934, [ii], 45, 743).—Absorption spectra (200—700  $m\mu$ ) of smoky quartz before and after decoloration by heat and recoloration by exposure to Ra, and the spectra of irradiated clear crystal, and fused specimens, support the view that the colour of smoky quartz is due to radioactive action. L. S. T.

The 4502 Å. band of  $NH$ . R. W. LUNT, R. W. B. PEARSE, and E. C. W. SMITH (*Proc. Roy. Soc.*, 1935, A, 151, 602—609; cf. A., 1935, 679, 912).—A new band at 4502 Å., degraded to the red, has been observed in the spectrum of a hollow-cathode discharge in streaming  $NH_3$ . The band arises from a

$^1\Pi \rightarrow ^1\Sigma$  transition. The rotational consts. for the new level have been calc. L. L. B.

**Beryllium deuteride spectra.** P. G. KOONTZ (Physical Rev., 1935, [ii], 48, 707—713).—The spectra of the BeD green bands at 4990 Å. and the ultra-violet BeD<sup>+</sup> bands at 2200—3100 Å. were photographed. Rotational analyses of the former and rotational and vibrational analyses of the latter are tabulated. The electronic isotope shift in the ultra-violet is 0.8 cm.<sup>-1</sup> Rotational consts. are evaluated, and the slight discrepancy between the ratio of the  $B_e$  consts. for the deuterides and hydrides and the ratio of the reduced masses is discussed. N. M. B.

**Fine structure of the C bands of calcium deuteride.** B. GRUNDSTROM (Z. Physik, 1935, 97, 171—176). A. B. D. C.

**E Band system of calcium hydride.** W. W. WATSON and R. L. WEBER (Physical Rev., 1935, [ii], 48, 732—734).—The E band system of CaH at 4900 Å. is the  $\Delta v=0$  sequence of a  $^2\Pi \rightarrow ^2\Sigma$  transition, the lower state being the normal  $^2\Sigma^+$  state. Frequency assignments and calc. mol. consts. are tabulated. There is evidence of strong interaction between the E state and other near CaH states. N. M. B.

**Dissociation energy of carbon monoxide.** F. BRONS (Nature, 1935, 136, 796, and Physica, 1935, 11, 1108—1113).—The structure of the fourth positive group in the spectrum of CO confirms the val. 8.41 volts for dissociation energy (cf. A., 1934, 828).

L. S. T.

**Vibrational analysis of the hafnium oxide band spectrum.** R. W. SHAW and H. C. KETCHAM (Physical Rev., 1934, [ii], 45, 753).—Approx. 100 bands arising from the HfO mol. have been observed in the region 6350—3330 Å. in an arc flame. No rotational structure has been observed. L. S. T.

**Ultra-violet band spectrum of N<sub>2</sub>O<sub>3</sub>.** E. H. MELVIN and O. R. WULF (Physical Rev., 1934, [ii], 45, 751—752).—Mixtures of NO and small amounts of NO<sub>2</sub> give a group of bands in the near ultra-violet probably due to N<sub>2</sub>O<sub>3</sub>. A process of dissociation of the N<sub>2</sub>O<sub>3</sub> mol. in the region 2400—2200 Å. is indicated. L. S. T.

**Emission spectrum of the selenium oxide SeO.** I. BLOCH, E. BLOCH, and C. S. PIAT (Compt. rend., 1935, 201, 824—825; cf. A., 1935, 1443).—The spectrum of a high-frequency discharge in SeO<sub>2</sub> vapour has a no. of bands at  $\lambda$  3800—2880 Å., degraded to the red, attributed to SeO. The fundamental vibrational frequencies of SeO in the normal and excited state were 908.9 and 533.4 cm.<sup>-1</sup>, respectively; energy of dissociation 5.31 e.v. H. J. E.

**Spectra of SeO and SeO<sub>2</sub>.** R. K. ASUNDI, M. JAN-KHAN, and R. SAMUEL (Nature, 1935, 136, 642—643; cf. A., 1935, 1188).—The emission bands of SeO and the absorption bands of SeO<sub>2</sub> have been analysed. The energy of dissociation of unexcited SeO is 4.17 volts. L. S. T.

**Vibrational analysis of BaCl and BeCl bands.** A. E. PARKER (Physical Rev., 1934, [ii], 45, 752; cf. A., 1934, 1153).—A band system due to BeCl,

a  $^2\Pi \rightarrow ^2\Sigma$  transition degrading to the red, has been photographed. L. S. T.

**Photo-dissociation of polyatomic molecules in the Schumann ultra-violet.** A. TERENTIN and H. NEUMANN (J. Chem. Physics, 1935, 3, 436—437).—Threshold energies of dissociation were obtained for the vapours of H<sub>2</sub>O, MeOH, EtOH, HCO<sub>2</sub>H, AcOH, MeCN, NH<sub>3</sub>, and I. N. M. B.

**Spectrum, fluorescence, and photochemical decomposition of acetaldehyde.** H. W. THOMPSON and J. W. LINNETT (J.C.S., 1935, 1452—1459).—Absorption by the vapour was observed at  $\lambda$  3800—2900 and < 2320 Å. In the first region there were sharp bands, degraded to the red, and max. absorption was at approx. 3450 Å. The bands at < 2320 Å. were narrow and diffuse. No fluorescence was observed on irradiating with  $\lambda$  3800—3000 Å. The photochemical decomp. ( $\lambda$  3665, 3135 Å.) yielded polymerised C<sub>2</sub>H<sub>3</sub>·CHO, CO, and small amounts of C<sub>2</sub>H<sub>2</sub>. The quantum yield for the decomp. ( $\lambda$  3665 Å.) was approx. 10<sup>-2</sup>. That for the polymerisation was 2.3. Both vals. increased with decreasing  $\lambda$ .

H. J. E.

**Influence of temperature on methyl iodide absorption spectrum in [quartz] ultra-violet.** A. HENRICI and H. GRIENEISEN (Z. physikal. Chem., 1935, B, 30, 1—39; cf. A., 1933, 445).—Numerous new bands have been observed, particularly at higher temp. The electron transition responsible for the B bands is either in the C-I linking or in a non-linking I electron shell (cf. A., 1935, 562). Most of these bands may be accounted for by assuming vibrational frequencies of 525, 1 880, and 1237 cm.<sup>-1</sup> in the ground state and 508, 1 780, 1090, and 1 1250 cm.<sup>-1</sup> in the excited electronic state. A resolution of various bands, observed at higher temp., is interpreted as removal of a degeneracy. Several bands exhibit exceptional weakening with rise of temp. and apparently represent transitions to a new electron term, 49,220 cm.<sup>-1</sup>, the probability of transition to which varies with temp. In this term the frequencies have become 495, 1 805, and 985 cm.<sup>-1</sup> R. C.

**Optical absorption of substituted benzenes.** E. STEURER (Z. physikal. Chem., 1935, B, 30, 157—158).—The absorption curves of  $\psi$ -cumene, mesitylene, and  $p$ -xylene have been determined and the results compared with those of Conrad-Billroth (A., 1935, 913). R. C.

**Optical absorption of porphyrins. III.** A. STERN and H. WENDERLEIN (Z. physikal. Chem., 1935, 174, 321—334; cf. A., 1935, 1444).—The absorption curves of two chloroporphyrin- $e_5$  Me<sub>2</sub> esters accord with the structure previously suggested (A., 1933, 402). The curve of 4-de-ethyldeoxy-phyloerythrin Me<sub>1</sub> ester exhibits only a small shift towards the blue compared with that of the corresponding porphyrin with Et substituted in the  $\beta$ -position. Absorption curves of derivatives of the chlorophyll- $b$  series reveal regularities similar to those observed in the  $a$  series. The effect on the light absorption of the hydrogenation of the vinyl group in methylphæophorbide- $a$  and - $b$  has been examined. R. C.

**Determination of ionisation by ultra-violet spectrophotometry: its validity and application to the measurement of the strength of very weak bases.** L. A. FLEXSER, L. P. HAMMETT, and A. DINGWALL (J. Amer. Chem. Soc., 1935, 57, 2103—2115).—Ultra-violet absorption spectra of  $\text{BzOH}$ ,  $2:4\text{-C}_6\text{H}_3(\text{NO}_2)_2\cdot\text{OH}$ ,  $\text{NH}_2\text{Ph}$ ,  $\text{COPh}_2$ , anthraquinone,  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{H}$ , and  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  in different solvents have been determined. The technique of ionisation determination by this method is described and discussed. The strengths of the very weak bases  $\text{COPh}_2$ ,  $\text{BzOH}$ , and  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{H}$  have been measured.

E. S. H.

**Interpretation of vibration spectrum of organic molecules with the aid of the isotopy effect.** E. BARTHOLOME and H. SACHSSE (Z. physikal. Chem., 1935, B, 30, 40—52).—The magnitude of the change in a frequency when in a H compound D is substituted for H is a measure of the participation of the substituted atom in that particular mol. vibration. In numerous cases substitution reduces the symmetry of the original mol., resulting in a resolution of vibrations which are degenerate in the H compound; from the resolution the degree of degeneracy and hence the symmetry character of the original frequency may be deduced. Comparison of the infra-red absorption spectra of  $\text{MeOH}$  and  $\text{MeOD}$  has made it possible to identify the normal vibrations; in an appreciable proportion of the mols. there is no free rotation of the OH relative to the Me. The  $827\text{ cm}^{-1}$  band of  $\text{C}_2\text{H}_6$  is a degenerate  $\sigma$ -vibration, and  $1465$  and  $1495\text{ cm}^{-1}$  are  $\sigma$ -bands. The identification of the normal vibrations of  $\text{C}_2\text{H}_6$  is largely completed.

R. C.

**Infra-red spectrum of heavy water.** E. F. BARKER and W. W. SLEATOR (J. Chem. Physics, 1935, 3, 660—663).—The absorption bands  $\nu_2$  and  $\nu_3$  for  $\text{D}_2\text{O}$  and  $\nu_2$  and  $\nu_1$  for  $\text{HDO}$  have been located in water vapour containing 90 and 40% of D.  $\nu_3$  for  $\text{HDO}$  is masked by the corresponding band for  $\text{H}_2\text{O}$ . The fine structure of the  $\nu_2$  bands agrees approx. with that calc. from mol. dimensions.

F. L. U.

**Infra-red absorption spectrum of methyl deuteride.** N. GINSBURG and E. F. BARKER (J. Chem. Physics, 1935, 3, 668—674; cf. A., 1934, 716).—The six fundamental vibrational frequencies of  $\text{MeD}$  have been observed and the fine structure of the bands resolved. Moments of inertia and inter-nuclear distances are calc.

F. L. U.

**Infra-red absorption of cyanides and thiocyanates.** W. GORDY and D. WILLIAMS (J. Chem. Physics, 1935, 3, 664—667; cf. A., 1934, 1288).—The absorption of  $\text{MeCN}$ ,  $\text{CH}_2\text{Ph}\cdot\text{CN}$ ,  $\text{MeCNS}$ , and aq. solutions of  $\text{HCN}$  and of some simple and complex metal cyanides shows in all cases a characteristic band in the region  $4.38\text{--}4.90\text{ }\mu$ . Slight variations in the position are attributed to changes in the vibrational energy of the bound CN groups. An additional band shown by highly ionised cyanide solutions is attributed to  $\text{CN}'$ .

F. L. U.

**Infra-red absorption spectra of plant and animal tissue and of various other substances.** R. STAIR and W. W. COBLENTZ (J. Res. Nat. Bur. Stand., 1935, 15, 295—316).—The infra-red absorption

spectra to  $15\text{ }\mu$  has been studied for pure rubber, gutta-percha hydrocarbon, balata hydrocarbon, polyindene, polystyrene, indene, styrene, Cellophane, pokeweed pith, onion skin, moonwort-seed septum, cotton-seed wing, chitin, pith of feathers, fish bladder, dragon-fly wing, bat-wing, ovalbumin, egg membrane, gelatin, polyvinyl acetate and chloroacetate, glyptal resin, shellac, paraffin oil, sperm oil, linseed oil,  $\text{CCl}_4$ ,  $(\text{CH}_2\text{Cl})_2$ ,  $\text{PhEt}$ ,  $\text{PhCl}$ ,  $o\text{-C}_6\text{H}_4\text{Cl}_2$ ,  $\text{EtOAc}$ ,  $\text{Pr}^n\text{Br}$ ,  $\text{Bu}^n\text{Br}$ , and  $\text{C}_2\text{HCl}_5$ .

J. W. S.

**Origin of the wing accompanying the Rayleigh line in liquids.** S. C. SIRKAR (Nature, 1935, 136, 759—760).—The changes in intensity of the wings which accompany the dissolution of  $\text{C}_6\text{H}_6$ ,  $\text{C}_{10}\text{H}_8$ , or  $\text{Ph}_2\text{O}$  in cyclohexane do not support the hypothesis of Gross and Vuks (A., 1935, 914).

L. S. T.

**Determination of degree of depolarisation of light scattered by molecules.** H. VOLKMANN (Ann. Physik, 1935, [v], 24, 457—484).—An apparatus is described by which the degree of depolarisation ( $\Delta$ ) of light scattered in  $\text{CH}_4$ ,  $\text{H}_2$ ,  $\text{CO}_2$ , and  $\text{N}_2\text{O}$  has been determined. The accuracy of former determinations is discussed.  $\Delta$  for  $\text{CH}_4$  is 0, indicating tetrahedral symmetry. The influence of the Raman effect on  $\Delta$  for  $\text{CH}_4$  is  $<0.001$ .  $\Delta$  for  $\text{CO}_2$  is  $0.0724 \pm 0.003$ ; for  $\text{H}_2$ ,  $0.009 \pm 0.001$ ; for  $\text{N}_2\text{O}$ ,  $0.102 \pm 0.004$ .

A. J. M.

**Rotational Raman spectrum of nitrous oxide.** D. BENDER (Physical Rev., 1934, [iii], 45, 732).—Comparison of the rotational Raman spectra of  $\text{N}_2\text{O}$  and  $\text{CO}_2$  shows no resolution of  $\text{N}_2\text{O}$ , the mol. of which is asymmetric.

L. S. T.

**Raman effect in fuming sulphuric acid.** J. CHEDIN (Compt. rend., 1935, 201, 724—726).—Vals. are recorded for oleum with 10—68% of  $\text{SO}_3$ , and for  $\text{H}_2\text{SO}_4$ . Oleums rich in  $\text{SO}_3$  have no Raman lines in common with  $\text{H}_2\text{SO}_4$ . This is attributed to formation of  $\text{H}_2\text{S}_2\text{O}_7$ .

H. J. E.

**Raman spectrum of sodium nitrate, sodium acetate, and acetic acid.** E. R. LAIRD and D. A. FRANKLIN (Physical Rev., 1934, [ii], 45, 738).—The Raman one-line spectrum for  $\text{NaNO}_3$  solutions has been re-examined. The slight change in  $\lambda$  between dil. and conc. solutions and the marked change in  $\lambda$  for the crystals and the appearance of other lines in the solid have been confirmed. With solutions of  $\text{NaOAc}$ , there is no difference in appearance or position of the five lines found. The solid gives a strong continuous background with faint lines in approx. the same positions as solutions. All lines, except one, are different from those found for  $\text{AcOH}$ , in which the no. and position of the lines change markedly from the glacial acid to a 28% solution.

L. S. T.

**Raman spectrum of arsenic trichloride.** D. M. YOST and T. F. ANDERSON (J. Chem. Physics, 1935, 3, 754).—It is pointed out, with reference to a paper by Brodski and Sack (A., 1935, 1189), that central forces alone do not suffice for the treatment of mols. of the  $\text{AsCl}_3$  type.

F. L. U.

**Raman spectra of oxalic acid.** J. H. HIBBEN (J. Chem. Physics, 1935, 3, 675—679).—Raman spectra of  $\text{H}_2\text{C}_2\text{O}_4$ ,  $\text{H}_2\text{C}_2\text{O}_4\cdot 2\text{H}_2\text{O}$ , and of aq. and

EtOH solutions have been determined. The results indicate that in the anhyd. acid and aq. solutions the two  $\text{CO}_2\text{H}$  groups behave differently, whilst in EtOH they behave similarly. Shifts due to C:O oscillations are either absent or are far weaker in the dihydrate. Chemical interpretations are suggested.

F. L. U.

**Raman spectrum of the isomeric chloronitrobenzenes.** R. MANZONI-ANSIDEI (Gazzetta, 1935, 65, 871—877).—Raman lines are recorded for *o*-, *m*-, and *p*- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{NO}_2$ . The vals. of the frequency characteristic of the  $\text{NO}_2$  group are: *o*- 1528, *m*- 1535, *p*- 1548  $\text{cm}^{-1}$ . Measurements of other workers are discussed.

O. J. W.

**Raman effect. XLV. Raman spectrum of organic substances. Poly-substituted benzenes. VII. K. W. F. KOHLRAUSCH and G. P. YPSILANTI. XLVI. Poly-substituted benzenes. VIII. A. W. REITZ and G. P. YPSILANTI. XLVII. Aromatic polycarboxylic acids. A. PONCRATZ and R. SEKA. XLVIII. Nuclear-substituted ethyl benzoates. K. W. F. KOHLRAUSCH and W. STOCKMAYER (Monatsh., 1935, 66, 285—298, 299—306, 307—315, 316—326).—XLV. The Raman spectra of *o*-, *m*-, and *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{NH}_2$ , *o*- and *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{OH}$ , *o*-, *m*-, and *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{CN}$ , *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{F}$ , *o*-, *m*-, and *p*- $\text{C}_6\text{H}_4\text{Br}$ , *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{I}$ , *p*- $\text{C}_6\text{H}_4\text{F}\cdot\text{NH}_2$ , *p*- $\text{C}_6\text{H}_4\text{F}\cdot\text{I}$ , and *p*- $\text{C}_6\text{H}_4\text{F}\cdot\text{OH}$  have been determined. Three lines found in the Raman spectrum of these substances occur also in that of  $\text{C}_6\text{H}_6$ , and the degrees of depolarisation of these lines are almost identical with the corresponding ones for  $\text{C}_6\text{H}_6$ . Only the line 1156  $\text{cm}^{-1}$  occurs in *o*-, *m*-, and *p*-*di*-derivatives, in mono-derivatives, and in  $\text{C}_6\text{H}_6$  itself. The lines 615, 999, and 1020  $\text{cm}^{-1}$  occur independently of the substituent in mono-substituted derivatives, but in the di-derivatives 634 (corresponding with 615) occurs only in the spectrum of *p*-compounds, 994 only in that of *m*-compounds, and 1037 only in that of *o*-compounds. The special characteristics of the spectra of *p*-compounds are discussed.**

XLVI. The Raman spectra of compounds of the type  $\text{C}_6\text{H}_4\text{X}\cdot\text{OMe}$  [ $\text{X}=\text{NH}_2$  (*o*, *m*, and *p*),  $\text{OH}$  (*o*, *m*, and *p*),  $\text{Me}$  (*o*, *m*, and *p*),  $\text{F}$  (*p*),  $\text{Cl}$  (*o* and *p*),  $\text{Br}$  (*o* and *p*),  $\text{I}$  (*o*, and *p*),  $\text{CN}$  (*p*)] have been determined. All *p*-derivatives show lines at 634, 1169, and 1590  $\text{cm}^{-1}$ .

XLVII. The Raman spectra of *m*- and *p*- $\text{C}_6\text{H}_4(\text{CO}_2\text{X})_2$  ( $\text{X}=\text{Me}$ ,  $\text{Et}$ ), 1:2:3- and 1:3:5- $\text{C}_6\text{H}_3(\text{CO}_2\text{Me})_3$  have been determined. The positions of the double linkings in the nucleus with respect to the substituent groups cannot be found by a study of the constitutive effects of substituents on the frequencies of the nucleus.

XLVIII. The Raman spectra of compounds of the type  $\text{C}_6\text{H}_4\text{X}\cdot\text{CO}_2\text{Et}$  ( $\text{X}=\text{NH}_2$ ,  $\text{OH}$ ,  $\text{Cl}$ ,  $\text{Br}$ ,  $\text{NO}_2$ , *o*, *m*, and *p* in each case) have been determined. The effect of  $\text{X}$  on the inner vibrations of the  $\text{NO}_2$  and  $\text{CO}_2\text{R}$  groups is discussed. The effect is strongest in the *o*-position, and the characteristic frequencies of the  $\text{NO}_2$  and  $\text{CO}$  groups are increased by the introduction of further substituents, the increase being the greater the higher is the substituent in the series  $\text{OH}$ ,  $\text{NH}_2$ ,  $\text{Me}$ ,  $\text{Cl}$ ,  $\text{Br}$ ,  $\text{CO}_2\text{R}$ ,  $\text{NO}_2$ , *i.e.*, in the order in which

substituents tend to increase the dissociation const. of  $\text{BzOH}$ .

A. J. M.

**Raman effect and organic chemistry: isopropylacetylene, isopropylethylene, and some of their derivatives.** B. GREDY (Bull. Soc. chim., 1935, [v], 2, 1951—1958).—Raman lines are recorded for  $\text{CPr}^i\text{:CH}$ ,  $\text{CHPr}^i\text{:CH}_2$ , and some of their derivatives. Lines characteristic of the double and triple linkings are found in all the substances. The influence of substituted  $\text{Cl}$  or  $\text{Br}$  on the double linking frequency at about 1600  $\text{cm}^{-1}$  is confirmed.

O. J. W.

**Raman effect and organic chemistry. Raman spectra of the ethylenic compounds  $\text{CH}_2\text{:CHR}$ .** M. BOURGUEL and L. PIAUX (Bull. Soc. chim., 1935, [v], 2, 1958—1969).—Measurements are recorded for > 20 substances of the type  $\text{CH}_2\text{:CHR}$  ( $\text{R}=\text{a}$  variety of atoms and radicals). These all have five characteristic frequencies, each of which may vary within narrow limits. For butene the vals. are: 1295, 1417, 1642, 3004, and 3083  $\text{cm}^{-1}$ . The various radicals  $\text{R}$  are classified according to their influence on the 1600 frequency. In derivatives of the type  $\text{CH}_2\text{:CH}\cdot\text{CH}_2\text{R'}$  this frequency is const. at 1642  $\text{cm}^{-1}$ .

O. J. W.

**Raman spectra of methyldiethylcarbinol, benzyldimethylcarbinol, and the corresponding olefines.** J. SAVARD (Compt. rend., 1935, 201, 833—835; cf. A., 1935, 681).—Data are recorded and compared.

H. J. E.

**Polarisation of Raman radiation.** F. HEIDENREICH (Z. Physik, 1935, 97, 277—299).—The method of circular polarisation (cf. Hanle, A., 1933, 114) has been applied to Raman displacements of  $\text{C}_2\text{H}_2\text{Cl}_2$  (*cis* and *trans*),  $\text{C}_2\text{Cl}_4$ ,  $\text{C}_6\text{Cl}_6$ , cyclohexane (I), and  $\text{Ac}_2\text{O}$ . Pure rotation broadening should be shown by inverted circular polarisation, as do  $\text{PhMe}$ ,  $\text{C}_6\text{H}_6$ ,  $\text{AcOH}$ , and  $\text{Ac}_2\text{O}$ ;  $\text{EtOH}$ ,  $\text{H}_2\text{O}$ , and (I) do not give inverted polarisation, and indicate that all broadening due to liquids is not rotation broadening. Sirkar's polarisation dispersion (cf. A., 1934, 942) could not be observed.

A. B. D. C.

**Depolarisation in the Raman spectra of halogenated derivatives of ethyl acetate.** H. C. CHENG (J. Chim. phys., 1935, 32, 541—548; cf. A., 1934, 1056).—Raman spectra of  $\text{AcOH}$ ,  $\text{EtOAc}$ ,  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{Et}$ ,  $\text{CHCl}_2\cdot\text{CO}_2\text{Et}$ , and  $\text{CCl}_3\cdot\text{CO}_2\text{Et}$  have been measured, and the fundamental frequencies of  $\text{C}\cdot\text{CO}_2\text{Et}$ ,  $\text{CH}_2\text{Cl}$ ,  $\text{CHCl}_2$ , and  $\text{CCl}_3$  ascertained. Various depolarised lines are fully discussed in relation to the groupings in the molecules.

T. G. P.

**Intensity and polarisation of Raman radiation from liquids.** A. V. RAO (Z. Physik, 1935, 97, 154—157).—The relative intensity and polarisation of  $Q$  branches of the different Raman lines of  $\text{C}_6\text{H}_6$ ,  $\text{CCl}_4$ ,  $\text{CHCl}_3$ , and  $\text{AsCl}_3$  have been determined; the total depolarisation obtained from the Raman lines is an appreciable fraction of the depolarisation of the total scattered radiation.

A. B. D. C.

**Raman effect of organic molecules. Vibration spectra of acrylonitrile and ethylene oxide.** B. TRIM and R. MECKE (Z. Physik, 1935, 97, 221—224).—Frequencies are given for  $\text{C}_3\text{H}_3\cdot\text{CN}$  and

(CH<sub>2</sub>)<sub>2</sub>O, and are classed as valency frequencies of the vinyl groups, ring frequencies, and CH frequencies.

A. B. D. C.

**Relation between the ultra-violet absorption spectrum and the Raman spectrum of pyridine.** V. HENRI and P. ANGENOT (Compt. rend., 1935, 201, 895—896).—Fundamental frequencies of 600, 857, 993, 1031, and 1159 cm.<sup>-1</sup> have been observed in the ultra-violet absorption spectrum of the vapour of C<sub>5</sub>H<sub>5</sub>N (I) at various pressures. The frequencies correspond with those of the Raman spectrum of (I) and C<sub>6</sub>H<sub>6</sub>, since CH and N have nearly the same mass. For the higher electronic level the frequency 542 cm.<sup>-1</sup> has been observed. Ultra-violet light of  $\lambda < 2750$  Å. falling on (I) is photochemically active and causes predissociation.

R. S. B.

**Application of the Raman effect to the *cis-trans* isomerism of methylcyclohexanols.** J. TABUTEAU (Compt. rend., 1935, 201, 897—898).—The Raman spectra of *cis*- and *trans*-*o*-, *m*-, and *p*-methylcyclohexanol differ most for frequencies 300—900 cm.<sup>-1</sup> The spectra of the *cis*-alcohols and -acetates have many lines in common, but with the *trans*-compounds the no. of common lines is much less. The distinction between *cis*- and *trans*-isomerides decreases in the order *o*, *m*, *p*, and is  $<$  with the borneols and myrtanols owing to the relatively small mass of the Me.

R. S. B.

**Stability of the Lenard light centres in zinc sulphide.** N. RIEHL (Ann. Physik, 1935, [v], 24, 536—542).—An investigation has been made to discover whether the Lenard light centres change spontaneously in the course of time, depending on the history of the phosphor. ZnS phosphors which have been kept in the dark for some years show a decreased sensitivity to  $\alpha$ -ray phosphorescence and probably also to ordinary light phosphorescence, showing that spontaneous changes in the lattice or light centres have taken place. X-Ray analysis shows that the ageing is not due to a change of the wurtzite lattice into the Zn-blende lattice. The aged phosphor can be partly regenerated by prolonged heating at 500°. The thermodynamic instability of the light centres may be due to the rapid cooling of the phosphor when first prepared, the equilibrium being frozen, for minerals which have cooled comparatively slowly show but feeble phosphorescence. The existence of phosphorescent minerals indicates that the capacity to phosphoresce is not completely lost by ageing.

A. J. M.

**Luminescent properties of zinc sulphide in relation to X-rays.** L. LEVY and D. W. WEST (Brit. J. Radiol., 1935, 8, 184—185).—The afterglow and latent fluorescence of "Fluorazure" ZnS intensifying screens becomes very feeble if a trace of Ni is added before firing the powder. A screen made from ZnS and CdS is superior to one from CdWO<sub>4</sub>.

CH. ABS. (e)

**Polarised fluorescence of organic compounds.** S. M. MITRA (Z. Physik, 1935, 97, 138—153).—Variation in polarisation of fluorescence radiation from succinylfluorescein and eosin with temp., viscosity, and concn. of solution, and  $\lambda$  of the exciting radiation is given for the solvents glycerol, castor oil, sugar solutions, collodion, and gelatin.

A. B. D. C.

**Role of oxidation-reduction potential and acidity in quenching of fluorescence in solutions.** K. WEBER (Z. physikal. Chem., 1935, B, 30, 69—83).—For quinine sulphate and aesculin the logarithm of the concn.,  $k$ , of halogen ion which halves the fluorescence intensity increases linearly as the reduction-oxidation potential,  $E$ , of the halogen ion becomes increasingly negative, whilst for fluorescein and uranine the relation between  $k$  and  $E$  is more complex.  $k$  rises with [H<sup>+</sup>]. Following Schneider (A., 1935, 681) and assuming quenching by halogen ions to be a sensitised photo-oxidation, a reaction mechanism is postulated which leads to quenching formulae agreeing with experiment. These latter yield quantitatively the observed relation between  $k$  and  $E$ , so that from  $k$  the differences between the  $E$  vals. of the halogens may be derived. For the quenching of the fluorescence of the above substances by cations there is no connexion between  $k$  and  $E$ , suggesting that oxidation-reduction reactions play no part.

R. C.

**Photochemical reactions connected with the quenching of fluorescence of dyes by ferrous ions in solution.** J. WEISS (Nature, 1935, 136, 794—795; cf. A., 1935, 1211).—Irradiation of different dyes, e.g., methylene-blue, thionine, brilliant-cresyl-blue, etc., in acid FeSO<sub>4</sub> with the visible radiation of a strong C arc produces bleaching or a change in colour, due to the formation of leuco-dyes, which is irreversible when the Fe<sup>+++</sup> is pptd. by hydrolysis. With the above dyes the process is completely reversible in the dark, the Fe<sup>+++</sup> being reduced by the leuco-dye. The direct, unsensitised photochemical process is obtained by irradiating 0.5*M*-FeSO<sub>4</sub> in H<sub>2</sub>SO<sub>4</sub> with light from a strong Hg arc, H<sub>2</sub> being formed when O<sub>2</sub> is excluded. The bearing of these results on biological problems is discussed.

L. S. T.

**Dependence of fluorescence spectra on the viscosity of the solvent.** A. JABLONSKI (Physikal. Z. Sovietunion, 1935, 8, 105—108).—The results of Tumermann (A., 1935, 807) are not inconsistent with those of Jablonski (A., 1932, 213).

A. J. M.

**Photoluminescence.** F. OBERHAUSER and R. CABRERA (Anal. Fac. Filos. Univ. Chile, 1934, 1, 28—44; cf. A., 1929, 793).—Org. acids containing a trace of fluorescein exhibit fluorescence and phosphorescence when exposed to light sources.

F. R. G.

**Diffusion in the bulb of a mercury rectifier.** D. R. KANASKOV (Physikal. Z. Sovietunion, 1935, 8, 119—135).—The dark space in a Hg rectifier has been examined with a Langmuir probe. Linear relations exist between (a) log random electron current or (b) log concn. of electrons, or (c) the potential, at a point along the axis of the tube and the distance of the point from the cathode.

T. G. P.

**Bulk and superficial conductivities of cuprous oxide.** L. DUBAR (Compt. rend., 1935, 201, 883—885).—Using conductors of different surface the bulk and superficial conductivities ( $\sigma$ ,  $\omega$ ) of Cu<sub>2</sub>O have been determined in dry air at 15.8°;  $\sigma = 1.61 \times 10^{-8}$  mho cm./cm.<sup>2</sup> and  $\omega = 21.7 \times 10^{-8}$  mho cm./cm.  $\sigma$  is unaffected by H<sub>2</sub>O vapour, but  $\omega$  decreases owing to

adsorption.  $\omega$  is greatly reduced by the action of dil.  $\text{H}_3\text{PO}_4$ . R. S. B.

**Investigations on electrets.** A. GEMANT (Phil. Mag., 1935, [vii], 20, 929—952).—The main results of Eguchi (A., 1925, ii, 462) have been verified. Electrets prepared by allowing substances to solidify in a field of 5—10 kv. per cm. are the electrical analogues of permanent magnets. The field on their free surface may be utilised provided they are nearly short-circuited and kept dry. The charge is acquired either by ionic space charges (heterocharge) or by the orientation of dipole mols. (homocharge) which may be accompanied by a secondary piezoelectric effect. Acidic substances yield ions producing heterocharge, whilst non-dissociating dipoles, chiefly esters, yield homocharge. For mixtures an additive law is valid. T. G. P.

**Elimination of peculiarities in the dielectric behaviour of water vapour.** J. D. STRANATHAN (Physical Rev., 1934, [ii], 45, 741).—The breaks in the pressure- $(K-1)$  curves for  $\text{H}_2\text{O}$  vapour have been eliminated by using a brass condenser, and quartz or Pyrex insulators, and by exercising a strict control on the rate at which the vapour enters the condenser. The electric moment of the  $\text{H}_2\text{O}$  mol. is  $1.83 \times 10^{-18}$ . L. S. T.

**Dipole moments and structure of quinoline derivatives.**—See A., 1935, 1506.

**Physical methods in chemistry. IV. Dipole measurement and its application to chemistry.** P. C. HENRIQUEZ and L. J. N. VAN DER HULST (Chem. Weekblad, 1935, 32, 636—645).—The calculation of at., electronic, and orientation polarisation and the relationships between dipole moment and structure are discussed. D. R. D.

**Configuration of the mercuric halides.** W. J. CURRAN and H. H. WENZKE (J. Amer. Chem. Soc., 1935, 57, 2162—2163).—Electric moments of  $\text{HgPh}_2$ ,  $\text{HgCl}_2$ ,  $\text{HgBr}_2$ , and  $\text{HgI}_2$  have been determined. The vals. are < those calc. from solubility data. The configuration of these compounds is not linear. E. S. H.

**Dipole measurements with isomeric platon-complexes.** K. A. JENSEN (Z. anorg. Chem., 1935, 225, 97—114).—Determinations of the dipole moments of compounds  $[\text{PtX}_2(\text{SR}_n)_2]$  ( $\text{X}=\text{Cl}, \text{Br}, \text{I}, \text{NO}_2$ ,  $\text{NO}_3$ , and  $\text{R}=\text{Et}, \text{Pr}^n, \text{Pr}^s, \text{Bu}^n, \text{Bu}^s, \text{CHMeEt}, \text{CH}_2\text{Ph}$ ) give  $2.2\text{--}2.5 \times 10^{-18}$  e.s. unit for the  $\alpha$ -compounds and about  $9 \times 10^{-18}$  ( $\text{Cl}, \text{Br}$ ) or  $13 \times 10^{-18}$  ( $\text{NO}_2, \text{NO}_3$ ) for the  $\beta$ -compounds. The results indicate that the  $\alpha$ -compounds are *trans*- and the  $\beta$  *cis*-isomerides. Cryoscopic measurements in  $\text{C}_6\text{H}_6$  show both the  $\alpha$ - and  $\beta$ -chlorides to have simple mols., the latter being associated in conc. solutions. No interconversion of the  $\alpha$ - and  $\beta$ -forms occurs in  $\text{C}_6\text{H}_6$ , but it does in the case of  $[\text{PtCl}_2(\text{Et}_2\text{Sc})_2]$ . F. L. U.

**Dipole moments of ethyl and isoamyl borates and triphenyl phosphate.** E. G. COWLEY and J. R. PARTINGTON (Nature, 1935, 136, 643).—The vals. obtained in  $\text{C}_6\text{H}_6$  at  $20^\circ$  are 0.75, 0.81, and 2.79 *D*, respectively.  $P_\infty$  and  $P_E$  are 50.5 and 38.63, 94.3 and 80.20, 252.5 and 87.41 c.e., respectively. L. S. T.

**Dipole moments of certain organic compounds.** J. N. PEARCE and L. F. BERHENKE (Proc. Iowa Acad. Sci., 1934, 41, 141—142).—The dielectric consts. of  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{CHO}$ ,  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{CHO}$ ,  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$ , and *p*-anisaldehyde in dioxan at  $25^\circ$  gave dipole moments 2.20, 3.27, 4.18, and  $3.70 \times 10^{-18}$ , respectively. The angle between the CHO moment and the line through the 1:4 C atoms of the  $\text{C}_6\text{H}_6$  nucleus was  $51^\circ$ . Those between the directions of the OH and CHO group moments were  $50^\circ, 49^\circ$ , respectively. CH. ABS. (e)

**Structure of antipyrine [and pyrimidone] in aqueous solution.** G. DEVOTO (Atti R. Accad. Lincei, 1935, 21, 819—820).—The dielectric consts. of aq. antipyrine (I) and pyrimidone (II) of various concns. have been determined at  $25^\circ$  ( $\lambda 90$  cm.).  $d\epsilon/dc=1.5$  for (I) and  $-6.7$  for (II), indicating that polar structures for these compounds are untenable. D. R. D.

**Transitions in camphor and chemically related compounds. I. Dipole rotation in crystalline solids.** W. A. YAGER and S. O. MORGAN. II. Vibration of atomic groups. A. H. WHITE and S. O. MORGAN (J. Amer. Chem. Soc., 1935, 57, 2071—2078, 2078—2086).—I. Determination of the dielectric properties of *d*- and *dl*-camphor, *d*-camphoric anhydride, borneol, *isoborneol*, and bornyl chloride shows that these compounds undergo transitions in the solid state. Above the transition temp. the dielectric const. of the solid is that normally expected of the polar substance in the liquid state; below the transition temp. the dielectric const. has a low val., approx. equal to  $n^2$ . This behaviour is explained by the rotation of dipoles in the solid.

II. An increase of about 18 g.-cal./ $^\circ\text{C.}/\text{mol.}$  in the sp. heat of *d*-camphor at the transition at  $-30^\circ$  has been observed; it is assumed that energetic intramol. vibration arises. The total polarisation behaviour of *d*-camphor in dil. solution is explained by assuming that at room temp. dipole moment is < and at. polarisation > was formerly supposed, and that at. polarisation begins to decline with falling temp. below  $-10^\circ$ , when the transition to the more rigid mols. begins. Similar transitions, observed in crystals of cyclohexane derivatives, appear to be due to transformations from the rigid to the pliable forms of the mols. forming the crystals. E. S. H.

**Calculation of dipole interaction.** R. P. BELL (Trans. Faraday Soc., 1935, 31, 1557—1560).—The method proposed by Martin (A., 1934, 1063) for calculating dipole interaction is shown to be valid for sufficiently small vals. of the dipole moment. F. L. U.

**Reactivity and dipole moment.** E. HERTEL and E. DUMONT (Z. physikal. Chem., 1935, B, 30, 139—148; cf. A., 1935, 1232).—Measurement of the dipole moments of *p*-substituted derivatives of  $\text{NPhMe}_2$  and the corresponding substitution products of  $\text{C}_6\text{H}_6$  has shown that the effect of a substituent on the reactivity of a functional group ( $\text{NMe}_2$ ) runs parallel with its contribution to the dipole moment of the compound. It is suggested in explanation that the group moment of a substituent is the result chiefly of a considerable dissymmetry in the distribution

of charge about the point of attachment to the ring, and that the reactivity of a functional group is determined by the state of the nuclear C to which it is attached, this in its turn being a function of the states of the other C atoms of the ring. R. C.

**Index of refraction of HCl from 1 to 10  $\mu$ .** R. ROLLEFSON and A. H. ROLLEFSON (J. Chem. Physics, 1935, 3, 434).—Dispersion measurements over 1–10  $\mu$  show that the dispersion curve is matched best by using the vals.  $1.00 \times 10^{-10}$  and  $1.18 \times 10^{-18}$  e.s.u. for the effective charge of the rotator-vibrator and the electric moment of the rotator, respectively.

N. M. B.  
**Double refraction of chitin tendons.** J. M. DIEHL and G. VAN ITERSSEN, jun. (Kolloid-Z., 1935, 73, 142–146).—When chitin is immersed in glycerol-quinoline mixtures its double refraction changes from positive to negative as  $n$  of the liquid mixture increases.

E. S. H.  
**Maximum rotations of carboxylic acids containing a phenylethyl group.**—See this vol., 70.

**Optical rotatory power of solutions in an electric field.** J. KUNZ and A. McLEAN (Nature, 1935, 136, 795–796).—Changes in optical rotatory power are observed when solutions of 2-*l*-menthyl H 3-nitrophthalate in  $C_6H_6$  or PhMe are placed in an electric field. This behaviour is distinct from the Kerr effect and is attributed to the electric moment induced in the solvent mols. by the electric field. Anomalous effects are obtained with the 2-Et ester.

L. S. T.  
**Magnetic birefringence in solutions of paramagnetic salts of rare earths.** S. W. CHINCHALKAR (Phil. Mag., 1935, [vii], 20, 856–858; cf. A., 1932, 677).—The results of Haenny (cf. *ibid.*, 909) are reduced to the same equiv. concn., and the connexion between the birefringence and the orbital moment of the ion is discussed.

N. M. B.  
**Temperature variation of the electro-optical Kerr effect of nitrobenzene at its transition point.** W. HERZOG (Z. Physik, 1935, 97, 233–241).—No discontinuity was observed at the Wolfke-Mazur transition point (cf. A., 1932, 329).

A. B. D. C.  
**Magneto-optics.** C. G. DARWIN (Proc. Roy. Soc., 1935, A, 151, 512–539).—Theoretical. A formal method suitable for the discussion of magneto-optics, irrespective of the underlying at. theory, is developed. The magneto-optic effects of material of any at. character are discussed. The formulæ are applied to test the experimental results of the Kerr effect.

L. L. B.  
**Discussion of experiments on the time-lag in the magneto-optic effect.** G. F. HULL (Physical Rev., 1934, [ii], 45, 738).

L. S. T.  
**Affinity in Hume-Rothery phases.** U. DEHLINGER (Metallwirts., 1935, 14, 145–149; Chem. Zentr., 1935, i, 2130).—Theoretical. The affinity in Hume-Rothery phases is explained by the attribution of a definite lattice linking to each valency electron. The energy levels are calc. from Bloch's wave theory of metallic electrons, where  $\lambda$  must be an integral sub-multiple of the lattice spacing. Highly

symmetrical lattices, for which there are insufficient electrons for twofold occupation of each linking, can be formed only at high temp., when free rotation within the lattice is possible. J. S. A.

**Planar configuration of quadricovalent nickel, palladium, and platinum: dithio-oxalate derivatives.** E. G. COX, W. WARDLAW, and K. C. WEBSTER (J.C.S., 1935, 1475–1480).—The three salts  $K_2[M^H(COS)_4]$  ( $M^H=Ni, Pt, \text{ and } Pd$ ) have been prepared, and are shown to be isomorphous. The four valencies to the metal atom are co-planar in each case. The crystals are monoclinic; 4 mols. in unit cell; space-group  $A2/a$  ( $C_{2h}^0$ ). The principal interat. distances were Ni-S 2.30, Pd-S 2.44, Pt-S 2.44, C-S 1.83, K-O 2.57–3.0, K-S 3.73 (min.) Å. Crystallographic and X-ray data are given. H. J. E.

**Electronic structures of molecules. XIV. Linear triatomic molecules, especially carbon dioxide.** R. S. MULLIKEN (J. Chem. Physics, 1935, 3, 720–739; cf. A., 1935, 1188).—Electron configurations of a no. of triat. linear mols. are given, and ionisation potentials of  $CO_2$ ,  $CS_2$ ,  $N_2O$ , and  $HgCl_2$  are interpreted in relation to these. An explanation of the triangular form of  $NO_2$  is given. F. L. U.

**"Most probable" locations of the valency electrons in the carbon atom.** W. P. DAVEY (Physical Rev., 1934, [ii], 45, 763).—Theoretical.

L. S. T.  
**Deuterium. II. III.** D. MACGILLAVRY (Chem. Weekblad, 1935, 32, 650–655, 679–684; cf. A., 1935, 1185).—A further review.

**Deuterium and X-ray absorption.** D. K. FROMAN (Physical Rev., 1934, [ii], 45, 731).—The presence of  $D_2$  in ordinary  $H_2$  does not account for the peculiarity in its absorption of X-rays in the range 0.5–0.6 Å.

L. S. T.  
**Sputtering of metals by incidence of slow ions and measurement of sputtering swelling values.** H. LÜDER (Z. Physik, 1935, 97, 158–170).—Degree of sputtering by positive ions of energies of 40 volts and upwards was determined from the resistance of the sputtered wire. Swelling val. or min. energy of sputtering was determined for  $A^+$  ions incident on Ni, Cu, Fe, and W, for  $K^+$ ,  $Cs^+$ , and  $Li^+$  incident on W, and for  $Cs^+$  on Cu.

A. B. D. C.  
**Molecular ions from heated salts of some of the alkali metals.** L. L. BARNES (Physical Rev., 1934, [ii], 45, 751).—At temp. just < m.p., KCl give an ion of mass  $K_2Cl^+$ , and  $K_2SO_4$  one of mass  $K_3SO_4^+$ . Salts of other alkali metals give similar ions.

L. S. T.  
**Periodic system of energy coefficients.** A. E. FERSMAN (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 173–176; cf. A., 1935, 1305).—The *VEK* vals. (energy of unit valency of an ion) for a large no. of ions are tabulated according to the periodic classification, and correlated. J. W. S.

**Solution of variation problems in quantum mechanics.** A. SCHUCHOVICKI (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 161–164).—Mathematical.

J. W. S.

**Temperatures and heat effects of genotypic transformation of alkali salts of long-chain fatty acids.** P. A. THIESSEN and J. VON KLENOK [with H. GOCKOWIAK and J. STAUFF] (*Z. physikal. Chem.*, 1935, 174, 335—358; cf. *A.*, 1933, 1004, 1011).—The temp. at which the heat effect,  $Q$ , corresponding with genotypic transformation sets in has been determined. The dielectric const.-temp. curve is discontinuous at the transformation point. For a single crystal of Na stearate on heating up through  $49^\circ$  the double refraction undergoes an abrupt irreversible change in sign.  $Q$  increases with the chain length and also runs parallel with the radius of the cation. Above the transformation temp. the sp. heat rises discontinuously. R. C.

**Kinetic interpretation of internal effects.** V. NJEGOVAN (*Z. Physik*, 1935, 97, 390—394).—Rotation and vibration of elastic mol. of an ideal gas effectively decrease the radius of the mol. and so liberate energy. This hypothesis is applied to thermal dissociation, ionisation, and gas degeneracy.

A. B. D. C.

**Movement of a heavy drop in the acoustic field.** S. V. GORBATSHEV and A. B. SEVERNY (*Kolloid-Z.*, 1935, 73, 146—154).—Theoretical.

E. S. H.

**Relation between internuclear distances and force constants of molecules and its application to polyatomic molecules.** R. M. BADGER (*J. Chem. Physics*, 1935, 3, 710—714; cf. *A.*, 1934, 477).—The relation between internuclear distances and force consts. found for diat. mols. persists in polyat. mols. This fact provides a method whereby internuclear distances in the latter can be calc. from vibrational data alone.

F. L. U.

**Mean free paths of molecules and wave mechanics.** J. A. EEDRIDGE (*Proc. Iowa Acad. Sci.*, 1934, 41, 257).—Direct determinations of the mean free path of  $H_2$ ,  $N_2$ , and  $O_2$  yield vals. for the effective cross-section of the mol. which are 4—5 times those based on viscosity data; theoretical factor should be  $\approx 2$ .

CH. ABS. (e)

**Electrostatic interaction in atoms.** R. F. BACHER and S. GOUDSMIT (*Physical Rev.*, 1934, [ii], 45, 767).

L. S. T.

**Vibrations and internal rotation of a chain of four atoms.** L. S. KASSEL and C. W. MONTGOMERY (*Physical Rev.*, 1934, [ii], 45, 766).—The dynamical behaviour of a chain of four equal atoms with tetrahedral bond angles has been studied in an attempt to classify the infra-red and Raman spectra of the higher hydrocarbons. Extra Raman lines observed by Kohlrausch and the tendency of long-chain hydrocarbons to exist in a linear form are explained.

L. S. T.

**Hydrocarbon linking additivity.** V. DEITZ (*J. Chem. Physics*, 1935, 3, 436).—Corrections previously proposed for obtaining linking additivity (cf. *A.*, 1935, 284) are tested with the help of experimental data (cf. Kistiakowsky, *ibid.*, 825) on the heats of hydrogenation of some olefines.

N. M. B.

**Fundamental frequencies of the cyanogen molecule.** S. C. WOO, T. K. LIU, and T. C. CHU

(*J. Chinese Chem. Soc.*, 1935, 3, 301—307).—The fundamental frequencies assigned by Kistiakowski *et al.* (*A.*, 1934, 30, 145) are criticised. The restoring force consts. of linkings in the mols. HCN, ClCN, BrCN,  $(CN)_2$ , and  $C_2H_2$  have been calc. from the fundamental frequencies of the valency vibrations. All the cyanides have the same type of CN linking. The frequencies have been re-assigned on the basis of the above calculations, the selection rule for infra-red and Raman spectra, and heats of formation of linkings.

A. J. M.

**Quantum-mechanical discussion of orientation of substituents in aromatic molecules.** G. W. WHELAND and L. PAULING (*J. Amer. Chem. Soc.*, 1935, 57, 2086—2095).—Using the method of mol. orbitals, the charge distribution in aromatic mols. undergoing substitution is discussed quantitatively, taking into consideration the inductive effect, the resonance effect, and the polarising effect of the attacking group. With reasonable vals. for the parameters involved, the calc. charge distributions for several aromatic compounds are in qual. agreement with experimental results regarding position and rate of substitution.

E. S. H.

**Effect of surface tension on flow from Poncelet apertures.** H. LAUFFER (*Forsch. Ing.*, 1934, 5, A, 266—274; *Chem. Zentr.*, 1935, i, 1987).—Theoretical. Contrary to accepted views, the flow from small apertures at low pressure is augmented by the influence of surface tension.

J. S. A.

**Aluminium alkoxides and their parachors.** R. A. ROBINSON and D. A. PEAK (*J. Physical Chem.*, 1935, 39, 1125—1133).—Surface tension and density data and parachor vals. are given for *Al acetylacetonate* (I), m.p.  $192^\circ$ , *aluminoethyl acetoacetate* (II), m.p.  $78-79^\circ$ , *Al diethylmalonate* (III), m.p.  $95-96^\circ$ , *Cr acetylacetonate*, m.p.  $212^\circ$ ,  $[Al(OEt)_3]_4$ , m.p.  $146-151^\circ$ ,  $[Al(OPr^a)_3]_4$ , m.p.  $106-108^\circ$ ,  $[Al(OPr^b)_3]_4$ , m.p.  $118^\circ$ ,  $[Al(OBu^a)_3]_4$ , m.p.  $102-106^\circ$ ,  $[Al(OBu^b)_3]_4$ , m.p.  $208-210^\circ$ , sec.- $[Al(OBu)_3]_4$ , b.p.  $174-176^\circ/5$  mm., *Sb(OEt)\_3*, b.p.  $99.5^\circ/13$  mm. Assuming singlet linkings in (I), (II), and (III), the mean parachor of Al is 39.5. The parachor deficiencies which occur in the alkoxides may be accounted for by an 8-membered ring in which the O are attached to Al by singlet linkings.

R. S.

**The parachor as a function of density and molecular volume of a substance in its different chemical states.** I. R. MOROZOV (*J. Gen. Chem. Russ.*, 1935, 5, 1020—1023).—The parachor is calc. from  $P = (V + V_1)(2dV_1/V)^{1/2}$ , where  $V$  is the sum of the vols. of the constituent atoms,  $V_1$  is the mol. vol. of the substance, and  $d$  is the density.

R. T.

**Investigations on diffusion of cathode rays by means of the cloud chamber.** I. GUNTHER (*Ann. Physik*, 1935, [v], 24, 377—392).—The directional distribution of cathode rays after passing various thickness of matter was particularly studied. The results suggest that the passage of rays through matter is a combination of absorption and diffusion processes.

J. W. S.

**Absorption of short-wave-length X-rays.** W. V. MAYNEORD and J. E. ROBERTS (*Nature*, 1935, 136,

793).—For elements up to Ca the mean absorption per electron for X-rays of  $\lambda$  59 X is in agreement with the Klein-Nishina formula. The photo-electric absorption coeff. per electron varies according to (at. no.)<sup>3</sup>.  
L. S. T.

Widths of X-ray bands in solids. J. REHNER, jun. (Physical Rev., 1934, [ii], 45, 735).—Theoretical (cf. A., 1934, 576).  
L. S. T.

X-Ray and magnetic measurements of KCl powders in relation to lattice distortion and photochemical coloration. G. W. BRINDLEY, F. W. SPIERS, and F. E. HOARE (Phil. Mag., 1935, [vii], 20, 1041—1054).—Comparisons of high-order spectra of finely-ground and pptd. KCl show that the greater photo-coloration of the former, which has been attributed to flaws and cracks (Smekal), is not due to lattice distortion. The question of extinction is considered in detail. Grinding reduces the diamagnetic susceptibility of KCl only from  $39.3 \times 10^{-6}$  to  $38.8 \times 10^{-6}$ , confirming the above conclusion.  
T. G. P.

Examination of electro-deposited nickel coatings by X-ray diffraction. W. A. WOOD (Phil. Mag., 1935, [vii], 20, 964—971).—Specimens of electro-deposited Ni differing in hardness and initial brightness have been examined. Brightness is associated with the selective orientation of the metal grains, and hardness with the degree of diffusion of the X-ray diffraction spectra. The grain size has been estimated from the broadening of the spectral lines for a series of deposits of known hardness.  
T. G. P.

X-Ray examination of lattice distortion in copper and nickel powders. G. W. BRINDLEY and F. W. SPIERS (Phil. Mag., 1935, [vii], 20, 882—893; cf. A., 1935, 150).—The scattering factors for Cu  $K\alpha$  radiation of finely filed Cu and Ni are < those of chemically prepared powders. The diminution increases with the order of the spectrum. The average displacements due to lattice distortion caused by filing are 0.106 Å. for Cu and 0.083 Å. for Ni, and are explicable if distortion is a random displacement of atoms from the points of the undistorted lattice. Scattering factors for the (200) reflexions indicate, however, that distortion is not entirely random.  
T. G. P.

Discontinuous variation in the diffusion of X-rays with the angle of diffusion. J. LAVAL (Compt. rend., 1935, 201, 889—891).—For a beam of X-rays of  $\lambda$  incident at an angle  $\phi$  on Al, Cr, Ni, In, Mo, Ag, Sb, Pt, and Au the diffusion of the rays varies discontinuously with  $\sin \phi/2$ . For similarly placed discontinuities  $\lambda \sin \phi/2$  is a linear function of at. no.  
R. S. B.

Effect of additions of cadmium on growth of zinc crystals. E. P. T. TYNDALL (Proc. Iowa Acad. Sci., 1934, 41, 252).—In Zn containing several tenths of 1% of Cd, mosaic formation was largely prevented (cf. Hoyem and Tyndall, A., 1929, 246).  
CH. ABS. (e)

Relation between the mechanical strain and the intensity of X-rays reflected by a quartz plate. I. E. FUKUSHIMA (Bull. Inst. Phys. Chem.

Res. Japan, 1935, 14, 1105—1112).—Intensities of X-rays reflected from a strained quartz plate have been measured. The distribution of intensity depends on the distribution of strain.  
R. S.

Relation between amorphous and crystalline scattering and its application to crystal analysis. N. S. GINGRICH and B. E. WARREN (Physical Rev., 1934, [ii], 45, 762—763).—An expression for the average radial distribution of atoms about any one atom, expressed as a series over the no. of lines in the powder pattern, is given. Interat. distances can be obtained directly without determining a complete structure.  
L. S. T.

Structure of layer lattices. W. LOTMAR (Z. Krist., 1935, 91, 187—191).—To explain the observed broadening of (*hkl*) reflexions in layer lattices as compared with the (*hko*) and (*ool*), a particular distortion is suggested which leaves the (*hko*) planes undisturbed.  
B. W. R.

Alternating axes and symmetry symbols in crystallography. J. D. H. DONNAY (J. Washington Acad. Sci., 1935, 25, 476—488).—A discussion of the use and nomenclature of the alternating axis, regarded as a single symmetry operation, in point- and space-group theory. The international point-group symbols are tabulated with the other notations in use.  
B. W. R.

Advantages of employing four-index notation for crystals of rhombohedral symmetry. H. UNGEMACH (Z. Krist., 1935, 91, 97—113).—The reasons for preferring the Bravais to the Miller system for crystallographic calculation and description are given.  
B. W. R.

Growth of metal crystals in metal vapour. IV. M. STRAUMANIS (Z. physikal. Chem., 1935, B, 30, 132—138; cf. A., 1934, 946).—Experiments have been made on the sublimation of Te and Se in H<sub>2</sub> and the equilibrium crystal forms determined. The results do not wholly agree with Stranski's theory of homopolar crystal growth.  
R. C.

X-Ray diffraction in solutions. J. A. PRINS and R. FONTEYNE (Physica, 1935, 2, 1016—1028; cf. A., 1935, 931).—"Superarrangement" of the cations is present with ThCl<sub>4</sub>, UO<sub>2</sub>Cl<sub>2</sub>, La(NO<sub>3</sub>)<sub>3</sub>, Cd(NO<sub>3</sub>)<sub>2</sub>, Zn(NO<sub>3</sub>)<sub>2</sub>, Ni(NO<sub>3</sub>)<sub>2</sub>, ZnCl<sub>2</sub>, ZnI<sub>2</sub>, and NiCl<sub>2</sub>; it is probable with the multivalent anions of Na<sub>2</sub>WO<sub>4</sub>, Na<sub>2</sub>MoO<sub>4</sub>, H<sub>2</sub>PtCl<sub>6</sub>, HIO<sub>4</sub>, HClO<sub>4</sub>, and H<sub>2</sub>SO<sub>4</sub>. No such arrangement is found in univalent cations. HIO<sub>3</sub>; CdI<sub>2</sub> in H<sub>2</sub>O or EtOH; CdCl<sub>2</sub>, Hg(NO<sub>3</sub>)<sub>2</sub>, Na<sub>3</sub>(PW<sub>12</sub>O<sub>40</sub>), Ce<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, and Zr(NO<sub>3</sub>)<sub>4</sub> in H<sub>2</sub>O exhibit only gaseous distribution. Superarrangement is related to solvation. *d*<sup>18</sup> and have been determined for *M*/15 to *M*/85 aq. Th(NO<sub>3</sub>)<sub>4</sub>.  
T. G. P.

Cybotactic group structure of isopentane near the critical point. C. A. BENZ (Proc. Iowa Acad. Sci., 1934, 41, 249—250; cf. A., 1934, 1297).—X-Ray diffraction intensity curves were measured at various points on the isothermal diagram. There is no sharp transition as the gaseous state is approached. Cybotactic groups appear in regions commonly known as gas if the sp. vol. is kept near that of a liquid.  
CH. ABS. (e)

**Dimorphism of trinitroresorcinol, bromobenzhydrazine, and benzaldehyde-*p*-nitrophenylhydrazine.** R. FISCHER and A. KOFLER (Mikrochem., 1935, 19, 38—46).—The following stable (*s*) and metastable (*ms*) forms are obtained on vac. sublimation. Trinitroresorcinol: (*s*), m.p. 177°, monoclinic prisms of high optic axial angle; (*ms*), m.p. 165.5°, trigonal prisms, uniaxial and optically negative. "Bromobenzhydrazine": (*s*), m.p. 165°, rectangular monoclinic prisms with high double refraction; (*ms*) monoclinic plates, m.p. 159°. Benzaldehyde-*p*-nitrophenylhydrazine: (*s*), stout monoclinic rods, m.p. 261°; (*ms*), thin ill-formed monoclinic crystals, m.p. 234—236°. J. S. A.

**Silicon disulphide, a fibrous inorganic compound with chain molecules.** E. ZINTL and K. LOOSEN (Z. physikal. Chem., 1935, 174, 301—311).—In respect of the character of the constituent units of its lattice  $\text{SiS}_2$  is intermediate between the mols. of the mol. lattice of  $\text{CO}_2$  and the three-dimensional macromols. of  $\text{SiO}_2$  in quartz. It forms on sublimation flexible fibres, which consist of one-dimensional macromols. oriented parallel to each other. The crystals are rhombic and the probable space-group is  $V_{20}^a$ . R. C.

**Orthonitric acid,  $\text{H}_3\text{NO}_4$ .** E. ZINTL and W. HAUCKE (Z. physikal. Chem., 1935, 174, 312—316).—Comparison of the powder diagram of  $\text{HNO}_3 \cdot \text{H}_2\text{O}$  with those of the five low-pressure modifications of  $\text{NH}_4\text{NO}_3$  and that of  $\text{H}_3\text{PO}_4$  makes it appear not improbable that  $\text{HNO}_3 \cdot \text{H}_2\text{O}$  is orthonitric acid. R. C.

**Crystal growth of the alkali halides.** Z. GYULAI (Z. Krist., 1935, 91, 142—153).—Crystallisation from conc. solution, vapour, and melt of NaCl and KCl is studied microscopically, and the chief directions of growth from the nucleus are described. B. W. R.

**Crystal structure of  $[\text{Rh}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$ .** C. D. WEST (Z. Krist., 1935, 91, 181—186).—This typical member of the isomorphous orthorhombic pentammines  $[\text{R}(\text{NH}_3)_5\text{X}]\text{Y}_2$  has  $a_0$  13.32,  $b_0$  6.71,  $c_0$  10.42 Å., space-group  $V_{16}^b$ . The 16 necessary parameters are determined, and the structure is compared with that of the hexammines  $\text{R}(\text{NH}_3)_6\text{Y}_2$ . B. W. R.

**Structure of green basic cobalt bromide.** W. FEITKNECHT and W. LOTMAR (Z. Krist., 1935, 91, 136—141).—The three isomorphous basic compounds, basic Zn bromide III, green Co bromide and iodide, are investigated by X-rays. The existence of regular layers of pure hydroxide groups at intervals of 8.2 Å. is established; the intervening material is randomly arranged, and its origin and relations are discussed. B. W. R.

**Crystal structure of nickel sulphate heptahydrate,  $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$ .** C. A. BEEVERS and C. M. SCHWARTZ (Z. Krist., 1935, 91, 157—169).—The at. parameters of the orthorhombic variety have been determined, using Patterson's method for the location of Ni and S and a double Fourier analysis for the remaining parameters. 6  $\text{H}_2\text{O}$  surround Ni forming an almost octahedral group. The structure is compared with that of  $\text{NiSO}_4 \cdot 6\text{H}_2\text{O}$ . B. W. R.

**Crystal structure of potassium persulphate,  $\text{K}_2\text{S}_2\text{O}_8$ .** R. C. KEEN (Z. Krist., 1935, 91, 129—135).—The cell is triclinic,  $a_0$  5.10,  $b_0$  6.83,  $c_0$  5.40 Å.,  $\alpha$  106° 54',  $\beta$  90° 10',  $\gamma$  102° 35', space-group  $C_1^1$ . At. parameters are found from intensity measurements. B. W. R.

**Crystallography of the copper-pyridine-saccharin complex.** J. BEINTEMA, P. TERPSTRA, and J. J. DE VRIEZE (Pharm. Weekblad, 1935, 72, 1287—1294).— $\text{Cu}(\text{C}_5\text{H}_5\text{N}, \text{H}_2\text{O}, \text{C}_6\text{H}_5\text{O}_3\text{NS})_2$  (A., 1933, 732) forms rhombic bipyramidal crystals with 4 mols. in the unit cell of dimensions  $a$  9.50,  $b$  21.57,  $c$  13.16 Å., space-group  $V_{16}^a$ . Full crystallographic data are given and the orientation of the constituent mols. is discussed. D. R. D.

**Structure of natural wollastonite.** M. BARNICK (Naturwiss., 1935, 23, 770—771).—X-Ray methods give monoclinic symmetry for wollastonite ( $a$  15.33,  $b$  7.28,  $c$  7.07 Å.;  $\alpha=\gamma=90^\circ$ ,  $\beta$  95° 24' 30"). The unit cell contains 12  $(\text{CaO}, \text{SiO}_2)$ . It does not possess a chain structure, but has  $\text{Si}_3\text{O}_9$  rings. A. J. M.

**Crystal structure of hexagonal silver iodide.** L. HELMHOLTZ (J. Chem. Physics, 1935, 3, 740—747).—Hexagonal AgI has been examined by powder, Laue, and oscillation methods. At  $-180^\circ$  the structure is essentially that of wurtzite with the ideal parameter val., whilst at room temp. the Ag atoms appear to be distributed at random among four positions tetrahedrally surrounding the ideal position. On the basis of these structures an explanation of some of the peculiarities of AgI is offered. F. L. U.

**Crystal structure of silver azide.** M. BASSIERE (Compt. rend., 1935, 201, 735—737).—The crystals are orthorhombic ( $a$  5.58,  $b$  5.93,  $c$  6.04, all  $\pm 0.03$  Å.; 4 mols. in unit cell; space-group  $V_{20}^a$ ). The crystal is built up from Ag and  $\text{N}_3$  ions. The  $\text{N}_3$  group is linear, the N—N distance being  $1.18 \pm 0.04$  Å., as in other azides. H. J. E.

**Molecular structure of di-iodoethane. Iodine bond resonance and molecular structure of di-iodoethylene. Molecular packing in their crystal lattices.** H. P. KLUG (J. Chem. Physics, 1935, 3, 747—753).—Distances between the I atoms of  $(\text{CH}_2\text{I})_2$  and of *s-trans*- $\text{C}_2\text{H}_2\text{I}_2$  in mol. models predicted theoretically agree well with these distances within the crystal cells as given by X-ray data (A., 1935, 1195). These models, in conjunction with Mack's concept of the at. domain radius in crystals, lead to a picture of mol. packing which agrees with observed physical properties of the crystals. F. L. U.

**Molecular map of resorcinol.** J. M. ROBERTSON (Nature, 1935, 136, 755—756).—The electron density map obtained by a quant. X-ray analysis of resorcinol (I) is reproduced. The complete structure is described. OH belonging to adjacent (I) mols. approach to within 2.66 Å., indicating the existence of a strong (OH) linking or secondary valency force between mols. L. S. T.

**Crystal structure of pyrene.** J. DHAR and A. C. GUHA (Z. Krist., 1935, 91, 123—128).—Pyrene is monoclinic prismatic,  $a_0$  13.74,  $b_0$  9.22,  $c_0$  8.45 Å.,  $\beta$  102½°, 4 mols. in cell, space-group  $C_{2h}$ . Tentative mol. orientations are suggested. B. W. R.

**An orthorhombic crystalline modification of 1:2:5:6-dibenzanthracene.** K. S. KRISHNAN and S. BANERJEE (*Z. Krist.*, 1935, **91**, 170—172).—This substance is normally monoclinic; an orthorhombic bipyramidal form occurs occasionally when cryst. from EtOAc. M.p. and *d* are nearly the same as for the normal form. B. W. R.

**Magnetic anisotropy and crystal structure of 1:2:5:6-dibenzanthracene.** K. S. KRISHNAN and S. BANERJEE (*Z. Krist.*, 1935, **91**, 173—180).—Measurement of the anisotropy and the absolute susceptibility for very small crystals (0.02 mg.) is described. Measurements on both monoclinic and orthorhombic dibenzanthracene enable the directions of the lengths of the mols. and the angles of tilt of the mol. planes to be determined. B. W. R.

**Thread diagram for polyvinyl alcohol.** F. HALLE and W. HOFMANN (*Naturwiss.*, 1935, **23**, 770).—Polyvinyl alcohol gives a typical thread diagram similar to that of a natural fibre; identity period in the direction of the thread axis is  $2.57 \pm 0.02$  Å. It is composed of crystallites which readily arrange themselves parallel on stretching, especially when warmed. A. J. M.

**X-Ray structure investigations on elastic tissue with special reference to extension and shrinkage.** H. KOLPAK (*Kolloid-Z.*, 1935, **73**, 129—142).—The results previously reported (*A.*, 1934, 244) are confirmed and extended, and discussed in relation to current theories of valency chain structures. E. S. H.

**Electron diffraction by gases.** L. R. MAXWELL, S. B. HENDRICKS, and V. M. MOSLEY (*J. Chem. Physics*, 1935, **3**, 699—709; cf. *A.*, 1934, 17, 835).—The C—O—C valency angle in 4:4'-di-iododiphenyl ether has been found to be  $118 \pm 3^\circ$  by the electron diffraction method. This is  $>$  the O valency angle for simpler mols. such as  $F_2O$ ,  $Cl_2O$ , and  $Me_2O$ . By the same method P and As mols. have been shown to have regular tetrahedral structure, the at. separations being respectively 2.21 and 2.44 Å. F. L. U.

**Electron diffraction pattern from the natural (111) face of diamond.** R. BEECHING (*Phil. Mag.*, 1935, [vii], **20**, 841—855).—Intensity measurements on the pattern were made, relative intensities of the main spots were determined, and tolerances in the Bragg angles were compared with the widths of the corresponding Kikuchi lines (cf. *A.*, 1935, 570). The inner potential was measured, and various qual. observations were made. A case where a spot has been partly suppressed by Kikuchi lines is recorded. N. M. B.

**"Extra" electron diffraction rings.** (A) L. H. GERMER. (B) G. I. FINCH (*Nature*, 1935, **136**, 832).—(A) Calculations show that the exit face theory (*A.*, 1935, 287) of the origin of these rings is untenable.

(B) Germer's calculations agree with the view that the "extra" rings are due to surface contamination (*ibid.*, 1452). L. S. T.

**Electron diffraction in rubber films.** K. I. KRILOV (*Physikal. Z. Sovietunion*, 1935, **8**, 136—152).—The diffraction patterns from crepe rubber

films are rings. Stretched films gave points generally explicable on Susich's X-ray structure (*A.*, 1928, 1186), but certain modifications are necessary. Unstretched chloroprene gave spots of an orthorhombic unit: *a*, 10.93, *b* 8.23 Å. (for crepe *a* 12.23, *b* 8.3 Å.). No spots were obtained with Na-butadiene rubber. T. G. P.

**Permanent polarisation of Rochelle salt.** H. MÜLLER (*Physical Rev.*, 1934, [ii], **45**, 736; cf. *A.*, 1935, 288). L. S. T.

**Dielectric properties of Rochelle salt.** J. E. FORBES and H. MÜLLER (*Physical Rev.*, 1934, [ii], **45**, 736—737; cf. *A.*, 1935, 228). L. S. T.

**Magnetisation of imperfect crystals.** F. BRATER (*Physical Rev.*, 1934, [ii], **45**, 742; cf. *A.*, 1934, 945). L. S. T.

**Dependence of internal friction on magnetisation in iron.** W. T. COOKE (*Physical Rev.*, 1934, [ii], **45**, 742). L. S. T.

**Approach to the theoretical magnetisation curve.** T. D. YENSEN (*Physical Rev.*, 1934, [ii], **45**, 743).—The curves reproduced for Fe, Fe-Si and Fe-Ni alloys show that the approach to the theoretical curves, based on the Langevin-Weiss theory, depends not only on lattice orientation, but also on purity of material. L. S. T.

**Separation of magnetic viscosity and eddy-current lag.** A. V. MITKEVITSCH (*Compt. rend. Acad. Sci. U.S.S.R.*, 1935, **3**, 209—211).—Eddy-current lags can be detected through the sp. influence of previous changes in magnetic induction. C. W. G.

**Rotatory power of quartz for rays perpendicular to the optic axis and its dispersion between 2537 and 5780 Å.** G. BRUHAT and L. WEIL (*Compt. rend.*, 1935, **201**, 887—889).—The ratio of the rotatory powers of quartz for rays perpendicular and parallel to the optic axis is (mean)  $0.54 \pm 0.01$ . The dispersion is the same for both rays. R. S. B.

**Quantum mechanical investigation of the cohesive forces of metallic copper.** K. FUCHS (*Proc. Roy. Soc.*, 1935, **A**, 151, 585—602).—The wave functions and energies of the 4s electrons of Cu have been calc. by a method analogous to that used by Wigner and Seitz for Na (*A.*, 1933, 660). The right order of magnitude is obtained for the lattice const. and for the heat of vaporisation, but to obtain the correct compressibility, the interaction between the ions in the lattice due to the overlapping of the closed shells must be considered. For Cu, the face-centred structure will have lower energy than the body-centred, but for Na the two structures have almost equal energies. Thus the calculations show why Cu has a close-packed structure, but fail to show why Na should have one cubic structure rather than the other. L. L. B.

**Effect of photochemical colouring on the extension and strength limits of single crystals of rock-salt.** M. N. PODASCHEVSKI (*Physikal. Z. Sovietunion*, 1935, **8**, 81—92).—The extension and strength limits of single NaCl crystals are increased by photochemical coloration, the result being the

same whether the coloration is produced by X-rays or ultra-violet light. A. J. M.

**Plastic properties of silver chloride and sodium chloride single crystals.** A. V. STEPANOV (Physikal. Z. Sovietunion, 1935, 8, 25—40).—The plastic properties of single crystals of AgCl and NaCl are compared to show that they are connected with the polarisation effect of the lattice. Single crystals of AgCl show a high degree of plasticity and metallic properties in general. AgCl which has been exposed to light is not so plastic. The elastic limit along the cubic axis of a crystal tempered at 350° was 70 g. per sq. mm. Deformation on extension is similar to that of a metal belonging to the cubic system. The elastic limits for crystals of AgCl and NaCl are similar. The deformation work for NaCl is > for AgCl. At room temp. AgCl is more plastic than NaCl. A. J. M.

**Tension coefficient of [electrical] resistance of the single hexagonal crystals, zinc and cadmium.** M. ALLEN (Physical Rev., 1934, [ii], 45, 757). L. S. T.

**Allotropy of calcium.** M. C. NEUBERGER (Z. Elektrochem., 1935, 41, 790).—Published work is considered. E. S. H.

**Thermodynamics of stationary systems. I. The thermo-element. II. The diffusion element.** B. BRUZZ (Proc. Roy. Soc., 1935, A, 151, 640—651, 651—665).—I. A quant. application of the first and second laws of thermodynamics to stationary systems is connected with an introduction of certain arbitrary assumptions, of which two are distinguished. The first is the "non-interaction" assumption of Kelvin, leading to the well-known relations connecting the Seebeck, Peltier, and Thomson coeffs. The second postulates the existence of a const. ratio between the Joule and the polarisation effects, and leads to a new relationship between the Seebeck coeff. and the thermal and electrical conductivities of the material.

II. The above treatment of the thermo-element is extended to the problem of the diffusion element, and it is shown that a close correspondence exists between thermo- and diffusion element. The problem of the diffusion element reduces to a knowledge of the diffusion and electrical conductivities. L. L. B.

**Influence of a magnetic field on the high-frequency conductivity of an ionised medium.** E. V. APPLETON and D. B. BOOHARIWALLA (Proc. Physical Soc., 1935, 47, 1074—1084; cf. *ibid.*, 1932, 44, 246).—The relation between the transverse high-frequency conductivity and the pressure of ionised air under the influence of an imposed magnetic field was investigated. The pressure for max. conductivity varies with field intensity. The relation of results to ionospheric conductivity is discussed. N. M. B.

**Change in resistance of bismuth single crystals at the m.p.** J. H. SCHROEDER (Proc. Iowa Acad. Sci., 1934, 41, 254).—Measurements of resistance for various crystal orientations are recorded up to temp. > the m.p. The change from solid to liquid did not occur suddenly at the m.p., but began 1.5° < and continued 1.5° > m.p. CH. ABS. (e)

**Change in resistance of single crystals of bismuth in a magnetic field at low temperatures.** W. J. DE HAAS, J. W. BLOM, and L. SCHUBNIKOV (Physica, 1935, 2, 907—914; cf. A., 1930, 1102, 1353).—The influence of magnetic fields (4000—22,000 gauss) on the resistance of Bi single crystals is greater at 1.35° and 4.22° abs. than at 14.15° abs.

T. G. P.  
**Magneto-resistance of bismuth films at low temperature.** C. T. LANE (Physical Rev., 1934, [ii], 45, 733—744).—The magneto-resistance of films 0.1—4  $\mu$  thick has been measured at -180° and 20°. There is a change in direction of the  $[\Delta R_{-180^\circ}/\Delta R_{20^\circ}]$ -thickness curve at a thickness < 1  $\mu$ , and the magneto-resistance approaches temp. independence as the film thickness approaches zero. L. S. T.

**Resistance of single crystals of gallium in a magnetic field. III.** W. J. DE HAAS and J. W. BLOM (Physica, 1935, 2, 952—958; cf. A., 1934, 588).—Change of resistance of single crystals of Ga with the pseudo-tetragonal axis parallel to the length of the wire in a magnetic field perpendicular to the wire has been measured at liquid He temp. At 1.35° and 4.22° abs. the influence of the magnetic field is independent of temp., but > at liquid H<sub>2</sub> temp. T. G. P.

**Electrical resistance of tantalum wires charged with hydrogen.** A. SIEVERTS and H. BRUNING (Z. physikal. Chem., 1935, 174, 365—369).—For H. pressures,  $p$ , up to  $\sim 1$  atm., the amount sorbed by Ta at 500° and 600° is  $\propto \sqrt{p}$ ; at 400° there are deviations from this relation. The resulting increase in resistance is at 500° and 600°  $\propto \sqrt{p}$ , whilst at 400° this is approx. Comparison of these results with similar data for the system Pd-H<sub>2</sub> indicates that the sorption has not involved the formation of a new phase. R. C.

**Electrical conductance of colloidal solutions at high frequencies.** H. J. CURTIS and H. FRICKE (Physical Rev., 1935, [ii], 48, 775; cf. *ibid.*, 47, 974).—Suspensions of powdered glass and kaolin, and colloidal Al<sub>2</sub>O<sub>3</sub>, V<sub>2</sub>O<sub>5</sub>, starch, and gelatin showed a marked increase in conductance at frequencies  $\geq 16,000$  kc. per sec. The phenomenon is attributed to a form of Debye-Falkenhagen effect. N. M. B.

**Diamagnetism of the tervalent bismuth ion.** S. S. BHATNAGAR and B. S. BAHL (Current Sci., 1935, 4, 234).—The val. calc. for Bi<sup>+++</sup> is in agreement with the experimental val. (A., 1935, 1453). From Kido's work the predicted difference between the diamagnetism of Bi<sup>++++</sup> and Bi<sup>+++</sup> should be of the order of 12.87, as is obtained. W. R. A.

**Theory of dispersion of magnetic permeability in ferro-magnetic bodies.** L. LANDAU and E. LIFSCHITZ (Physikal. L. Sovietunion, 1935, 8, 153—169).—The distribution of magnetic moments in a ferromagnetic crystal is investigated. The crystal consists of elementary layers magnetised to saturation. T. G. P.

**Ionic diamagnetism in the solid state and in solution.** H. FAHLENBRACH (Ann. Physik, 1935, [v], 24, 485—488).—The results of Frivold *et al.* (A., 1935, 1197) on the susceptibility of solutions may

be explained by the work of Cabrera *et al.* (A., 1933, 766, 1002, 1233). The results of Flordahl *et al.* (A., 1935, 1197) are also discussed. A. J. M.

**Magnetic moment of the manganic ion.** L. C. JACKSON (Proc. Physical Soc., 1935, 47, 1029—1031).—The magnetic susceptibility of  $\text{Mn}^{\text{III}}$  acetylacetonate was measured for a powdered specimen in the range 292—16.9° abs. The law  $\chi(T+5.5)=\text{const.}$  is obeyed down to about 75° abs., below which the susceptibility increases more rapidly. The calc. magneton no. of the  $\text{Mn}^{+++}$  ion is 4.98, in agreement with the Bose-Stoner theory. N. M. B.

**Diamagnetic study of structure.** F. W. GRAY and J. H. CRUICKSHANK (Trans. Faraday Soc., 1935, 31, 1491—1510).—A new method of treating at. and mol. diamagnetic data is described, whereby deviations of the observed diamagnetism of mols. from that calc. from the diamagnetism of free atoms may be used to establish the modes of linking of atoms in mols. Details are worked out for  $\text{C}_6\text{H}_6$ ,  $\text{C}_{10}\text{H}_8$ ,  $\cdot\text{CO}_2\text{H}$ ,  $\text{H}_2\text{O}$ , and  $\text{H}_2\text{O}_2$ . F. L. U.

**Effect of crystalline fields on the magnetic susceptibilities of  $\text{Sm}^{+++}$  and  $\text{Eu}^{+++}$ , and the heat capacity of  $\text{Sm}^{+++}$ .** (MISS) A. FRANK (Physical Rev., 1935, [ii], 48, 765—771; cf. A., 1932, 217).—Mathematical. The temp. variation of the paramagnetic susceptibility of  $\text{Sm}^{+++}$  is calc. on the assumption that the ion is subject to a cryst. field which can be represented by a potential expression. Eu behaves, in contrast, like the free ion even in presence of a cryst. field. The contribution to the heat capacity of  $\text{Sm}^{+++}$  at various temp. due to the excited levels is calc. Results are compared with available experimental data. N. M. B.

**Magnetic susceptibility of mixtures of oxides of the rare earths: mixtures of neodymium with praseodymium and of neodymium with samarium [oxides].** I. L. MAZZA (Atti R. Accad. Lincei, 1935, [vi], 21, 813—818).—The mixtures of the oxides were obtained by calcining the co-pptd. oxalates. In the system  $\text{Sm}_2\text{O}_3\text{--Nd}_2\text{O}_3$ , the magnetic susceptibility follows the simple additive law. In the system  $\text{Pr}_6\text{O}_{11}\text{--Nd}_2\text{O}_3$ , this could not be established, but the deviations are attributed to mutual reduction and oxidation of these oxides during the calcining. For  $\text{Nd}_2\text{O}_3$   $\kappa=3.10\times 10^{-7}$ ; for  $\text{Sm}_2\text{O}_3$ ,  $6.1\times 10^{-6}$ ; and for  $\text{Pr}_6\text{O}_{11}$ ,  $1.56\times 10^{-7}$ . D. R. D.

**Propagation of elastic waves in ice.** I. M. EWING, A. P. CRARY, and A. M. THORNE, jun. II. A. P. CRARY and M. EWING (Physical Rev., 1934, [ii], 45, 749). L. S. T.

**Propagation of sound and supersonic waves in gases.** H. L. SAXTON (Physical Rev., 1934, [ii], 45, 749).—The derivation of equations for velocity and the absorption const. is outlined. L. S. T.

**Vibrations of air and carbon dioxide in closed bulb resonators.** K. VOECKLER (Ann. Physik, 1935, [v], 24, 361—376).—The frequency of vibration is in accord with the theory of Rayleigh and Thiesen, and the damping is of the order of magnitude predicted by the theory. The damping is less in  $\text{CO}_2$

than in air and is diminished by addition of  $\text{H}_2\text{O}$  vapour. J. W. S.

**Collision excitation of intramolecular vibrations in gases and gas mixtures studied by sound dispersion measurements. III. Measurements with nitrous oxide.** A. EUCKEN and H. JAACKS (Z. physikal. Chem., 1935, B, 30, 85—112; cf. A., 1935, 155).—From determinations of the  $\lambda$  of ultrasonic waves in pure  $\text{N}_2\text{O}$  and mixtures of  $\text{N}_2\text{O}$  with foreign gases the variation of collision efficiency with temp. and pressure at  $-60^\circ$  to  $200^\circ$  and 0.3—1 atm. has been measured. The deactivation of  $\text{N}_2\text{O}$  mols. by either  $\text{N}_2\text{O}$  or  $\text{NH}_3$  mols. occurs by binary collisions. The difference between physical and chemical collision excitation of mol. vibration is discussed in relation to the collision efficiency in presence of  $\text{H}_2$ ,  $\text{D}_2$ , and He. Measurements have been made with  $\text{CO}_2$  mixed with a little  $\text{H}_2\text{O}$  to determine the effect of  $\text{H}_2\text{O}$  on the vibrational excitation of  $\text{CO}_2$ . The reported dispersion of the rotational heat of  $\text{H}_2$  in the ultrasonic region (A., 1934, 588) could not be confirmed (cf. *ibid.*, 950). R. C.

**Experiments at very low temperatures obtained by the magnetic method. II. New superconductors.** N. KURTI and F. SIMON (Proc. Roy. Soc., 1935, A, 151, 610—623; cf. A., 1935, 290).—The experimental technique of cooling down additional substances with the paramagnetic salts by applying the magnetic method (*loc. cit.*) is discussed. The measurement of the magnetic behaviour of a metal can be used to detect superconductivity, and to find the transition point and the threshold vals. Cd, Zr, and Hf become superconducting in the new temp. region, the normal transition points being  $0.54^\circ$ ,  $0.70^\circ$ , and  $0.35^\circ$  abs. Au, Cu, Bi, Mg, and Ge did not become superconducting down to  $0.05^\circ$  abs. L. L. B.

**Theory of anomalies in specific heats.** L. LANDAU (Physikal. Z. Sovietunion, 1935, 8, 113—118). T. G. P.

**Characteristic point of pure substances.** F. MICHAUD (J. Chim. phys., 1935, 32, 527—540).—The characteristic point of a solid body is defined as the point of contact of the tangent passing through the origin to the curve giving at. or mol. heat capacity as a function of abs. temp. The co-ordinates of this point define the characteristic temp. and characteristic heat capacity. The point with the same abscissa on the curve at. or mol. entropy/abs. temp. is the characteristic entropy. The characteristic point plays a part in comparisons of heat properties of solids analogous to that of the crit. point in comparisons of thermo-elastic properties of fluids. The curves  $S/\text{temp.}$  for certain substances are approx. superposable by a simple translation of the co-ordinates. The characteristic entropies of pure substances of the same atomicity are approx. equal amongst themselves, diat. and triat. mols. having twice and three times the characteristic entropy of a normal metal. A more rigorous comparison is effected by plotting log heat capacity/entropy. Such curves are a criterion of the existence of allotropic changes. Anomalies are discussed. T. G. P.

Specific heats of solid substances at higher temperatures. XX. Molecular heats of the alloys of palladium and antimony in comparison with the sum of the atomic heats of the free elements. XXI. Molecular heats of the compound  $\text{PtSb}_2$  in comparison with the sum of the atomic heats of the free composing elements. XXII. Molecular heats of the supposed binary compounds of copper and palladium. T. J. POPPEMA and F. M. JAEGER (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 822—833, 833—836, 836—841; cf. A., 1935, 924).—XX. The sp. heats of Sb measured under different conditions are not quite const., but no transformation point could be observed at  $414^\circ$ . At. heat data between  $100^\circ$  and  $600^\circ$  are tabulated and sp. heats of  $\text{PdSb}$ ,  $\text{PdSb}_2$ , and  $\text{Pd}_3\text{Sb}$  over a range of temp. are given. The difference between the mol. heats  $C_p$  and the sum of the at. heats  $\Sigma$  is small, but increases with rise of temp. and % of Pd. The change  $\beta\text{-Pd}_3\text{Sb} \rightarrow \alpha\text{-Pd}_3\text{Sb} - 4800 \text{ g.-cal. per g. occurs at } 950^\circ$ .

XXI. Sp. heat data are given for  $\text{PtSb}_2$  up to  $600^\circ$ .  $C_p - \Sigma$  increases from  $-8\%$  of  $C_p$  at  $200^\circ$  to  $-19\%$  at  $600^\circ$ .

XXII. Alloys of the composition  $\text{CuPd}$  and  $\text{Cu}_3\text{Pd}$  have been prepared and the sp. heats determined up to  $900^\circ$ .  $C_p - \Sigma$  is small, and it is concluded, in conjunction with X-ray measurements, that the alloys are chiefly composed of solid solutions.

R. S.

Specific heat of  $\text{Ag}_2\text{HgI}_4$  in relation to the crystal structure. J. A. A. KETELAAR (Z. physikal. Chem., 1935, B, 30, 53—60; cf. A., 1934, 1056).—The sp. heat has been measured at  $20\text{--}100^\circ$ . From  $37^\circ$  it rises anomalously, and immediately below the transition point at  $50^\circ$  reaches three times the normal val., to which it falls discontinuously at transition. The heat of transition is  $0.32$  for the homogeneous, and  $1.13 \text{ g.-cal. per g.}$  for the heterogeneous, part. The explanation of the sp. heat anomaly is that with rise in temp. even below the transition point there is increasing misplacing of the metal atoms (cf. *ibid.*, 947). An "averaged structure" may be interpreted either as a statistical distribution of the atoms over the available lattice points or as the result of repeated twinning (cf. *ibid.*, 16); X-ray examination affords no means of decision. With  $\alpha\text{-Ag}_2\text{HgI}_4$ , however, the high electrical conductivity and considerable heat of transition  $\beta \rightarrow \alpha$  decide for the former alternative.

R. C.

Specific heat of iron nitrides. S. SATOH (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1935, 28, 135—139; cf. A., 1933, 27).—The sp. heat of a series of Fe-N alloys is a max. at  $9.7\%$  N. This is discussed in relation to the Fe-N equilibrium diagram. R. S.

Evaporation as mechanical subdivision to molecules. P. V. ZOLOTAREV (Trans. Inst. Chem. Tech. Ivanovo, 1935, 50—53).—Mathematical. The heat of evaporation of a given substance is shown to be  $\propto$  the work expended in breaking it down to its constituent mols. Formulae are derived for calculating Avogadro's const. for different types of mols., and for solids and liquids.

R. T.

Determination of fixed points at low temperatures with a hydrogen thermometer. S.

AOYAMA and E. KANDA (Bull. Chem. Soc. Japan, 1935, 10, 472—481).—Existing vals. for the b.p. of  $\text{O}_2$  and  $\text{N}_2$  and the sublimation point of  $\text{CO}_2$  are confirmed by means of the H thermometer described. Temp. are determined to within  $\pm 0.036^\circ$  at  $0^\circ$  and  $\pm 0.025^\circ$  at  $-200^\circ$ .

J. G. A. G.

Melting curve of oxygen to 170 kg. per sq. cm. J. H. C. LISMAN and W. H. KEESOM (Physica, 1935, 2, 901—906; cf. A., 1935, 1197).—Points on the melting curve of  $\text{O}_2$  have been determined up to  $167.7 \text{ kg. per sq. cm.}$  and  $56.25^\circ \text{ abs.}$  Extrapolation gives the triple point  $54.32(5)^\circ \text{ abs.}$  The density of solid  $\gamma\text{-O}_2$  at the triple point calc. from Clapeyron's equation is  $1.37(2)$ .

T. G. P.

Polarisation effects in thallous fluoride. E. HAYEK (Z. anorg. Chem., 1935, 225, 47—48).— $\text{TlF}$  has b.p.  $655^\circ \pm 10^\circ$ ,  $d_4^{20} 8.36$ . Attempts to prepare a subfluoride analogous to  $\text{Ag}_2\text{F}$  were unsuccessful.

F. L. U.

Transition points of hexachloroethane. E. H. WIEBENGA (Z. anorg. Chem., 1935, 225, 38—42).—Transition temp. of  $\text{C}_2\text{Cl}_6$ , determined both thermally and dilatometrically, are: rhombic—triclinic  $43.6^\circ$ , triclinic—cubic  $71.1^\circ$ . The transition reported at  $125^\circ$  does not occur. The rates of transformation, although slow, are finite except at the actual transition temp.

F. L. U.

New form of thermodynamic diagrams. K. PAVLOV and A. PIVOVAROVA (Chimstr., 1935, 7, 33—37).—A graphical method is described.

CH. ABS. (e)

Influence of the degree of dispersion on physico-chemical constants. IV. E. COHEN and J. J. A. BLEKKINGH (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 842—849).—Crystals of KCl of 0.1, 0.5, and 5 mm. mean cross-section have been prepared.  $d = 1.9891 \pm 0.0004$  in each case. R. S.

International Bureau of Physico-Chemical Standards. VII. Physical constants of twenty organic compounds. J. TIMMERMANS and (MME.) HENNAUT-ROLAND (J. Chim. phys., 1935, 32, 501—526; cf. A., 1934, 480).—The following data for b.p./760 mm., f.p., and  $d_4^{25}$  have been determined:  $n\text{-C}_5\text{H}_{12}$   $36.10^\circ$ ,  $-129.1^\circ$ ,  $0.63114$ ;  $n\text{-C}_7\text{H}_{16}$   $98.35^\circ$ ,  $-90^\circ$ ,  $0.68785$ ;  $(\text{CH}_2\text{OH})_2$   $197.85^\circ$ ,  $-12.6^\circ$ ,  $1.11710$ ; glycerol —, —,  $1.26443$ ;  $\text{Et}_2\text{S}$   $92.10^\circ$ ,  $-103.3^\circ$ ,  $0.84102$ ;  $\text{HCO}\cdot\text{NH}_2$  —,  $2.55^\circ$ ,  $1.13756$ ;  $\text{PhF}$   $84.85^\circ$ ,  $-41.9^\circ$ ,  $1.03091$ ;  $\text{CH}_3\text{PhCl}$   $179.35^\circ$ ,  $-39.2^\circ$ ,  $1.10426$ ;  $\text{CH}_3\text{Ph}\cdot\text{OH}$   $205.45^\circ$ ,  $-15.3^\circ$ ,  $1.04927$ ; anisole  $153.80^\circ$ ,  $-37.5^\circ$ ,  $0.99858$ ;  $\text{COPhMe}$   $202.00^\circ$ ,  $19.6^\circ$ ,  $1.03236$ . The data include the relations between b.p. and pressure, coeffs. of dilatation, refractive indices, viscosity coeffs., and surface tensions. The crit. solution temp. of  $n\text{-C}_5\text{H}_{10}$  in  $\text{PhNO}_2$  is  $24.5^\circ$ . Earlier data are tabulated.

T. G. P.

Isotherms of methane between  $0^\circ$  and  $150^\circ$  and densities 19 and 53 Amagat (pressures between 20 and 80 atm.). A. MICHELS and G. W. NEDERBRAGT (Physica, 1935, 2, 1000—1002; cf. A., 1934, 837).—Isotherms of pure methane (b.p. const. to  $0.03^\circ$ ) have been determined at  $25^\circ$  intervals between  $0^\circ$  and  $150^\circ$ .

T. G. P.

**Acetylmethylcarbinol.** J. R. POUND and A. M. WILSON (J. Physical Chem., 1935, 39, 1135—1138).—The v.p. of acetoin between 0° and the b.p. (144°) has been determined and the polymerisation has been studied by measurement of *n* and *d*. Crystallographic and thermal data relating to the polymeride are given. R. S.

**Difference in vapour pressures of *ortho*- and *para*-deuterium.** F. G. BRICKWEDDE, R. B. SCOTT, and H. S. TAYLOR (J. Chem. Physics, 1935, 3, 653—660; cf. A., 1934, 1164).—The differences in v.p. of the mixture of *ortho*- and *para*-D<sub>2</sub> in equilibrium at 20.4° abs. and of the normal mixture have been determined between 15° and 20.4 abs. The speed of the uncatalysed change for normal liquid D<sub>2</sub> is about 0.001 of that for H<sub>2</sub>. F. L. U.

**Vapour pressures of neon of different isotopic compositions.** W. H. KEESOM and J. HAANTJES (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 810).—The differences in v.p. of Ne of five different isotopic compositions (at. wt. 20.043—21.157) have been determined. At const. temp., v.p. is a linear function of at. wt. The divergence between the theoretical and observed dependence on temp. of  $\log p_{20}/\log p_{22}$  for solid state is attributed to a difference between the potential energy of Ne<sup>20</sup> and Ne<sup>22</sup> and to variation in the zero-point energy. It is concluded, from data for the liquid state, that the sp. heat of Ne<sup>20</sup> is > that of Ne<sup>22</sup>. The triple point of Ne<sup>22</sup> is 0.134° > that of Ne<sup>20</sup> and the melting heat of Ne<sup>22</sup> is the greater by 1.18 g.-cal. per mol. R. S.

**Measurement of v.p. of mercury from absorption of resonance radiation.** H. VON HALBAN, jun. (Helv. Phys. Acta, 1934, 7, 856—875; Chem. Zentr., 1935, i, 1980).—The v.p. of Hg at -18° and -53.4° is calc. from abs. measurements of the absorption of the 2537 Å. resonance line by saturated Hg vapour at those temp. The accuracy is independent of the v.p. and unaffected by other gases at pressures below those causing broadening of the absorption line. J. S. A.

**Vapour pressure of metals and their velocity of vaporisation in a vacuum.** J. A. M. VAN LIEMPT (Rec. trav. chim., 1935, 54, 847—852).—Formulae are derived relating the velocity of sublimation in a vac., v.p., and heat of sublimation with the at. wt., m.p., and at. vol. of the metal and the temp. The equations agree with experiment. J. W. S.

**Vapour pressure of zinc, lead, cadmium, cuprous, and silver chlorides.** D. N. TARASENKOV and P. A. KOSHMIJAKOV (J. Gen. Chem. Russ., 1935, 5, 830—835).—The v.p. have been determined at 516—728°/7.4—723 mm. for ZnCl<sub>2</sub>, at 650—942°/4.5—692 mm. for PbCl<sub>2</sub>, at 618—952°/3—722 mm. for CdCl<sub>2</sub>, at 632—1070°/3—216 mm. for Cu<sub>2</sub>Cl<sub>2</sub>, and at 882—1120°/3.7—59 mm. for AgCl. R. T.

**Variation of the volume of elements in the act of fusion.** I. L. LOSANA (Gazzetta, 1935, 65, 851—864).—The change in vol. in passing from the solid to the liquid state of the alkali metals is found to be (m.p. given in parentheses): Li (180.2°) 0.184, Na (97.7°) 0.512, K (62.1°) 1.072, Rb (38.8°) 1.472,

Cs (28.8°) 1.900 c.c. per g.-atom. These vals. were obtained by measuring the increased upthrust of a given wt. of metal at the m.p. in petroleum or vaseline oil by means of a hydrostatic balance. The vals. for Rb and Cs were confirmed by measurements of the m.p. at pressures from 1 to 135 atm. The change in vol. on fusion of elements in relation to their position in the periodic classification is discussed. O. J. W.

**Aggregative states. An empirical law.** E. I. ACHUMOV (J. Gen. Chem. Russ., 1935, 5, 843—847).—The empirical expression  $\beta(T_b - T_e) - C$ , where  $\beta$  is the coeff. of expansion of a liquid between the m.p.  $T_e$  and the b.p.  $T_b$ , and  $C$  is a const., is shown to hold for a no. of org. liquids. R. T.

**Thermal expansion of cast and rolled zinc.** H. G. JONES (Proc. Physical Soc., 1935, 47, 1117—1128).—Data tabulated and plotted for steady and continuously rising temp. show marked differences in the coeffs. for cast and rolled Zn. On rolling, the random orientation of crystals in the cast Zn is broken up, and most of the long axes are set perpendicular to the plane of rolling, but no change is produced in the vol. coeff. For small crystals the continuous expansion is small, but increases with the size of the crystals. Discontinuities in the continuous expansion are traced to the long axis. N. M. B.

**Linear thermal expansion of sodium tungstate between 20° and 600°.** J. B. AUSTIN and R. H. H. PIERCE, jun. (J. Chem. Physics, 1935, 3, 683—686; cf. A., 1933, 342).—The results, obtained by an interferometric method, show that at atm. pressure Na<sub>2</sub>WO<sub>4</sub> is trimorphous. The transition III—II occurs at 585°, and II—I at a slightly lower temp., II being stable over a very short range. F. L. U.

**Thermal stability of the lower atmosphere.** A. L. HALES (Proc. Roy. Soc., 1935, A, 151, 624—640).—Mathematical. Equations for the conduction of heat by turbulence, and for the stability of a compressible fluid when the hotter fluid is below, are deduced. Super-adiabatic lapse rates are possible in limited regions of the atm. L. L. B.

**Thermal conductivity law in moving media. Derivation of a molecular kinetic theory of thermal conductivity with an investigation of the limits of the Fourier method.** M. LANG (Ann. Physik, 1935, [v], 24, 393—408).—Theoretical. A. J. M.

**Viscosity of liquid phosphorus.** A. N. CAMPBELL and S. KATZ (J. Amer. Chem. Soc., 1935, 57, 2051—2055).—Viscosity has been determined between 20° and 140°. There is evidence of association in liquid P below 45°, but no evidence of a change of viscosity when heated P is suddenly chilled. E. S. H.

**Viscosity of liquid methane and ethylene in relation to temperature.** N. S. RUDENKO and L. V. SCHUBNIKOV (Physikal. Z. Sovietunion, 1935, 8, 179—184).—Measurements have been made between 90° and 111° abs. for CH<sub>4</sub> and between 110° and 169° abs. for C<sub>2</sub>H<sub>4</sub>. T. G. P.

**Complex viscosity.** A. GEMANT (Trans. Faraday Soc., 1935, 31, 1582—1590; cf. A., 1935, 1065).—

Maxwell's theory of the behaviour of materials exhibiting both viscosity and plasticity is generalised and developed so as to take account of mol. vibrations. The theory is applied to dielectric losses due to dipole rotation. F. L. Ü.

**Definition and correction of diffusion constants of gases.** J. KUUSINEN (Ann. Physik, 1935, [v], 24, 445—446).—The work of Trautz and Muller (A., 1935, 575) is criticised on the ground that a false interpretation of Fick's law was used. The Maxwell-Chapman method leads to results identical with those obtained by the correct use of Fick's law. A. J. M.

**Definitions of diffusion constants.** J. KUUSINEN (Ann. Physik, 1935, [v], 24, 447—456).—A general definition of the diffusion const. of a binary mixture is derived. A. J. M.

**Criticism of certain researches on the physico-chemical analysis of binary systems.** V. F. USTRKATSKINTZEV (J. Gen. Chem. Russ., 1935, 5, 892—898).—The experimental data given by Terpugov (A., 1933, 354; 1934, 1167) for the systems  $\text{Et}_2\text{O}-\text{AsCl}_3$  and  $-\text{H}_2\text{SO}_4$ , by Usanovitsch *et al.* (A., 1934, 1167) for  $\text{Et}_2\text{O}-\text{SbBr}_3$ , and by Pushin *et al.* (A., 1932, 1197) for  $\text{C}_5\text{H}_5\text{N}-\text{AcOH}$  do not confirm the conclusions reached by the authors relative to the existence of compounds. In general, systems which exhibit deviations from the additive rule for certain properties may follow it for others, and, in particular, max. and min. on curves which represent temp. coeffs. of various properties cannot be accepted as evidence of compound formation. R. T.

**Association and molecular polarisation.** V. Simultaneous formation of double and triple complexes in dipole association. I. SAKURADA (Bull. Inst. Phys. Chem. Res. Japan, 1935, 14, 1120—1126; cf. A., 1935, 927).—The equilibrium consts. for double and triple dipole association can be calc. from dielectric data, and it is concluded that such complexes exist simultaneously in the mixtures  $\text{CCl}_4-\text{PhCl}$ ,  $\text{CCl}_4-\text{PhBr}$ ,  $\text{C}_6\text{H}_{14}-\text{PhNO}_2$ , and  $\text{C}_6\text{H}_6$ -quinoline. The heats of association have been calc. from the variation of the equilibrium consts. with temp. R. S.

**Simultaneous formation of double and triple complexes in dipole association.** E. HERTEL and E. DUMONT (Z. physikal. Chem., 1935, B, 30, 149—151).—Polemical against Sakurada (A., 1935, 927). R. C.

**Viscosity of sulphuric acid [solutions].** S. D. BESKOV and O. A. SLIZKOVSKAJA (Chimstr., 1935, 7, 32—33).—Vals. for  $\text{H}_2\text{SO}_4$  ( $d$  1.38—1.84) between  $5^\circ$  and  $90^\circ$  are recorded. The  $\eta$  of  $\text{H}_2\text{SO}_4-\text{H}_2\text{O}$  mixtures does not follow the additive law.

CH. ABS. (e)

**Viscosity of solutions of salts in methyl alcohol.** G. JONES and H. J. FORNWALT (J. Amer. Chem. Soc., 1935, 57, 2041—2045).—Determinations of  $d$  and  $\eta$  at  $25^\circ$  have been carried out for solutions of KCl, KBr, KI, and  $\text{NH}_4\text{Cl}$  over a wide concn. range in MeOH. The results for  $d$  can be expressed by an equation of the form suggested by Root (A., 1933,

347). The data for  $\eta$  are used to test the validity of several equations connecting  $\eta$  with concn.

E. S. H.

**Viscosity of sugar and dextrin solutions containing salts.** J. H. C. MERCKEL (Kolloid-Z., 1935, 73, 171—174).—The influence of NaI, NaBr, NaCNS, NaCl,  $\text{NaBrO}_3$ ,  $\text{NaIO}_3$ , and NaF on the viscosity of sucrose or dextrin solutions is in the order of their lyotropic nos. E. S. H.

**S-Shaped viscosity curves.** M. USANOVITSCH (J. Gen. Chem. Russ., 1935, 5, 996—1001).—S-Shaped viscosity-composition curves are obtained in binary systems of which one component is associated when this forms an unassociated compound with the other component. The rule is exemplified by the systems  $\text{PhNO}_2-\text{H}_2\text{SO}_4$  and  $\text{AsCl}_3-\text{Et}_2\text{O}$ . R. T.

**Concentrated solutions. I. Conductivity, viscosity, and density of fused  $\text{NH}_4\text{Ag}(\text{NO}_3)_2$  and of its concentrated solutions.** M. S. SKANAVI-GRIGORIEVA and E. B. SCHTERNIN (J. Gen. Chem. Russ., 1935, 5, 799—806).—The conductivity  $\kappa$  of the fused salt rises abruptly at  $113^\circ$ , and then continues to increase at a slower rate with rising temp.;  $\eta$  falls linearly over the same range. Up to 10%  $\text{H}_2\text{O}$  has little effect on  $\kappa$  at  $100^\circ$ , but further addition of  $\text{H}_2\text{O}$  leads to a rapid rise in  $\kappa$  to a max. in 75% solutions. At  $25^\circ$  a well-defined max. val. of  $\kappa$  is found for 60% solutions. Composition- $d$  and  $-\eta$  curves are given for numerous aq. systems at  $25^\circ$ . R. T.

**Conductivity and viscosity in the systems (A) sulphuric acid-nitrobenzene, (B) nitrobenzene-acetic acid, (C) sulphuric acid-acetic acid.** M. USANOVITSCH (J. Gen. Chem. Russ., 1935, 5, 701—708, 709—711, 712—718).—(A) [with G. KOZMINA and V. TARTAKOVSKAJA]. The conductivity curves ( $0-30^\circ$ ) have a well-defined min., suggestive of the compound  $2\text{PhNO}_2\cdot\text{H}_2\text{SO}_4$ . The temp. coeff. of conductivity curves have 2 max. and a min., corresponding with 2:1, 1:1, and 1:2 compounds of  $\text{PhNO}_2$  and  $\text{H}_2\text{SO}_4$ . The  $\eta$ -composition curves do not possess max. or min.

(B) [with A. TENENBAUM]. The system ( $20-80^\circ$ ) is non-conducting, and the composition curves do not suggest compound formation. The formation of electrolytic solutions when two non-electrolytes are mixed is ascribed exclusively to compound formation.

(C) [with A. NAUMOVA]. The temp. coeff. of conductivity-composition curves ( $0-30^\circ$ ) suggest 1:1 and 1:2 compounds. R. T.

**Viscosity coefficients in the system fused  $\text{KCl}-\text{MgCl}_2$ .** S. KARPATSCHEV and A. STROMBERG (J. Gen. Chem. Russ., 1935, 5, 625—630).—The viscosity isotherms ( $550-650^\circ$ ) suggest the compound  $\text{MgCl}_2\cdot 2\text{KCl}$ . R. T.

**Chemical composition and optical properties of solutions. I. Quaternary system  $\text{KCl}-\text{NaCl}-\text{MgCl}_2-\text{H}_2\text{O}$  at  $15^\circ$ .** E. I. ACHUMOV and M. P. GOLOVKOV (J. Gen. Chem. Russ., 1935, 5, 500—509).—Composition- $n$  curves for the above system are of the same general shape as are those connecting composition with other physical properties. R. T.

**Equilibria in liquid mixtures and solutions.**  
**IV. B. p. and composition of vapour of solutions of carbonyl chloride in dichloroethane and xylene.** V. A. KIREEV, S. I. KAPLAN, and V. N. ZLOBIN (J. Appl. Chem. Russ., 1935, 8, 949—951).—B. p. and composition of the vapour phase at the b. p. have been determined for 0—35%  $\text{COCl}_2$  in xylene and in  $\text{C}_2\text{H}_4\text{Cl}_2$ . R. T.

**Fugacity of salts present in boiling solutions.**  
 P. ZOLOTAREV and J. ORUDOVSKAJA (Trans. Inst. Chem. Tech. Ivanovo, 1935, 54—55).—The salt content of river- $\text{H}_2\text{O}$  falls from 134.6 to 3.4 mg. per litre after one distillation; the same salts are present in the distillate as were originally present. The phenomenon is ascribed to sputtering at the heated walls of the vessel above the surface of the liquid, leading to the formation of an aerosol of the salts. R. T.

**Röntgen analysis of  $\beta$ -phases of Cu-Be and Al-Zn alloys at high temperatures.** G. F. KOSOLAPOV and A. K. TRAPESNIKOV (Metallwirt., 1935, 14, 45—46; Chem. Zentr., 1935, i, 2243).—The  $\beta$ -phase of a Cu-Be alloy (7.2% Be) exists above  $620^\circ$ , with a random-distributed body-centred lattice,  $a$  2.79 Å. The  $\alpha$ -phase has the Cu lattice, and the  $\gamma$ -phase at room temp. a CsCl structure,  $a$  ( $570^\circ$ ) 2.72 Å. Al-Zn alloy with 40% of Al exhibits the Zn and Al lattices at room temp., and a single face-centred  $\gamma$ -phase at  $410^\circ$ . J. S. A.

**X-Ray studies on the systems tin-antimony and tin-arsenic.** G. HÄGG and A. G. HYBINETTE (Phil. Mag., 1935, [vii], 20, 913—929).—The homogeneous phase extending from 45 to 55 at.-% Sb has a deformed NaCl structure. The unit cell at the Sn limit is a rhombohedron with  $r$  6.117 Å.,  $\alpha$   $89.70^\circ$ , and vol. 228.9 Å.<sup>3</sup> With increasing Sb content the vol. and deformation increase until  $r$  is 6.138 Å.,  $\alpha$   $89.18^\circ$ , and vol. 231.2 Å.<sup>3</sup> As is insol. in the Sn phase. Two intermediate phases of narrow range exist at  $\text{Sn}_3\text{As}_2$  and  $\text{SnS}$ . The Laue symmetry of the former is  $D_{3d}$ . The unit cell is a rhombohedron with  $r$  12.23 Å. and  $\alpha$   $19.22^\circ$ . The structure probably corresponds with the ideal formula  $\text{Sn}_4\text{As}_3$ , where some As is replaced by Sn. The probable space-group is  $D_{3d}^4$ . The phase at  $\text{SnAs}$  has the NaCl structure with lattice const. 5.716 Å. As dissolves 21 at.-% Sn, which increases the rhombohedral edge and diminishes the angle of the As phase. T. G. P.

**Alloys of rhodium with copper.** O. E. ZVJAGINTZEV and B. K. BRUNOVSKI (Ann. Inst. Platine, 1935, No. 12, 37—66).—Cu-Rh alloys are easily oxidised in air. With 0—20 at.-% Rh they are homogeneous and have the structure of Cu. From 90—100 at.-% Rh they have the Rh structure. Between these limits there are two phases, except where the compounds  $\text{Cu}_2\text{Rh}_3$  and  $\text{CuRh}_3$  (both with a face-centred cubic structure) exist. There is also a partial change of structure at  $\text{Cu}_3\text{Rh}$ . CH. ABS. (e)

**Modulus of elasticity of copper-beryllium alloys.** L. GUILLET (Compt. rend., 1935, 201, 960—962).—The modulus of elasticity and Rockwell hardness increase linearly with [Be] up to approx. 18 and 12% Be, respectively. For [Be] > 12% the

hardness increase is less. The elasticity of the alloy with 15% of Be equals that of steel. H. J. E.

**Structure of zinc-cadmium eutectic.** M. STRAUMANIS and N. BRAKŠS (Z. physikal. Chem., 1935, B, 30, 117—131; cf. A., 1912, ii, 744).—The eutectic consists of comparatively coarse fibres which grow into the melt perpendicularly to the surface of cooling and are built up of alternating parallel crystal leaflets of Zn and Cd, running lengthwise. These leaflets, which are somewhat crumpled, are so arranged in the fibres that their wide basal faces are in contact and the digonal axes of the first position make an angle of  $0-5^\circ$  with the fibre axis. The leaflets are thinner the more rapid is the cooling. It is inferred that the structure of eutectics is determined primarily by the crystallophysical properties of the components, surface tension playing a part only in exceptional circumstances. R. C.

**Binary systems of alkali metals.** I. C. GORIA (Gazzetta, 1935, 65, 865—870).—The system Rb-K shows limited solubility in the solid state and a eutectic at  $34^\circ$  with 15 at.-% K. In the Rb-Na system there is a eutectic at  $-5.2^\circ$  with 92 at.-% Rb, but no solid solutions or compounds are formed. O. J. W.

**Electrical resistance of wires of palladium-silver and palladium-gold alloys charged with hydrogen.** A. SIEVERTS and H. HAGEN (Z. physikal. Chem., 1935, 174, 247—261).—The pressure-concn. ( $p$ - $c$ ) isotherms for alloys with 5 and 10% Ag are similar to those for pure Pd; at  $155^\circ$  there is a hysteresis loop and at  $200^\circ$  an approx. flat portion on the isotherm, but no hysteresis. The isotherms for alloys with 20—50% Ag are all parabolic. Up to 30 at.-% Ag the pressure-resistance ( $p$ - $R$ ) isotherms are similar to those of Pd, but for a given  $c$  and  $p$  the increase in  $R$  caused by the H is the smaller the larger is the proportion of Ag. For alloys with 30 and 40% Ag  $\Delta R$  is negative over a certain range of temp. and  $p$ , whilst for 50%  $\Delta R$  rises again. Pd-Au alloys behave similarly to Pd-Ag alloys of the same at. composition, but both the H absorption and  $\Delta R$  for the Ag alloys are for the Au alloys at the same temp. and  $p$ . R. C.

**Resistance thermometry below  $10^\circ$  abs.** J. D. BABBITT and K. MENDELSSOHN (Phil. Mag., 1935, [vii], 20, 1025—1041).—The resistances of phosphor-bronze wires have been measured at low temp. The superconductive component responsible for the temp. dependency below  $7^\circ$  abs. is Sn-P, transition point  $8.9^\circ$  abs. A binary alloy of definite composition properly treated is suitable for low-temp. thermometry, e.g., 5% Pb-Ag. T. G. P.

**Experiments on a superconductive alloy in a magnetic field.** J. M. C. JONKER and W. J. DE HAAS (Physica, 1935, 2, 935—942).—Resistance may be detected by studying the dying-out of the persisting current in a ring composed in part of Pb wire and in part of the alloy, when the latter is placed in a longitudinal magnetic field. The magnetic transition curve of a 64.8% Tl-Pb alloy has been studied. In a magnetic field slightly > the penetration val. there is no resistance >  $5 \times 10^{-11}$  ohm. The magnetic threshold depends on the measuring current. T. G. P.

**Intermetallic compounds.** W. KLEMM (Angew. Chem., 1935, 48, 713).—A review in which the general differences between intermetallic and salt-like compounds are discussed. R. S. B.

**New methods and results for the detection of intermetallic compounds.** G. GRUBE (Angew. Chem., 1935, 48, 714—719).—A review of experimental methods, including the study of magnetic susceptibility ( $\chi$ ). For Pd-Mn below 500°  $\chi$  rises rapidly with increasing % of Mn. The classification of compounds is discussed. R. S. B.

**Structure of intermetallic phases.** G. HAGG (Angew. Chem., 1935, 48, 720—723).—A review of structural relations from the viewpoint of the position of the constituents in the periodic table. R. S. B.

**Energy and space problems in the formation of intermetallic compounds.** W. BILTZ (Angew. Chem., 1935, 48, 729—734).—A lecture. E. S. H.

**Magnetism and chemical linking in intermetallic phases.** E. VOOT (Angew. Chem., 1935, 48, 734—740).—A crit. discussion of published work. E. S. H.

**Theory of transition of metallic mixed phases. III. Diagrams of state for partly ordered mixed phases.** G. BORELIUS (Ann. Physik, 1935, [v], 24, 489—506).—Theoretical. The theory previously put forward (A., 1934, 724, 1166) is applied to alloys in which the constituents are not in stoichiometrical proportions. The general thermodynamic theory underlying the equilibria in binary alloys is considered. The zero-point entropy and zero-point energy are discussed as measures of the at. ordering. A. J. M.

**Effect of thermal agitation on atomic arrangement in alloys. II.** W. L. BRAGG and E. J. WILLIAMS (Proc. Roy. Soc., 1935, A, 151, 540—566).—Theoretical. The treatment given previously (A., 1934, 954) for the order-disorder transformation in alloys, and a recent extension of it by Bethe (A., 1935, 1193), are compared with the formal methods of Borelius, Gorsky, and Dehlinger (A., 1928, 822, 1078; 1933, 896). The energy contents of the alloys CuZn and Cu<sub>3</sub>Au as deduced theoretically are compared with those found experimentally by Sykes (A., 1935, 576). Expressions are given for the dependence of temp. on composition. L. L. B.

**Solid solutions with a varying number of atoms in the unit cell.** G. HAGG (Z. Krist., 1935, 91, 114—122).—"Interstitial solution" is suggested to describe those solid solutions formed by adding or subtracting one kind of atom *A* in a given lattice *B*. For stability, a rigid skeleton lattice *B* and small substituent atoms *A* are desirable. The interstitial solutions can be classified according to the means whereby electrical neutrality is maintained. Valency change in one kind of atom may make an interstitial solution possible. The electrical conductivity of such lattices is discussed. B. W. R.

**Separation of binary liquid mixtures into two layers.** R. V. MERZLIN and V. F. UST-KATSCHKINTZEV (J. Gen. Chem. Russ., 1935, 5, 771—778).—Phase diagrams for KCl-H<sub>2</sub>O-NEt<sub>3</sub>, -C<sub>5</sub>H<sub>5</sub>N, and

-piperidine have been constructed at 0—80°. The systems H<sub>2</sub>O-C<sub>5</sub>H<sub>5</sub>N and -piperidine appear to have a high lower crit. miscibility temp. R. T.

**Physico-chemical properties of certain aqueous systems containing amines, and capable of stratification.** R. V. MERZLIN (J. Gen. Chem. Russ., 1935, 5, 886—891).—The composition- $d$  and -surface tension ( $\sigma$ ) and  $\sigma$ -temp. curves have been determined for the systems H<sub>2</sub>O- $\beta$ -collidine and -NEt<sub>3</sub>; the composition- $\eta$  curve for the latter suggests a 1:1 compound. The data suggest formation of thermolabile compounds in both systems. R. T.

**Viscosity of binary systems at critical zones.** R. V. MERZLIN (J. Gen. Chem. Russ., 1935, 5, 899—903).—Binary liquid systems exhibit irrational max. in the  $\eta$ -composition curves at the lower crit. temp. zone; at the upper crit. temp. two types of curve are possible, (a) in which the curves exhibit a negative deviation from additivity, due to dissociation of associated complexes, and (b) in which electrolytic dissociation of the complexes is superimposed on this effect. R. T.

**Mutual solubility and surface tension. II. Surface tension and dipole moment.** V. K. SEMENTSCHENKO and T. N. IVANOVA (J. Gen. Chem. Russ., 1935, 5, 807—813).—The surface tension,  $\sigma$ , of H<sub>2</sub>O, nicotine (I), and PhNO<sub>2</sub> (II) at 25° is depressed by PrCO-NH<sub>2</sub> (III), PrCl, PrCHO (IV), PrCN, PrOH, and PrCO<sub>2</sub>H (V), to an extent which increases with the concn. In the case of H<sub>2</sub>O no obvious connexion exists between surface activity and dipole moment,  $\mu$ ; in (I) and (II) it rises with increasing  $\mu$  for substances not containing N, and falls for those containing N. The crit. temp. of miscibility of (I) with H<sub>2</sub>O is raised by (III) and (V), is unaffected by PrOH, and lowered by the remaining substances, to an extent which increases linearly with the concn. The val. of  $\sigma$  at 70° at a H<sub>2</sub>O-(I) interface rises with increasing concn. of PrCl, (IV), and PrCN, but is practically unaffected by PrOH, and is lowered by (III) and (V). R. T.

**Homogenisation by means of amines of certain aqueous amine systems with an upper critical temperature of stratification.** R. V. MERZLIN and V. F. UST-KATSCHKINTZEV (J. Gen. Chem. Russ., 1935, 5, 904—919).—Phase diagrams have been constructed for the systems H<sub>2</sub>O-NHPh-NH<sub>2</sub> (I)-piperidine (II), -C<sub>5</sub>H<sub>5</sub>N, -NH<sub>2</sub>·CH<sub>2</sub>Ph (III), and -NH<sub>2</sub>Ph, and for H<sub>2</sub>O-NH<sub>2</sub>Ph-(II), -C<sub>5</sub>H<sub>5</sub>N, and -(III), at 0—50°. No connexion is apparent between the dipole moment, dissociation coeff., or dielectric const. of the amines and their homogenising action at any arbitrarily fixed temp. Within the temp. range studied the homogenising action rises in the series (I) < (III) < C<sub>5</sub>H<sub>5</sub>N < (II), but falls with rise of temp. for C<sub>5</sub>H<sub>5</sub>N and (III), and rises for (II); the principle of corresponding temp. should be taken into account in comparing the activity of a series of homogenisers. R. T.

**Solubility of ammonium oxalate in water.** A. E. HILL and E. F. DISTLER (J. Amer. Chem. Soc., 1935, 57, 2203—2204).—Data are recorded for the

range 0—100°. The solid phase throughout is the monohydrate. E. S. H.

**Solubility of sodium cyanide in water and in aqueous sodium hydroxide.** V. A. KIREEV and L. I. VAGRANSKAJA (J. Gen. Chem. Russ., 1935, 5, 963—966).—The solubility of NaCN at 0°, 25°, and 40° falls linearly with increasing [NaOH]. R. T.

**Solubility of cobaltous nitrate in aqueous nitric acid, and the transition point of  $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  to  $\text{Co}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ .** A. VALDMAN and L. L. KLATSCHKO-GURVITSCH (J. Gen. Chem. Russ., 1935, 5, 791—794).—Aq.  $\text{Co}(\text{NO}_3)_2$  saturated at 80° solidifies on cooling to 25°, to yield 39.5% of trihydrate (I) and 60.5% of hexahydrate (II). (I) alone can be prepared by cooling to 56°, and (II) alone by saturating at 56° and cooling. The transition point of (II) to (I) falls from 54° in absence of  $\text{HNO}_3$  to 42° in presence of 30% of  $\text{HNO}_3$ . R. T.

**Determination of solubility of the complex  $\text{K}_2\text{SiF}_6$  under various conditions.** A. A. VASSILIEV and N. N. MARTIANOV (Z. anal. Chem., 1935, 103, 103—106).—The solubility of  $\text{K}_2\text{SiF}_6$  in  $\text{H}_2\text{O}$  at 17° has been determined titrimetrically. The solubility is lower in 50% aq. EtOH, and is further decreased in presence of 2% of KCl. J. S. A.

**Solubility of phosphoric acid.** A. E. MAKOVETZKI and M. A. OSTROUMOV (Trans. Kirov Inst. Chem. Tech. Kazan, 1935, No. 3, 103—106).—The best solvents for separating  $\text{H}_3\text{PO}_4$  from its aq. solutions are isoamyl alcohol and fusel oil.  $\text{H}_3\text{PO}_4$  is almost insol. in  $\text{CHCl}_3$ ,  $\text{CCl}_4$ , liquid  $\text{SO}_2$ , PhMe, xylene, benzene, kerosene, and turpentine. CH. ABS. (e)

**Solubility of 6-nitro-3-methylbenzoic acid in benzene, toluene, and water.** A. GIACALONE (Gazzetta, 1935, 65, 844—850).—The solubility of 6:3- $\text{NO}_2\text{-C}_6\text{H}_3\text{Me-CO}_2\text{H}$  (I) has been measured in  $\text{C}_6\text{H}_6$  and in PhMe between 10° and 80° and in  $\text{H}_2\text{O}$  between 10° and 100°. In the first two solvents the influence of temp. is given by  $S = K \times 2^{t/10}$ , where  $K$  is a const. (I) crystallises from  $\text{C}_6\text{H}_6$  in two forms, of which only one is stable at higher temp. The solubility in  $\text{H}_2\text{O}$  is very small up to 50°, but increases rapidly above 60° due to formation of hydrates. O. J. W.

**Solubility of several compounds of the mannose series in alcohols.** F. W. UPSON, E. A. FLUEVOG, and W. D. ALBERT (J. Physical Chem., 1935, 39, 1079—1094).—The solubilities of *l*-rhamnose (I),  $\alpha$ -*d*-mannose (II),  $\beta$ -*d*-mannose (III), *d*-mannono- $\gamma$ -lactone (IV), *d*-mannono- $\delta$ -lactone (V),  $\alpha$ -methyl-*d*-mannoside, and *d*-mannitol (VI) in MeOH, EtOH,  $\text{CH}_2\text{OH-CH}_2\text{OH}$ ,  $\text{Pr}^n\text{OH}$ ,  $\text{Pr}^i\text{OH}$ ,  $\text{Bu}^n\text{OH}$ ,  $\text{Bu}^i\text{OH}$ ,  $\text{Bu}^t\text{OH}$ , and *sec*-BuOH have been determined at different temp. (I) is the most sol. and (VI) the least sol. in all cases. (II) is more sol. than (III), whilst (IV) is almost twice as sol. as (V). R. S.

**Solute as liquid.** W. D. BANCROFT (Science, 1935, 82, 388—389).—A discussion. L. S. T.

**Equilibrium distribution of acetic acid between isopropyl ether and water.** A. A. SMITH and J. C. ELGIN (J. Physical Chem., 1935, 39, 1149—1153).—Distribution data are given for 20°. The

results, considered in relation to Almqvist's equation (A., 1934, 22), suggest that AcOH forms double mols. in  $\text{Pr}^i\text{O}$ . R. S.

**Equilibria and surface phenomena in the system water-formic acid-phenol.** V. I. NESTEROVA, N. N. PETIN, and K. V. TOPTSCHIEVA (J. Gen. Chem. Russ., 1935, 5, 848—861).—The partition coeff. of  $\text{HCO}_2\text{H}$  (I) between  $\text{H}_2\text{O}$  and PhOH at 20° rises with increasing concn. to 1.075*M*, and then falls to 1.507*M*-(I), at which concn. the system becomes homogeneous. The conductivity of the PhOH layer rises uninterruptedly to the crit. point, whilst that of the aq. layer rises to a max., and then falls with increasing  $[\text{HCO}_2\text{H}]$ . The dissociation coeff. of (I) rises with increasing  $[\text{HCO}_2\text{H}]$  in the PhOH, but remains const. in the aq. layer. The surface tension at the air- $\text{H}_2\text{O}$  interface remains const., but that at the  $\text{H}_2\text{O}$ -PhOH interface rises linearly with increasing  $[\text{HCO}_2\text{H}]$  to the crit. point. R. T.

**Solubility of deuterium and hydrogen in solid palladium.** A. SIEVERTS and G. ZAPF (Z. physikal. Chem., 1935, 174, 359—364).—The solubilities have been determined at 300—1100°. The ratio of the solubility of D to that of H is 0.67 at 300° and 0.91 at 1000° and approaches 1 at higher temp. The solubility of either at a given temp. is  $\propto \sqrt{\text{gas pressure}}$ . R. C.

**Colloid-chemical phenomena in metals. I. Gases in aluminium.** J. A. KLJATSCHKO (Kolloid-Z., 1935, 73, 226—236).—Mainly a discussion of published work. The vol. of gas liberated from Al and duralumin when heated at different temp. and the proportion of  $\text{H}_2$  contained therein have been measured. E. S. H.

**Accommodation coefficient of hydrogen on iron.** H. H. ROWLEY and W. V. EVANS (J. Amer. Chem. Soc., 1935, 57, 2059—2064).—The accommodation coeff. is 0.31 at 450—350° abs. and increases steadily with falling temp. to 0.55 at 120° abs. Comparison with other work suggests that the exchange of energy between  $\text{H}_2$  gas mols. and an adsorbed layer of  $\text{H}_2$  is measured in each case. An attempt to remove this adsorbed layer reduces the accommodation coeff. to 0.18 at 350° abs. E. S. H.

**Sorption of gases by minerals. V. [Extra-Japanese zeolites.] VI.** J. SAMESHIMA and N. MORITA (Bull. Chem. Soc. Japan, 1935, 10, 485—490, 490—494).—V. The rate of absorption of  $\text{NH}_3$  and  $\text{CO}_2$  at 1 atm. by the dehydrated minerals has been determined at 25°. Thomsonite, scolecite, epistilbite, and phillipsite absorb large vols. of  $\text{NH}_3$ , probably forming compounds, but only very small quantities of  $\text{CO}_2$  are absorbed; the absorption depends on the temp. of dehydration.

VI. Sepiolite absorbs large vols. of  $\text{NH}_3$  and  $\text{CO}_2$ , and belongs to the  $\text{SiO}_2$  gel class. Asbestos, acid clay, and bentonite absorb large vols. of  $\text{NH}_3$ , but only very small quantities of  $\text{CO}_2$ . Talc, serpentine, and vivianite absorb only very small quantities of  $\text{NH}_3$  and  $\text{CO}_2$ . J. G. A. G.

**Adsorption of alkali metals on metal surfaces. VI. Selective photo-electric effect.** J. H. DE BOER and C. F. VEENEMANS (Physica, 1935, 2, 915—

922; cf. A., 1935, 929).—The photo-electric emission of a cathode has been measured at increasing vals. of the covering fraction for  $\lambda\lambda > 3600 \text{ \AA.}$  and  $2537 \text{ \AA.}$  With the longer  $\lambda\lambda$  emission is due solely to the normal photo-electric effect, but at  $2537 \text{ \AA.}$  the selective effect contributes.

T. G. P.

**Mechanism of displacement adsorption of gases and vapours.** P. K. MIGAL (J. Gen. Chem. Russ., 1935, 5, 614—621).—The molar heat effect observed when an adsorbed gas is replaced by a vapour ( $\text{CHCl}_3$ ,  $\text{CCl}_4$ ,  $\text{MeOH}$ ,  $\text{CS}_2$ ,  $\text{EtI}$ ,  $\text{EtOH}$ ,  $\text{Et}_2\text{O}$ ) may be expressed by  $q = \lambda + [(C_2/\alpha_2) - (C_1/\alpha_1)]\beta P$ , where  $\lambda$  is the heat of condensation of 1 g.-mol. of vapour, and  $C_2$  are the sp. heats of the gas and vapour, respectively,  $\alpha_1$  and  $\alpha_2$  are the coeffs. of thermal compression,  $\beta$  is the compression coeff., and  $P$  is the deformative force due to the adsorbent. When the capillary activity of the second adsorbate is  $>$  that of the first, adsorption on the first adsorbate, but not displacement, occurs, but under converse conditions, adsorption takes place with replacement of the first adsorbate.

R. T.

**Velocity of adsorption of gases on porous adsorbents.** G. DAMKOHLER (Z. physikal. Chem., 1935, 174, 222—238).—Langmuir's theory of adsorption velocity is applicable only to pore-free adsorbents and leads to a val. of  $10^{-5}$ — $10^{-10}$  sec. for the time,  $\tau$ , required for the establishment of adsorption equilibrium. A theory of velocity of adsorption on porous adsorbents is developed, making various simplifying assumptions and taking the rate-determining process to be diffusion in the pores. This diffusion can be regarded as consisting of a Knudsen mol. streaming in a capillary and a surface diffusion in Volmer's sense on the pore walls. The two diffusion consts. and the pore size are estimated, and the theory indicates that if  $\tau$  is several min. the mean pore length is of the order of several mm. Langmuir's theory is not applicable to Berl and Weingaertner's experiments (A., 1935, 696), but these are reconcilable with the new theory.

R. C.

**Heats of adsorption of gases and vapours on crystallogenic adsorbents.** A. B. LAMB and E. N. OHL (J. Amer. Chem. Soc., 1935, 57, 2154—2161).—Heats of adsorption of several gases and vapours on dehydrated chabasite, thomsonite, and brucite have been determined at  $0^\circ$ . In cases where adsorption is considerable, the mol. heats are  $>$  those previously observed with C or  $\text{SiO}_2$ , but can be represented by the same empirical equation.

E. S. H.

**Liquid-side resistance against gas absorption by a liquid drop.** (A) Theoretical. (B) Experimental. S. HATTA and A. BABA (J. Soc. Chem. Ind. Japan, 1935, 38, 544—546B, 546—550B).—(A) The resistance to gas absorption due to turbulence on the liquid side of the interface has been calc. for falling drops with (i) no damping of the initial turbulence due to drop formation, (ii) gradual damping during fall, and (iii) immediate disappearance of turbulence, in which case absorption follows a diffusion law. The frictional resistance offered to a falling drop is discussed.

(B) The absorption of  $\text{CO}_2$  by falling drops of  $\text{H}_2\text{O}$

has been studied at  $20^\circ$ . Absorption during drop formation is negligible compared with that during time of fall.  $C/\bar{C}_\infty = 6q^{1/2} - 3q$  ( $C$  = mean concn. at time  $t$ ,  $\bar{C}_\infty$  = saturated concn.,  $q = Dt/a^2$ , where  $D$  = diffusion coeff. of dissolved gas,  $a$  = radius of drop), in agreement with (iii).  $D = 1.08 \times 10^{-3}$  sq. cm. per sec., which is 60—70 times the published val.

R. S. B.

**Surface tension of the system sulphuric acid-water.** L. E. SABININA and L. I. TERPUGOV (J. Gen. Chem. Russ., 1935, 5, 783—787).—The temp. coeff. of surface tension-composition curves ( $10$ — $50^\circ$ ) exhibits a min. corresponding with  $\text{H}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$ . The max. deviation from the additive rule for  $\sigma$  is found for the same concn.

R. T.

**Measurements of surface tension of solutions of potassium and lithium salts of higher fatty acids by the ring method with exclusion of atmospheric carbon dioxide and with special regard to other disturbing influences.** I. A. LOTTERMOSER and E. GIESE (Kolloid-Z., 1935, 73, 155—170).—The lack of reproducibility of surface tension measurements of soap solutions cannot be overcome entirely by exclusion of  $\text{CO}_2$ . Other sources of error are the enrichment of the solute by adsorption at the Pt ring and at other surfaces in the apparatus. Whilst these effects cannot be eliminated, means are considered whereby they may be reduced to a min. and kept const.

E. S. H.

**Cation exchange in permutites, especially hydrogen and heavy-metal permutites.** A. RENOLD (Kolloid-Beih., 1935, 43, 1—142).—A comprehensive investigation and discussion of the prep. and exchange reactions of permutites of H, alkali and alkaline-earth metals, Cd, Ni, Cu, Hg, and Ag.

E. S. H.

**Transmission of surface perturbations to within real crystals.** V. D. BALAREV [with V. CHRISTOFOROVA] (Z. physikal. Chem., 1935, B, 30, 152—156; cf. A., 1935, 1069).—Admixture with  $\text{NaCl}$ ,  $\text{KCl}$ , or  $\text{PbCl}_2$  causes the dehydration and rehydration curves for  $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$   $\text{BaCl}_2 \cdot \text{H}_2\text{O} + \text{H}_2\text{O}$  to approach; this can be due only to the transmission of surface energy from the points of contact of the two salts (cf. *ibid.*, 447).

R. C.

**Sorption phenomena and chemical processes. VII. Permutoid reactions.** I. PUTILOVA (J. Gen. Chem. Russ., 1935, 5, 934—937).—Experimental data for the heat effect of the reaction between nitroalizarin and aq.  $\text{Cu}(\text{OAc})_2$  agree with those calc. from the Le Chatelier theorem.

R. T.

**Surface potentials and force-area relations of unimolecular films. II. *d*-Pimaric acid and tetrahydro-*d*-pimaric acid.** W. D. HARKINS, H. E. RIES, jun., and E. F. CARMAN (J. Amer. Chem. Soc., 1935, 57, 2224—2227; cf. A., 1934, 141).—The max. thickness of the mono-layer is about  $12 \text{ \AA.}$  for both compounds. The coeffs. of compressibility have been calc. The structures of the pimaric acids are compared with that of cholesterol, and their orientations in surface films are related to the different positions of the polar groups. The surface potential of tetrahydro-*d*-pimaric acid is about 200 mv., whilst that of

*d*-pimaric acid is about 100 mv. In the latter case an unprecedented decrease in surface potential on compression is observed. These facts may be related to an increasing intramol. dipole compensation on compression. E. S. H.

**Unimolecular films of molecules which lie flat on the surface of water. I. Surface pressures and potentials of films of long molecules: polymerides of  $\iota$ -hydroxydecoic acid.** W. D. HARKINS, E. F. CARMAN, and H. E. RIES, jun. (J. Chem. Physics, 1935, 3, 692—698).—Improvements in the apparatus of Harkins and Fischer (A., 1934, 141) are described. The relation between surface pressure and area per mol. (*A*) has been determined for a series of linear polymerides of  $\iota$ -hydroxydecoic acid with mol. wts. from 780 to 25,200. The films have high compressibilities and *A* is approx.  $\propto$  mol. wt. The mols. are oriented parallel to the surface. Their dimensions are calc. Differences between films with perpendicular and with parallel orientation are tabulated. Measurements of the surface potentials show that the contribution of each polar group is  $>$  that of the dipole of vertically oriented stearic acid. The films are not very sensitive to changes in  $[H^+]$ .

F. L. U.

**Theory of physico-chemical periodic processes. I.** A. A. VITT and F. M. SCHEMJAKIN (J. Gen. Chem. Russ., 1935, 5, 814—817).—Mathematical.

R. T.

**Emission wave theory of periodic reactions. VIII.** F. M. SCHEMJAKIN (J. Gen. Chem. Russ., 1935, 5, 943—949; cf. A., 1935, 453).—In general, the periodicity const. is given by  $K - \lambda V$ , where  $\lambda$  is the distance between two Liesegang rings, and  $V$  is the velocity of propagation, at limiting concns. of the substrates, whilst at optimal concns.  $K - V/4$ ; the latter relation also applies to micro-periodic phenomena. These findings are in accord with the theoretical considerations of Christiansen *et al.* (A., 1934, 955).

R. T.

**Relation between volumes of substances in the free state and in solution. I. I.** ZASLAVSKI, A. A. ASTASCHEVA, and I. A. SAKOV (Trans Inst. Chem. Tech. Ivanovo, 1935, 47—49).—The mol. wt.-equiv. vol. curves of chlorides of metals in the solid state and in solution exhibit parallel variations.

R. T.

**Viscosity of aqueous solutions of electrolytes. II. Comparison of specific ionic viscosities with other ionic properties of homologous elements.** H. TOLLERT (Z. physikal. Chem., 1935, 174, 239—246; cf. A., 1935, 443).—The lattice energies of the alkali chlorides and Na halides, the ionic radii in the lattice, the ionic hydration vals. and heats of hydration, and the mol. ionisation energies of the alkali chlorides all run parallel with the sp. ionic viscosities in 0.1*N* solution. It is inferred that the hydrated ions up to 0.1*N* are in a state of equilibrium with free  $H_2O$  which is a function of the at. no. in the same kind of way as are the above ionic properties.

R. C.

**Refractometric investigations of aqueous solutions of salt mixtures. System barium chloride-potassium chloride.** G. SPACU and E. POPPER

(Z. physikal. Chem., 1935, B, 30, 113—116; cf. A., 1934, 723).—The existence in solution of complex anions corresponding with the compounds  $[BaCl_4]K_2$  and  $[BaCl_5(H_2O)]BaK$  is said to have been established.

R. C.

**Structure of solutions of strong electrolytes in alcohols and water.** G. W. STEWART (Proc. Iowa Acad. Sci., 1934, 41, 250—251; cf. A., 1934, 591).—Aq. LiCl behaves as a submicroscopic emulsion, consisting of a  $LiCl-H_2O$  structure in  $H_2O$  as a solvent. Aq.  $MgCl_2$ ,  $(NH_4)_2SO_4$ ,  $NH_4Cl$ , and  $NaCl$  are similar. A solution of LiCl in EtOH shows a composite liquid structure, which behaves as if liquid alcoholate were thoroughly mixed with the EtOH, the two forming a single cybotactic structure.

CH. ABS. (e)

**Measurement of the size of colloidal particles from the intensity of light transmitted through the solutions.** N. N. ANDREEV (J. Gen. Chem. Russ., 1935, 5, 529—534).—The radius of suspended colourless particles (colophony) can be derived from the absorption of transmitted light by a modified Mie formula (Ann. Physik, 1908, [iv], 25, 377).

R. T.

**Donnan effect in ultrafiltration of colloidal solutions.** A. RABINOVITSCH, P. VASILEV, and T. GATOVSKAJA (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 109—112).—In ultrafiltration the vol. of the initial sol is diminished by the same amount as the vol. of the ultrafiltrate is increased. By assuming complete dissociation of sols and ultrafiltrates new equations, based on those of Donnan, are derived; they yield theoretical vals. for  $Fe_2O_3$ ,  $WO_3$ ,  $TiO_2$ , and  $V_2O_5$  sols in good agreement with experimental data.

W. R. A.

**Uranium colloids. II.** S. I. DIJATSKHOVSKI and M. F. IVANOVA (J. Gen. Chem. Russ., 1935, 5, 638—642; cf. A., 1927, 1137).—Highly disperse, photosensitive sols of uranyl tartrate are described.

R. T.

**Formation of zirconate hydrosols and their disintegration by certain neutral salts.** A. W. THOMAS and H. S. OWENS (J. Amer. Chem. Soc., 1935, 57, 2131—2135).—The anions citrate, glycolate, lactate, malate, mucate, pyruvate, tartrate,  $H_2PO_4^-$ ,  $P_2O_7^{4-}$  reverse cationic basic Zr chloride micelles to anionic zirconate micelles. The conditions are: (1) ability of the salt anion to displace aquo-groups from the cationic micelle, (2) the formation of a sol. anionic complex, (3) the equilibrium const. of the anionic complex must be  $>$  the solubility product of  $ZrO(OH)_2$ . The basic Zr sols can be brought into crystalloidal solution by addition of K acetate, tartrate, or glycolate.

E. S. H.

**Distance between colloidal particles in the iridescent films of certain iron oxide sols.** W. HELLER (Compt. rend., 1935, 201, 831—833; cf. A., 1930, 439).—Vals. are recorded for the distances between layers at various concns. and for varying periods of ageing.

H. J. E.

**Magnetic study of sols of hydrated ferric oxide.** A. BOUTARIO and R. BONNEVIALE (Bull. Soc. chim., 1935, [v], 2, 1998—2008).—The measured sp. susceptibilities,  $\chi$ , of  $Fe_2O_3$  sols, containing up to

75 g. of  $\text{Fe}_2\text{O}_3$  per litre, obey the mixture law. The val. of  $\chi$  for  $\text{Fe}_2\text{O}_3$  does not vary appreciably with the length of dialysis, but decreases with increasing age of the sol, the decrease being faster at higher temp.

O. J. W.

**Osmotic pressure and mol. wt. of cellulose acetate.** A. DOBRY (Bull. Soc. chim., 1935, [v], 2, 1882—1884).—From the limiting val. of the osmotic pressure at zero concn. in various solvents the mol. wt. of cellulose acetate is found to be 66,500.

O. J. W.

**Viscosity of solutions of cellulose in cuprammonium.** O. KRATKY and G. SAITO (Cellulosechem., 1935, 16, 85—90).—Data are recorded for  $\eta$  of 0.1, 0.25, and 0.5% solutions of modified celluloses regenerated from alkali-cellulose aged in air, and these are approx. expressed by the equation  $\eta_{sp}/c = A + Bc$ , in which  $A$  and  $B$  are consts. The term  $Bc$  is regarded as due to mechanical interaction of the long chain mols. or micelles with each other. The ratio length/width of the particles calc. on this hypothesis agrees approx. with that calc. from Staudinger's equation.

A. G.

**Dissolution of cellulose nitrate. I—III.** T. TOMONARI (J. Soc. Chem. Ind. Japan, 1935, 38, 517—528B; cf. A., 1934, 637).—The solubility of various types of cellulose nitrate in org. solvents and in aq.  $\text{HNO}_3 + \text{H}_2\text{SO}_4$ , and the relative  $\eta$  for solutions, have been determined at 0—25°. Dissolution of di- and tri-nitrates in aq.  $\text{HNO}_3 + \text{H}_2\text{SO}_4$  is hindered by the presence of an unknown constituent.

R. S. B.

**Action of alcohols on organosols (especially polystyrene, caoutchouc, and cellulose acetate).** H. ERBRING and K. SAKURADA (Kolloid-Z., 1935, 73, 191—201).—The pptg. effects of a homologous series of alcohols increases with increasing mol. polarisation, except for organosols of paraffin and caoutchouc, where the reverse effect is observed, and polystyrene in  $\text{COMeEt}$ , in which the pptg. val. is independent of mol. polarisation. In general the concn. of alcohol required for pptn. increases with increasing viscosity of the system. By addition of alcohols to polystyrene in  $\text{C}_6\text{H}_6$  a liquid-liquid system is formed at first.

E. S. H.

**Coagulation of organosols of cellulose nitrate by electrolytes. II.** S. PAPKOV and M. TSCHVEL-EVA (Kolloid-Z., 1935, 73, 202—203; cf. A., 1935, 1319).—The coagulation of sols of cellulose nitrate in  $\text{COMe}_2$  by  $\text{H}_2\text{O}$  in presence and in absence of electrolytes has been studied. The stability of the sols cannot be traced to the charge on the particles; the existence of such a charge is doubtful.

E. S. H.

**Variation of flocculation threshold in starch sols.** H. KOBER and F. DITTMAR (Kolloid-Z., 1935, 73, 219—226).—Capillary-active substances, such as sulphonated fatty acids, have very little influence on the coagulation of starch sols except in presence of salts, when small concns. cause turbidity or flocculation according to the concns. of electrolyte and sol. The effect also varies with the degree of hydrolysis of the starch which occurs during prep. of the sol.

E. S. H.

**Imbibition of organic solvents by Yamagata imbibing clay.** M. UTIDA (J. Soc. Chem. Ind. Japan, 1935, 38, 513—514B).—The quantity of org. solvent imbibed is  $<$  for  $\text{H}_2\text{O}$ , but no systematic relation applies. The relative  $\eta$  of the system clay sol- $\text{H}_2\text{O}$ - $\text{EtOH}$  is infinite near the max. point of the system  $\text{H}_2\text{O}$ - $\text{EtOH}$ .

R. S. B.

**Imbibition of electrolyte solution by Yamagata imbibing clay.** M. UTIDA (J. Soc. Chem. Ind. Japan, 1935, 38, 514B).—The swelling of clay in aq.  $\text{HCl}$ ,  $\text{NaOH}$ , and  $\text{NaCl}$  is compared with  $\eta$  for the systems clay sol-electrolyte. A base exchange occurs, as with zeolites, the reaction velocity increasing rapidly with concn. of electrolyte.

R. S. B.

**Structure viscosity of lyophilic sols. I. Gelatin sol.** N. PESKOV and S. AVERBUCH (Kolloid-Z., 1935, 73, 182—191).—A viscosimeter for use with lyophilic sols is described. The deviations from the Hagen-Poiseuille law shown by gelatin sols are traced to the inner structure and orientation of the particles. The influence of acids and alkalis on  $\eta$  is ascribed to the electro-viscous effect, the increase in dispersity, the possible increase in swelling power, and the change in the form of the micelles. Deviations from the law disappear at 34° in 2% electrodialysed gelatin, and at 30° when acids or bases are added to give  $p_H < 3.5$  or  $> 5.5$ .

E. S. H.

**Silicic acid gels. V. Determination of the hydrogen-ion concentration of gel mixtures.** C. B. HURD and R. L. GRIFFETH (J. Physical Chem., 1935, 39, 1155—1159; cf. A., 1934, 730).—The quinhydrone (I) method can be used for the determination of the  $p_H$  of  $\text{SiO}_2$  gels. The vals. obtained are  $< 7$  and const. during setting, whilst the time of setting is unaffected by the presence of (I).

R. S.

**Cryolysis, diffusion, and particle size. II. Investigations with myosin.** F. E. M. LANGE and F. F. NORB (Biochem. Z., 1935, 281, 444—446).—A table shows the diffusion coeffs. for myosin (unfrozen) at temp. down to  $-79^\circ$ . The decrease of these coeffs. with chilling points to an irreversible aggregating action.

P. W. C.

**Ideal and real protein solutions.** G. ETTISCH and R. HAVEMANN (Z. physikal. Chem., 1935, 174, 199—221).—If a homodisperse quartz suspension is allowed to sediment in presence of a protein the increase in the sedimented vol. compared with the val. in absence of the protein is a max. at the isoelectric  $p_H$  (I). This is a more precise method for the location of I than mere observation of the sedimented vol. alone. For ovalbumin and serum-albumin the val. of I so obtained falls with increasing protein concn.,  $c$ , when the latter is  $>$  a certain val. It follows therefore that at the higher  $c$  the mean valency of the protein mol. (cf. A., 1934, 36) is a function of  $c$ . Cataphoresis measurements show that at concns.  $> 0.5\%$  I of ovalbumin is not const. at  $p_H 4.93$ , but moves to lower  $p_H$  with rising  $c$ . These observations are attributed to electrical interaction between the isoelectric protein mols. in the more conc. (non-ideal) solutions. In such solutions the mols. behave as polypoles, and at I the  $\text{NH}_3^+$  and  $\text{CO}_2^-$  groups of

different mols. approach as close as possible. This theory accounts for the above phenomena and also for the effect of neutral salts on *I*. R. C.

**Diffusion of colouring matters in gelatin and morphology of their reactions with electrolytes.** S. VEIL (Bull. Soc. chim., 1935, [v], 2, 1830—1832).—The use of characteristic diffusion figures in gelatin (cf. A., 1934, 1172) for the purpose of qual. analysis is extended to the case of colouring matters.

O. J. W.

**Diffusion in gelatin and rhythmic precipitation of magnesium hydroxide.** G. AMMON and R. AMMON (Kolloid-Z., 1935, 73, 204—219).—The formation of periodic structures of  $Mg(OH)_2$  in gelatin by interaction of aq.  $NH_3$  and  $MgCl_2$  has been studied in relation to the diffusion coeffs. of the two reagents, the ratio of the distances between successive rings, and the viscosity of the gelatin. The results of other investigators are discussed in the light of these results.

E. S. H.

**Quinone-gelatin gels.** J. BUCHHOLZ (Kolloid-Z., 1935, 73, 237).—The phenomenon previously reported has been observed with tolu-, naphtha-, and anthra-quinone.

E. S. H.

**Lyophilic colloids. XXV. Coacervation. II. Complex coacervation of the system gum arabic-gelatin.** H. G. B. DE JONG and W. A. L. DEKKER (Kolloid-Beih., 1935, 43, 143—212; cf. A., 1935, 821).—Determinations of  $\eta$ , turbidity, and electrophoretic velocity have been carried out. Neutral salts inhibit coacervation; a valency influence, but not a lyotropic influence, is noted. Coacervation is still observed in very dil. solutions. The composition relations for optimum coacervation vary with  $pH$ . The behaviour of the coacervate droplets in the electric field is described.

E. S. H.

**Phenomena of electrofiltration in the electrolysis of gels.** J. SWYNGEDAuw (Compt. rend., 1935, 201, 821—823; cf. A., 1934, 961).—A discussion.

H. J. E.

**Generalised thermodynamic notation.** H. A. C. MCKAY (J. Chem. Physics, 1935, 3, 715—719)

F. L. U.

**Quantity parameter, intensity parameter, and stable equilibrium.** M. PLANCK (Physica, 1935, 2, 1029—1032).—Polemical. (cf. A., 1935, 1076).

T. G. P.

**Displacement of equilibrium and the laws of moderation [i.e., of Le Chatelier and van 't Hoff].** D. MATURO (Rev. Fac. Quim. Ind. Agric., 1934, 3, 109—118).—Mathematical.

D. R. D.

**Reversible thermo-elastic systems. Generalised coefficients.** D. MATURO (Rev. Fac. Quim. Ind. Agric., 1934, 3, 119—130).—Mathematical.

D. R. D.

**Osmotic equilibrium and real solutions.** D. MATURO (Rev. Fac. Quim. Ind. Agric., 1934, 3, 131—146).—Theoretical. A rigid thermodynamic treatment of equilibria across a semi-permeable membrane.

D. R. D.

**Partial molal quantities in an infinitely dilute solution.** I. R. KRITSCHESKI and J. S. KASARNOVSKI (J. Amer. Chem. Soc., 1935, 57, 2171—2172).—Theoretical.

E. S. H.

**Equilibrium studies on the exchange reaction between acetylene and heavy water.** L. H. REYERSON and B. GILLESPIE (J. Amer. Chem. Soc., 1935, 57, 2250—2251).—Average vals. of  $K_e$  for the reaction  $C_2H_2 + HDO = C_2HD + H_2O$  are 0.365, 0.45, and 0.51 at 0°, 25°, and 100°, respectively.

**Second dissociation constant of carbonic acid.** Y. KAUKO and V. MANTERE (Suomen Kem., 1935, 8, B, 34; cf. A., 1935, 823).—Extrapolation of measurements in dil. solution gives  $K_2 = 5.0 \times 10^{-11}$  at 18°.

R. S.

**Peculiar behaviour of aqueous carbonic acid.** Y. KAUKO (Suomen Kem., 1935, 8, B, 39—41).—Recorded vals. for the dissociation consts. of  $H_2CO_3$  are discussed. The author's val. for the second const. is  $5.3 \pm 0.3 \times 10^{-11}$  at 25°. A slow change occurs in the solution.

R. S. B.

**Relative strengths of acids in *n*-butyl alcohol.** L. A. WOOTEN and L. P. HAMMETT (J. Amer. Chem. Soc., 1935, 57, 2289—2296).—The relative strengths of 33 carboxylic and phenolic acids have been determined by the potentiometric method. The effect of a substituent on variation in relative strength with changing medium is that to be expected from the electric moment of the substituent and the dielectric const. of the medium, when the substituent is introduced into the mol. at some distance from  $CO_2H$ . Some other influence is preponderant when substitution is adjacent to  $CO_2H$ .

E. S. H.

**Existence of boric acid complexes with one and with two molecules of a diol in aqueous solutions.** J. BOESEKEN and N. VERMAAS, and (in part) W. H. ZAAYER, and J. L. LEEFERS (Rec. trav. chim., 1935, 54, 853—860).—From the equations representing the equilibria involved in the titration of diols with  $KBO_2$  (cf. A., 1932, 1204), and the evaluation of  $K_1$  ( $2.5 \times 10^{-6}$  at 18° for mannitol;  $3.7 \times 10^{-6}$  at 18.5° for sorbitol) and  $K_2$  ( $1.10$  and  $2.11 \times 10^{-4}$ , respectively), it is possible to calculate the concn. of all the components present in solution. Rotatory dispersions, in close agreement with the experimental vals., are calc. The rotatory dispersion curve for a solution containing an excess of borate is different from that containing an excess of mannitol. A preliminary analysis of the system  $NaBO_2$ -sorbitol indicates that the system is less simple.

J. W. B.

**Activity of chloride ions in some solutions of complex chlorides of cobalt and chromium (III).** M. CHATELET and F. KERTESZ (Compt. rend., 1935, 201, 817—819).—Electrode potential measurements with  $AgCl$  electrodes are recorded for aq.  $KCl$ ,  $BaCl_2$ ,  $[CoCl(NH_3)_5]Cl_2$ ,  $[CoH_2O(NH_3)_5]Cl_2$ , and  $[CrCl(NH_3)_5]Cl_2$  (0.0002—1 molar). For the two Co salts there is only one ionised Cl. For the Cr salt the ionisation of the second Cl increases with dilution.

H. J. E.

**Amphoteric hydrated oxides, solutions of their hydrolysing salts, and their compounds of high mol. wt. XXX. Iso- and hetero-polytungstic acids, especially the mechanism of formation of arseno- and phospho-tungstic acids.** G. JANDER and H. BANTHIE (Z. anorg. Chem., 1935, 225, 162—172; cf. A., 1934, 1319).—In aq. solutions containing

$\text{WO}_4''$  and  $\text{PO}_4'''$  (or  $\text{AsO}_4'''$ ) increasing  $[\text{H}^+]$  leads to the successive formation of hexatungstic acids, and hetero-acids in which  $\text{P(As):W}=1:6, 1:12$ , or  $2:18$ . The systems have been studied by the diffusion method. F. L. U.

**Test of mass law on concentrated molten solutions by potential measurements.** L. HOLUB, F. NEUBERT, and F. SAUERWALD (Z. physikal. Chem., 1935, 174, 161—198).—Equilibrium consts. and activities have been determined by potentiometric measurements for the systems  $\text{Pb-Sn-Cl}_2$ ,  $\text{Pb-Cl}_2$ ,  $\text{Cd-Pb-Cl}_2$ ,  $\text{Cd-Cl}_2$ ,  $\text{Pb-Ag-Cl}_2$ ,  $\text{Pb-Ag-Br}_2$ ,  $\text{Pb-Ag-I}_2$ ,  $\text{Ti-Cd-Cl}_2$ ,  $\text{Ti-Pb-Cl}_2$ , and  $\text{Cd-Sn-Cl}_2$ . The equilibrium consts. determined directly with cells of the Daniell type differ from the vals. calc. from activities, indicating that activities cannot generally be determined electrochemically owing to irreversibility of the necessary electrodes. The Lorenz-van Laar mass law (A., 1926, 355) fails completely in almost every case. There are large deviations from the ideal mass law, and in some cases where the const. has approx. the correct val. this is due to the accidental compensation of opposed deviations from ideality on the part of the substances involved. It has not been possible to determine at what concns. there is ideality of behaviour of the mols. and ions. In attempting to determine the mol. state of reactants from the constancy of the appropriate mass law quotients it is found that quotients which are most nearly const. do not always correspond with the most probable reaction; both simple and associated mols. or ions may be present simultaneously. R. C.

**Physical chemistry of lipins. III.**—See A., 1935, 1523.

**Thermodynamical calculations of solubilities of nitrogen and hydrogen in water at high pressures.** I. R. KRITSCHESKI and J. S. KASARNOVSKI (J. Amer. Chem. Soc., 1935, 57, 2168—2171).—A thermodynamic equation, which allows the calculation of the solubility of slightly sol. gases in solvents with small v.p., is given. The equation is verified for  $\text{N}_2$  and  $\text{H}_2$  in  $\text{H}_2\text{O}$  at 0—100° and pressures up to 1000 atm. Partial mol. vols. of  $\text{N}_2$  and  $\text{H}_2$  in aq. solution are calc. E. S. H.

**Deliquescence and efflorescence.** A. DAMIENS (Bull. Soc. chim., 1935, [v], 2, 1893—1901; cf. A., 1934, 490).—It is suggested that the terms "deliquescent" and "efflorescent" should be replaced by "critical hygrometric state" defined by  $100p/P$ , where  $p$  and  $P$  are the v.p. of the system and the v.p. of  $\text{H}_2\text{O}$ , respectively. Hygrometric data recorded in various parts of France during several years are discussed. O. J. W.

**Determination of critical hygrometric states.** M. DIENIS (Bull. Soc. chim., 1935, [v], 2, 1901—1907; cf. preceding abstract).—The aq. v.p. of various saturated salt solutions and solid salt hydrates has been measured at 20° and 25°. The "crit. hygrometric states" are recorded. O. J. W.

**Fusion curves of mixtures of water and deuterium oxide. Solution equilibrium in the system water-deuterium oxide.** M. DEZELIC (Z. anorg. Chem., 1935, 225, 173—174).— $\text{H}_2\text{O}$  and  $\text{D}_2\text{O}$

form an unbroken series of solid solutions, the f.p. of which is a linear function of the composition. Separation by means of fractional crystallisation is therefore impossible. F. L. U.

**Thermal analysis of the system  $\text{POCl}_3\text{-SO}_2\text{Cl}_2$ .** G. P. LUTSCHINSKI and A. I. LICHATSHEVA (Z. anorg. Chem., 1935, 225, 175—176).—The m.p.-composition diagram of  $\text{POCl}_3\text{-SO}_2\text{Cl}_2$  is of the simple eutectic type. The eutectic point is at  $-73.8^\circ$  and 25.1 mol.-% of  $\text{POCl}_3$ . F. L. U.

**Thermal analysis of the system argon-boron trifluoride. Compounds with the inert gases of the atmosphere.** H. S. BOOTH and K. S. WILLSON (J. Amer. Chem. Soc., 1935, 57, 2273—2280).—F.p.-composition curves show maxima at ratios of 1 atom of A to 1, 2, 3, 6, 8, and 16 mols. of  $\text{BF}_3$ , indicating that compounds are formed. The compounds are unstable and decompose above their m.p.;  $\text{A}_2\text{BF}_3$  appears to be the most stable. The influence of pressure on f.p. suggests the equilibrium  $\text{A} + x\text{BF}_3 \rightleftharpoons \text{A}_x\text{BF}_3$  or  $\text{A}_x\text{BF}_3 + y\text{BF}_3 \rightleftharpoons \text{A}_{(x+y)}\text{BF}_3$ . E. S. H.

**Critical phenomena of the system argon-boron trifluoride.** H. S. BOOTH and K. S. WILLSON (J. Amer. Chem. Soc., 1935, 57, 2280—2284).—Retrograde condensation and immiscibility are observed. The compounds formed in this system (cf. preceding abstract) are completely dissociated in the crit. temp. region and scarcely affect the results. E. S. H.

**Dissociation of ferrous carbonate.** J. KRUSTINSONS (Z. anorg. Chem., 1935, 225, 93—96).—Dissociation pressures of  $\text{FeCO}_3$  have been determined over the range 250—290°. The calc. heat of dissociation is 20.9 kg.-cal. F. L. U.

**Dissociation of NiS.** D. N. TARASENKOV and A. V. BOGOSLOVSKAJA (J. Gen. Chem. Russ., 1935, 5, 836—838).—NiS gradually loses S when heated in  $\text{N}_2$  at 700°, and the v.p. gradually diminishes as the composition of the product approaches that of  $\text{Ni}_3\text{S}_2$ . This suggests that the NiS ordinarily prepared from Ni and S is a solid solution of S in some other sulphide. R. T.

**Direct determination of zinc vapour concentration in the thermal reduction of zinc oxide.** O. DONY-HÉNAULT and C. DECROLY (Compt. rend., 1935, 201, 726—728).—The  $[\text{Zn}]$  in the vapour phase has been determined by allowing the gas in the reduction vessel (at 920—1075°) to expand into a second evacuated vessel, cooling the latter, and determining its Zn content. H. J. E.

**Solubility product constant of calcium carbonate in sea-water.** R. REVELLE and R. H. FLEMING (Proc. 5th Pacific Sci. Cong., 1933, 3, 2089—2092).—The solubility product of  $\text{CaCO}_3$  in sea- $\text{H}_2\text{O}$  is  $2.37 \times 10^{-6}$ . The activity coeff. of  $\text{Ca}^{++}$  for normal salinity is 0.225. Sea- $\text{H}_2\text{O}$  is approx. saturated with  $\text{CaCO}_3$ . CH. ABS. (f)

**Equilibrium in the system  $\text{H}_2\text{O-MgBr}_2$ .** F. H. GETMAN (Rec. trav. chim., 1935, 54, 866—872).—Solubility data are recorded for  $-42.7^\circ$  to  $100^\circ$  and extrapolated to  $172.4^\circ$ , the m.p. of  $\text{MgBr}_2 \cdot 6\text{H}_2\text{O}$ . F.p. data for  $\text{MgBr}_2$  solutions are also given. The only hydrates formed are  $\text{MgBr}_2 \cdot 6\text{H}_2\text{O}$  and

MgBr<sub>2</sub>·10H<sub>2</sub>O, the transition temp. being 0.83°. The eutectic temp. for MgBr<sub>2</sub>·10H<sub>2</sub>O, ice, and solution is -42.7°. Attempts to obtain MgBr<sub>2</sub>·4H<sub>2</sub>O by heating MgCl<sub>2</sub>·6H<sub>2</sub>O were unsuccessful. J. W. S.

**System alkali oxide-CaO-Al<sub>2</sub>O<sub>3</sub>-SiO<sub>2</sub>-CO<sub>2</sub>. V. Stable equilibria in the system Na<sub>2</sub>O-SiO<sub>2</sub>-CO<sub>2</sub> and pressures of CO<sub>2</sub> in the reaction between K<sub>2</sub>CO<sub>3</sub> and K<sub>2</sub>SiO<sub>3</sub>. C. KROGER and E. FINGAS (Z. anorg. Chem., 1935, 225, 1—23; cf. A., 1935, 935).—The reaction of Na<sub>2</sub>CO<sub>3</sub> with Na<sub>2</sub>SiO<sub>5</sub>, Na<sub>2</sub>SiO<sub>7</sub>, and Na<sub>6</sub>Si<sub>2</sub>O<sub>7</sub> and mixtures of these has been studied by measuring the pressure (*p*) of CO<sub>2</sub> over the systems at various temp. (*t*). CO<sub>2</sub> is absorbed only when the ratio Na<sub>2</sub>O/SiO<sub>2</sub> > 0.5. *p-t* diagrams are given for this system and for the system K<sub>2</sub>O-SiO<sub>2</sub>-CO<sub>2</sub>. Thermal data relating to the formation of several Na silicates are calc. Dissociation pressures of cryst. and fused Na<sub>2</sub>CO<sub>3</sub> and K<sub>2</sub>CO<sub>3</sub> have been determined. F. L. Ü.**

**Double decomposition in absence of a solvent. XXVIII. V. P. RADISCHTSHEV (J. Gen. Chem. Russ., 1935, 5, 455—490).—Equilibrium data are recorded for the system NaCl-NaBr-NaI-KCl-KBr-KI, which is treated as a combination of 9 binary, 2 ternary, and 4 quaternary systems. The solid phases are binary, ternary, and quaternary solid solutions. R. T.**

**Heat capacity and free energy of formation of naphthalene. J. N. PEARCE and W. B. TANNER (Proc. Iowa Acad. Sci., 1934, 41, 123—126).—The heat capacity of C<sub>10</sub>H<sub>8</sub> has been measured from liquid air temp. to 298.1° abs.; vals. for changes in heat content, entropy, and free energy accompanying its formation from its elements are calc. CH. ABS. (e)**

**Difference in the heats of formation of the two isomerides of butane. Estimate of the heat of formation of tetramethylmethane. F. D. ROSSINI (J. Chem. Physics, 1935, 3, 438; cf. A., 1934, 966, 1071).—Computed vals. (kg.-cal. per mol.) are: *n*-C<sub>4</sub>H<sub>10</sub> (gas) → *iso*-C<sub>4</sub>H<sub>10</sub> (gas), -1.63 ± 0.15; *n*-C<sub>5</sub>H<sub>12</sub> (gas) → CMe<sub>4</sub> (gas), -4.9 ± 1.0; 5C (graphite) + 6H<sub>2</sub> → CMe<sub>4</sub>, -40.7 ± 1.2; 5C (diamond) + 6H<sub>2</sub> → CMe<sub>4</sub>, -41.8 ± 1.2. N. M. B.**

**Ionic migration as a molecular-kinetic problem. A. MAGNUS (Z. physikal. Chem., 1935, 174, 262—268).—Regarding the solvent, not as a continuous medium, but as a system the mol. motions of which are controlled by the laws of the kinetic theory of gases, the steady mobility of ions is accounted for by supposing that between two collisions with solvent mols. the ion is accelerated in the direction of the electric field, then slowed down again by the next collision. From known ionic mobilities the mean free paths can be calc., and prove, especially for small and doubly-charged ions, to be the calc. mol.-kinetic vals. and independent of temp., a discrepancy which is attributed to attraction between the ions and the H<sub>2</sub>O dipoles. R. C.**

**Mobility of the hydrogen and hydroxyl ions in aqueous solution. I. G. WANNIER (Ann. Physik, 1935, [v], 24, 543—544).—The explanation of the high mobilities of H' and OH' on the basis of a proton transfer from one H<sub>2</sub>O mol. to the next is discussed.**

H' and OH' should approximate to Na' in mobility, and an interpretation of the proton transference is offered on the basis of the tetrahedral structure of H<sub>2</sub>O, H<sub>3</sub>O', and OH'. H<sub>2</sub>O has one potential "hole" and 3 protons, H<sub>3</sub>O' 2 holes and 2 protons, OH' 3 holes and one proton, so that in a sense OH' is the mirror image of H<sub>3</sub>O'. The effect of a field on the ions does not require further assumptions.

A. J. M.

**Electrolysis of copper in rock-salt. S. A. ARZIBISCHEV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 157—160; cf. A., 1935, 39).—Data recorded previously are corr. and discussed. Cu diffuses readily in either NaCl or KCl, although the ionic radii of K' and Cu'' are very different. Au also diffuses readily in KCl or NaCl. J. W. S.**

**Thermodynamics of the electric cell in heterogeneous systems. D. MATURO (Rev. Fac. Quim. Ind. Agric., 1934, 3, 159—167).—Mathematical.**

D. R. D.

**The concentration cell and Nernst's formula. D. MATURO (Rev. Fac. Quim. Ind. Agric., 1934, 3, 168—176).—The equations already deduced (cf. preceding abstract) are applied to the study of the contact potential between a metal and a solution of one of its salts.**

D. R. D.

**Potentials of cells in liquid ammonia solutions. Thermodynamic constants of the amminocadmium chlorides and of cadmium chloride. C. S. GARNER, E. W. GREEN, and D. M. YOST (J. Amer. Chem. Soc., 1935, 57, 2055—2058).—E.m.f. of the cells Zn(amalgam, N<sub>2</sub>)|ZnCl<sub>2</sub>·6NH<sub>3</sub>(s), NH<sub>4</sub>Cl in NH<sub>3</sub>(l), CdCl<sub>2</sub>·6NH<sub>3</sub>(s)|Cd(amalgam, N<sub>2</sub>) have been determined at 25°. When Zn and Cd are present as pure metals *E*<sub>298.2</sub> = 0.3605 volt. The standard free energies, heat contents, and virtual entropies of CdCl<sub>2</sub> and CdCl<sub>2</sub>·*x*NH<sub>3</sub> (where *x* = 1, 2, 4, 6, 10) have been calc. E. S. H.**

**Becquerel cells. G. ATHANASIU (Ann. Physique, 1935, [xi], 4, 377—449; cf. A., 1925, ii, 1067).—For cells with Ag-AgI and Hg-Hg<sub>2</sub>I<sub>2</sub> electrodes the positive photo-voltaic effect is increased by the H ions of the electrolyte, and may be destroyed or reversed by the OH ions. This is explained by assuming that the electrolyte is a "receiver" of products liberated in the photo-chemical reaction. Lowering of temp. increases the photo-voltaic effect; this is explained by regarding the electrode as the seat of two opposing reactions, a photo-chemical, on which temp. has little effect, and a purely thermal inverse reaction. Ag-AgI electrodes show sensitivity max. at 0.4225 and 0.30 μ, coinciding with the absorption max. of AgI; 0.4225 μ coincides with the photo-conductivity max. of AgI. For Hg-Hg<sub>2</sub>I<sub>2</sub> electrodes the max. is at 0.400 μ, and the sensitivity threshold at 0.530—0.540 μ. The Cu-CuO electrode sensitivity ranges from 1 μ, in the infra-red, to a max. at 0.400 μ. Ag electrodes covered with a thick cryst. layer of Ag<sub>2</sub>S show a sensitivity max. at 1.35—1.4 μ, coinciding with the photo-conductivity max.; this is also the case for Cu electrodes covered with Cu<sub>2</sub>O by thermal and by electrical deposition. The sensitivity max. is at 0.480 μ, and the photo-voltaic and photo-cryst. effects are compared. Results, in general,**

support the theoretical explanations previously reported. N. M. B.

**Polarographic studies with the dropping mercury cathode. LV. Influence of air on solutions of salvarsan derivatives.** R. BRDIČKA (Coll. Czech. Chem. Comm., 1935, 7, 457—466; cf. A., 1934, 1241).—Traces of toxic oxidation products (I) present in neosalvarsan (II), syntharsan (III), and myosalvarsan (IV) may be determined electro-polarimetrically. (II) is most sensitive to oxidation and has been studied most fully. Using an atm. of  $H_2$  and a dropping Hg cathode it is shown that (II), (III), and (IV) are not electro-reduced in presence of NaCl, LiCl, and  $LiNO_3$ , but waves appear in the polarograms, due to electro-reducible (IV) (present even in the purest specimens). Solutions which have been oxidised by  $O_2$ , and from which dissolved  $O_2$  has been expelled by  $H_2$ , give more pronounced waves owing to increased concn. of (I); the latter may be determined from the height of the waves. (III) gives smaller waves than corresponding solutions of (II) owing to its greater purity, but is otherwise similar; (IV) is more slowly oxidised than (II). In presence of LiCl,  $Na^+$  gives a wave of the polarograms at  $-2.0$  volt, owing to the diffusion current associated with the deposition of Na, and the % of Na can be determined from the height of this wave.

R. S. B.

**Electrode polarisation in separation of metal from solutions of complex cyanides.** O. ESSIN and A. MATANZEV (Z. physikal. Chem., 1935, 174, 384—394).—Analysis of Glasstone's experimental data (A., 1929, 654; 1930, 864) has shown that the existence of concn. polarisation caused by accumulation of  $CN^-$  at the cathode leads in several cases to relations between polarisation and c.d. which are analogous to the equation for H overvoltage. For the discharge of Hg from cyanide solutions, this demonstrates the existence of chemical polarisation, supposedly due to delayed discharge in the sense of Volmer's theory of overvoltage. In the separation of Cu there is no chemical polarisation, but rather a depolarising action. For the separation of Ag and Cd the experimental data are indecisive. R. C.

**Organic depolarisers.** W. F. HUNTER and L. F. STONE (J. Physical Chem., 1935, 39, 1139—1147).—The single potentials of a no. of depolarisers have been measured against Pt, Au, Ag, Sn, and Ni cathodes. A general interpretation in terms of the electron affinity of depolarisers and the work function of electrodes is advanced. R. S.

**Acid-base titration in alcohol-water mixtures. III. Titration of alkaloids and alkaloid salts.**—See this vol., 91.

**Electrometric control of displacement reactions. (Mlle.) S. VEIL** (Compt. rend., 1935, 201, 885—887).—The e.m.f. produced by Pt and Zn when in contact and immersed in  $0.2N$ - $CuSO_4$  decreases rapidly from the Volta p.d. to a min., then rises to a max., and oscillates. R. S. B.

**Determination of activity of unsaturated organic compounds from the e.m.f. of their reaction with sodium.** B. V. TRONOV and L. P.

KULEV (J. Gen. Chem. Russ., 1935, 5, 1007—1015).—The e.m.f. between Na and Pt electrodes in  $C_6H_6$  solutions of ketones, keto-acids, aldehydes (except MeCHO), nitriles (except MeCN), amines,  $C_5H_5N$ , cyclohexanone, and mesitylene oxide is greatly increased in presence of NaI, whilst that of carboxylic acids, esters (including nitrates), alcohols, unsaturated hydrocarbons, pyrrole, and nitromethane is unaffected;  $PhNO_2$  and isoamyl nitrite occupy an intermediate position. R. T.

**Explosion regions. XXVI. Shape of explosion regions and their diameters.** W. P. JORISEN (Rec. trav. chim., 1935, 54, 888—892; cf. A., 1933, 469, 573, 790).—Theoretical. J. W. S.

**Heavy hydrogen. V. Elementary reactions of light and heavy hydrogen. Thermal conversion of ortho-deuterium and the interaction of hydrogen and deuterium. VI. Ratio of the magnetic moment of the proton to the magnetic moment of the deuteron.** A. FARKAS and L. FARKAS (Proc. Roy. Soc., 1935, A, 152, 124—151, 152—157).—V. In the temp. range  $850$ — $1000^\circ$  abs. and at pressures 3—74 mm. the reconversion of ortho- $D_2$  (i) and the interaction of  $H_2$  and  $D_2$  (ii) proceed in the homogeneous gas phase according to the mechanisms: (i)  $D + o\text{-}D_2 \rightleftharpoons p\text{-}D_2 + D$  and (ii)  $D + H_2$   $HD + H$ ,  $H + D_2$   $HD + D$ . Reaction (i) proceeds 2.4 times, and reaction (ii) 1.5 times, more slowly than the reconversion of para- $H_2$  at the same temp. and pressure. In (i) this is mainly due to the different collision frequency and concn. of D atoms. The difference in the energies of activation involved in the reactions  $D + D_2$ ,  $D_2 + D$  and  $H + H_2$   $H_2 - H$  is only 510 g.-cal., but in (ii), the different reaction rate is due to the fact that the energy of activation for the partial reaction  $H + D_2 \rightleftharpoons HD + D$  is about 1.7 kg.-cal. > that for  $D + H_2$   $HD + H$ . This behaviour is explained by assuming that the activated complexes HHH, DHH, HDD, and DDD possess zero-point energies similar to the mols.  $H_2$ , HD, and  $D_2$ . A scheme for the energy levels involved in these interchanges is worked out.

VI. From a comparison of the velocity coeffs. of the ortho-para  $H_2$  and  $D_2$  conversions, in the presence of  $O_2$ , using the theory of Kalckar and Teller (A., 1934, 940), the ratio of the magnetic moment of the proton to that of the deuteron is found to be 3.96—0.11. J. L. L. B.

**Mechanism of the chain reaction in oxygen-hydrogen mixtures.** M. PRETTE (Compt. rend., 1935, 201, 728—730; cf. A., 1935, 827).—The activation energy of the  $H_2$ - $O_2$  reaction in reaction vessels coated with KCl is  $95,000 \pm 6000$  g.-cal. The reaction kinetics under these conditions are consistent with the Haber chain mechanism. H. J. E.

**Explosion of mixtures of combustible gases with air by nuclear drops of water and other nuclei and by X-rays. V. Experimental conditions required for ignition of hydrogen-air mixtures and nuclei. VI. Nuclear drop-ignition temperatures of ethylene-air mixtures passing through a silica combustion tube; relation between wall and gas temperature and effect on**

ignition temperatures of the central thermocouple sheath. VII. Effect of a variety of nuclei, mainly mineral dusts, to ignite and explode a mixture of hydrogen and air; exceptional efficacy of  $\text{Ni}_2\text{O}_3$  dust to ignite mixtures of air with hydrogen, ethylene, or methane. R. O. KING and G. MOLE (J. Inst. Petroleum Tech., 1935, 21, 838—845, 845—853, 853—859; cf. A., 1934, 1074).—V. An apparatus for direct measurement of the steam-forming activities (from dry  $\text{H}_2$  and air) of various combustion-tube surfaces, *e.g.*, Cr-Ni steel, Ni steel, and  $\text{SiO}_2$ , is described. The over-all steam-forming effect varies in a particular tube with the variety, temp., and distribution of surface oxide, and steam is not formed at a const. rate until the oxide attains equilibrium with the  $\text{H}_2$  in the existing conditions. Self- ( $T_s$ ) and nuclear-ignition temp. ( $T_n$ ) were determined in the same apparatus.  $T_s$  varies with surface activity, and it is concluded that self-ignition occurs in the boundary layer adjacent to the hot surface.

VI. The wall temp. in the Ni-steel tube was  $16\text{--}30^\circ >$  the temp. indicated by a central thermocouple, and the differences were always  $2\text{--}5^\circ$  greater when the tube was coated with oxide. Experiments showed that the surface of the thermocouple sheath was without effect on  $T_s$  of  $\text{C}_2\text{H}_4$ -air mixtures. Ignition in this mixture may begin in the gaseous mixture apart from a free surface.  $T_s$  diminishes on changing from the active steel surface to the relatively inactive  $\text{SiO}_2$  surface and the range of inflammability increases to a remarkable extent. Nuclear ignition is obtainable when ignition from the surface is prevented by steam dilution of the adjacent layer of gaseous mixture, the effect then being obtained on the surface of the nuclei in the gaseous stream. The effect is obtained when oxidation nuclei reach a suitable concn., or it may be induced by providing nuclear centres, *e.g.*,  $\text{H}_2\text{O}$  or dust.

VII. Added nuclei such as compounds of Fe, Pb, Zn, Ni, and Cr all proved effective to explode a mixture of  $\text{H}_2$  and air,  $\text{Ni}_2\text{O}_3$  having an exceptional igniting effect;  $T_n$  was as low as  $430^\circ$  for  $\text{Ni}_2\text{O}_3$ , compared with  $640\text{--}690^\circ$  for other nuclei, for a 40%  $\text{H}_2$  mixture supplied to a Cr-Ni steel tube at 300 c.c. per min. In a  $\text{SiO}_2$  tube for  $\text{H}_2$ -air, the min.  $T_s$  under given conditions was  $566^\circ$  compared with  $T_n$   $395^\circ$ .  $\text{Ni}_2\text{O}_3$  has a smaller igniting effect on  $\text{C}_2\text{H}_4$ -air mixtures than on  $\text{H}_2$ -air, the max. igniting effect occurring when the  $[\text{C}_2\text{H}_4]$  is about 50% > is required for combining proportions. For  $\text{CH}_4$ -air, using  $\text{Ni}_2\text{O}_3$ ,  $T_n$  is about  $75^\circ < T_n$  and the min.  $T_n$  is obtained when the  $[\text{CH}_4]$  is 50% < is required for combining proportions. C. C.

Ignition of firedamp by compression.—See B., 1935, 1124.

Homogeneous unimolecular decomposition of gaseous alkyl nitrites. IV. Decomposition of isopropyl nitrite. E. W. R. STEACIE and G. T. SHAW (Proc. Roy. Soc., 1935, A, 151, 685—693).—The thermal decomp. of  $\text{Pr}^i\text{NO}_2$  between  $170^\circ$  and  $210^\circ$  is homogeneous and of the first order. The main reaction is  $\text{Pr}^i\text{NO}_2 = \text{NO} + 0.5\text{COMe}_2 + 0.5\text{Pr}^i\text{OH}$ , analogous to those of the other alkyl nitrites investigated (cf. A., 1934, 847, 1312). The reaction rate is

given by  $k = 1.26 \times 10^{14} e^{-37,000/RT}$  sec.<sup>-1</sup> Comparison of the rates and activation energies of  $\text{Pr}^i\text{NO}_2$  and  $\text{Pr}^n\text{NO}_2$  shows that there is no appreciable variation due to chemical configuration. L. L. B.

Thermal decomposition of triethylamine. H. A. TAYLOR and E. E. JUTERBOCK (J. Physical Chem., 1935, 39, 1103—1110; cf. A., 1932, 1002).—The decomp. is unimol. at high pressures between  $450^\circ$  and  $500^\circ$  and tends to become bimol. at lower pressures. In the initial stages, the energy of activation is approx. 50,000 g.-cal. A sevenfold increase of surface and additions of  $\text{N}_2$  and  $\text{NH}_3$  are without effect, but marked differences occur when  $\text{H}_2$  is added. It is suggested that the intermediate products are  $\text{Et}_4\text{N}_2$  and  $\text{C}_4\text{H}_{10}$ , which ultimately yield  $\text{CH}_4$  and  $\text{N}_2$ . R. S.

Mechanism of slow oxidation of propane. R. N. PEASE (J. Amer. Chem. Soc., 1935, 57, 2296—2299).—At  $300^\circ$ , with mixtures containing 10—30% of  $\text{O}_2$ , the primary products are  $\text{MeOH}$ ,  $\text{MeCHO}$ ,  $\text{CO}$ , and  $\text{H}_2\text{O}$ . The results are interpreted in terms of Rico's radical-chain theory, on the assumption that  $\text{OMe}$  and  $\text{Pr}$  are the chain carriers. Similar mechanisms may apply to the oxidation of  $\text{CH}_4$  and  $\text{C}_3\text{H}_8$ . E. S. H.

Thermal decomposition of nitromethane. H. A. TAYLOR and V. V. VESSELOVSKY (J. Physical Chem., 1935, 39, 1095—1101; cf. A., 1931, 175).—The reaction is unimol. in its early stages and has an energy of activation of 61,000 g.-cal. The gaseous and solid products have been analysed and the intermediate formation of  $\text{MeNO}$  is postulated. Increase of surface affects the later stages of the reaction, additions of  $\text{He}$ ,  $\text{N}_2$ ,  $\text{NO}$ , and  $\text{CO}_2$  are without effect, whilst  $\text{O}_2$  reacts. H. S.

Induction period in gaseous thermal explosions. O. K. RICE, A. O. ALLEN, and H. C. CAMPBELL (J. Amer. Chem. Soc., 1935, 57, 2212—2222).—When the differential equation connecting temp. with time in an exothermic gas reaction is integrated, a sudden rise of temp., corresponding with an explosion, is indicated above a definite pressure. An approx. method for calculating the induction period in thermal explosions has been obtained from such curves, and applied to explosions of  $\text{Me}_2\text{N}_2$  and  $\text{EtN}_3$ . Approx. heats of decomp. of these compounds have been obtained. E. S. H.

Temperature coefficients in the acid hydration of sodium pyrophosphate. S. J. KIEHL and E. CLAUSSEN, jun. (J. Amer. Chem. Soc., 1935, 57, 2284—2289).—The rate of conversion of  $\text{Na}_4\text{P}_2\text{O}_7$  into  $\text{Na}_3\text{PO}_4$  in  $\text{HCl}$  solution has been determined at  $30\text{--}90^\circ$  and an empirical equation developed. Temp. coeffs. for  $15^\circ$  intervals have been calc. E. S. H.

Kinetics of the permanganate-oxalate reaction. I. Effect of various salts on the rate of reaction. R. W. FESSENDEN and B. C. REDMON (J. Amer. Chem. Soc., 1935, 57, 2246—2249).—A negative salt effect has been found in this reaction.  $\text{Zn}^{++}$ ,  $\text{Cd}^{++}$ , and  $\text{Al}^{+++}$ , which show apparent positive effects, form complex oxalates and thus decrease  $[\text{C}_2\text{O}_4^{--}]$ . E. S. H.

**Oxidation under pressure of ferrous sulphate in neutral and acid solution.** G. AGDE and F. SCHIMMEL (Z. anorg. Chem., 1935, 225, 29—32).—The influence of temp.,  $[\text{FeSO}_4]$ , and pressure of  $\text{O}_2$  on the oxidation of aq.  $\text{FeSO}_4$  has been determined. Under suitable conditions the oxidation is nearly complete. A part of the product is in the form of insol. basic salt, unless the required amount of free  $\text{H}_2\text{SO}_4$  is added. The presence of the latter does not affect the extent or the rate of oxidation. F. L. U.

**Kinetics of the reaction between permanganate and manganous ions.** M. J. POLISSAR (J. Physical Chem., 1935, 39, 1057—1066).—The reaction between  $\text{Mn}^{++}$  and  $\text{MnO}_4^-$  has been studied visually and by a semi-quant.  $\text{H}_2\text{C}_2\text{O}_4$ -I method. It is autocatalytic, catalysis being due to the  $\text{MnO}_2$  formed. The rate increases with the concn. of reactants, but diminishes with increasing acidity.  $\text{MnO}_2$  prepared in neutral solution is more effective than that prepared in acid solution, probably owing to its greater dispersion. Determinations of  $\text{MnO}_2$  by the  $\text{H}_2\text{C}_2\text{O}_4$  method may be carried out only at low  $[\text{Mn}^{++}]$ . The course of the reaction is altered by addition of  $\text{SO}_4^{--}$  or  $\text{F}^-$ , which form complex manganic ions, whilst sunlight has no appreciable effect. R. S.

**Hydrolysis velocity of ketimines: steric hindrance effect.** J. B. CULBERTSON, W. REYNOLDS, and C. MAIN (Proc. Iowa Acad. Sci., 1934, 41, 170—171).—Data are recorded for the rates of hydrolysis of 2:6-, 2:5-, 2:4-, and 3:5-dimethyldiphenyl ketimine hydrochlorides. CH. ABS. (c)

**Hydrolysis of phenyl furyl ketimine: relative negativity effect.** J. B. CULBERTSON and L. HINES (Proc. Iowa Acad. Sci., 1934, 41, 172).—Data for the rate of hydrolysis at  $0^\circ$  and  $25^\circ$  are recorded. The rule that the ketimine salts are more resistant to hydrolysis the more negative are the radicals attached to the C:NH is supported. CH. ABS. (c)

**Velocity of decomposition of diazo-compounds in water.** XVIII. E. YAMAMOTO (J. Soc. Chem. Ind. Japan, 1935, 38, 528—532B; cf. A., 1935, 1082).—The velocity coeffs. for the decomp. of 4:4'-tetrazo-, 2:2'-dimethyl-, 2:2'-dimethoxy-, and 2:2'-disulpho-4:4'-tetrazo-diphenyl chloride at  $30^\circ$  are respectively 1.31, 10.3, 0.0483 (extrapolated) and  $2.42 \times 10^{-4}$ . The temp. coeffs. have been determined. R. S. B.

**Reaction rate of acetic anhydride and water.** E. K. PLYLER and E. S. BARR (J. Chem. Physics, 1935, 3, 679—682; cf. A., 1934, 829).—By measuring the intensity of infra-red absorption bands characteristic of  $\text{AcOH}$  and  $\text{Ac}_2\text{O}$ , reaction velocities of  $\text{Ac}_2\text{O} + \text{H}_2\text{O} \rightarrow \text{AcOH}$  have been determined. The reaction is approx. unimol. at all concns. studied, and the velocity coeff. decreases with time. An extended application of the method is suggested. F. L. U.

**Kinetics of addition of hypochlorous acid to double linkings. I. Crotonic acid.** E. A. SCHILOV and N. P. KANJAEV (Trans. Inst. Chem. Tech. Ivanovo, 1935, 19—46).—The reaction of addition of  $\text{HOCl}$  (I) to crotonic acid (II), or its anion, is one of the first order with respect to (II), and of the second

with respect to (I); the reaction is retarded by  $\text{H}^+$ , and unaffected by neutral salts, whilst  $\text{Cl}^-$  acts catalytically in acid solutions only, so that in presence of  $\text{HCl}$  the velocity of reaction  $-d[\text{HOCl}]/dt = (k'[\text{H}^+] + k''n)[\text{HOCl}][\text{crotonic acid}][\text{Cl}^-]$ , where  $n$  is the dissociation const. of (II). The temp. coeff. of the reaction in presence of  $\text{HCl}$  is 1.62 per  $10^\circ$ . The order of the reaction varies greatly with changes in the concn. of the substrates and in the  $p_{\text{H}}$  of the medium. The reaction in acid media is supposed to consist of addition of the complex  $\text{HOCl} \cdot \text{HCl}$  to the  $\text{C}=\text{C}$ , followed by regrouping and elimination of  $\text{HCl}$ , whilst in alkaline media, in which  $\text{OCl}^-$  is the catalyst, the complex ion  $\text{HOCl} \cdot \text{OCl}^-$  is assumed to react directly with (II). R. T.

**Time course of the heat effects in rapid chemical changes.**—See this vol., 91.

**Oxidation of hæmoglobin to methæmoglobin by oxygen.** II.—See this vol., 92.

**Kinetics of displacement of silver from silver nitrate solutions by metallic lead.** S. KRZYŻAN-SKI (Z. anorg. Chem., 1935, 225, 151—161).—The reaction is of zero order for initial concns. within the limits 0.125—1N- $\text{AgNO}_3$ . The temp. coeff. of the velocity is of the same order as that of the diffusion coeff. F. L. U.

**Dust explosions.** A. A. VAN DER DUSSEN (Rec. trav. chim., 1935, 54, 873—884).—The quantities of Al-S mixture, coal, or anthracene dust required to be suspended in unit vol. of air to cause explosion on ignition have been measured. The effects of non-combustible powders in suppressing such explosions follow the order  $\text{K}_2\text{SO}_4 > (\text{NH}_4)_2\text{SO}_4 > \text{stone dust} > \text{fuller's earth}$ . J. W. S.

**Corrosion of iron.**—See B., 1935, 1145.

**Sensitised explosions. I. Hydrogen-oxygen reaction catalysed by nitrogen peroxide.** S. G. FOORD and R. G. W. NORRISH (Proc. Roy. Soc., 1935, A, 152, 196—220; cf. A., 1933, 236).—The region of ignition, which occurs between narrow limits of concn. of catalyst, is bounded by regions of slow reaction, the velocity of which is increased by light which generates O atoms from the  $\text{NO}_2$ . There is no distinction in the mode of generation of the slow and explosive reactions; both intervene sharply at the end of an induction period, during which the no. of chains grows at first slowly and then rapidly to a crit. val. The induction periods are reduced by irradiation to  $< 1$  sec. over nearly the whole range of catalytic effect of  $\text{NO}_2$ . The data support the view that the branching initially exceeds the extinction of chains over the whole region of catalysis, and that an equilibrium concn. of chains is ultimately imposed on the slow reaction by the self-neutralisation of chains, and by an increase in their extinction due to products of reaction. The process becomes adiabatic when the no. of chains exceeds a crit. val.  $\text{NO}_2$  exercises a triple role in affecting the origin, branching, and extinction of chains. L. L. B.

**Oxidation of carbon monoxide catalysed by nitrogen dioxide.** R. H. CRIST and O. C. ROEHLING (J. Amer. Chem. Soc., 1935, 57, 2196—2203; cf. A.,

1934, 1314).—The rate is first order with respect to O, at high concns. of NO<sub>2</sub>, and at low concns. it is  $\propto$  [O<sub>2</sub>] and [CO]<sup>2</sup>. E. S. H.

**Aqueous solutions of stannic chloride. III. Autocatalytic character of the flocculation.** J. GUÉRON (Bull. Soc. chim., 1935, [v], 2, 1993—1998; cf. A., 1934, 960).—The curves previously given for the rate of hydrolysis of aq. SnCl<sub>4</sub> solutions can be represented satisfactorily by an equation of the autocatalytic type. The bearing of this on the structure of the colloidal particles formed during the flocculation is discussed. O. J. W.

**Thermal decomposition of sugars and its catalytic acceleration.**—See this vol., 56.

**Influence of pectin on inversion of sucrose.** S. BERLINGOZZI and M. TESTONI (Annali Chim. Appl., 1935, 25, 489—496).—The presence of pectin lowers the velocity of inversion of sucrose (I) in aq. citric acid, the effect being max. at 35° and tending to decrease with rise in temp. For the same temp., inhibition with high concns. of (I) is > that with low concns. F. O. H.

**Effect of salts on the velocity of inversion of sucrose at 25°.** J. N. PEARCE and M. THOMAS (Proc. Iowa Acad. Sci., 1934, 41, 139).—For equal molal concns. of different salts the velocity coeff. increased in the order KCl < NaCl < LiCl < BaCl<sub>2</sub> < Al(NO<sub>3</sub>)<sub>3</sub>. The salt effect is best explained on the basis of ionic hydration. CH. ABS. (c)

**Polar and non-polar effects in esterification.** C. N. HINSHELWOOD and A. R. LEGARD (J.C.S., 1935, 1588—1591; cf. A., 1935, 828).—The H<sup>+</sup>-catalysed rates of esterification by EtOH of Bu<sup>n</sup>CO<sub>2</sub>H and CCl<sub>3</sub>·CO<sub>2</sub>H are < of AcOH, and the energies of activation are raised. The influence of Cl is probably polar, but that of Me is of another kind. J. G. A. G.

**Titanium. Chlorination of titanium dioxide.** A. V. PAMFILOV, A. S. CHUDAKOV, and E. G. SHTANDEL (J. Gen. Chem. Russ., 1935, 5, 605—608).—Max. utilisation of Cl<sub>2</sub> is found at 400° in presence of birch C and MnO<sub>2</sub>; in absence of catalysts, velocity of reaction rises continuously with temp. Considerable quantities of COCl<sub>2</sub> are produced during the reaction. R. T.

**Displacement of noble metals from solutions of their salts by hydrogen at atmospheric or increased pressure. Displacement of (I) Pd from solutions of PdCl<sub>2</sub>, (II) Pt from solutions of H<sub>2</sub>PtCl<sub>6</sub>.** V. V. IPATIEV and V. G. TRONEV (J. Gen. Chem. Russ., 1935, 5, 643—652, 661—666).—I. The reaction PdCl<sub>2</sub> + H<sub>2</sub> → Pd + 2HCl is of an autocatalytic nature, and proceeds at considerable velocity at room temp. and atm. pressure; its velocity is determined by the rate of diffusion of H<sub>2</sub> into the solution. The reaction is retarded by increasing the [HCl] or by adding oxidising agents, but is unaffected by ions of less noble metals, which are displaced only after complete displacement of Pd.

II. The reaction consists of the steps H<sub>2</sub>PtCl<sub>6</sub> → H<sub>2</sub>PtCl<sub>4</sub> → Pt; the above considerations are also applicable to it. R. T.

**Active nitrogen of long duration, law of decay and of increased brightness on compression.** (LORD) RAYLEIGH (Proc. Roy. Soc., 1935, A, 151, 567—584).—The catalytic destruction of active N<sub>2</sub> caused by the walls of the vessel is reduced to a min. by coating the walls with H<sub>2</sub>SO<sub>4</sub> or HPO<sub>3</sub>. Using HPO<sub>3</sub> and a large bulb, the glow remains visible for > 6 hr. A photometric examination over a wide intensity range of the decay of the glow at const. vol., using (a) a bulb coated with Apiezon oil (considerable wall activity), and (b) a bulb coated with HPO<sub>3</sub>, shows that for (a) the decay proceeds according to an exponential law, being apparently a first order reaction, whilst for (b) the data indicate a reaction of the second, or possibly the third, order. The increase of luminosity under compression has been studied photometrically; the intrinsic brightness  $\propto$  (concn.)<sup>2</sup>. This indicates a bimol. reaction in which the excess of neutral N<sub>2</sub> mols. have no part. L. L. B.

**Chlorination of propane. II. The heterogeneous reaction.** L. H. REYERSON and S. YUSTER (J. Physical Chem., 1935, 39, 1111—1123; cf. A., 1935, 1082).—The reaction in presence of Al<sub>2</sub>O<sub>3</sub>, Cu, and CuCl<sub>2</sub> catalysts deposited on SiO<sub>2</sub> gel has been investigated and the energies of activation have been determined. Al<sub>2</sub>O<sub>3</sub> gave some H<sub>2</sub>O, but good results were obtained with CuCl<sub>2</sub>. The amount of Cl<sub>2</sub> reacting increased with rise of temp., but when 100% conversion was attained, the temp. could be considerably reduced without diminishing the % of reaction. This hysteresis effect is interpreted on the basis of the relation between the heat of reaction and the energy of activation. Production of the higher chlorinated products is favoured by high [Cl<sub>2</sub>], high temp., and greater rates of flow, whilst secondary chlorination of CHMe·CH<sub>3</sub>, arising from the pyrolysis of PrCl has been shown to occur. R. S.

**Hydrogenation catalysis. II. Technique of hydrogenation.** A. S. GINSBERG (J. Gen. Chem. Russ., 1935, 5, 795—798).—A simple method of hydrogenation consists in shaking a given wt. of unsaturated substance in EtOH with 1 g. of powdered Fe or Ni, and 0.1 g. of Pd (as PdCl<sub>2</sub>·2NaCl) in an atm. of H<sub>2</sub>. The decrease, *V*, in vol. of the gas is measured after 15 min., and the H no. (vol. of H<sub>2</sub> at n.t.p. absorbed by 1 g. of substance) is given by  $V(B-d)/760(1+\alpha)p-K$ , where *B* is the barometric pressure, *d* the v.p. of H<sub>2</sub>O at temp. *t*,  $\alpha=1/273$ , *p* the wt. of substance taken, and *K* the vol. of H<sub>2</sub> absorbed by the catalyst alone. Instructions for recovering Pd from the used catalyst are given. R. T.

**Conversion of fatty acids and their esters into higher alcohols by catalytic reduction under pressure.**—See B., 1935, 1149.

**Reduction of a catalyst for ammonia synthesis.**—See B., 1935, 1141.

**Catalytic oxidation of sulphur dioxide.**—See B., 1935, 1141.

**Methane formation in gas mixtures containing carbon monoxide and dioxide in contact with various nickel catalysts.**—See B., 1935, 1124.

**Electrolytic separation factor of hydrogen isotopes under various experimental conditions.** A. EUCKEN and K. BRATZLER (*Z. physikal. Chem.*, 1935, 174, 273—290).—Separation factors,  $S$ , varying from 2.7 to 17 have been observed. Using cathodes of Pt, Au, Ag, Cu, Pb, graphite, and Hg no relation between the material or overvoltage of the cathode and  $S$  could be detected. After anodic polarisation of the cathode, unless this is Hg,  $S$  is for some time abnormally high, which suggests that the max. separation will be obtained by electrolysis with a.c., or better, commutated d.c. This effect appears to be due not only to electrolytic liberation of O, but to sorption of O by the cathode from the solution or air, forming a surface oxide; probably the catalytic power of the surface for the union of H atoms to  $H_2$  mols. is in this way increased, so that very rapid removal of the H atoms liberated is achieved. Small amounts of  $\alpha$ -naphthoquinoline depress  $S$  considerably (cf. A., 1935, 309), possibly owing to the formation of intermediate reduction products the H and D atoms of which are able to equilibrate themselves with the solvent. For a given electrode metal  $S$ , if it is already large, rises with the c.d. There is no direct connexion between  $S$  and the slope of the logarithmic c.d.—potential curve. R. C.

**Efficiency of separation of hydrogen and deuterium by electrolysis.** T. H. ODDIE (*Proc. Physical Soc.*, 1935, 47, 1060—1067).—A method is described, taking account of evaporation and spraying losses, for determining the efficiency  $\alpha$  of concn. of  $D_2O$  by electrolysis of  $H_2O$ - $D_2O$  mixtures.  $\alpha$  is independent of the [H] of the electrolyte and the nature of the electrodes, but increases with rising c.d.  $\alpha = 4.0 \pm 0.2$  for c.d. 0.6, and  $4.6 \pm 0.1$  for c.d. 2 amp. per sq. cm., in agreement with theory.

N. M. B.

**Electrolytic separation of lithium isotopes.** A. EUCKEN and K. BRATZLER (*Z. physikal. Chem.*, 1935, 174, 269—272).—Experiments in which aq.  $Li_2SO_4$  was electrolysed with a flowing Hg cathode, and the Li set free reconverted into  $Li_2SO_4$ , and again electrolysed and so on five times gave finally a specimen of Li the at. wt. of which differed from that of ordinary Li by an amount within the limit of experimental error. The separation factor,  $S$ , was at most 1.070. Bell's calculation of  $S$  (A., 1934, 738) is criticised.

R. C.

**Kinetics of formation of anode films on metals.** II. Films of lead chloride on lead. L. J. KURTZ (*Compt. rend. Acad. Sci. U.R.S.S.*, 1935, 3, 305—308; cf. A., 1935, 1083).—When 0.5*N*-HCl saturated with  $PbCl_2$  is electrolysed with a Pb anode, the latter is first covered with "islands" of cryst.  $PbCl_2$ , which later spread over the whole surface and increase in thickness. The electrical conductivity of the  $PbCl_2$  film increases with increase of c.d., as for AgCl and AgBr films.  $PbCl_2$  films have very small porosity. The kinetics of the growth of  $PbCl_2$  films are studied in the same way as for AgCl films, but the polarisation curves show some differences owing to the greater porosity of the AgCl films. A. J. M.

**Reaction mechanism at a graphite anode.** V. SIHVONEN (*Suomen Kem.*, 1935, 8, B, 35; cf. A.,

1934, 1186).—The electrode processes occurring in presence of fused alkali and carbonate electrolytes are discussed. R. S.

**Electro-deposition of nickel from nickel chloride solutions.**—See B., 1935, 1147.

**Nickel-plating of aluminium.**—See B., 1935, 1147.

**Electric currents flowing over rusting iron.** U. R. EVANS (*Nature*, 1935, 136, 792—793).—An arrangement for investigating currents flowing over an Fe surface in contact with 0.01*N*- $NaHCO_3$  during rusting is described. Intense anodic action occurs immediately around a scratched line where rusting is rapid, while cathodic areas are free from attack.

L. S. T.

**Electrodeposition of tin alloys from alkaline stannate baths.**—See B., 1935, 1098.

**Chemical reactions in rarified gases under the influence of electric discharges.** P. JOLIBOIS (*Bull. Soc. chim.*, 1935, [v], 2, 2035—2052).—A lecture.

**Chemical reaction in the electric discharge.** I. Chemical effects of impulse discharges. E. J. B. WILLEY (*Proc. Roy. Soc.*, 1935, A, 152, 158—171).—Wrede's results for  $N_2$  (A., 1930, 394) may be confirmed by chemical means and by simpler apparatus. The controlled impulse discharge is far superior, as regards both abs. and power yields, to a.c. and d.c. discharges. Some probable consequences of the action of an impulse discharge on a gas are discussed. It is considered that, if the breakdown period is not too short compared with the total duration of the discharge, and if the development of the positive column does not lead to a destruction of products first formed in this induction period, the total effects may approximate to those found in cathodic reactions. L. L. B.

**Effect of light on periodic reactions.** V. K. NIKIFOROV (*J. Chim. phys.*, 1935, 32, 585—587).—Wave equations yield the correct order for the ratio between the distances apart of Liesegang rings in the presence and absence of light in the reaction  $2AgNO_3 + K_2Cr_2O_7 = Ag_2Cr_2O_7 + 2KNO_3$  (Kofman, A., 1934, 346).

T. G. P.

**Separation of the mercury isotopes by a photochemical method.** K. ZUBER (*Nature*, 1935, 136, 796).—A partial separation of  $Hg^{200}$  and  $Hg^{202}$  from ordinary Hg has been effected by irradiation of Hg vapour in a magnetic field with the Hg resonance line 2537 Å.

L. S. T.

**Question of further maxima of the density curves of photographic emulsions after the appearance of solarisation.** H. BORST (*Phot. Ind.*, 1935, 33, 1056, 1058).—With some plates (e.g., Agfa Normal), but not with others (e.g., Perutz Orthochromatic), second and third max. can be shown to occur in the density curve, after the first solarisation, on prolonged exposure (to Uviol or Nitrachrom lamp). Measurement of the densities of the direct blackening produced (not developed), by red light, shows similar variations, but these densities are always much <

those obtained by development, and cannot therefore be concerned with the causes of the recurring max.

J. L.

**Mechanism of the desensitisation of photographic plates.** II. M. BLAU and H. WAMBACHER (Z. wiss. Phot., 1935, 34, 253—266; cf. A., 1935, 177, 1331).—About 300 experiments were made to examine the relation of the density curves obtained from desensitised emulsions (Agfa Contrast) to the  $O_2$  content of the surrounding atm., and also to the concn. of the desensitiser. Graphs are given showing the relation between various factors, e.g., intensity of light against concn. of desensitiser, for const. density production. Previous results are substantiated, that desensitisation is dependent on the presence of  $O_2$ , without which there is no residual effect; the dye acts as  $O_2$  carrier for reoxidation of nascent Ag. Other theories are discussed in detail. Solarisation, unobtainable in desensitised plates at atm. pressure, appears on exposure in vac. Similarly, increased densities were obtainable in emulsions bathed in KBr or KI solutions, when exposed in vac.; bathing in  $NaNO_2$  or Na salicylate was, however, not affected by the presence or absence of  $O_2$ .

J. L.

**Law of blackening of the photographic plate.** H. KIENLE (Naturwiss., 1935, 23, 762—767).—The failure of the photographic reciprocity law is examined particularly in connexion with intermittent illumination. For each emulsion there is a lower-frequency limit of illumination, independent of intensity, above which the Talbot law holds. The curves expressing deviations from the reciprocity law are parallel for all  $\lambda$  at all temp. investigated.

A. J. M.

**Photographic photometry.** H. KIENLE (Naturwiss., 1935, 23, 759—762).—Theoretical discussion. The assignation of a scale to intensities of blackening produced on a photographic plate can be of val. only when the method of determining the intensities is stated. The different effect on the plate of intermittent and continuous illumination when the same total quantity of light falls on the plate is discussed.

A. J. M.

**Heterogeneous reaction kinetics. Effect of light exposure on the kinetics of thermal decomposition of silver oxalate.** A. F. BENTON and G. L. CUNNINGHAM (J. Amer. Chem. Soc., 1935, 57, 2227—2234).—Exposure to light, especially  $\lambda < 520$  m $\mu$ , accelerates the subsequent thermal reaction; the effect is relatively less at higher decomp. temp. Contact with  $O_2$  during exposure results in initial poisoning. In the earlier stages of thermal decomp., the extent of reaction at any time,  $t$ , approx.  $\propto t^m$ , where  $m$  is 3.5 for unexposed samples, but is progressively less with increasing exposure.

E. S. H.

**Change of sodium nitroprusside into Prussian-blue.** E. JUSTIN-MUELLER (Bull. Soc. chim., 1935, [v], 2, 1932—1936).—When exposed to sunlight in an open vessel an aq. solution of Na nitroprusside (I) is decomposed giving  $NaNO_2$ , HCN, and  $Na_2Fe_2(CN)_6$ . The last named, in presence of NaOH, is converted into Prussian-blue. When (I) is exposed to sunlight in a closed vessel NO is evolved. The structure of (I) is discussed.

O. J. W.

**Reaction between ethylene and chlorine in presence of chlorine acceptors. Photochlorination of ethylene.** T. D. STEWART and B. WEIDENBAUM (J. Amer. Chem. Soc., 1935, 57, 2036—2040).—The rate of photochlorination of  $C_2H_4 \propto [Cl_2]$  at const. light intensity and is independent of  $[C_2H_4]$ . In  $H_2-Cl_2-C_2H_4$  mixtures, illuminated or in the dark, practically no  $H_2$  reacts, although the  $C_2H_4-Cl_2$  reaction goes to completion. The reaction of  $C_2H_4$  with  $Cl_2$  in  $C_2H_4Cl_2$  solution is very rapid and involves  $< 10\%$  of the  $Cl_2$  in substitution; in pentane solution 37—73% of  $Cl_2$  is used for substitution, the amount increasing as the  $C_2H_4 : Cl_2$  ratio increases.

E. S. H.

**Photobromination of tetrachloroethylene and of chloroform with special reference to the effects of oxygen.** J. WILLARD and F. DANIELS (J. Amer. Chem. Soc., 1935, 57, 2240—2245).—Photobromination of  $C_2Cl_4$  is inhibited by the reaction product, and depends little on  $[C_2Cl_4]$ ; the temp. effect is small. Small amounts of  $O_2$  accelerate the reaction, but large amounts almost completely inhibit it, probably because of a competing Br-sensitised photo-oxidation.  $CHCl_3$  and Br react at  $25^\circ$  when illuminated with  $\lambda$  2650 Å. in presence, but not in absence, of  $O_2$ . The mechanism is discussed.

E. S. H.

**Catalysis of acetylene polymerisation in ultra-violet light by mercury vapour.** (A) F. TOUL. (B) W. KEMULA (Coll. Czech. Chem. Comm., 1935, 7, 491—492, 493—494).—(A) Polemical against Kemula (cf. A., 1935, 1208).

(B) A reply.

R. S. B.

**Primary process in the photochemical and thermal decomposition of azomethane.** F. PATAT (Naturwiss., 1935, 23, 801).—The photochemical decomp. of  $Me_2N_2$  under various pressures at temp. from  $20^\circ$  to  $266^\circ$  by light of  $\lambda$  366 m $\mu$  has a zero temp. coeff. in respect of the quantum yield. The primary process is  $Me_2N_2 \rightarrow 2Me + N_2$  and the existence of a chain reaction involving the interaction of Me with  $Me_2N_2$  is excluded.

W. O. K.

**Photochemical decomposition of methylamine and ethylamine.** H. J. ÉMELÉUS and L. J. JOLLEY (J.C.S., 1935, 1612—1617; cf. A., 1931, 1251).—The absorption spectra of  $NH_2Me$  and  $NH_2Et$  are on the short- $\lambda$  side of approx. 244 and 237 m $\mu$ , respectively, and the frequency differences between the bands lead to the frequencies 670 and 726 cm. $^{-1}$ , respectively, which are probably characteristic of the excited  $\cdot NH_2$ . The bands of long  $\lambda$  have fine structure. In the light of the Hg lamp and the Al spark, the chief products from  $NH_2Me$  are  $H_2$ ,  $NH_3$ , and a liquid, with small quantities of  $CH_4$  and  $N_2$ . Similarly,  $NH_2Et$  gives the same gaseous products and small quantities of  $C_2H_6$  and  $C_2H_4$ . Photo-oxidation of  $NH_2Me$  affords chiefly  $NH_3$  and a liquid, and smaller quantities of CO,  $N_2$ ,  $H_2$ , and  $CH_4$ . In each case,  $< 0.7$  mol. is decomposed per quantum absorbed.

J. G. A. G.

**Photochemical decomposition of nitrosoisopropylacetone and  $\beta$ -nitroso- $\beta$ -dimethylhexane.** K. D. ANDERSON, C. J. CRUMPLER, and D. L. HAMMICK (J.C.S., 1935, 1679—1684; cf. A., 1903, i, 322; 1935,

307).—The quantum efficiency of the decomp. of the monomeric forms of nitrosoisopropylacetone (I) and  $\beta$ -nitroso- $\beta$ -dimethylhexane (II) in  $C_6H_6$  solution is approx. unity in light of  $\lambda$  6400–7100 Å. (I) and (II) give  $H_2N_2O_2$  and its decomp. products; (I) also yields mesityl oxide and (II) affords, probably,  $\beta$ -dimethyl- $\Delta^8$ -hexene. The reaction probably proceeds by the primary elimination of  $HON^*$ .

J. G. A. G.

**Primary photochemical reactions.** VIII. Quantum yield of the photolysis of methyl *n*-butyl ketone. B. M. BLOCH and R. G. W. NORRISH (J.C.S., 1935, 1638–1642; cf. A., 1934, 852).—In light of  $\lambda$  2480–2770 Å., the quantum efficiency,  $\gamma$ , of the decomp. of COMeBu (I) at 760 mm. and 127° by the primary processes  $(I) \rightarrow CO + CH_3 + C_4H_9$  and  $(I) \rightarrow C_3H_6 + COMe_2$  is approx. 0.03 and 0.27, respectively.  $\gamma$  for condensation or polymerisation is approx. 0.04. The absorption spectrum is diffuse and fluorescence was not observed. It is probable that the energy of a considerable proportion of the excited mols. which do not decompose is degraded by an internal redistribution process. J. G. A. G.

**Products and processes of ionisation in methyl chloride as determined by a mass spectrometer.** S. H. BAUER and T. R. HOGNESS (J. Chem. Physics, 1935, 3, 687–692).—The following ions, in order of decreasing intensity, are generated as primary products in the decomp. of MeCl by electrons:  $MeCl^+$ ,  $Me^+$ ,  $CCl^+$ ,  $CH_3^+$ ,  $Cl^+$ ,  $HCl^+$ ,  $CH^+$ ,  $C^+$ ,  $H^+$ . Appearance potentials for  $MeCl^+$ ,  $Me^+$ , and  $Cl^+$  are respectively 11.0, 14.7, and 26 volts. Experimental details are given. F. L. U.

**Inversion of sucrose solutions in tropical sunlight.** N. A. YAJNIK, D. N. GOYLE, and M. L. WADIHERA (Z. anorg. Chem., 1935, 225, 24–28).—Aq. sucrose solutions contained in Jena glass vessels undergo inversion when exposed to tropical sunlight in the absence of acid. When acid (0.25*N*) is present the rate of inversion is increased by sunlight. These experiments confirm Dhar's observations (A., 1922, ii, 39). F. L. U.

**Photochemical oxidation of hæmoglobin.**—See this vol., 92.

**Action of radon on polymethylenes: cyclopentane and cyclopentene.** G. B. HEISIG (J. Physical Chem., 1935, 39, 1067–1073; cf. A., 1932, 918).—V.-p. data are given for cyclopentane and -pentene and the  $-M/N$  vals. for the Rn polymerisation are 1.7 and 4.5, respectively.  $-M/N$  is inversely  $\propto \Delta(H_2 + CH_4)/100 - \Delta H_C$  and increases above 2 with a negative heat of formation. R. S.

**Decomposition of ozone by the action of  $\alpha$ -particles.** P. C. CAPRON and R. CLOETENS (Bull. Soc. chim. Belg., 1935, 44, 441–466).— $M/I$  data for  $C_2H_2$  have been used to calculate  $M/I$  vals. in the decomp. of  $O_3$  (3–20 mm. in about 700 mm.  $O_2$ ). It is shown graphically that the velocity of decomp.  $\propto [O_3]$  and increases with the radiation intensity. Considering  $O_3$  ions alone, the ionic yield is approx. const. for a given intensity. R. S.

**Separation by rectification of neon into its isotopic components.** W. H. KESOM and J.

HAANTJES (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 809).—Ne of at. wt. 21.157 has been prepared after 14 rectifications. R. S.

**Influence of hydrogen-ion concentration on oxidation and reduction reactions.** A. K. BABKO (Z. anal. Chem., 1935, 103, 98–103).—In oxidation-reduction reactions not directly involving  $H^+$ , but involving compounds of multivalent ions with O,  $H^+$  lowers the stability of the compounds, and raises the oxidation-reduction potential  $\epsilon$ . Expressions for the influence of  $[H^+]$  on  $\epsilon$  are derived. J. S. A.

**Change of isotopic composition of water by distillation.** J. HORIUTI and G. OKAMOTO (Bull. Chem. Soc. Japan, 1935, 10, 503–505).—The % of D in the distillate is < that in the original liquid when  $H_2O$  containing 2.6% of D is distilled between  $-7^\circ$  and  $22^\circ$ . J. G. A. G.

**Purification of water and its  $p_H$  value.** S. B. ELLIS and S. J. KIEHL (J. Amer. Chem. Soc., 1935, 57, 2145–2149).—Technique for purifying  $H_2O$  is critically discussed. The purest  $H_2O$ , collected in Ag vessels, had  $p_H$  7.01 at  $27.5^\circ$ , as determined by the glass electrode. E. S. H.

**Action of alkali hydroxide solutions on ultramarine-blue.** K. LESCHIEWSKI and E. PODSCHUS (Z. anorg. Chem., 1935, 225, 43–46; cf. A., 1934, 1318).—Aq. LiOH (1–2.5*N*) when boiled with ultramarine-blue (I) decolorises it and yields a cryst. product (II) containing no S. KOH is relatively inactive, but at a concn. of 7.5*N* removes all S on prolonged boiling, giving a cryst. product having a lattice different from that of (I) or (II). In both cases the Na of (I) is almost completely exchanged for Li or K. F. L. U.

**Hydrolysis of solutions of cupric sulphate.** O. BINDER (Compt. rend., 1935, 201, 893–894).—The slow hydrolysis of  $CuSO_4$  has been studied by boiling solutions for 0.25–12 hr., and determining the change in acidity by the glass electrode and the composition of the ppt. by X-rays and analysis. Hydrolysis increases with the time of boiling and the change in acidity increases with concn. (c). Insol. solid phases are  $4CuO, SO_3, 4H_2O$  ( $c < 0.06$  mol. per litre) and  $3CuO, SO_3, 2H_2O$  ( $c > 0.06$ ). R. S. B.

**Substitution of copper and silver by silver.** A. P. SERGEEV and A. A. KOSHUCHOVSKI (J. Appl. Chem. Russ., 1935, 8, 1073–1075).—A ppt. of Cu is obtained on the surface of Ag foil (I) when the latter is immersed in aq.  $CuSO_4$  containing excess of KCl or NaCl. When (I) is wrapped up in filter-paper moistened in  $H_2O$ , and the packet is placed on conc. aq.  $AgNO_3$ , crystals of Ag deposit on the filter-paper; the system acts as a concn. cell, in which Ag is dissolved from the foil, and pptd. at the boundary between conc. and dil.  $AgNO_3$ . R. T.

**Electrometric and analytical evidence for the composition of precipitated basic copper perchlorate.** R. A. BEEBE and S. GOLDWASSER (J. Physical Chem., 1935, 39, 1075–1078; cf. A., 1932, 243).—The composition of  $Cu(ClO_4)_2 \cdot 6CuO, xH_2O$  has been determined electrometrically and by direct analysis. R. S.

**Preparation of sulphur and magnesium sulphate from sulphur dioxide and magnesia.** II. H. HAGISAWA (Bull. Inst. Phys. Chem. Res. Japan, 1935, 14, 1161—1176).—The velocity of absorption of dil.  $\text{SO}_2$  by aq.  $\text{Mg}(\text{OH})_2$  has been studied. When conc. aq.  $\text{Mg}(\text{HSO}_3)_2$  is heated with  $\text{MgO}$  (+S) in a sealed tube at 130—140°, the reaction  $3\text{Mg}(\text{HSO}_3)_2 + \text{MgO} = 4\text{MgSO}_4 + 3\text{H}_2\text{O} + 2\text{S}$  is complete. R. S.

**Preparation and properties of mono-, di-, and tri-calcium phosphates.** H. W. E. LARSON (Ind. Eng. Chem. [Anal.], 1935, 7, 401—406).— $\text{CaH}_2(\text{PO}_4)_2 \cdot \text{H}_2\text{O}$ ,  $\text{Ca}_2\text{H}_2(\text{PO}_4)_2 \cdot 4\text{H}_2\text{O}$ , and  $\text{Ca}_3(\text{PO}_4)_2 \cdot \text{H}_2\text{O}$  have been prepared. Their solubilities,  $p_{\text{H}}$  of the solutions,  $n$ , and behaviour on heating have been determined. E. S. H.

**Reactions of phosphates with soils.** II. **Action of lime on monocalcium phosphate in presence of anhydrous calcium sulphate.** J. CLARENS and H. MARGULIS (Bull. Soc. chim., 1935, [v], 2, 1980—1985; cf. B., 1934, 642).—When solutions of  $\text{H}_3\text{PO}_4$  and  $\text{Ca}(\text{OH})_2$  are mixed in presence of anhyd.  $\text{CaSO}_4$  pptn. of  $\text{CaHPO}_4$  first takes place. With further addition of  $\text{Ca}(\text{OH})_2$  the  $\text{CaHPO}_4$  is converted into  $\text{Ca}_3(\text{PO}_4)_2$ . O. J. W.

**Decomposition of barium sulphate by chlorine.**—See B., 1935, 1141.

**Cadminitrites of univalent metals.** A. FERRARI, A. BARONI, and C. COLLA (Gazzetta, 1935, 65, 797—809; cf. following abstract).—The prep. of  $\text{K}[\text{Cd}(\text{NO}_2)_2]$  and of the compounds  $\text{M}[\text{Cd}(\text{NO}_2)_2]$  ( $\text{M} = \text{Rb}, \text{Cs}, \text{Tl}, \text{NH}_4$ ) is described. They crystallise in the monometric system, 1 mol. per unit cell, and have, in the order given,  $a$  5.325, 5.375, 5.390, 5.340, 5.355 Å., and  $d_{\text{calc.}}$  3.183, 3.509, 4.063, 4.958, 2.902, respectively. Arguments in favour of the structure  $\text{M}_2[\text{Cd}(\text{NO}_2)_6]$  are given, but, as with the Hg compounds, the cationic Cd cannot be replaced by other metals. O. J. W.

**Mercurinitrites of univalent metals.** A. FERRARI and C. COLLA (Gazzetta, 1935, 65, 789—797).—The prep. of the compounds  $\text{MHg}(\text{NO}_2)_3$  ( $\text{M} = \text{Rb}, \text{Cs}, \text{Tl}$ ) is described. The corresponding K and  $\text{NH}_4$  compounds could not be obtained. These double nitrites crystallise in the monometric system with 1 mol. per unit cell. For the Rb, Cs, and Tl compounds  $a = 5.540, 5.475, 5.385$  Å., and  $d_{\text{calc.}} = 4.35, 4.77, 5.77$ , respectively. The Hg and M are at the corners and centre of the cube, but the position of the  $\text{NO}_2$  is uncertain. It seems probable that the formulae of these substances should be doubled, viz.,  $\text{M}_2\text{Hg}[\text{Hg}(\text{NO}_2)_6]$ . The Hg outside the complex cannot, however, be replaced by any other metal. O. J. W.

**Mercury powder.** A. GALATZKY (Bull. Soc. chim., 1935, [v], 2, 1801—1807).—Very finely-divided Hg powder is prepared by reducing  $\text{HgO}$  suspended in  $\text{H}_2\text{O}$  with  $\text{N}_2\text{H}_4$  and other reducing agents. The grey powder has an appreciable v.p., forms an amalgam by simple contact with Au or Sn, and is readily dissolved by 25%  $\text{HNO}_3$ . It is probably a mixture of Hg with small amounts of  $\text{HgO}$ . O. J. W.

**Rare earths.** XLV. **Preparation of rare-earth amalgams by displacement.** D. H. WEST

[with B. S. HOPKINS] (J. Amer. Chem. Soc., 1935, 57, 2185—2186).—Amalgams of Ce, Nd, "didymium," and Yt have been prepared by the action of Na amalgam on conc. alcoholic solutions of their chlorides. The metals (except Yt) can be obtained free from Hg by heating the amalgams in vac. E. S. H.

**Production of rare-earth metals by thermal decomposition of their amalgams.** L. F. AUDRIETH (Metallwirts., 1935, 14, 3—5; Chem. Zentr., 1935, i, 2145—2146).—Amalgams of Ce, La, Nd, Sm, and Y are made by electrolysis of EtOH solutions of the anhyd. chlorides with an Hg cathode. The amalgam is conc. in vac. at 250°, and Hg is removed completely by heating the residue at >1000°. Crucibles lined with pure rare-earth oxides, grading outwards into  $\text{Al}_2\text{O}_3$ , must be used. Ce is cubic face-centred,  $a$  5.14 Å.; La and Nd are hexagonal with  $a$  3.75, 3.65,  $c$  6.06, 5.88 Å., respectively. J. S. A.

**Action of Clerici's solution on gypsum.** G. PEHRMANN (Zentr. Min., 1935, A, 54—55; Chem. Zentr., 1935, i, 2146—2147).—Clerici's solution attacks gypsum (I) and deposits  $\text{Ti}_2\text{SO}_4$ , thereby making the apparent  $d$  of (I) too high. J. S. A.

**Preparation of carbon suboxide.** A. KLEMENC, R. WECHSBERG, and G. WAGNER (Monatsh., 1935, 66, 337—344).—Pure  $\text{C}_3\text{O}_2$  may be obtained by the dehydration of  $\text{CH}_2(\text{CO}_2\text{H})_2$ , and from diacetyltartaric anhydride, and subsequent fractionation of the products. A. J. M.

**Preparation of pure carbon monoxide.** G. MEYER, R. A. HENKES, and A. SLOOFF (Rec. trav. chim., 1935, 54, 797—799).—CO cannot be freed completely from  $\text{H}_2$  by fractional distillation. Pure CO is obtained by decomp. of  $\text{Ni}(\text{CO})_4$  at 200°, and a laboratory apparatus for this purpose is described. J. W. S.

**Silicates.** III. **Behaviour of talc on heating with  $\text{MgO}$  and Mg, Co, and Mn chlorides.** E. THILO (Z. anorg. Chem., 1935, 225, 49—63; cf. A., 1933, 794).—Experiments are described showing that, although the chemical composition and cryst. structure of pyrophyllite and talc are closely analogous, the latter behaves quite differently towards  $\text{MgO}$  and anhyd.  $\text{MgCl}_2$ ,  $\text{CoCl}_2$ , and  $\text{MnCl}_2$ , when heated with them. An explanation based on the respective lattice structures is offered. F. L. U.

**Formation of "persilicate."** H. DITZ (Z. anorg. Chem., 1935, 225, 90—92).—Comments on a paper by Krauss and Oettner (A., 1935, 833). F. L. U.

**Carbides of lead and silver.** E. MONTIGNIE (Bull. Soc. chim., 1935, [v], 2, 1807—1809).— $\text{PbC}_2$  is obtained by adding  $\text{CaC}_2$  to a solution of  $\text{Pb}(\text{OAc})_2$  in MeOH. It is stable at room temp., but is easily hydrolysed, and in acid solution evolves  $\text{C}_2\text{H}_2$ . Pb cyanide could not be prepared. Org. Ag salts do not give  $\text{Ag}_2\text{C}_2$  when strongly heated. O. J. W.

**Attempted concentration of the heavy nitrogen isotope.** M. H. WAHL, J. F. HUFFMAN, and J. A. HIPPLE, jun. (J. Chem. Physics, 1935, 3, 434—435).—A study of the isotopic reaction  $\text{N}^{15}\text{H}_3 + \text{N}^{14}\text{H}_4\text{OH} \rightarrow \text{N}^{14}\text{H}_3 + \text{N}^{15}\text{H}_4\text{OH}$  showed that the distribution of  $\text{N}^{15}$  was slightly favoured in the  $\text{NH}_4\text{OH}$  mol. The

ratio of the v.p. of  $N^{14}H_3$  and  $N^{15}H_3$ , determined by fractional distillation of anhyd.  $NH_3$ , was  $1.0052 \pm 0.0013$ . N. M. B.

**Corrosive action of solutions of ammonium nitrate in liquid ammonia on metals.**—See B., 1935, 1091.

**Action of hydrogen sulphide on hydrogen sulphite solutions.** J. JANICKIS (Z. anorg. Chem., 1935, 225, 177—203; cf. A., 1931, 1255).—The products of the action of  $H_2S$  on aq.  $KHSO_3$  at  $p_H$  5.1—2.3 are  $S_2O_3^{''}$ ,  $S_nO_6^{''}$  ( $n=2-5$ ),  $S$ , and  $H^+$ . At first  $S_2O_3^{''}$  and  $S_3O_6^{''}$  are chiefly formed. The production of higher polythionates is favoured by increase of  $[H^+]$  or of  $[S_2O_3^{''}]$ , but there is no evidence that  $S_3O_6^{''}$  takes part in it. The occurrence of the reaction  $H_2SO_3 + 2HS_2O_3 \rightarrow S_5O_6^{''} + 2H_2O$  is supported by the above observations and by the qual. detection of  $H_2SO_3$  in the reaction mixture.  $S_4O_6$  and  $S_3O_6$  are successive degradation products of  $S_5O_6^{''}$  according to:  $S_5O_6^{''} + HSO_3 \rightarrow S_4O_6^{''} + S_2O_3^{''} + H^+$ ;  $S_4O_6^{''} + HSO_3 \rightarrow S_3O_6^{''} + S_2O_3^{''} + H^+$ . F. L. U.

**Reaction of sulphur dioxide with water under pressure.**—See B., 1935, 1091.

**Hydrogen sulphites. III. Reduction of sodium hydrogen sulphite by zinc amalgam.** II. T. MUROOKA (Bull. Inst. Phys. Chem. Japan, 1935, 14, 1154—1160).—Reduction of  $HSO_3^+$  by the amalgam method can be carried out in the presence of  $H_2SO_3$  or  $H_2SO_4$ . The yield decreases as the temp. rises, and the best result is obtained when the quantity of amalgam is 1.2 times the theoretical. The solid remaining after reduction has the approx. composition  $3ZnSO_3 \cdot Na_2SO_3 + Zn(OH)_2$ . R. S.

**Thermal decomposition of  $CrO_4 \cdot 3NH_3$ .** W. F. EHRET and A. GREENSTONE (J. Amer. Chem. Soc., 1935, 57, 2330—2331).— $CrO_4 \cdot 3NH_3$  does not lose  $NH_3$  in vac. at room temp., but at  $120 \pm 10^\circ$  a vigorous reaction occurs and a solid residue,  $CrO_3 \cdot NH_3$ , is formed. The presence of small amounts of impurities has a marked influence on the rate of decomp.; the reaction does not occur in the dark.  $CrO_3 \cdot NH_3$  has  $d$  2.073; it is stable in air, but hydrolysed by  $H_2O$ . E. S. H.

**Formation of masked complexes in normal and basic solutions of chromium and aluminium salts.** A. KÜNTZEL, C. RIESS, and G. KONIGFELD (Collegium, 1935, 484—502; cf. B., 1935, 818).—Cr acido-complexes are formed with both sulphates and chlorides, but analogous Al complexes are not formed. Conductivity measurements show that Al sulphato-complexes are not present in aq.  $Al_2(SO_4)_3$  which has been boiled and cooled again, but are formed in aq.  $Cr_2(SO_4)_3$ . The hydrolysis of Cr salts occurs in three successive stages, but that of Al salts is in one stage. Masking occurs on adding a neutral salt containing an anion common to both aq. Cr and Al salts; the rate of masking is greater in Al salts, but the masked Cr salts are more stable. Both basic Al and Cr salts form complexes; the change is complete in Al salts, but in Cr salts the degree of formation diminishes as the Cr salt is more aged. D. W.

**Isotopic exchange reactions with iodine.** F. JULIUSBURGER, B. TOPLEY, and J. WEISS (J. Chem. Physics, 1935, 3, 437—438; cf. A., 1935, 1328).—The reaction  $RX + I^- = RI + X^-$  ( $R$ =alkyl,  $X=I$ ) was examined for two series of aliphatic I compounds by dissolving activated  $Na^+I^-$  in alcohol- $H_2O$ , thereby obtaining radio-I ions in solution, adding the alkyl iodide, removing the partly activated org. iodide by pptn. with  $H_2O$ , and, after conversion into AgI, making Geiger-Müller counter measurements. Exchanges  $>50\%$  were found. The upper limit of the activation energy for the interchange reaction  $MeI + I^-$  in EtOH is 16.5 kg.-cal. N. M. B.

**X-Ray investigation of method of preparing spongy iron by reducing hæmatite with gases.** V. P. KASANZEV (Z. physikal. Chem., 1935, 174, 370—383).—X-Ray examination of the products of reduction with  $H_2$  shows them to consist of a mechanical mixture of  $\alpha$ -Fe, FeO,  $Fe_3O_4$ , and  $Fe_2O_3$ ; no solid solutions are present. The length of edge of the primary fine crystals of  $\alpha$ -Fe has been measured. At  $700^\circ$  the reduction of  $Fe_2O_3$  to  $Fe_3O_4$  is more rapid than the subsequent stages of reduction. After reduction is 82.5% complete the product is mainly  $\alpha$ -Fe with a small residue of  $Fe_3O_4$ . R. C.

**Ageing and stability towards light of ferrous oxide hydrates in presence and absence of alkali nitrates.** O. BAUDISCH (Ber., 1935, 68, [B], 2046—2049).—Colourless FeO hydrate is obtained by gradual addition of alkali to  $FeCl_2$  and allowing to age under  $H_2O$  during  $\frac{1}{2}$ —several hr. The suspension when agitated with  $O_2$  gives  $\alpha$ - $Fe_2O_3$  which probably contains  $\gamma$ - $Fe_2O_3$  on account of the magnetic properties. Ageing occurs very rapidly. Pptn. of  $Fe(OH)_2$  in presence of air and nitrates causes almost immediate reduction of the latter to nitrites. It is probable that  $H_2O$  eliminated from the primary  $Fe(OH)_2$  yields active H under the experimental conditions,  $H_2O \rightarrow H + OH(H_2O_2)$  and corresponding with production of the latter compounds the oxidation of suitable org. compounds (lactic acid, uracil, thymine) occurs concurrently in the system. Neither reduction nor oxidation is observed with aged  $Fe^{II}$  hydrates. Even after very long periods in the dark nitrates are not reduced by  $Fe^{II}$  salts in the complete absence of  $O_2$ . At. O, liberated from nitrates by light energy, has a powerful oxidising action and the nitrite thus produced reacts momentarily with excess of  $Fe^{II}$ ; according to the  $p_H$  of the medium, further and complete reduction of the O-N compounds ensues. H. W.

**Action of alkali sulphides on sodium nitroprusside.** E. JUSTIN-MUELLER (J. Pharm. Chim., 1935, [viii], 22, 496—503).—The violet colour is due to the formation of an intermediate compound,  $Na_2(CN)_3Fe(SNO)_2$ , which rapidly decomposes into  $Na(NO)S$  groups and  $Na_2Fe_2(CN)_6$ ; these partly recombine to give  $Fe_2S_4(NO)_2Na_6$  and the residual  $Na_2Fe_2(CN)_6$  is transformed into  $Fe[Fe_2(CN)_6]$  and finally into Prussian-blue. E. H. S.

**New group of complex compounds. Compounds with a complex anion, the central ion of which is a complex cation. III. Complex phos-**

phato-anions with complex cobalt cations as central ions. H. BRINTZINGER and H. OSSWALD (Z. anorg. Chem., 1935, 225, 33—37; cf. A., 1935, 1091).—Determination of the ionic wt. by measuring the rate of diffusion of complex Co cations in  $3N$ - $K_2HPO_4$  indicates the existence of the following complex anions ( $X=HPO_4''$ ):

F. L. U.

Mixed nickelnitrites of uni- and bi-valent metals. II. A. FERRARI and C. COLLA (Gazzetta, 1935, 65, 809—818; cf. A., 1935, 717).—The prep. of the triple nitrites  $M^iCd[Ni(NO_2)_6]$  ( $M^i=Ti, K$ ) is described. These are isomorphous with  $K_2Pb[Ni(NO_2)_6]$  and have  $a$  10.37 and 10.28 Å, respectively. When  $M^i$  is Rb, Cs, or  $NH_4$ , the triple nitrites with the general formula given above could not be obtained, as there is a great tendency to form solid solutions between nickelnitrites and cadmiumnitrites, with  $a$  10.58, 10.81, and 10.41 Å, respectively.

O. J. W.

Red and green forms of Magnus' salt. H. D. K. DREW and H. J. TRESS (J.C.S., 1935, 1586—1588).—When the red form of Magnus' salt,  $[Pt(NH_3)_4]PtCl_4$  (I), is treated with  $AgNO_3$  followed by  $K_2PdCl_4$ ,  $[Pt(NH_3)_4]PdCl_4$  is pptd., whereas the red triammine platino salt,  $[Pt(NH_3)_3]PtCl_4$  (II), of Peyrone and Cleve gives the quite different chlorotriamminoplatinous palladochloride,  $[Pt(NH_3)_3Cl]PdCl_4$ . Contrary to Cox *et al.* (A., 1933, 41), (II) could not be converted into a green form, and (I) and (II) are not identical. Earlier work (A., 1906, ii, 289) was confirmed, but some  $H_2PtCl_4$  solutions gave the red form of (I) even in the presence of much  $HCl$ , which usually favours the green isomeride. The red and green forms of (I) may be electro-isomerides. J. G. A. G.

Asymmetric platinum atom. VII.—See this vol., 84.

Microchemical spectral analysis in high-frequency spark. A. SCHLEICHER and N. BRECHT-BERGEN (Z. anal. Chem., 1935, 103, 198; cf. A., 1935, 947).—Supplemental details are recorded. J. S. A.

Quantitative analysis of solutions by spectrographic means. O. S. DUFFENDACK, F. H. WILEY, and J. S. OWENS (Ind. Eng. Chem. [Anal.], 1935, 7, 410—413).—An uncondensed spark in air between a suitable solid electrode and the solution is photographed and, from measurements of the relative intensities of chosen spectral lines, the analysis for metals is made by comparison with previously constructed reference curves. The method has been applied to the determination of Na, K, Mg, and Ca in dil., mixed solutions of their salts. The error is about 2%. E. S. H.

Solubility of precipitates in acids. A. K. BABKO (Z. anal. Chem., 1935, 103, 190—196).—A general expression is given for the solubility of ppts. with varying acid concn., with or without the presence of excess of precipitant. J. S. A.

Electro-capillary method of qualitative analysis. S. I. DIJATSKHOVSKI (J. Gen. Chem. Russ., 1935, 5, 728—730).—Theoretical aspects of electrolysis of solutions on filter-paper are discussed. R. T.

Analysis of anions. S. M. PUZEVSKAJA (J. Gen. Chem. Russ., 1935, 5, 498—499).—The procedure proposed by Birulia (A., 1933, 1260) is not feasible. R. T.

Application of the glass electrode to unbuffered systems. S. B. ELLIS and S. J. KIEHL (J. Amer. Chem. Soc., 1935, 57, 2139—2144).—General technique for  $p_H$  determination in unbuffered solutions is described. The method has been applied to very pure  $H_2O$  and to some very dil. salt solutions. E. S. H.

Application of bimetallic electrodes to titration of acids or alkalis. J. A. BOLTUNOV and M. A. VORSINA (J. Gen. Chem. Russ., 1935, 5, 519—528).—The bimetallic electrodes Pt-Ni, -Sb, -Co, -Pd, Pd-Ni, and Ni- $Hg_2Cl_2$  may be used repeatedly without inactivation for the titration of weak or strong acids ( $< 0.001N$ ), and of alkalis, Pt-W, -Mo, -Ta, W-Ni, and C-Sb are less suitable, as they have to be reactivated after each determination, whilst Pt-Fe, -Cu, -C, -Al, -Pb, and -Sn electrodes do not give trustworthy results under any conditions. R. T.

Determination of small quantities of water by Crismer's method. L. DE BROUCKERE and A. GILLET (Bull. Soc. chim. Belg., 1935, 44, 473—503).—Crit. solution temp. (c.s.t.) have been determined for the mixtures  $MeOH-CS_2$ ,  $MeOH-EtOH-CS_2$ ,  $MeOH-n-C_6H_{14}$ , and  $MeOH-cyclohexane$ . Interaction occurs between  $MeOH$  and  $CS_2$  at high temp., resulting in a progressive shift of the c.s.t., but this may be avoided by addition of  $EtOH$ , which lowers the c.s.t. Ac.s.t.  $\propto$  the concn. of  $H_2O$  added, and small quantities can be determined by this means. The combustion analysis of an org. compound is given as an example. R. S.

Titrimetric determination of water and alcohols by their acid-catalysed reactions with acetic anhydride in organic media. G. TOENNIES and M. ELLIOTT (J. Amer. Chem. Soc., 1935, 57, 2136—2139).—General technique and scope of the method are described. The error in concns. of about 1% is  $< \pm 1\%$ ; the lower limit of response is  $< 0.001\%$ . E. S. H.

Chromyl chloride test for chloride. L. MARTINI (Annali Chim. Appl., 1935, 25, 528—530).—A positive reaction with  $H_2SO_4-K_2Cr_2O_7$  may be due to either  $Cl'$  or  $F'$ . The vapour is absorbed in dil. alkali,  $CrO_4''$  confirmed as  $Pb$  salt, and  $Cl'$  or  $F'$  identified by the usual tests ( $CaCl_2$ ,  $AgNO_3$ , etc.) with due consideration to the presence of  $I$  or  $Br$ . F. O. H.

Determination of fluorine in soluble and insoluble fluorides by its separation as  $K_2SiF_6$  and subsequent titration of the complex. A. A. VASSILIEV [with N. N. MARTIANOV] (Z. anal. Chem., 1935, 103, 107—113).—Sol. fluorides are dissolved in  $H_2O$  and an equal vol. of aq.  $Na_2SiO_3$  (0.01 g. of  $SiO_2$  per c.c.) +  $KCl$  is added, and then acidified with 50%  $HCl$  (Me-orange). The solution is made 50%

with respect to EtOH. Pptd.  $K_2SiF_6$  is collected, dissolved in  $CO_2$ -free  $H_2O$ , and titrated with 0.1N-NaOH (phenolphthalein). The loss due to solubility of  $K_2SiF_6$  is calc. from the vol. of solution and wash liquid. Insol. fluorides are fused with  $SiO_2 + NaKCO_3$ , and extracted with about 10% aq.  $(NH_4)CO_3$ . F' in an aliquot part of the solution is determined as above.

J. S. A.

**Examination of therapeutic oxygen.**—See B., 1935, 1117.

**Determination of sulphur in soluble sulphides by photometric titration.** S. HIRANO (J. Soc. Chem. Ind. Japan, 1935, 38, 598—601B).—The sol. sulphide is neutralised with HCl and titrated in presence of gum arabic with 0.01 and 0.001N-Pb( $NO_3$ )<sub>2</sub> and  $HgCl_2$ , the end-point being determined photometrically.  $BiCl_3$  may be similarly used in slightly acid solution. The method is trustworthy in presence of reducing agents (sulphite, thiosulphate) which preclude the use of the I method.

R. S. B.

**Determination of sulphuric acid in presence of ferric salts.** M. I. GARBER and I. V. SURIKOV (Trans. Butlerov Inst. Chem. Tech. Kazan, 1934, No. 2, 35—40).—Lunge's method (A., 1905, ii, 350) was superior to those of Allen and Bishop (A., 1913, ii, 722) and of Küster and Thiel (A., 1900, ii, 242).

CH. ABS. (e)

**Determination of carbon disulphide and hydrogen sulphide in air.**—See B., 1935, 1087.

**Potassium thiocyanate as a primary standard substance.** I. M. KOLTHOFF and J. J. LINGANE (J. Amer. Chem. Soc., 1935, 57, 2126—2131).—The side reactions occurring in the pptn. of  $Ag^+$  solutions with KCNS have been investigated. KCNS is a suitable standard for work of ordinary accuracy ( $\pm 0.1\%$ ). The solubility product of  $AgCNS$  at  $24^\circ$  in 0.05N- $KNO_3$  is  $3.2 \times 10^{-12}$ .

E. S. H.

**Stability of standard potassium thiocyanate solutions.** E. N. TARAN (J. Gen. Chem. Russ., 1935, 5, 602—604).—The titre of 0.1N-KCNS rises, during 8 months of storage, to a greater extent ( $+1.5\%$ ) in presence of air and diffused light than in their absence ( $+0.63\%$ ). The variations are ascribed to development of micro-organisms.

R. T.

**Kjeldahl method. IV. Metallic catalysts and metallic interferences.** R. A. OSBORNE and J. B. WILKIE (J. Assoc. Off. Agric. Chem., 1935, 18, 604—609; cf. A., 1934, 857).—Hg is the most satisfactory catalyst, but it must be pptd. as  $HgS$  before distillation of  $NH_3$ . Te, Ti, Fe, and Cu are also satisfactory. Se, Mo, V, W, and Ag are satisfactory in ordinary amounts ( $< 0.003$  g.-mol. per g. of material) or under less violent conditions of digestion. Pt and larger amounts of Se, V, and  $MnO_4'$  interfere. Mixed catalysts are not recommended for the digestion of samples of flour.

E. C. S.

**Micro-determination of phosphorus.** A. D. BRAUN (Trud. Vseso. Inst. Exp. Med., 1934, 1, No. 3, 171—174).—The Fiske-Subbarow method was modified by replacing the mixture of sulphite and H sulphite by 30%  $CH_2O$ .

CH. ABS. (e)

**Oxidative determination of hypophosphite.** L. MARTINI (Annali Chim. Appl., 1935, 25, 525—

528).—The sample (0.1 g. in 50 c.c.  $H_2O$ ) is boiled for 10 min. with 16%  $H_2SO_4$  (10 c.c.) and 0.1N- $KMnO_4$  (50 c.c.). The ppt. of Mn oxides is dissolved by addition of excess (25 c.c.) of 0.1N- $H_2C_2O_4$  and the solution is re-titrated with 0.1N- $KMnO_4$ . The difficulty of dehydrating  $NaH_2PO_2 \cdot H_2O$  is demonstrated.

F. O. H.

**Determination of small concentrations of arsine in air.** B. A. RASCHKOVAN (J. Gen. Chem. Russ., 1935, 5, 675—689).— $H_2SO_4$  and  $H_2MoO_4$  afford colourless sulphomolybdic acid (I), which is unstable when  $[H_2SO_4]/[MoO_3] < 30$ , and yields Mo-blue when  $SnCl_2$  is added. Addition of  $H_3AsO_3$  causes formation of arsenomolybdic acid (II), which is in equilibrium with (I) and  $H_2SO_4$ ; when  $[H_2SO_4]/[MoO_3] > 75$ , (II) is not formed, and no coloration results with  $SnCl_2$ . The following procedure, based on the above considerations, is proposed for determination of  $AsH_3$  ( $< 2 \times 10^{-8}$  g.) in air: the sample of air is shaken with 10—20 c.c. of 65%  $HNO_3$ , and a known vol. of the acid is evaporated to dryness after 24 hr. The residue is dissolved in a known vol. of  $H_2O$ , and 1 c.c. of the solution is shaken with 1 c.c. of a solution containing 3.4 g. of  $(NH_4)_2MoO_4$  and 3 c.c. of conc.  $H_2SO_4$  per 100 c.c. 15 min. later, the mixture is shaken with 0.05 c.c. of aq.  $SnCl_2$  (prepared by dissolving 25 g. of Sn in 30 c.c. of conc. HCl, adding a further 20 c.c. of HCl, and diluting to 1 litre), and the coloration is compared with that of a standard solution.

R. T.

**Determination of small amounts of boron by means of quinalizarin.** G. S. SMITH (Analyst, 1935, 60, 735—739).—A difference in colour produced by equal amounts of quinalizarin with 1 c.c. of test solution + 9 c.c. of  $H_2SO_4$ , and 10 c.c. of solution of 9 : 1  $H_2SO_4$ , indicates the presence of  $H_3BO_3$ , and may be matched against a standard solution of  $H_3BO_3$ . The method is suitable for determining  $1-40 \times 10^{-6}$  g. of B. Al-Si alloys may be dissolved in 10% NaOH, the solution after acidification being examined for B as above.

J. S. A.

**Determination of carbon monoxide in admixture with hydrogen and methane.** G. MEYER and A. SLOOFF (Rec. trav. chim., 1935, 54, 800—803).—CO in a mixture of CO,  $H_2$ , and  $CH_4$  may be oxidised to  $CO_2$  by passage over  $I_2O_5$  at  $120-130^\circ$ , the  $CO_2$  being retained by a liquid-air trap during measurement of the decrease of vol. Combustion of a second sample with CuO completes the analysis.

J. W. S.

**Dependence of the detection of carbon monoxide with palladium salt solutions on various additions.** W. DALLER (Z. anal. Chem., 1935, 103, 83—88).—The presence of excess of acid or of chlorides hinders the deposition of Pd; salts of weak acids, e.g., NaOAc, favour the action. Solutions of  $Na_2PdCl_4$  containing excess of  $Na_2SO_3$  are somewhat slowly reduced by CO but not by  $H_2$ , and may be used for the analysis of CO- $H_2$  mixtures.  $CH_4$  reduces Pd solutions at  $100^\circ$ , or at  $50^\circ$  in presence of NaOAc.

J. S. A.

**Determination of the  $CO_2$  pressure of natural waters.** A. PEKKARINEN (Suomen Kem., 1935, 8, B, 34—35).—If a stream of air containing a known % of  $CO_2$  is passed through dil.  $NaHCO_3$  and the solu-

tion is then shaken with a known vol. of air, the % of  $\text{CO}_2$  taken up is equal to that of the first air. This principle has been applied to the determination of free  $\text{CO}_2$  in natural  $\text{H}_2\text{O}$ . R. S.

**Electro-analytical determination of alkalis.** K. ABRESCH (*Angew. Chem.*, 1935, **48**, 683—685; cf. B., 1935, 1059).—K and Na are separated by the perchlorate or platinichloride method, and are then each determined by the polarographic method (cf. B., 1933, 944; A., 1933, 1024). K and Na can be determined in this manner conveniently and rapidly in solutions containing also Fe, Al, Ca, Mg, etc.

A. B. M.

**Application of spectrum analysis to determination of alkalis and alkaline earths. V. Direct photometric determination of alkali metals.** W. H. JANSEN, J. HEYES, and C. RICHTER (*Z. physikal. Chem.*, 1935, **174**, 291—300; cf. A., 1935, 185).—The liquid under examination is fed into a compressed air- $\text{C}_2\text{H}_2$  flame and the principal strong line of the element to be determined, picked out by a monochromator, falls on a photo-electric cell. The magnitude of the photo-electric current, which is measured by allowing it to charge a Lindemann electrometer, is within certain limits of concn. of the element in the flame a linear function of the concn., which is therefore determined by interpolation of data obtained with solutions of known concn. The experimental error is  $\pm 5\%$ . R. C.

**J. Lawrence Smith fusion [method].** M. O. LAMAR, W. M. HAZEL, and W. J. O'LEARY (*Ind. Eng. Chem. [Anal.]*, 1935, **7**, 429—431).—Modified procedure is recommended. E. S. H.

**Determination of calcium phosphates.** H. TRAPP (*J. pr. Chem.*, 1935, [ii], **144**, 93—105).—Ca in  $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$  can be determined (max. error,  $+0.17\%$  to  $-0.18\%$ ) by dissolving the sample (0.7—0.1 g.) in 30 c.c. of 30%  $\text{AcOH}$  + 1 c.c. of  $\text{HCl}$  ( $d$  1.19) at  $100^\circ$ , diluting to 400 c.c., and adding 4 g. of  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  to the boiling solution. The ppt. is ignited, treated with  $(\text{NH}_4)_2\text{CO}_3$ , and weighed as  $\text{CaCO}_3$ . Similar results are obtained by dissolving  $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$  in  $\text{HCl}$ , diluting with  $\text{H}_2\text{O}$  to 250 c.c., adding  $\text{NH}_3$  until the solution is red to phenolphthalein, and then 25 c.c. of 10%  $\text{NH}_3$ . The mixture is heated for several hr. on the water-bath, kept overnight, and the pptd.  $\text{Ca}_3(\text{PO}_4)_2$  is washed with  $\text{H}_2\text{O}$  and weighed. Difficulties in the alkalimetric determination,  $3\text{CaHPO}_4 \cdot 2\text{H}_2\text{O} + 2\text{NaOH} = \text{Ca}_3(\text{PO}_4)_2 + \text{Na}_2\text{HPO}_4$ , by use of excess of 0.1N-NaOH and back-titration with acid are due to the tenacious occlusion of alkali by the ppt.; the optimum conditions are defined. Under suitable conditions, pptn. of  $\text{P}_2\text{O}_5$  by  $\text{MoO}_4^{4-}$  is quant. and the ratio  $\text{MoO}_3 : \text{P}_2\text{O}_5$  is const. Variations are due to the ignition, whereby reduction to ill-defined lower oxides readily occurs. Repeated alternate treatment with  $\text{NH}_3$  and ignition of the blue residues leads to its complete dissolution with the exception of a residue containing  $\text{Fe}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{CaO}$ , and  $\text{P}_2\text{O}_5$ . The proportion of the blue matter in the residue varies with the conditions of ignition; it is richer in  $\text{P}_2\text{O}_5$  than the portion sol. in  $\text{NH}_3$ .

H. W.

**Spectrographic micro-determination of zinc [in plant material].** L. H. ROGERS (*Ind. Eng. Chem. [Anal.]*, 1935, **7**, 421—422).—The method is applicable when the concn. of Zn is 0.1—0.005%. Fe interferes in concns. of about 1%, but a procedure for making allowance is suggested. E. S. H.

**Quantitative separation of lead from other cations by the chromate method.** Z. KARAOGLANOV and M. MICHOV (*Z. anal. Chem.*, 1935, **103**, 113—119).—Pb is quantitatively pptd. as  $\text{PbCrO}_4$  by  $(\text{NH}_4)_2\text{CrO}_4$  in  $\text{HNO}_3$  solution, and may be so separated from Cu, Ni, Ag, Ca, Ba, Mn, Zn, Cd, Sr, Fe<sup>+++</sup>, or Al. J. S. A.

**Separation of lead from copper, cobalt, nickel, and cadmium by carbon dioxide in pyridine solution.** A. JÍLEK, J. KOT'Á, and J. VŘEŠT'AL (*Chem. Listy*, 1935, **29**, 299—304).—The solution of nitrates, containing alkali metals and  $> 0.2$  g. of Cu, is made alkaline with 10% aq.  $\text{C}_5\text{H}_5\text{N}$ , the vol. is made up to 100 c.c.,  $\text{CO}_2$  is passed for 5 min., 2 c.c. of aq.  $\text{NH}_3$  are added, and  $\text{CO}_2$  is passed for a further 40 min. The ppt. of  $\text{PbCO}_3$  is collected, washed with aq.-alcoholic  $\text{C}_5\text{H}_5\text{N}-\text{NH}_3$  mixture saturated with  $\text{CO}_2$ , ignited, and weighed as  $\text{PbO}$ ; Cu is determined electrolytically in the filtrate. Pb is separated from Ni and Co similarly, except that  $\text{NH}_3$  is omitted from the solutions. A similar method cannot be applied to separation of Pb from Cd. R. T.

**Use of ceric sulphate in determining cuprous oxide obtained by reducing sugars on Fehling's solution.** R. A. STEGEMAN and D. T. ENGLIS (*Trans. Illinois State Acad. Sci.*, 1934, **27**, 75—76).— $\text{Cu}_2\text{O}$  is treated with excess of  $\text{Ce}(\text{SO}_4)_2$  and the latter titrated back with standard  $\text{FeSO}_4$  (o-phenanthroline as internal indicator). The results are better than those by the  $\text{KMnO}_4$  and  $\text{K}_2\text{Cr}_2\text{O}_7$  methods.

CH. ABS. (e)

**Determination of mercury in mercuric cyanide.** E. CATTELAINE (*J. Pharm. Chim.*, 1935, [viii], **22**, 454—456).— $\text{Hg}(\text{CN})_2$  acidified with  $\text{HCl}$  affords  $\text{HgS}$  quantitatively when boiled with  $\text{Na}_2\text{S}_2\text{O}_3$ . Traces of S are removed with  $\text{Na}_2\text{SO}_3$  and the residue is weighed. J. L. D.

**Volumetric determination of mercuric chloride by means of lead sulphide.** N. A. TANANAEV and V. D. PONOMAREV (*J. Appl. Chem. Russ.*, 1935, **8**, 1076—1078).—25 ml. of approx. 0.1N- $\text{HgCl}_2$  are boiled during 15 min. with 25 ml. of an aq. suspension of freshly pptd.  $\text{PbS}$ , the solution is filtered, the filtrate + washings are boiled, and titrated with 0.1N- $\text{Na}_2\text{CO}_3$  (phenolphthalein); the  $\text{HgCl}_2$  content is calc. according to the reaction  $\text{HgCl}_2 + \text{PbS} \rightarrow \text{HgS} + \text{PbCl}_2$ . The mean error is  $-0.4\%$ . R. T.

**Analytical reactions for detecting salts of cerium and other elements with methylene-blue.** L. PASSERINI and L. MICHELOTTI (*Gazzetta*, 1935, **65**, 824—832).—Complex compounds with characteristic colours are formed when an aq. solution of methylene-blue is added to solutions containing the following ions:  $\text{Ce}^{+++}$ ,  $\text{Hg}^{++}$ ,  $\text{PtCl}_6^{--}$ ,  $\text{Au}^{+++}$ ,  $\text{Ir}^{+++}$ ,  $\text{Pd}^{++}$ ,  $\text{MoO}_4^{--}$ ,  $\text{Fe}(\text{CN})_6^{--}$ ,  $\text{Fe}(\text{CN})_6^{--}$ ,  $\text{CNS}^+$ ,  $\text{Cr}_2\text{O}_7^{--}$ . With many other ions no characteristic colours are formed. The intense scarlet coloration formed with

Ce<sup>+++</sup> salts can be used for detecting this element in presence of all other elements of the third analytical group, including Fe and Cr. The composition of many of the coloured pptts. is given. O. J. W.

**Colour reactions of rare-earth metals with pyrogallol and gallic acid.** II. F. M. SOHEMJAKIN and T. V. VASCHEDTSCHENKO (J. Gen. Chem. Russ., 1935, 5, 667—674; cf. A., 1934, 621).—The phenomena observed when solutions of Ce(NO<sub>3</sub>)<sub>3</sub>, NH<sub>3</sub>, and pyrogallol or gallic acid (I) are mixed are represented on triaxial diagrams. A colorimetric method for Ce<sup>III</sup> determination, based on the diagrams, consists in placing 4 c.c. of 0.001*M*-(I) in a Nessler cylinder, adding 4 c.c. of 0.0001—0.0002*M*-Ce<sup>III</sup>, and 2 c.c. of 0.1*M*-NH<sub>3</sub> containing 1% of Na<sub>2</sub>SO<sub>3</sub>, filling the remaining space with Et<sub>2</sub>O, and comparing the intensity of coloration with that of a standard solution after < 2 min. R. T.

**Oxidation mechanisms in aqueous solution. [Manganic sulphate as a reagent.]** A. R. J. P. UBHELOHDE (J.C.S., 1935, 1605—1607).—A solution of Mn<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, stable when kept in the dark, is prepared by adding 3 c.c. of conc. H<sub>2</sub>SO<sub>4</sub> followed by six 2-c.c. portions of 0.5*N*-KMnO<sub>4</sub> at 3-min. intervals to 50 c.c. of MnSO<sub>4</sub> solution (15.1 g. of MnSO<sub>4</sub> in 1000 c.c. of 6*N*-H<sub>2</sub>SO<sub>4</sub>) with continuous cooling. 2 c.c. of conc. H<sub>2</sub>SO<sub>4</sub> are added after 8 c.c. and 12 c.c. of KMnO<sub>4</sub> have been added. The reagent rapidly oxidises nitrites, oxalates, VII to VV, H<sub>2</sub>O<sub>2</sub>, and Fe<sup>II</sup> in the presence of Cl<sup>-</sup>. The reactions are stoichiometric and the end-points are well defined, thus affording superior results to titrations with KMnO<sub>4</sub>. J. G. A. G.

**Bismuthate method for [determination of] manganese.** II. B. PARK (Ind. Eng. Chem. [Anal.], 1935, 7, 427; cf. A., 1926, 704).—Modified procedure is recommended. E. S. H.

**Absolute colorimetry. XII. Absolute colorimetric determination of iron.** A. THIEL and O. PETER (Z. anal. Chem., 1935, 103, 161—166; cf. A., 1934, 1324).—For the determination of Fe<sup>++</sup>, the sample is acidified with HCl (against Congo-red), and sulphosalicylic acid is added. The extinction of the red colour produced towards filtered blue or blue-green light is determined by comparison with the standard grey solution, Fe<sup>+++</sup> being calc. from the extinction coeff. For the determination of total Fe, the above solution is made alkaline with aq. NH<sub>3</sub>. Rapid atm. oxidation of Fe<sup>++</sup> occurs, and the yellow colour due to total Fe is colorimetric as before, using light of 462 mμ. Citrates and tartrates interfere. J. S. A.

**Simple reaction for cobalt ion.** A. V. VOLKOV (J. Appl. Chem. Russ., 1935, 8, 1095).—Crystals of MgCl<sub>2</sub>·6H<sub>2</sub>O acquire a bluish-green coloration when immersed in solutions containing Co. R. T.

**Thiocyanate-acetone reaction for detecting minimal quantities of cobalt in presence of iron.** H. DITZ and R. HELLEBRAND (Z. anorg. Chem., 1935, 225, 73—80; cf. A., 1934, 1085).—The sensitivity of the NH<sub>4</sub>CNS-COMe<sub>2</sub> test for Co is greatly reduced if accompanying Fe is removed

either by Na<sub>2</sub>CO<sub>3</sub> or by conversion into a complex fluoride. Removal of Fe by means of pptd. CaCO<sub>3</sub> leaves the sensitivity of the Co test unimpaired, so that 1.5 mg. of Co per litre can be detected in presence of 15 g. of Fe. F. L. U.

**Analysis of iron and nickel present together.** J. HANUS and J. VOŘÍŠEK (Chem. Listy, 1935, 29, 288—295).—When Ni : Fe < 1 : 40, a single pptn. of Fe suffices [acetate, succinate, and (CH<sub>3</sub>)<sub>4</sub>N<sub>4</sub> procedures], whilst when Ni : Fe > 1 : 40 a double pptn. is necessary for the first two methods, but does not give complete separation in the third method. The amount of Ni carried down with the Fe ppt. may be reduced by adding AcOH to 0.01*N* and NH<sub>4</sub>Cl to 1%. The fraction of the Ni pptg. together with Fe is const. for a given Ni : Fe, irrespective of the vols. of solutions taken. R. T.

**Determination of cobalt and nickel in zinc ores and electrolytic zinc.**—See B., 1935, 1146.

**Use of hydrogen peroxide and amyl acetate for micro-determination of chromium.** W. B. S. BISHOP and F. P. DWYER (J. Proc. Austral. Chem. Inst., 1935, 2, 278—280).—Amyl acetate is the best solvent for extraction of the blue colour given by CrO<sub>4</sub><sup>2-</sup>+H<sub>2</sub>O<sub>2</sub> in acid solution. 2×10<sup>-6</sup> g. of Cr may be so detected. J. S. A.

**Colorimetry of chromates at *p<sub>H</sub>* greater than 7.** V. N. SKVORTZOV (Trans. Butlerov Inst. Chem. Tech. Kazan, 1934, No. 2, 63—66).—A discussion. CH. ABS. (e)

**Determination of chromium in titanium oxide.** R. FLATT and X. VOOR (Bull. Soc. chim., 1935, [v], 2, 1985—1993).—The Cr is oxidised to chromate by fusing with a mixture of K<sub>2</sub>CO<sub>3</sub> and KClO<sub>3</sub>. After removal of most of the TiO<sub>2</sub> with HF the Cr is determined colorimetrically by means of the violet-red colour formed with diphenylcarbazide in acid solution. Using 10 g. of a commercial TiO<sub>2</sub> sample, 0.1—1.0 part of Cr in 10<sup>6</sup> can be determined with an accuracy of 15%. O. J. W.

**Colorimetric determination of molybdenum. Variables involved.** L. C. HURD and H. O. ALLEN (Ind. Eng. Chem. [Anal.], 1935, 7, 396—398).—Modified procedure in the KCNS-SnCl<sub>2</sub> method is recommended. E. S. H.

**Volumetric determination of tin with ceric sulphate.** N. A. RUDNEV (Trans. Butlerov Inst. Chem. Tech. Kazan, 1934, No. 2, 51—62).—The titration of Sn<sup>++</sup> with Ce(SO<sub>4</sub>)<sub>2</sub>, with NHPh<sub>3</sub> as indicator, is described. CH. ABS. (e)

**Colorimetric determination of titanium by means of gallic acid, as compared with the hydrogen peroxide method.** F. M. SCHEMJAKIN and A. NEUMOLOTOVA (J. Gen. Chem. Russ., 1935, 5, 491—497).—4 c.c. of 5% NaOAc, 8 c.c. of 1% gallic acid, and a vol. of solution containing 3—800×10<sup>-7</sup> g. of Ti are placed in a 50-c.c. cylinder in the order given, H<sub>2</sub>O is added to the mark, and the coloration is compared with that given by a standard solution. Al does not interfere, but Fe, Mo, U, W, Th, Be, Mn, Zn, Ni, Co, and Ca should be removed. The order of accuracy is the same as for the H<sub>2</sub>O<sub>2</sub> method, which,

however, is applicable to the determination of  $\leq 6 \times 10^{-6}$  g. of Ti. R. T.

**Colorimetric determination of titanium in presence of bromine compounds.** G. P. LUTSCHINSKI and A. I. LICHATSHEVA (Z. anal. Chem., 1935, 103, 196—198).—A high  $[H_2SO_4]$  and a large excess of  $H_2O_2$  are added to the Ti solution, liberating Br quantitatively. Br is extracted with  $CHCl_3$ , and Ti in the aq. layer determined from the yellow coloration remaining. J. S. A.

**Detection of vanadium.** E. I. KRETSCH (J. Appl. Chem. Russ., 1935, 8, 1092—1094).—5—100 mg. of powdered salt or alloy are mixed with 0.05—0.1 g. of wood C and 0.2—0.5 g. of anhyd.  $AlCl_3$ , and the mixture is gently heated for 1—2 sec. in a test-tube having a plug of glass-wool moistened with 75%  $H_2SO_4$  inserted at about 7 cm. from the bottom, when an orange coloration indicates V ( $\leq 0.01$  mg. as  $V_2O_5$ ). Other elements not giving coloured chlorides volatile at  $< 150^\circ$  do not interfere. R. T.

**Persulphate method of determining vanadium.** L. N. MONJAKOVA (Rept. Cent. Inst. Met., 1934, No. 16, 197—199).—Factors affecting the method [e.g., the rate of reduction of V with Mohr's salt, and the time for oxidation of excess of Mohr's salt with  $(NH_4)_2S_2O_8$ ], and its application for determining V in high-V steel were studied. CH. ABS. (e)

**Possibility of determining bismuth as basic carbonate.** F. HECHT and R. REISSNER (Z. anal. Chem., 1935, 103, 186—189).—Bi, in solution as nitrate only, is treated at room temp. with the min. excess of aq.  $(NH_4)_2CO_3$ . The liquid is heated to boiling, and the ppt. of  $(BiO)_2CO_3$  is washed and dried at  $100^\circ$ . The method may be applied to micro-analytical determinations. J. S. A.

**Micro-electrolytic determination of bismuth and lead, and their separation by graded potential.** A. J. LINDSEY (Analyst, 1935, 60, 744—746).—Bi is deposited at  $60$ — $70^\circ$  from dil.  $HNO_3$  solution at a potential of 0.8 volt, in presence of  $N_2H_4 \cdot H_2O$  as depolariser. Pb is deposited anodically as  $PbO_2$  from dil.  $HNO_3$  at  $90$ — $100^\circ$ , at a potential of  $\leq 1$  volt. For the separation of Bi and Pb, Bi is first deposited as above. The solution and washings are treated with an excess of  $NaOH + Na_2O_2$ , and are finally acidified with  $HNO_3$ .  $PbO_2$  is deposited at a potential of 1.2 volts, and is preferably redissolved and re-deposited from 20%  $HNO_3$ . J. S. A.

**Determination of bismuth with  $[\alpha]$ -naphthoquinoline.** F. HECHT and R. REISSNER (Z. anal. Chem., 1935, 103, 88—98).—To a solution containing Bi as  $Bi_2(SO_4)_3$ , + 3% free  $H_2SO_4$ , 2.5% aq.  $\alpha$ -naphthoquinoline sulphate (I) and some  $H_2SO_3$  are added and then an excess of KI.  $C_{13}H_9N \cdot HBiI_4 \cdot H_2O$  is pptd., and is collected on a glass filter. The ppt. is washed twice with a solution of (I) + KI (3 c.c. for 10 mg. Bi), followed by  $\geq 6$  c.c. of  $H_2O$ . The ppt. is dried at room temp., and the Bi calc. as if from  $C_{13}H_9N \cdot HBiI_4$ . Vols. of solution and wash liquid must be rigidly adhered to, to ensure compensation between  $H_2O$  in the ppt. and loss of  $C_{13}H_9N \cdot HI$  during washing. J. S. A.

**Use of a [heated] bar in determining m.p.** R. DOLIQUE (J. Pharm. Chim., 1935, [viii], 22, 441—451).—The temp. gradients along bars of different metals heated at one end and with different cross-sectional areas are studied and the method is applied to the determination of m.p. J. L. D.

**Colour temperatures of the Hefner and acetylene flames.** A. R. PEARSON and B. PLEASANOE (Proc. Physical Soc., 1935, 47, 1032—1041).—The colour of the "cylindrical"  $C_2H_2$  flame depends on gas pressure, rate of consumption, and height of flame. In view of discordant data for photometric purposes, results for various burners and conditions are given. The colour temp. for  $C_2H_2$  flames is approx.  $2380$ — $2520^\circ$ , and for the Hefner flame  $1910^\circ$  abs. N. M. B.

**Simple thermo-regulator.** H. P. BLOXAM (J. Sci. Instr., 1935, 12, 361—363).—A bimetallic instrument with a general accuracy of  $\pm 2$ — $3^\circ$  is described. It is suitable for temp. up to  $300^\circ$ . C. W. G.

**Semi-automatic potentiometer for thermal analysis.** R. J. M. PAYNE (J. Sci. Instr., 1935, 12, 348—355).—A mechanically-driven potentiometer is combined with an inverse-rate recorder. C. W. G.

**Determination of the b.p. of small quantities of substances.** R. DOLIQUE (Bull. Soc. chim., 1935, [v], 2, 1832—1847).—A differential Hg manometer is described, which can be used for measuring v.p. and b.p. with only a few drops of liquid. The apparatus can be made suitable for the fractional distillation of small amounts of liquid, and can be used for distinguishing a pure liquid from an azeotropic mixture. O. J. W.

**Precision determination of lattice constants.** E. R. JETTE and F. FOOTE (J. Chem. Physics, 1935, 3, 605—616).—Theoretical and experimental conditions necessary for the precise determination of lattice consts. are discussed with reference to symmetrical focussing cameras. Methods for the evaluation of standard errors and fiduciary limits of results from one film and from a set of films are developed. X-Ray targets of alloys have been used to obtain a larger no. and better distribution of lines. The influence of the no. of Miller indices of diffraction lines on the vals. of lattice consts. in non-cubic systems is shown. The importance of the method of prep. of the samples is emphasised. Lattice consts. of pure Al, Ni, Ag, Au, Si, Fe, Mo, W, Mg, Zn, Cd, Sb, Bi, and Sn have been measured. T. G. P.

**New technique for obtaining X-ray powder patterns.** R. A. STEPHEN and R. J. BARNES (Nature, 1935, 136, 793—794).—In the method described a flat specimen such as is met with in metallurgical practice is used, the intensity of each line can be easily calc., and the sharpness controlled, and the time of exposure is lessened in certain cases. L. S. T.

**Variable-temperature X-ray powder camera.** W. H. BARNES and W. F. HAMPTON (Rev. Sci. Instr., 1935, [ii], 6, 342—344).—Temp. between  $-60^\circ$  and  $0^\circ$  are obtained in the camera by circulating through it a suitable liquid precooled in a separate bath. C. W. G.

**Two-crystal spectrometer for X-rays of wavelength  $0.030 < \lambda < 0.215 \text{ \AA}$ .** T. R. KUYKENDALL and M. T. JONES (Rev. Sci. Instr., 1935, [ii], 6, 356—361).—Transmission and reflexion through the body of the crystals are employed instead of reflexion from the surface. Specially designed induction coils and a cascade Coolidge tube for a source of short- $\lambda$  X-rays are described. C. W. G.

**Trichromatic colorimeter.** R. DONALDSON (Proc. Physical Soc., 1935, 47, 1068—1073).—A simplified instrument for use with a.c. or d.c. is described. The integrating properties of a diffusing sphere are employed to effect the mixture of the three instrumental stimuli; means are described for obtaining linearity of the scales. N. M. B.

**Universal colorimeter-nephelometer.** A. A. MALICIN (J. Appl. Chem. Russ., 1935, 8, 1110—1115).—A double-wedge colorimeter, also adapted to nephelometry, is described. R. T.

**Optical system of the disappearing-filament pyrometer.** F. A. CUNNOLD (Proc. Roy. Soc., 1935, A, 152, 64—80).—Reflexion at the round filament is negligible in the usual type of disappearing-filament pyrometer. Perfect disappearance of the filament is not essential for the attainment of max. accuracy. The aperture limits suggested by previous workers may be considerably widened, enabling pyrometers transmitting much more light to be constructed. L. L. B.

**Construction and use of a quartz quarter wave.** G. BRUHAT and L. WRIL (Compt. rend., 1935, 201, 719—721). H. J. E.

**Bismuth electrode.** D. N. MEHTA and S. K. K. JATKAR (J. Indian Inst. Sci., 1935, 18A, 109—113).—The Bi electrode can be used for  $p_{\text{H}}$  5.0—7.4. C. W. G.

**Glass electrodes.** P. L. VARNEY (Science, 1935, 82, 396—397).—A double-shank electrode is described. L. S. T.

**Micro-hydrogen electrode.** J. LOBERING (Z. anal. Chem., 1935, 103, 180—183).—An electrode for use with  $< 0.1$  c.c. of liquid is described. J. S. A.

**Unpolarisable electrodes to carry action currents.**—See A., 1935, 1552.

**Application of controlled potential to micro-chemical electrolytic analysis.** A. J. LINDSEY and H. J. S. SAND (Analyst, 1935, 60, 739—743).—Apparatus and procedure are described. J. S. A.

**Sound-proof box for electrically driven laboratory centrifuges.** N. POLLARD (Analyst, 1935, 60, 752—753). J. S. A.

**Image errors of the electron microscope.** W. GLASER (Z. Physik, 1935, 97, 177—201).—Comma and spherical aberration errors are discussed theoretically. A. B. D. C.

**[Mechanical] relay for spark counters of the Greinacher type.** H. TEICHMANN (Nature, 1935, 136, 871—872). L. S. T.

**Magnetic properties of natural and artificial iron-oxygen compounds. I. Magnetic measurements on powder samples.** W. LUYKEN and L. KRAEBER (Mitt. Kaiser-Willh. Inst. Eisenforsch.,

1934, 16, 169—178; Chem. Zentr., 1935, i, 2141).—A magnetic balance, especially suited for measurement on paramagnetic substances, is described. Conditions necessary for abs. measurements on ferromagnetic material have been investigated. J. S. A.

**Accurate measurement of volumes, and accurate titration.** R. GOLTZ (J. Gen. Chem. Russ., 1935, 5, 779—782).—A burette adapted for the accurate delivery of liquids is described, and conditions for prep., standardisation, and storage of standard solutions are specified. R. T.

**Absorber for titrimetric determination of traces of admixtures to gases.** V. G. GUREVITSCH (J. Appl. Chem. Russ., 1935, 8, 1107—1109).—A wash-bottle for the absorption of traces of admixtures to gases is described. R. T.

**Kjeldahl flasks and other apparatus of arsenic-free glass.** G. LOCKEMANN (Z. anal. Chem., 1935, 103, 81—82).—The use of apparatus of special Jena As-free glass (cf. A., 1935, 948) is discussed. J. S. A.

**Pyknometer.** G. A. FESTER (Rev. Fac. Quím. Ind. Agric., 1934, 3, 177).—The apparatus consists of a tap-funnel attached to a narrow U-tube with a bulb on the other limb and a graduation mark above the bulb. The liquid is run in through the tap until the meniscus reaches the mark, and the excess in the funnel is washed out before weighing. D. R. D.

**Absorption and titration flask for carbon dioxide determination.** R. GARDNER (Ind. Eng. Chem. [Anal.], 1935, 7, 437—438).—A modification of Thomas' absorption unit (B., 1933, 574) is proposed. E. S. H.

**Continuous distilling apparatus.** F. M. SCHERTZ (Ind. Eng. Chem. [Anal.], 1935, 7, 441).—The apparatus is suitable for liquids with b.p. 20—100°, and minimises risk of fire. E. S. H.

**Glass water-stills.** B. SIEDE (Chem.-Ztg., 1935, 59, 925).—Modern resistance glasses enable satisfactory stills to be constructed. The simple all-glass apparatus without rubber or ground joints illustrated compares favourably with metal stills for efficiency. G. H. C.

**Molecular still.** W. H. STRAIN and W. M. ALLEN (Ind. Eng. Chem. [Anal.], 1935, 7, 443).—Apparatus, accommodating 1—2 g. of substance, suitable for the purification of biological products is described. E. S. H.

**Automatic cut-off for electric stills.** M. R. A. RAO and B. S. RAO (Ind. Eng. Chem. [Anal.], 1935, 7, 377). E. S. H.

**Automatic still cut-off.** A. H. HALE and F. D. TUENMILER (Ind. Eng. Chem. [Anal.], 1935, 7, 441). E. S. H.

**All-glass valve.** J. WILLARD (J. Amer. Chem. Soc., 1935, 57, 2328—2329). E. S. H.

**Superiority of a Knudsen type vacuum gauge for large metal systems with organic vapour pumps, its design and operation.** J. W. M. DUMOND and W. M. PICKELS, jun. (Rev. Sci. Instr., 1935, [ii], 6, 362—370).—A discussion of the advantages and disadvantages of different types of gauge. C. W. G.

**Use of the Pirani gauge in finding vacuum leaks.** T. R. CUYKENDALL (Rev. Sci. Instr., 1935, [ii], 6, 371—372).—Gauges may be made from C-filament lamps. Leaks are shown by the gauge if a stream of illuminating gas is played over the surface of the apparatus. C. W. G.

**Precision oil gauge.** S. PALKIN (Ind. Eng. Chem. [Anal.], 1935, 7, 434—435).—The gauge is suitable for measuring pressures  $< 40$  mm. with a precision of about 0.033 mm. Hg. E. S. H.

**Design of pressure control assembly.** S. PALKIN (Ind. Eng. Chem. [Anal.], 1935, 7, 436).—The apparatus previously described (A., 1934, 1195) is modified. E. S. H.

**Sampling apparatus for chemical-climatological and technical investigations.** H. CAUER (Z. anal. Chem., 1935, 103, 166—180).—Portable and permanent installations of pump, flow meter, air filter, and absorption tubes for air sampling are described, and their uses indicated. J. S. A.

**Cataphoresis chamber for measurement of the cataphoretic migration velocity of microscopic particles.** R. HAVEMANN (Biochem. Z., 1935, 281, 402—407).—The usual methods for determination of  $\zeta$ -potential and the theoretical requirements for microscopic measurement of cataphoresis in suspensions with the help of a closed chamber are discussed. The setting up of a suitable chamber is described. P. W. C.

**Laboratory apparatus for ammonia synthesis.** V. F. POSTNIKOV (Trans. Inst. Chem. Tech. Ivanovo, 1935, 66—67).—Apparatus for the study of catalytic  $\text{NH}_3$  synthesis at  $500^\circ/100$  atm. is described. R. T.

**Precise method of measuring viscosity of solutions of organic substances.** A. VAN DER WYK and K. H. MEYER (J. Chim. phys., 1935, 32, 549—563).—With the object of determining viscosities of dil. solutions of org. substances the errors in Ubbelohde's method have been examined in detail, and necessary precautions and corrections ascertained so that  $\eta$  may be found in the range 0.015—0.050 with an accuracy of  $4 \times 10^{-4}$  g./cm. sec. T. G. P.

**Structure-capillary viscosimeter.** V. Z. DANES (Kolloid-Z., 1935, 73, 174—181).—An overflow capillary viscosimeter with a very wide range of working pressures is described. Results are given for  $\text{H}_2\text{O}$  and some aq. solutions. E. S. H.

**Durability of quartz glass ignition vessels.** M. A. BESBORODOV and T. A. LADE (J. Soc. Glass Tech., 1935, 19, 217—220).—Measurements of the loss in wt. of transparent fused  $\text{SiO}_2$  vessels when used for the ignition of various ppts. encountered in quant. analysis showed that, after three successive heatings, the corrosion was greatest with  $\text{PbSO}_4$  (especially marked),  $\text{ZnNH}_4\text{PO}_4$ ,  $\text{ZnCO}_3$ , and  $\text{SnO}_2$ . Little or no loss in wt. was caused by the following, for the ignition of which fused  $\text{SiO}_2$  vessels are recommended:  $\text{KNO}_3$ ,  $\text{K}_2\text{PtCl}_6$ ,  $\text{MgSO}_4$ ,  $\text{HCl}$  (conc.),  $\text{Ni}$  dimethyl-

glyoxime, mixtures of  $\text{Al}$  and  $\text{Fe}$  (or of  $\text{Al}$ ,  $\text{Fe}$ , and  $\text{Ti}$ ) hydroxides,  $\text{NaCl}$  and  $\text{KCl}$  (1:1),  $\text{MgNH}_4\text{PO}_4$ , graphite ash,  $\text{MgNH}_4\text{AsO}_4$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{MnNH}_4\text{PO}_4$ ,  $\text{CaCO}_3$ , a mixture of  $\text{K}_2\text{S}_2\text{O}_7$ ,  $\text{Al}_2\text{O}_3$ , and  $\text{Fe}_2\text{O}_3$  (the loss in wt. was — that of a  $\text{Pt}$  vessel used under similar conditions),  $\text{CaC}_2\text{O}_4$ , and  $\text{BaSO}_4$ . A. L. R.

**Diacolation and filtration under pressure.** C. ROHMANN and J. H. EHLERS (Pharm. Ztg., 1935, 80, 1196—1197).—A laboratory apparatus for maintaining const. pressures  $\pm 1$  atm. for a const. delivery of 1 c.c. per min. from the diaculator or filter over a period of 80 hr. is described. E. H. S.

**Determination of the v.p. of compounds of metals.** D. N. TARASENKOV, A. N. GRIGOROVITSCH, and A. V. BOGOSLOVSKAJA (J. Gen. Chem. Russ., 1935, 5, 924—933).—Jellinek's method (A., 1929, 1262) is preferred to that of Volmer (*ibid.*, 1226). The b.-p. method gives trustworthy results for salts of high v.p., on condition that no decomp. occurs. Johnston's static method (A., 1908, ii, 358) is in particular convenient for determination of dissociation pressure when one of the products is a gas. R. T.

**Stirring air within desiccators.** F. J. ZINK (Ind. Eng. Chem. [Anal.], 1935, 7, 442—443).—Small fans mounted on pivots inside the desiccator are caused to rotate by a series of mechanically moved permanent magnets passing near the outside. E. S. H.

**Reflux condenser for use with Erlenmeyer flasks.** J. W. OLSON and C. E. PLASS (Ind. Eng. Chem. [Anal.], 1935, 7, 444). E. S. H.

**Liquid absorption tube.** W. D. TURNER (Ind. Eng. Chem. [Anal.], 1935, 7, 444). E. S. H.

**Carbon dioxide from "dry ice."** W. S. LEE (Ind. Eng. Chem. [Anal.], 1935, 7, 442).—Solid  $\text{CO}_2$  is a convenient source of gaseous  $\text{CO}_2$  for use in the determination of  $\text{N}$  by the micro-Dumas method. A suitable apparatus is described. E. S. H.

**Continuous production of distilled water free from carbon dioxide and ammonia.** F. G. STRAUB (Ind. Eng. Chem. [Anal.], 1935, 7, 433—434).—The apparatus described gives a distillate having a conductivity of  $0.5\text{--}0.3 \times 10^{-6}$  mho and  $p_{\text{H}}$  6.8. E. S. H.

**Calculation of  $\Delta D$  in a crystal growth process.** M. GORDON (Ind. Eng. Chem. [Anal.], 1935, 7, 386—387).—Mathematical. E. S. H.

**Decantation of crystalline suspensions. I. General theory. II. Characteristic functions.** G. BOZZA (Atti R. Accad. Lincei, 1935, [vi], 21, 697—700, 752—755).—Mathematical. O. J. W.

**Decantation of suspensions of crystals. III. Continuous cylindrical decanting apparatus.** G. BOZZA (Atti R. Accad. Lincei, 1935, 21, 809—813).—Theoretical. Formule correlating rate of flow, efficiency, the dimensions of the apparatus, concn. of suspended matter, etc. are evolved. D. R. D.

## Geochemistry.

**Reduced thickness of the atmospheric ozone [layer] during Polar winter.** D. BARBIER, D. CHALONGE, and E. VASSY (Compt. rend., 1935, 201, 787—789).—The quantity of  $O_3$  in the atm. has been studied spectroscopically at Abisko (Swedish Lapland) and compared with charts of air movements. Increased reduced thickness of  $O_3$  coincided with an invasion of Arctic air, which is richer in  $O_3$  than that of lower latitudes. The method permits the study of displacements of large masses of stratospheric air. Since air coming from regions to the north of the aurora zone is rich in  $O_3$  the origin of the latter is problematical.

R. S. B.

**Visual spectroscopic study of atmospheric ozone.** J. GAUZIT (Ann. Physique, 1935, [xi], 4, 450—532).—A simple spectrophotometer is described for the estimation of the abundance of atm.  $O_3$  by observation of the Chappuis bands when the sun is a few degrees below the horizon, by the study of the  $O_3$  absorption bands in the ultra-violet from observations of the blue sky, and by lunar spectrophotometry. Results of 156 measurements over 15 months show a max of  $O_3$  in March–April, and a min. in August–September. The distribution of  $O_3$  in a horizontal stratum was examined. Assuming the "thin layer" hypotheses, the estimated height of this layer is 20–50 km., with an average val. of 33 km.

N. M. B.

**Emanation content of air from the soil and underground tectonics.** (Foundation of geo-physical investigations on the basis of emanation measurements in air from soil.) H. ISRAEL-KOHLER and F. BECKER (Naturwiss., 1935, 23, 818).—It is assumed that Fick's law of diffusion governs the distribution of Rn in the air derived from the upper layers of soil. Three cases are possible: (a) the emanation originates completely in the surrounding earth, (b) an active layer at a certain depth is covered by weaker and inactive layers, (c) the sources of Rn are tectonic clefts covered with weakly active sedimentary layers. In the normal case the Rn content of the air increases rapidly with depth and reaches a const. concn. at a depth of about 5 m. In other cases the concn. varies exponentially with the depth.

A. J. M.

**Daruvar thermal spring.** S. MIHOLIC (Bull. Soc. Chim. Yougoslav., 1935, 6, 121—129).—The analytical data do not differ from those obtained in 1839.

R. T.

**Ansh-Bulat sulphate lake, and the possibilities of its exploitation.** A. B. ZDANOVSKI and D. I. RJABTSCHIKOV (J. Appl. Chem. Russ., 1935, 8, 981—993).—The  $H_2O$  contains 17.4% of solutes, chiefly  $Na_2SO_4$  6.9,  $MgSO_4$  2.5, and  $NaCl$  7.6%.  $Na_2SO_4 \cdot 10H_2O$  crystallises out over the range  $16^\circ$  to  $-5^\circ$ , and the mother-liquors yield 80 kg. of  $NaCl$  per ton when conc. at  $25^\circ$  and then cooled to  $-10^\circ$ . The final filtrates can be further conc. for the prep. of  $MgCl$ , and Br.

R. T.

**Distribution of nitrogen compounds in the sea near Southern California.** E. G. MOBERG and

R. H. FLEMING (Proc. 5th Pacific Sci. Cong., 1933, 3, 2085—2088).—The surface layer had 150 mg. of org. N and 30 mg. of  $NH_3$ -N per cu.m.,  $NO_2$  and  $NO_3$  being absent. The  $[NH_3]$  was const. to a depth of 70 m.  $NO_3$  was found at 40 m. and below.

CH. ABS. (e)

**Abnormal density of water from the deep portions of Lake Baikal.** J. MENDELEEV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 105—108).—The  $d$  of samples of  $H_2O$  from different depths of the lake increase with increasing depth of the sample. Comparative vals. for the sample before and after distillation show an almost const. diminution of  $d$  on distillation.

W. R. A.

**Sulphur bacteria in the "pink" waters of the Surakhani oilfields and their significance in the geochemistry of water.** V. T. MALISCHEK and A. A. MALIANG (Compt. rend. Acad. Sci. U.S.S.R., 1935, 3, 221—224).—Bacterial oxidation and reduction are discussed.

C. W. G.

**Occurrence of selenium in the Colorado River and some of its tributaries.** K. T. WILLIAMS and H. G. BYERS (Ind. Eng. Chem. [Anal.], 1935, 7, 431—432).—The Se content has been determined and its origins are traced.

E. S. H.

**Boron content of sea-water of the North Atlantic Coast.** N. W. RAKESTRAW and H. E. MAHNCKE (Ind. Eng. Chem. [Anal.], 1935, 7, 425).—The variation with locality and depth has been investigated.

E. S. H.

**Coastal ground water at Yumigahama, Tottori.** Y. TOYOHARA (Mem. Coll. Sci. Kyoto, 1935, A, 18, 295—309).—A theory based on hydrodynamical considerations holds good for the actual sea-shore as well as for models.

C. W. G.

**Geochemical characteristics of protocrystallisation.** A. E. FERSMAN (Compt. rend. Acad. Sci. U.S.S.R., 1935, 3, 216—220).—Theoretical.

C. W. G.

**Granite of Schärding [Upper Austria].** G. HORNINGER (Tsch. Min. Petr. Mitt., 1935, 47, 26—79).—A description is given of the rock, with chemical analyses.

L. J. S.

**Baryte from Kitzbühel, Tyrol.** H. LEITMEIER (Tsch. Min. Petr. Mitt., 1935, 47, 1—25).—White sparry baryte occurring as veins in dolomite has long been mined at this locality. The dolomite-rock contains  $BaO$  0.15% (sol. in  $HCl$  and presumably as carbonate) near the veins and 0.08% at some distance from them, but there is no evidence that the baryte was accumulated by lateral secretion from the rock. At one place the mineral is violet-coloured, but this quickly fades on exposure to light, and is restored by exposure to Ra.

L. J. S.

**Wollastonite and parawollastonite.** M. A. PEACOCK (Amer. J. Sci., 1935, [v], 30, 495—529).—Measurements of wollastonite crystals from Crestmore, California, show them to be triclinic, whilst crystals from the limestone blocks of Monte Somma, Vesuvius, are mostly monoclinic, but some are triclinic and others

consist of an intergrowth of the two kinds. In both kinds the angles and cleavages in the prism-zone parallel to the *b*-axis are identical, and the optical characters are the same, except that in the triclinic crystals the extinction is  $2\frac{1}{2}^\circ$  to the *b*-axis. The name wollastonite is reserved for the more common triclinic form, and the monoclinic form is called parawollastonite. A third modification of  $\text{CaSiO}_3$  is pseudo-wollastonite. L. J. S.

**"Ferrosilite" as a natural mineral.** N. L. BOWEN (Amer. J. Sci., 1935, [v], 30, 481—494).—"Ferrosilite,"  $\text{FeSiO}_3$  (A., 1932, 926), has been asserted to have no real existence (A., 1932, 997; 1933, 1120; 1935, 447). Minute acicular crystals found in the lithophysæ of an obsidian from Lake Naivasha are monoclinic with a prism angle of  $90^\circ 50'$ ,  $\alpha$  1.763,  $\beta$  only slightly greater,  $\gamma$  1.794,  $c : \gamma = 34\frac{1}{2}$ ,  $2V$  very small, suggesting a monoclinic pyroxene. From these data it is further concluded (by extrapolation in the systems  $\text{CaSiO}_3\text{--FeSiO}_3$  and  $\text{MgSiO}_3\text{--FeSiO}_3$ ) that the crystals have the composition  $\text{FeSiO}_3$ , and the mineral is named clinoferrosilite. The systems  $\text{CaSiO}_3\text{--FeSiO}_3$  and  $\text{MgSiO}_3\text{--FeSiO}_3$  are now discussed afresh. Similar crystals were also found in lithophysal obsidians from Iceland, Wyoming, and California; analyses of the obsidians are given. L. J. S.

**Composition of tectites.** F. LOEWINSON-LESSING (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 181—185; cf. A., 1931, 60, 1028, 1146).—There are no eruptive rocks analogous to tectites, although many of the latter have acidity coeffs. and monobasic : dibasic oxide ratios similar to rocks of terrestrial origin. J. W. S.

**Synthesis of pyrophyllite.** R. SCHWARZ and G. TRAGESER (Z. anorg. Chem., 1935, 225, 142—150).—In the synthesis of pyrophyllite (I) from orthoclase or anorthite (A., 1935, 1101) montmorillonite is not formed. The natural occurrence of kaolin or (I) arising from feldspars may serve as a geological thermometer, since (I) is not formed below  $400^\circ$ . F. L. U.

**Structural relationship of glauconite and mica.** J. W. GRUNER (Amer. Min., 1935, 20, 699—713).—X-Ray investigation (data given) of 8 glauconites subjected to various treatments shows that glauconite (I) is a mica in structure. The average vals. from 6 specimens for the consts. are  $a_0$  5.24,  $b_0$  9.07,  $c_0$  20.03 Å.,  $\beta$   $95^\circ 00'$ . (I) is as stable as biotite at temp. as high as  $750^\circ$ . It can absorb Tl ions, which probably replace  $\text{K}^+$  to  $\approx 25\%$ . The high  $\text{SiO}_2$  and  $\text{H}_2\text{O}$  content of (I) is apparently due to the environment in which it is formed. Excess of sol.  $\text{SiO}_2$  over sol.  $\text{Al}_2\text{O}_3$  gives rise to a Si : Al ratio in the  $(\text{Si}, \text{Al})_4\text{O}_{10}$  tetrahedral layer  $>$  in mica, and may even cause substitution of a few Si for  $\text{Fe}^{III}$  or Al in approx. the positions having a covalency of 6. In comparison with a muscovite (I) may occasionally have vacant positions in its structure, and a suitable formula is  $(\text{OH})_{6-10}\text{K}_{2-3}(\text{Mg}, \text{Fe}^{II} \text{Ca})_{1-3}(\text{Fe}^{III}, \text{Al}, \text{Si})_{3-6}$ . Probably one half of the  $\text{H}_2\text{O}$  given in analyses is adsorbed. L. S. T.

**Primary native silver ores at Batopilas, Mexico, and Bullard's Peak, New Mexico.** P. KRIEGER (Amer. Min., 1935, 20, 715—723).—At

Batopilas, native Ag is associated with safflorite, rammelsbergite, arsenopyrite (I), galena (II), and sphalerite (III). All the evidence indicates a primary origin for the Ag. The probable order of deposition is (i) sulphides, including pyrite, (II), and (III), (ii) Ni and Co arsenides and (I), and (iii) Ag minerals and Ag. At Bullard's Peak, native Ag is associated with a Ni-skutterudite in a manner similar to that of Ag and arsenides in the Cobalt district of Ontario. Primary origin of the Ag, and centrifugal replacement of the arsenide by Ag, are indicated. L. S. T.

**Monazite from West Portland Township, Quebec.** I. H. S. SPENOE. II. O. B. MUENCH (Amer. Min., 1935, 20, 724—732).—I. The waste dump of a felspar quarry at  $45^\circ 45' 30'' \text{N}$ ,  $75^\circ 36' 30'' \text{W}$  contained tourmaline, cuxenite, monazite, allanite (?), titanite-ilmenite, fergusonite (?), cyrtolite, muscovite, tenerite, and specularite.

II. Analysis of the monazite by Fenner's method gave Th 3.44, and Pb 0.068%; U, by emanation method, 0.054%. The Pb-U ratio is 0.053, giving a val. of 388—391  $\times 10^6$  years for the age of the mineral. The % of Pb obtained by a micro-analysis (A., 1935, 1216) is less (0.032—0.05%) than that obtained above by macro-methods. L. S. T.

**Piedmontite from Los Angeles County, California.** R. R. SIMONSON (Amer. Min., 1935, 20, 737—738).—Piedmontite occurs as small euhedral crystals in quartz-sericite-biotite schist and in quartzite from this locality. L. S. T.

**Radioactivity of ferro-manganese formations in seas and lakes of the U.S.S.R.** L. M. KURBATOV (Nature, 1935, 136, 871).—The Ra content of Fe-Mn bottom deposits of these lakes or seas varies from  $1.2 \times 10^{-10}\%$  (Caspian Sea) to  $31.8 \times 10^{-10}\%$  (Black Sea); it is much  $<$  in deep-water concretions of the Pacific Ocean ( $47.6\text{--}146.6 \times 10^{-10}\%$ ). Small concretions are more radioactive than large ones, and the surface layer is more active than the centre. The Th-X content is small. L. S. T.

**Crystallised melanterite from Pfaffenreuth, Bavaria.** F. MACHATSCHKI (Zentr. Min., 1935, A, 53—54; Chem. Zentr., 1935, i, 2148).—Native melanterite crystals, of octahedral habit, have been found;  $a : b : c = 1.180 : 1 : 1.534$ ,  $\beta = 104^\circ 23'$ . J. S. A.

**Maxixe beryl.** K. SCHLOSSMACHER and H. KLANG (Zentr. Min., 1935, A, 37—44; Chem. Zentr., 1935, i, 2147).—Structure and characteristics of the stone are discussed. The blue pleochroic colour is rapidly lost on exposure to light. J. S. A.

**Osmiridium.** III. X-Ray analysis. O. E. ZVJAGINTZEV and B. K. BRUNOVSKI (Ann. Inst. Platine, 1935, No. 12, 5—15; cf. A., 1932, 1107).—Natural osmiridium has a fibrous structure, probably due to partial recrystallisation. CH. ABS. (e)

**Gypsum crystals from Alfalfa County, Oklahoma.** C. A. MERRITT (Amer. Min., 1935, 20, 674). L. S. T.

**Method for removing iron oxide coatings from minerals.** M. DROSDOFF and E. TRUOG (Amer. Min., 1935, 20, 669—673).—The mineral is suspended in  $\text{H}_2\text{O}$ , treated with  $\text{H}_2\text{S}$ , and then with 0.05N-HCl.

Silicates and apatite are practically unaffected. The action of  $H_2S$  on haematite, limonite, goethite, biotite, basalt, granite, and certain Fe-coated minerals is also described. L. S. T.

**Augelite from Mono County, California.** D. M. LEMMON (Amer. Min., 1935, 20, 664—668).—Augelite, basic Al phosphate,  $d$  2.67, hardness 5, occurs as a hydrothermal mineral deposited from solutions which acted on the andalusite (I) deposit subsequent to the formation of (I), corundum, diaspore, topaz, etc. It is directly associated with lazulite, rutile, barite, pyrophyllite, muscovite, alunite, and quartz. Other occurrences are briefly described. L. S. T.

**Pseudo-brookite.** C. PALACHE (Amer. Min., 1935, 20, 660—663; cf. *ibid.*, 1934, 19, 16).—Pseudo-brookite from Thomas Mts., Utah, has [F. A. GONYER]  $Fe_2O_3$  60.57,  $TiO_2$  38.12, and  $MgO$  1.26, total 99.95%, indicating an excess of approx. 4% of  $TiO_2$  over that required by  $Fe_2TiO_5$ . L. S. T.

**Mineralogical classification of igneous rocks: comparison of recent proposals.** S. J. SHAND (J. Geol., 1935, 43, 609—617).—Various classifications based on texture, colour, degree of saturation with  $SiO_2$ , composition of the felspar developed in a rock, and the ratio of  $Al_2O_3$  to bases are compared and discussed. L. S. T.

**Mixing and unmixing of silicate rock magmas.** G. LINCK (Chem. Erde, 1935, 10, 126—128).—A criticism (cf. Grigoriov, Zentr. Min., 1935, 242). L. J. S.

**Lias clay from Dobbertin [Mecklenburg].** F. K. SCHLÜNZ (Chem. Erde, 1935, 10, 116—125).—Chemical analyses and microscopical examination were made of the fractions of the clay  $>1\mu$  and  $<1\mu$ . X-Ray patterns show the latter to be mainly halloysite. L. J. S.

**Minerals of lead slags.** W. FABER (Chem. Erde, 1935, 10, 67—115).—Chemical analyses and optical determinations are given of several fractions separated by heavy liquids from a Pb slag from the Harz. The minerals identified include  $\alpha$ -celsian, willemite, fayalite, magnetite, Zn-blende, and wurtzite. The diagrams of the systems  $CaO-FeO-SiO_2$  and  $\gamma-Ca_2SiO_4-Mg_2SiO_4-Zn_2SiO_4-Fe_2SiO_4$  are discussed. L. J. S.

**Recent and fossil red earth (terra rossa) formation.** E. BLANCK and E. VON OLDERSHAUSEN (Chem. Erde, 1935, 10, 1—66).—Analyses are given of soils and of the underlying limestone from which they are derived in the district of the southern Frankenalb in the Altmühl valley in Bavaria. L. J. S.

**Structure of dickite and other clay minerals.** C. J. KSANDA and T. F. W. BARTH (Amer. Min., 1935, 20, 631—637).—X-Ray measurements of dickite from Schuylkill Co., Pa., give  $a_0$  5.145,  $b_0$  8.882,  $c_0$  14.337,  $\beta$  96° 45',  $d_{calc}$  2.618, with four mols. of  $Al_2Si_2O_5(OH)_4$  per unit cell; space-group  $C4'$ . A test for piezo-electricity gave a negative result, making the latter improbable. Gruner's structure is, in the main, confirmed, but a certain difference renders proposed structures of kaolinite, nacrite, halloysite, and vermiculite uncertain. L. S. T.

**Combined water in clay substance.** O. KOERNER, K. PUKALL, and H. SALMANG (Z. anorg. Chem., 1935, 225, 69—72; cf. A., 1930, 720).—Isothermal dehydration of a very pure Zettlitz kaolin, extending over periods up to 1.5 years, shows that, contrary to the usual belief, the composition of the clay mol. is  $Al_2O_3 \cdot 2SiO_2 \cdot 1.5H_2O$ , the remaining  $H_2O$  being adsorbed. Dehydration proceeds by way of the mono- and hemi-hydrates. F. L. U.

**Minerals of Franklin and Sterling Hill, New Jersey.** C. PALACHE (U.S. Geol. Surv., 1935, Prof. Paper 180, 1—135).—Detailed descriptions are given of 148 minerals from this unique mineral locality; 30 of these minerals have not been found elsewhere. In addition to details from the lit., many new crystallographic and optical data and some new chemical analyses are given. Two new species are established: hydrohetaerolite,  $2ZnO \cdot 2Mn_2O_3 \cdot H_2O$ , tetragonal (?), as distinct from hetaerolite ( $ZnO \cdot Mn_2O_3$ ); and magnesium chlorophoenicite,  $(MgMn)_3As_2O_8 \cdot 7(Mg, Mn)(OH)_2$ , monoclinic, differing from chlorophoenicite in containing Mg in place of Zn. The primary ore is a granular mixture of franklinite (43%), willemite (26%), calcite (25%), zincite (1%), with tephroite and other silicates (5%). It is suggested that hydroxides of Mn and Fe and hemimorphite were first formed by the metasomatic replacement of limestone, and that this deposit was altered by regional metamorphism in pre-Cambrian times, and further alterations by later intrusions of pegmatites giving the complex variety of minerals. L. J. S.

**Heavy minerals of the "Erinpura" granite and microgranite of Danta state (N. Gujrat).** N. L. SHARMA and S. PURKAYASTHA (Proc. Indian Acad. Sci., 1935, 11, B, 369—376).—Comparative mineralogical data are recorded and discussed. A. G. P.

**Pre-Cambrian rocks of the Lake Superior Region.** C. K. LEITH, R. J. LUND, and A. LEITH (U.S. Geol. Surv., 1935, Prof. Paper 184, 1—34).—The correlation of the rocks in relation to their geological age is discussed. The extensive deposits of banded jaspery Fe ores were probably derived from the weathering of volcanic rocks with chemical (or organic-algal) pptn. from solution and subsequent concn. by oxidation and leaching of  $SiO_2$  by percolating surface waters. L. J. S.

**Dark inclusions in a tonalite of Southern California.** C. S. HURLBUT, jun. (Amer. Min., 1935, 20, 609—630).—Dark inclusions in a quartz diorite, known as the Bonsall tonalite (analysis given), are described. Plagioclase, hornblende, and biotite make up the bulk of the inclusions and are always present, whilst quartz, orthoclase, and pyroxene are sometimes found in small amounts. The inclusions and the tonalite are mineralogically similar, but the former are xenoliths of older rock (gabbro) and owe their present condition to reaction with the tonalite magma. L. S. T.

**Paragenesis of the mineral assemblage at Crestmore, Riverside County, California.** J. W. DALY (Amer. Min., 1935, 20, 638—659).—The geology of the district, the rocks, and the minerals are

described. The mode of formation of the latter is discussed, and the contact metamorphic minerals are grouped under the rocks to which they owe their origin. L. S. T.

**Radiometric prospecting of a [volcanic] flow of rhyolite.** E. ROTHE and (MME.) A. HÉE (Compt. rend., 1935, 201, 892—893).—The deposit at Welschbruch has been delimited radiometrically.

R. S. B.

**Occurrence of vanadium in fossil coals.** V. SILBERMINTZ (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 117—120).—800 samples of coal of different types and origins were considered. Analyses for V were made on 500 samples. Most samples show very slight content of  $V_2O_5$  in the ash, but certain specimens contained up to 8.79%  $V_2O_5$ . Most coals high in  $V_2O_5$  are of the clarain-vitrain type and often have a lignite structure. The origin of V in coal appears to depend principally on local conditions. W. R. A.

**Conversion of plant substances into fossil coals.**—See B., 1935, 1122.

**Origin of petroleum.** G. A. FESTER and J. CRUELLES (Rev. Fac. Quím. Ind. Agríc., 1934, 3, 76—108).—The following theory is put forward, based on numerous analyses of relevant materials. Marine flora and fauna suffer decomp. in tropical climates, evolving gases (including  $H_2S$ ) and leaving mainly fatty material, which by further decomp. is converted into petroleum. In colder climates, the cellulose and lignin do not decompose completely and coal etc. are produced. This theory is supported by the geographical distribution of petroleum and coal. The presence of colloidal V sulphides in South American petroleum is explained by the presence of vanadates (derived from the local igneous rocks) in the  $H_2O$ , the  $H_2S$  causing pptn. of the V. Analyses and other data concerning South American raphaellites and petroleum are given. D. R. D.

## Organic Chemistry.

**Free radicals.** E. DARMOIS (Bull. Soc. chim., 1935, [v], 2, 2053—2067).—A lecture.

**Thermal decomposition of nitromethane.**—See this vol., 33.

**Thermal decomposition of hexane at high pressures.** J. N. PEARCE and J. W. NEWSOME (Proc. Iowa Acad. Sci., 1934, 41, 139—140).—Between 460° and 490°/14,000—15,000 lb. the gaseous product consists of 25%  $CH_4$ , 47%  $C_2H_6$ , 15%  $C_3H_8$ , and 7%  $C_4H_{10}$ ; at 460° it contains 2.1%  $H_2$ , 1.4%  $C_2H_4$ , 1.5%  $C_3H_6$ , and 2.1%  $C_4H_8$ . At 497° both  $H_2$  and  $C_2H_2$  have disappeared and the  $C_3H_8$ ,  $C_4H_{10}$ ,  $C_3H_6$ , and  $C_4H_8$  have fallen to 5.5%, 4.0%, 0.04%, and 0.16%, respectively. At this temp. abundant formation of C begins and the proportion of  $CH_4$  increases. The liquid product contained cycloparaffins,  $C_6H_6$ , substituted benzenes, and higher unsaturated compounds. CH. ABS. (r)

**Polymerisation of ethylene under high pressures and in presence of phosphoric acid.** V. N. IPATIEV and H. PINES (Ind. Eng. Chem., 1935, 27, 1364—1369).—The gaseous products of polymerisation of  $C_2H_4$  under pressure in presence of  $H_3PO_4$  at 250°, 280°, 300°, and 330° contain chiefly  $C_2H_4$  and iso- $C_4H_{10}$  (2.5% of the total product at 250° and 18.8% at 330°), produced by hydrogenation of  $\Delta^+$ - and  $\Delta^+$ - $C_4H_8$ . The liquid products b.p. < 60° are paraffins; olefines are present in all fractions, naphthenes occur in fractions b.p. > 110°, and fractions b.p. > 250° are mainly aromatic, the proportions of the lower paraffinoid and higher aromatic fractions increasing with rise of temp. of polymerisation. The thermal polymerisation of  $C_2H_4$  in absence of  $H_3PO_4$  gives rise almost exclusively to olefines and naphthenes and aromatic compounds are absent. At 180°  $C_2H_4$  and  $H_3PO_4$  give  $(OH)_2PO \cdot OEt$ , which decomposes at higher temp. with the formation of olefines and naphthenes. The latter are subsequently hydrogenated to paraffins and dehydrogenated to aromatics, respectively. There is no evidence of cracking. S. C.

**Hydrogenation catalysis. II. Technique.**—See this vol., 35.

**Oxidation of  $\gamma$ - and  $\beta$ -methyl- $\Delta^2$ -pentene by selenium dioxide.** A. GUILLEMONAT (Compt. rend., 1935, 201, 904—906; cf. A., 1935, 852).— $\gamma$ -Methyl- $\Delta^2$ -pentene with  $SeO_2$  in AcOH gives  $\gamma$ -methyl- $\Delta^2$ -penten- $\delta$ -ol (cf. A., 1910, i, 454) and  $\beta$ -methyl- $\Delta^2$ -pentene gives  $\beta$ -methyl- $\Delta^2$ -penten- $\alpha$ -ol, b.p. 61—63°/14 mm. (Ac derivative, b.p. 61—63°/12 mm.). J. L. D.

**Kinetics and mechanism of thermal transformations of unsaturated hydrocarbons. Polymerisation of  $\Delta^2$ -butadiene at atmospheric pressure.** V. G. MOOR, N. V. STRIGALEVA, and L. V. SCHILAEVA (J. Gen. Chem. Russ., 1935, 5, 818—829).— $C_4H_6$  yields chiefly  $C_8H_{12}$ , b.p. 130°, when heated at 400°, whilst at higher temp. (450—700°) fractions of higher and of lower b.p. are obtained. The velocity of the reaction  $2C_4H_6 \rightarrow C_8H_{12}$  varies with temp. according to  $\log K = -6400/T + 7.32 \pm 0.04$ ; the energy of activation is 28 kg.-cal. per mol. R. T.

**Oxidation with selenium dioxide.** Y. R. NAVES and (MME.) M. G. IGOLEN (Bull. Inst. Pin, 1935, 234—238).—A review of its various applications. J. L. D.

**Acetylene series. VI. Oxidation of acetylenic hydrocarbons with permanganate.** V. N. KRESTINSKI and M. K. KELBOVSKAJA (J. Gen. Chem. Russ., 1935, 5, 871—876).— $C_2H_2$  and dil. aq.  $KMnO_4$  at 0° afford  $HCO_2H$  (I) and traces of  $H_2C_2O_4$ , CPh-CH gives  $BzOH$ ,  $CO_2$ , and traces of (I), CMe-CEt gives  $CO_2$ , AcOH, and  $EtCO_2H$ , and  $CBu^i$ :CH gives  $Bu^iCO_2H$ ,  $CO_2$ , and (I). Neutral intermediate oxidation products were not found in any case. R. T.

**Atomic equilibria in hydrocarbon molecules of the  $CH \cdot C \cdot CH_2 \cdot R$  series.** E. F. ZEBERG (J. Gen. Chem. Russ., 1935, 5, 1016—1019).— $\alpha\beta$ -Dibromo- $\gamma$ -phenylpropane and KOH at 100—120°, with or without EtOH, afford CPh:CMc and traces of  $CH_2Ph \cdot CH \cdot CH_2$ . R. T.

**Action of acetylene on acetyl chloride.** A. CORNILLON and R. ALQUIER (Compt. rend., 1935, 201, 857—838).—Condensation of  $\text{AcCl}$  with  $\text{C}_2\text{H}_2$  in presence of  $\text{AlCl}_3$  at  $15^\circ$  affords *Me*  $\beta$ -chlorovinyl ketone (I), b.p.  $40^\circ/20$  mm. [semicarbazone, m.p.  $180^\circ$  (decomp.)], which probably has a *cis*-configuration and rapidly decomposes, even in the dark, with evolution of  $\text{HCl}$  to an amorphous mass. With boiling  $\text{NaOH-EtOH}$  (I) gives a 20—25% yield of  $\text{C}_6\text{H}_5\text{Ac}_3$ . J. W. B.

**Use of copper to increase the yield of ethyl bromide.** P. HENDRIXSON (Proc. Iowa Acad. Sci., 1934, 41, 165).—Addition of  $\text{Cu}$  to the reaction mixture of  $\text{EtOH}$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{H}_2\text{O}$ , and  $\text{NaBr}$  increases the yield of  $\text{EtBr}$  from 57% to 80%. The effect is due to the liberation of  $\text{SO}_2$ , which reduces any free  $\text{Br}$  to  $\text{HBr}$ . CH. ABS. (r)

**Photochlorination of ethylene.**—See this vol., 37.

**Mechanism of slow oxidation of propane.**—See this vol., 33.

**Photobromination of tetrachloroethylene and of chloroform.**—See this vol., 37.

**Isotopic exchange reactions with iodine.**—See this vol., 40.

**Aluminium alkoxides and their parachors.**—See this vol., 14.

**Synthesis of octadecyl alcohols with branched chain.** O. BRUNNER and G. WIEDEMANN (Monatsh., 1935, 66, 438—442).— $\text{CH}_3\text{Et}(\text{CO}_2\text{Et})_2$  is converted by myristyl iodide in presence of  $\text{Na}$  and  $\text{PhMe}$  into *Et*, ethyltetradecylmalonate, b.p.  $132\text{—}136^\circ/14$  mm., hydrolysed and decarboxylated to  $\alpha$ -ethylpalmitic acid, b.p.  $215\text{—}220^\circ/10$  mm. (amide, m.p.  $111\text{—}112^\circ$ ), the *Et* ester, b.p.  $198\text{—}203^\circ/12$  mm., of which is reduced by  $\text{Na}$  and  $\text{Bu}^\circ\text{OH}$  in light petroleum to  $\beta$ -ethylhexadecyl alcohol, m.p.  $15^\circ$  (non-cryst. phenylurethane; 4'-chlorodiphenylcarbamate, m.p.  $105\text{—}106^\circ$ ). Analogously, *Et*, *n*-butyldodecylmalonate, b.p.  $224\text{—}226^\circ/1$  mm., affords successively  $\alpha$ -butylmyristic acid, b.p.  $214\text{—}219^\circ/10$  mm. (*Et* ester, b.p.  $189\text{—}192^\circ/10$  mm.; amide, m.p.  $109\text{—}110^\circ$ ), and  $\beta$ -*n*-butyltetradecyl alcohol, b.p.  $125\text{—}130^\circ/\text{high vac.}$ , m.p.  $1^\circ$  (non-cryst. phenylurethane; 4'-chlorodiphenylcarbamate, m.p.  $102\text{—}103^\circ$ ). *Et*, hexyldodecylmalonate, b.p.  $222\text{—}225^\circ/12$  mm., yields successively  $\alpha$ -hexyl-lauric acid, b.p.  $218\text{—}222^\circ/12$  mm. (*Et* ester, b.p.  $195\text{—}198^\circ/12$  mm.; amide, m.p.  $110\text{—}111^\circ$ ), and  $\beta$ -hexyldodecyl alcohol, b.p.  $120^\circ/\text{high vac.}$ , f.p.  $-7.5^\circ$  (non-cryst. phenylurethane; 4'-chlorodiphenylcarbamate, m.p.  $77\text{—}78^\circ$ ). *Et*, dioctylmalonate, b.p.  $220\text{—}225^\circ/15$  mm., affords  $\alpha$ -octyldecoic acid, b.p.  $212\text{—}218^\circ/13$  mm. (*Et* ester, b.p.  $195\text{—}197^\circ/12$  mm.; amide, m.p.  $122.5\text{—}123.5^\circ$ ), and  $\beta$ -octyldecoyl alcohol, b.p.  $110\text{—}120^\circ/\text{high vac.}$ , f.p.  $-8^\circ$  (non-cryst. phenylurethane; 4'-chlorodiphenylcarbamate, m.p.  $96^\circ$ ).

H. W.

**Existence of boric acid complexes with one and two molecules of a diol in aqueous solution.**—See this vol., 29.

**Preparation of pure sorbitol and sorbose and the influence of this ketose on the conductivity of boric acid.** J. BOESEKEN and J. L. LEEFERS (Rec. trav. chim., 1935, 54, 861—865).—Details are given for the prep. of an efficient  $\text{Ni-Co-Cr}$  catalyst and its use in the reduction of glucose in 96%  $\text{EtOH}$  with  $\text{H}_2$  at  $150^\circ/150$  atm., to give cryst. sorbitol. An improved oxidation of sorbitol to sorbose using *Acetobacter suboxydans* is described, oxidation being complete in 3.5 days instead of 4—6 weeks, necessary with *B. xylinum*. Addition of  $0.1M\text{-H}_3\text{BO}_3$  to  $0.1M$ -sorbose causes a much greater increase in conductivity than does similar addition to fructose. J. W. B.

**Fluorination of halogenomethyl ethers. I. Fluorination of trichlorodimethyl ether.** H. S. BOOTH and P. E. BURCHFIELD (J. Amer. Chem. Soc., 1935, 57, 2069).—Treatment of  $\text{CCl}_3\text{-OME}$  with  $\text{SbF}_3$  without a catalyst yields *Me* chlorodifluoromethyl ether, b.p.  $55.3^\circ$ , m.p.  $-105.1^\circ$ , and *Me* trifluoromethyl ether, b.p.  $30.1^\circ$ , m.p.  $-96.2^\circ$ . These compounds are only slowly hydrolysed by  $\text{H}_2\text{O}$ . E. S. H.

$\alpha\delta$ - and  $\alpha\epsilon$ -Oxido-compounds. **Synthesis of  $\alpha\epsilon$ -oxidodecane.** A. FRANKE, A. KROUPA, and O. SCHMID (Monatsh., 1935, 66, 406—432).—*Et* hexoylacetate (improved prep. from technical *Me* heptinene-carboxylate) is converted by the successive action of  $\text{Na-EtOH}$  and  $\text{CH}_2(\text{CH}_2\text{Br})_2$  followed by heating of the product under diminished pressure into anhydrodecan- $\alpha$ -ol- $\epsilon$ -one (I), which readily adds  $\text{H}_2\text{O}$  giving decan- $\alpha$ -ol- $\epsilon$ -one (II), m.p.  $24.5\text{—}25.3^\circ$ , b.p.  $144\text{—}148^\circ/11$  mm. (distillable only in complete absence of acidic or halogenic impurities), which does not reduce Fehling's solution or  $\text{NH}_3\text{-Ag}_2\text{O}$ , is little changed when heated at  $100^\circ$ , and according to optical evidence has the open structure  $\text{C}_5\text{H}_{12}\text{CO}[\text{CH}_2]_3\text{CH}_2\text{OH}$ . Oxidation of (II) with  $\text{CrO}_3$  in  $\text{AcOH}$  affords  $\delta$ -ketodecoic acid, m.p.  $56.3^\circ$ , and  $\epsilon$ -keto-*n*-decyl  $\delta$ -ketodecoate, m.p.  $52^\circ$ , probably formed through the semiacetal, since the direct esterification of acid by alcohol is somewhat difficult. (II) is unchanged by  $\text{Al-Hg}$  or  $\text{Na-Hg}$  in  $\text{EtOH-H}_2\text{O}$ , but is reduced by  $\text{Na}$  in 96%  $\text{EtOH}$  to decane- $\alpha\epsilon$ -diol (III), m.p.  $23\text{—}24^\circ$ , b.p.  $155.5\text{—}157^\circ/11$  mm. Hydrogenation ( $\text{Pt}$  sponge in  $\text{Et}_2\text{O}$ ) of (I) leads to  $\alpha\epsilon$ -oxidodecane (IV), b.p.  $198.5\text{—}200.5^\circ/747$  mm., which is transformed successively into  $\alpha\epsilon$ -dibromo-*n*-decane, b.p.  $150\text{—}151.5^\circ/10$  mm.,  $\alpha\epsilon$ -dicyano-*n*-decane, b.p.  $187\text{—}193^\circ/9$  mm., and non-cryst.  $\alpha$ -*n*-amylpimelic acid (diamide, m.p.  $161.5^\circ$  after softening at  $160^\circ$ ); indications of the presence of isomeric diamides, and hence of  $\alpha\delta$ -oxide in the initial material, are not observed. Elimination of  $\text{H}_2\text{O}$  from (III) by  $\text{H}_2\text{SO}_4$  occurs at a noticeable rate with boiling 30% acid, and then leads mainly to an unsaturated alcohol,  $\text{C}_{10}\text{H}_{20}\text{O}$ , b.p.  $228\text{—}231^\circ/1$  atm., with smaller amounts of an oxide essentially (IV). Interaction of  $\text{Br}[\text{CH}_2]_6\text{Br}$  with  $\text{CH}_2\text{Ac-CO}_2\text{Et}$  appears to lead mainly to the cryst. diketone  $\text{Ac}[\text{CH}_2]_3\text{Ac}$ . Treatment of dry  $\text{NaOBz}$  with  $\text{Br}[\text{CH}_2]_6\text{Br}$  at  $200^\circ$  affords  $\zeta$ -bromoheptyl benzoate (V), b.p.  $187\text{—}190^\circ/9$  mm., and  $\alpha\epsilon$ -dibenzoyloxy-*n*-hexane, m.p.  $55.5\text{—}56^\circ$  after softening at  $55^\circ$ . (V) and  $\text{CH}_2\text{Ac-CO}_2\text{Et}$  in boiling  $\text{EtOH}$  containing  $\text{NaOEt}$  afford a product which

after successive acid and alkaline hydrolysis gives *nonan- $\alpha$ -ol-one*, m.p. 23—23.5°. When heated with  $\text{H}_3\text{PO}_4$  the ketol gives only complex substances of uncertain constitution, whereas (II) readily yields (VI).

H. W.

**Constitution of adenylypyrophosphoric and adenosinediphosphoric acid.** K. LOHMANN (Biochem. Z., 1935, 282, 120—123).—Examination of the electro-titration curve of adenosinediphosphoric acid (I) before and after hydrolysis indicates that it is adenylic acid (II) esterified with 1  $\text{H}_3\text{PO}_4$  and that adenylypyrophosphoric acid (III) is (II) esterified with 2  $\text{H}_3\text{PO}_4$ . Constitutional formulæ, based on these and other deductions, are given for (I) and (III). The  $\text{NH}_2$  of the adenine residue is free in (I) and (III).

W. McC.

**Introduction of chlorine into nitromethanedisulphonic acid.** H. J. BACKER (Rec. trav. chim., 1935, 54, 899—904).—The following salts of nitromethanedisulphonic acid (A., 1931, 64) are described, crystallographic data (by TERPSTRA) being given for some of these: *dibrucine*+10 $\text{H}_2\text{O}$ , *Ba*<sub>2</sub>+2 $\text{H}_2\text{O}$ , *K*<sub>3</sub>, *Tl*<sub>3</sub>, and *Ba*<sub>3</sub>. All salts of type  $\text{MO}_2\text{N}:\text{C}(\text{SO}_3\text{M})_2$  are explosive. The action of  $\text{Cl}_2$  on  $\text{KO}_2\text{N}:\text{C}(\text{SO}_3\text{K})_2$  in  $\text{H}_2\text{O}$  gives *K chloronitromethanedisulphonate* (I), whence the *strychnine*, *brucine*+4 $\text{H}_2\text{O}$ , *Ba*+3 $\text{H}_2\text{O}$ , decomp. 150°, *Tl*, *Ag*+2 $\text{H}_2\text{O}$ , and *Ca*+3 $\text{H}_2\text{O}$ , salts of *chloronitromethanedisulphonic acid*+4 $\text{H}_2\text{O}$  and +2 $\text{H}_2\text{O}$ , m.p. 95.5° (explosive decomp.) (prep. from *Ba* salt), are obtained. (I) and aq.  $\text{K}_2\text{SO}_3$  affords *K nitromethanedisulphonate* thus: (I)+ $\text{K}_2\text{SO}_3$ + $\text{H}_2\text{O}$   $\rightarrow$  ( $\text{SO}_3\text{K}$ )<sub>2</sub> $\text{CH}\cdot\text{NO}_2$ + $\text{KCl}$ + $\text{KHSO}_4$ . J. W. B.

**Influence of an element or of a negative group on the relative mobilities of alkyl radicals in their chloroformates.** P. CARRÉ and H. PASSEDOUET (Compt. rend., 1935, 201, 898—900).—The effect of introducing Cl or Ph into the alkyl of alkyl chloroformates is to diminish the temp. of thermal decomp. (cf. A., 1935, 1105), i.e., to increase the mobility of alkyl (cf. A., 1933, 806; 1934, 509). The *Pr*<sup>a</sup> ester has a lower mobility than the allyl ester, but the  $\beta$ -phenylpropyl ester has a higher mobility than the cinnamyl ester. The suggestion that the tendency to migration is the greater the more electropositive is the migrating group is abandoned. J. L. D.

**Condensation of carboxylic compounds with substances capable of forming organo-metallic compounds or tautomerides thereof under the influence of alkali metals and of their water-decomposable derivatives.** G. V. TSHELINCEV (J. Gen. Chem. Russ., 1935, 5, 562—569).—Theoretical. Ester condensation reactions consist of the steps:  $\text{EtOAc} + \text{CH}_2\text{Na}\cdot\text{CO}_2\text{Et} \rightleftharpoons \text{ONa}\cdot\text{CMe}(\text{OEt})\cdot\text{CO}_2\text{Et} \rightleftharpoons \text{CH}_2\text{Ac}\cdot\text{CO}_2\text{Et} + \text{NaOEt} \rightleftharpoons \text{ONa}\cdot\text{CMe}\cdot\text{CH}\cdot\text{CO}_2\text{Et} + \text{EtOH}$ .

R. T.

**Addition of hydrogen bromide to allylacetic acid.** M. S. KHARASCH and M. C. McNAB (Chem. and Ind., 1935, 989—990; cf. A., 1933, 805).—A criticism of the views of Linstead *et al.* (A., 1935, 195).

J. W. B.

**Addition of hydrogen bromide to olefinic acids.** R. P. Linstead and H. N. RYDON (Chem. and Ind., 1935, 1009).—A reply to the above. J. W. B.

**Addition of hydrogen bromide to triple and double linkings.** Undecynoic, undecenoic, and  $\kappa$ -epoxyundecenoic acids. P. L. HARRIS and J. C. SMITH (J.C.S., 1935, 1572—1576).—The reaction between  $\Delta^1$ -undecenoic acid and HBr is sensitive to "oxidants." In the presence of  $\text{BzO}_2\text{H}$  (I) (modified prep.) at 0° during 3 hr.  $\kappa$ -bromoundecenoic acid (II) is formed, whilst in the presence of  $\text{NHPh}_2$  the reaction is slower and the  $\gamma$ -Br-acid (III) results. Undecenoic acid (IV) and (I) (in ligroin at 30° during 24 hr.) yield  $\kappa$ -epoxyundecenoic acid (V), m.p. 45.5° (after 10 days m.p. 50°), which reacts with HBr in air, forming mixed bromohydrins, m.p. 49—53°. In ligroin solution (IV) and HBr in air yield (III); in presence of (I) (0° during 15 min.) or (V) the product is (II). None of the catalysts is effective in absence of mol.  $\text{O}_2$ . F. N. W.

***p*-Xenylamine as new reagent for the identification of fatty acids and fatty acid derivatives.** Synthesis of the *p*-xenylamides [*p*-phenylanilides] of oleic and elaidic acid and their bromoderivatives. W. KIMURA and M. NIHAYASHI (Ber., 1935, 68, [B], 2028—2034).—The *p*-phenylanilides are obtained by heating the requisite acid with  $p\text{-C}_6\text{H}_4\text{Ph}\cdot\text{NH}_2$  (prep. from  $\text{Ph}_2$  described) in a vac. or through the acid chlorides and their derivatives by bromination of the anilides or through the chlorides of the Br-acids. Their m.p. are 34—61° > those of the corresponding *p*-phenylphenacyl esters. The following are described: *ole*<sup>a</sup>, m.p. 120°, *elaid*<sup>a</sup>, m.p. 134—135°, *oleodibromostear*<sup>a</sup>, m.p. 87.5°, and *elaidodibromostear-p-phenylanilide*, m.p. 133.5°.

H. W.

**Preparation in a high state of purity of long-chain compounds. I. Oleic acid.** L. KEFFLER and J. H. McLEAN (J.S.C.I., 1935, 54, 362—367T).—The Pb salt method fails to remove the final 3—4% of saturated impurities in oleic acid, even when prepared from high-grade olive oil and a large excess of  $\text{Pb}(\text{OAc})_2$  is used. The higher unsaturated impurities can be completely removed by 10—12 recrystallisations of the Li salts from 5 vols. of 80% EtOH; the final 3—4% of saturated impurities can then be removed, within 0.2 or 0.3%, by repeated fractional distillation under much reduced pressure. Oleic esters which had "aged" by keeping for long periods have also been purified by repeated fractional distillation, but the pure products were highly susceptible to rancidity changes, as were also the samples known to contain highly saturated impurities. Improvements in fractional distillation of fatty esters are described.

**Oleic acid.** T. P. HILDRICH (Chem. and Ind., 1935, 1009).—A reply to Keffler *et al.* (see above).

J. W. B.

**Unsaturated acids of natural oils. IV. The highly unsaturated acid of *Telfairia occidentalis*.** E. H. FARMER and E. S. PAICE. V.  $\alpha$ - and  $\beta$ -Licanic acids. W. B. BROWN and E. H. FARMER (J.C.S., 1935, 1630—1632, 1632—1633).—IV. *T. occidentalis* oil (7 months old) on saponification gives a mixture of fatty acids from which  $\beta$ -elæostearic acid (10% yield) is obtained. Freshly extracted (light petroleum) kernels give an oil containing

$\alpha$ - but no  $\beta$ -elaeostearic acid, although after irradiation (12 hr. in presence of S) the  $\beta$ -acid only is found.

V. Technical oiticica fat (I) or the kernel fat of *Licana rigida* normally yields  $\alpha$ -licanic acid (*semicarbazone*, m.p. 110—111°; *Me* ester) on saponification, but after irradiation (8 hr. in presence of I or S) *isolicanic acid*, m.p. 99.5° (*semicarbazone*, m.p. 138°), is formed. The fatty acids from (I) contain stearic (1.4%) and palmitic acids (about 1%).

F. N. W.

Polymerisation of methyl esters of higher unsaturated fatty acids. XVI. Polymerisation of methyl stearolate. K. KINO (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1935, 28, 140—145).—*Me* stearolate heated in  $H_2$  at 280—290° slowly polymerises to a bimol. product, which is not depolymerised when catalytically hydrogenated.

E. W. W.

Oxidation products of the unsaturated acids of linseed oil. L. C. A. NUNN and I. S. MACLEAN (Biochem. J., 1935, 29, 2742—2745; cf. A., 1935, 998).—The unsaturated acids of saponified linseed oil are oxidised by alkaline  $KMnO_4$ , the OH-acids are separated, and the remainder is steam-distilled. From the OH-acid fraction *isolinusic*, *linusic*, di-, tetra-, and hexa-hydroxystearic acids are separated, and from the steam distillate *Zn* -*dihydroxy-decane- $\alpha$ -dicarboxylate* is identified. The  $\Delta^0$  and  $\Delta^8$  positions of the ethylenic linkings in linoleic acid are confirmed.

H. D.

Preparation of brassidic acid from colza oil. L. KEFFLER and A. M. MAIDEN (Bull. Soc. chim. Belg., 1935, 44, 467—472).—Brassidic acid obtained from colza oil by a variation of the method of Reimer *et al.* (A., 1887, 233) and purified by repeated crystallisation from EtOH solidifies at 59.9° and is 99% pure.

H. G. M.

Acid fraction of mean mol. wt. 354 from the seeds of *Butea frondosa*, Roxb.—See A., 1935, 1550.

Odour and constitution:  $\gamma$ -substituted  $\gamma$ -butyrolactones. B. ROTHSTEIN (Bull. Soc. chim., 1935, [v], 2, 1936—1944).— $\alpha\beta$ -Epoxy-saturated hydrocarbons condense with  $CHNa(CO_2Et)_2$ , the malonyl residue becoming attached to the  $\alpha$ -C (the less substituted). The products on hydrolysis and loss of  $CO_2$  yield  $\gamma$ -substituted  $\gamma$ -butyrolactones. The b.p.,  $n$ , and  $d$  of the following are given:

$CH_2<\overset{CH_2}{\underset{CO}{\text{C}}}>CHR$ ,  $R=Bu^a$ ; amyl;  $Me\cdot[CH_2]_6$ ;  $Me\cdot[CH_2]_7$ ;  $Me\cdot[CH_2]_8$ ;  $Me\cdot[CH_2]_9$ , b.p. 140°/0.30 mm.;  $Me\cdot[CH_2]_{10}$ , m.p. 32°, b.p. 159°/0.43 mm.;  $Pr^b\cdot[CH_2]_2$ , b.p. 135°/16 mm.; and  $Pr^b\cdot[CH_2]_3$ , b.p. 145°/14 mm., the last four compounds being new. The odour of these compounds is described. The following epoxy-hydrocarbons (prepared from the appropriate chlorohydrin or by  $BzO_2H$ -oxidation of the corresponding ethylene) appear new:  $CHR<\overset{O}{\underset{CH_2}{\text{C}}}$ ,  $R=Bu^a$ , b.p. 123—124°/763 mm.;  $Me\cdot[CH_2]_6$ , b.p. 75°/13 mm.;  $Me\cdot[CH_2]_7$ , b.p. 94°/15 mm.;  $Me\cdot[CH_2]_8$ , b.p. 124—125°/15 mm.;  $Me\cdot[CH_2]_{10}$ , b.p. 138—139°/15 mm.  $\alpha$ -Chloro- $\zeta$ -methylheptan- $\beta$ -ol has b.p. 99—100°/12 mm.

H. G. M.

Oxidation of *dl*- $\alpha$ -hydroxystearic acid and its significance as regards the structure of cerebronic acid. (A) E. KLENK and F. DITT. (B) P. A. LEVENE and P. S. YANG (J. Biol. Chem., 1935, 749—750, 751).—(A) *dl*- $\alpha$ -Hydroxystearic acid and  $KMnO_4$  in  $COMe_2$  give other acids as well as margaric. The conclusions of Levene *et al.* (A., 1933, 1276) concerning cerebronic acid are thus invalidated.

(B) The above result is admitted, but the conclusions are upheld.

R. S. C.

Condensation of  $\alpha$ -aldehydo- $\alpha\beta$ -dicarboxylic esters with esters of  $\alpha$ -halogeno-substituted acids. M. N. SHTSCHUKINA and N. A. PREOBRAZHENSKI (Ber., 1935, 68, [B], 1991—1998).—The condensation is considered to consist of an *O*-alkylation of the  $\cdot CH\cdot OH$  form of the aldehydosuccinic ester. Condensation of  $CH_2Cl\cdot CO_2Et$  with  $NaOEt$  and  $Et_2\alpha$ -aldehydo- $\beta$ -ethylsuccinate (I) or directly with the Na derivative of (I) obtained from  $CO_2Et\cdot CHEt\cdot CH_2\cdot CO_2Et$  and  $HCO_2Et$  gives *Et*,  $\alpha$ -carbethoxymethoxymethylene- $\beta$ -ethylsuccinate (II),  $CO_2Et\cdot CHEt\cdot C(CO_2Et)\cdot CH\cdot O\cdot CH_2\cdot CO_2Et$ , b.p. 207°/15 mm., 195°/4 mm., which does not colour fuchsin- $H_2SO_3$  or yield a semicarbazone, immediately adds Br, and reduces boiling  $Ag_2O\cdot NH_3$ . Hydrolysis of (II) with boiling 10%  $H_2C_2O_4$  affords an acid,  $C_8H_{12}O_5$ , m.p. 102.5—103° (also obtained amongst other products by use of boiling 10% HCl), slowly hydrolysed by boiling HCl to ethylsuccinaldehydic acid [*semicarbazone*, m.p. 161—162° (decomp.)] and  $OH\cdot CH_2\cdot CO_2H$ . *Et* aldehydosuccinate (III) and  $CH_2Br\cdot CO_2Et$  analogously yield *Et*,  $\alpha$ -carbethoxy-*n*-propoxymethylenesuccinate,  $CO_2Et\cdot CH_2\cdot C(CO_2Et)\cdot CH\cdot O\cdot CH_2\cdot CO_2Et$ , b.p. 187°/7 mm., 211.5°/22.5 mm., which gives the same reactions as (II). It is very slowly hydrolysed by boiling dil.  $H_2C_2O_4$  to an acid,  $C_8H_{12}O_5$ , b.p. 182—184°/8 mm., and by boiling 10% HCl to  $OH\cdot CH_2\cdot CO_2H$  and succinaldehydic acid (IV). The Na derivative of (III) and  $CH_2Cl\cdot CO_2Et$  in boiling EtOH give *Et*, carbethoxymethoxymethylenesuccinate,  $CO_2Et\cdot CH_2\cdot C(CO_2Et)\cdot CH\cdot O\cdot CH_2\cdot CO_2Et$ , b.p. 211—212°/20 mm., hydrolysed by 10% HCl to a non-aldehydic acid, m.p. 126—129°, and (IV). H. W.

Nature of oxidising graphite anode and comparative electrolysis of *d*- and *meso*-tartaric acid in sodium hydroxide. V. SIHVONEN and M. PYLKKANEN (Suomen Kem., 1935, 2, B, 37—39).—0.5*M*-Na tartrate has been anodically oxidised at 25° with Pt, Ni, Fe, and C anodes, using 3*N*-NaOH in the cathodic compartment. Quant. analysis has been made on the product for  $O_2$ ,  $CHO\cdot CO_2H$  (I),  $HCO_2H$ , and  $H_2CO_3$ , and qual. analysis for dihydroxymaleic (II) and -tartaric (III) acid. The % of  $HCO_2H$  is approx. the same as that of the  $CO_2$ , and hence there can be no decomp. at the anode of (I) into 2 mols. of  $HCO_2H$ .  $H_2C_2O_4$  is present only as a trace. The formation of (III) is greatest with Fe. There is no formation of  $OH\cdot CH(CO_2H)_2$  or  $CO(CO_2H)_2$ . The primary product is (II), and in agreement the oxidation yield of *d*- is slightly < that of *meso*-tartaric acid, since the formation of (II) is slightly easier with the latter. Occlusion of  $O_2$  by C in presence of NaOH is slow, and the anodic p.d. remains positive a longer

time than with the other electrodes. Otherwise oxidation with C resembles that with Ni. There is no marked difference between the isomerides.

R. S. B.

**Decomposition of citric acid by yeast.**—See A., 1935, 1538.

**Preparation of crystalline aldolactones.** R. WEIDENHAGEN (Z. Wirts. Zuckerind., 1935, 85, 689—691).—*d*-Gluconic (I) and *d*-arabonic (II) acids are converted into mixtures of the lactone and Et ester when heated with HCl-EtOH for 8—10 hr. at 150°. Dissolution of the mixture from (I) in COMe<sub>2</sub> and addition of light petroleum affords cryst. *d*-gluconolactone in 40% yield. Similarly, an 84% yield of *d*-arabonolactone is obtained from the Ca salt of (II).

P. G. C.

**alloMucic acid and a new tetrahydroxyadipic acid.** T. POSTERNAK (Helv. Chim. Acta, 1935, 18, 1283—1287; see A., 1935, 846, 1483).—The Ca salt (+6H<sub>2</sub>O) and *di*(phenylhydrazide), m.p. 227—230° (decomp.), of  $\alpha\beta\gamma\delta$ -tetrahydroxyadipic acid are also described. The m.p. of the lactone is now given as 200—201° (decomp.).

J. W. B.

**Combination of thiol acids with methyl- [and phenyl-]glyoxal.** M. P. SCHUBERT (J. Biol. Chem., 1935, 111, 671—678).—Aq. AcCHO gives additive compounds (1:1) with SH·CH<sub>2</sub>·CO<sub>2</sub>H (*Hg* salt, decomp. about 220°), and its anilide (II), m.p. 70°, and with glutathione, amorphous. BzCHO gives similar compounds with (I), m.p. 159°, thiosinamine, m.p. 108°, (II), m.p. 149°, *o*-SH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H, m.p. 142°, and cysteine betaine (III), amorphous. Cysteine and CS(NH<sub>2</sub>)<sub>2</sub>, probably by virtue of the free NH<sub>2</sub> of the  $\psi$ -form, react with loss of H<sub>2</sub>O to give with AcCHO products, amorphous and m.p. 159°, and with BzCHO products, m.p. 141° and 222°, respectively. Cystine betaine, +H<sub>2</sub>O, cryst. (*Ag* and *Co* salts; *flavianate*, m.p. 230°), is prepared; it is readily reduced by Sn-HCl. The *flavianate* of (II) has m.p. 210°.

R. S. C.

**Optical rotation of configuratively related aldehydes.** P. A. LEVENE and A. ROTHEN (J. Biol. Chem., 1935, 111, 739—747).—*L*-C<sub>5</sub>H<sub>11</sub>·OH leads to  $\alpha$ -methylbutaldehyde, b.p. 90—92°, [*M*]<sub>D</sub><sup>20</sup> +20.3° (homogeneous), and  $\beta$ -methyl-*n*-valeraldehyde, b.p. 122°, [*M*]<sub>D</sub> -8.7° in heptane, CHMeEt·CH<sub>2</sub>·CH<sub>2</sub>Br, and thence  $\delta$ -methylhexan- $\alpha$ -al, b.p. 144°, [*M*]<sub>D</sub> +12.0° in heptane, and  $\epsilon$ -methylheptan- $\alpha$ -al, b.p. 72°/25 mm., [*M*]<sub>D</sub> +12.9° in heptane. [*M*] are max. vals. This series resembles the corresponding acids, azides, and iodides in changes of [*M*].

R. S. C.

**Action of alkyl halides on thio-aldehydes and -esters.** M. S. PLATONOV and S. B. ANISIMOV (J. Gen. Chem. Russ., 1935, 5, 622—624).—MeI or EtI and mono- or di-thioparaldehyde or Et thioacetate (110°; 20 hr.) yield SMe<sub>3</sub>I or SEt<sub>3</sub>I.

R. T.

**Mechanism and application of the Fries isomerisation.** V. C. SEKERA (Trans. Illinois State Acad. Sci., 1935, 27, 81—82; cf. A., 1928, 1010).—Anhyd. FeCl<sub>3</sub> and ZnCl<sub>2</sub> can replace AlCl<sub>3</sub> in this reaction, although they are not so effective.

CH. ABS. (r)

**Determination of diacetyl.** H. SCHMALFUSS and H. RETHORN (Z. Unters. Lebensm., 1935, 70, 233—240).—Ac<sub>2</sub> is heated at 100° with aq. NH<sub>2</sub>OH, HCl, NiCl<sub>2</sub>, and NH<sub>3</sub>. The Ni dioximine so formed is collected, washed at 0°, and weighed. The mean error of the determination of 0.05 g. of Ac<sub>2</sub> is -0.2%.

E. C. S.

**Properties and reactions of carbohydrates in liquid ammonia.** C. O. MILLER and A. E. SIEHRS (Proc. Soc. Exp. Biol. Med., 1931—1932, 29, 535—538; cf. A., 1934, 638).—Arabinose, glucose, fructose, galactose, sucrose, maltose, and  $\alpha$ -methylglucoside (I) are sol. in dry liquid NH<sub>3</sub> (II) at -33.5° and 25°. Glycogen (III) is dispersed to an opalescent solution. The presence of moisture causes caramel formation. Disaccharides and (I), but not monosaccharides, will crystallise from (II). Addition of a solution of KNH<sub>2</sub> causes pptn. of the K<sub>1</sub> salts of monosaccharides, the K<sub>2</sub> salts of disaccharides, and either, according to the proportions used, of (I); the salts are stable when dry. The K salt of (II) chars in air. Reducing sugars, but not sucrose, caramelize when sealed with KNH<sub>2</sub> at 20° for 24 hr.

CH. ABS. (r)

**Sugar determination by the ferricyanide electrode.**—See this vol., 126.

**Use of ceric sulphate in determining cuprous oxide obtained by reducing sugars on Fehling's solution.**—See this vol., 43.

**Action of phosphate on hexoses. II.** R. NODZU and K. MATSUI (Bull. Chem. Soc. Japan, 1935, 10, 467—471).—At  $p_H$  6.2—7 under the conditions previously defined (A., 1935, 734) Na<sub>2</sub>HPO<sub>4</sub>, K<sub>2</sub>HAsO<sub>4</sub>, and Na<sub>2</sub>SO<sub>3</sub> yield acetol (I) from glucose (II), but in smaller amounts than does K<sub>2</sub>HPO<sub>4</sub>. Alkali chlorides and sulphates are ineffective. Traces of Fe slightly increase, and of Zn or Cu decrease, the production of (I) by K<sub>2</sub>HPO<sub>4</sub>. Traces of Ca or Mg are without effect. (I) is obtained from pure (II) and K<sub>2</sub>HPO<sub>4</sub>.

R. S. C.

[2:3:6-Trimethylglucose anhydride.] K. HESS and F. NEUMANN (Ber., 1935, 68, [B], 2167; cf. A., 1933, 596, 1278).—A reply to Freudenberg *et al.* (A., 1935, 1484).

H. W.

**Colorimetric determination of glucose and fructose by their osazones.** V. S. BUTKEVITSCH and M. S. GAJEVSKAJA (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 313—316).—A modification of Herzfeld's method (A., 1932, 416; 1933, 175) for the colorimetric determination of glucose and fructose is described. The accuracy is  $\pm 2.5\%$ .

P. G. C.

**Reduction products of aromatic amines and sugars [condensation products].** P. KARRER, H. SALOMON, R. KUNZ, and A. SEEBACH (Helv. Chim. Acta, 1935, 18, 1338—1342).—The following compounds, all of type NHR·CH<sub>2</sub>·[CH·OH]<sub>4</sub>·CH<sub>2</sub>·OH, are obtained by heating together *d*-glucose and the appropriate amine in MeOH or EtOH, and catalytic reduction of the product with H<sub>2</sub> (20—25 atm.) at 100° (Ni catalyst) or 30° (Pd-C): *N*-phenyl-, m.p. 134° (*benzylidene* derivative, m.p. 118—119°), *N*-*p*-tolyl-, m.p. 122°, *N*-*p*-ethoxyphenyl-, m.p. 123°, *N*-*p*-hydroxyphenyl-, m.p. 163°, *N*- $\beta$ -(*p*-hydroxyphenyl)ethyl- (only

as its *hydrochloride*, m.p. 208°, and *N*-ethyl- (as its *hydrochloride*, m.p. 134°) -*d*-glucosamine. These compounds are not febrifuges.

J. W. B.

*ψ*-Galactal. H. LOHAUS and O. WIDMAIER (Annalen, 1935, 520, 301—304).—Hydrolysis of galactal triacetate (Levene *et al.*, A., 1931, 1400) with boiling H<sub>2</sub>O affords galactal diacetate (I),

b.p. 163—165°/0.04 mm.,  $[\alpha]_D^{20}$  -26.9° [p-nitrophenylhydrazone, m.p. 176°; acetal (II), b.p. 136—138°/0.05 mm.,  $[\alpha]_D^{20}$  -39.70°], converted by Ba(OH)<sub>2</sub> into isogalactal (isolated as its p-nitrophenylhydrazone, m.p. 187°), which, when distilled, affords protoglucal (Bergmann *et al.*, A., 1934, 173). Reduction of (I) with Pd-H<sub>2</sub> gives its H<sub>2</sub>-derivative, b.p. 148—153°/0.04 mm.,  $[\alpha]_D^{20}$  +44.2° [p-nitrophenylhydrazone, m.p. 148°; acetal, b.p. 107—108°/0.04 mm.,  $[\alpha]_D^{20}$  +23.78°, by similar reduction of (II)]. Galactal is reduced to its H<sub>2</sub>-derivative, m.p. 128°,  $[\alpha]_D^{20}$  +48.1°.

J. W. B.

Interaction of fructose and dinitrobenzene. L. VON SZÉCSÉNYI-NAGY (Biochem. Z., 1935, 281, 175—177).—*o*- but not *m*-C<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>2</sub> yields a deep violet colour with fructose.

W. McC.

Inversion of sucrose solutions in tropical sunlight.—See this vol., 38.

Thermal decomposition of sugars and its catalytic acceleration. E. H. RIESENFELD and F. MÜLLER (Ber., 1935, 68, [B], 2052—2054).—Technical sugar and sucrose are heated at 150° alone and with NaCl containing varied proportions of FeCl<sub>3</sub>. Incipient caramelisation is observed in absence of catalyst, whereas addition of NaCl causes marked caramelisation and some carbonisation. The influence of > 0.005% of Fe (calc. on total mass) is inappreciable, but greater concns. cause more profound caramelisation and much greater separation of C. FeCl<sub>3</sub> alone induces carbonisation, but no caramelisation. K<sub>2</sub>CO<sub>3</sub> and other salts behave similarly to NaCl.

H. W.

Robinobiose and kaempferolrhamnoside. G. ZEMPLÉN and A. GERECs (Ber., 1935, 68, [B], 2054—2059).—Contrary to Charaux (A., 1926, 1183), enzymic fission of robinine (acetate, m.p. 175° after softening at 135°,  $[\alpha]_D^{25}$  -95.83° in CHCl<sub>3</sub>) gives as least sol. product kaempferol-*l*-rhamnoside (I), m.p.

(I.)

230° (decomp.) (acetate, m.p. 159° after softening at 116°,  $[\alpha]_D^{25}$  -76.88° in CHCl<sub>3</sub>), hydrolysed by boiling 1% HCl to kaempferol and *l*-rhamnose. The mother-liquors from (I) yield robinobiose,  $[\alpha]_D^{25}$  +2.72° to ±0° in H<sub>2</sub>O [acetate, m.p. 113° after softening at 70°,  $[\alpha]_D^{25}$  -19.23° in CHCl<sub>3</sub>; α-chloroacetate (II), decomp. 180°,  $[\alpha]_D^{25}$  -5.05° in CHCl<sub>3</sub>], very similar to Charaux' robinose (III) and shown by oxidation with OI' to be *l*-rhamnosido-*d*-galactose. (II), Ag<sub>2</sub>CO<sub>3</sub>, and MeOH give β-methylrobinoside acetate, m.p. 153.5—154.5°,  $[\alpha]_D^{24}$  -25.24° in CHCl<sub>3</sub>. The sequence of

monoses in the non-isolated (III) is therefore *l*-rhamnose-*d*-galactose-*l*-rhamnose.

H. W.

Cellotriose. L. ZECHMEISTER and G. TÓTH (Ber., 1935, 68, [B], 2134—2136).—In reply to Hess *et al.*, (A., 1935, 1226, 1308) the homogeneity of the author's cellotriose is maintained.

H. W.

Influence of substitution in the benzene nucleus on enzymic fission of phenol-β-*d*-glucosides.—See A., 1935, 1536.

Emulsin. XXIV. Glucoside syntheses with emulsin. B. HELFERICH and U. LAMPERT (Ber., 1935, 68, [B], 2050—2051).—The dependence of the synthesis on the temp., nature of aglucone, β-glucosidase val. of the emulsin, and solvent is fully discussed. The prep. of *n*-butyl-β-*d*-glucoside in good yield is described.

H. W.

Determination of cardio-active glucosides by the step-photometer.—See A., 1935, 1531.

Arabogalactan of Siberian larch.—See this vol., 123.

Starch nitrates. E. BERL and W. C. KUNZE (Annalen, 1935, 520, 279—289).—When potato-starch (I) is nitrated with 1:1 H<sub>3</sub>PO<sub>4</sub>-HNO<sub>3</sub> the P<sub>2</sub>O<sub>5</sub> content (approx. 0.3%) of the starch nitrate (II) is of the same order as the SO<sub>3</sub> content of (II) when H<sub>2</sub>SO<sub>4</sub>-HNO<sub>3</sub> is used, but the N content (13.1%) never reaches the theoretical val. (14.14%) for the trinitrate. With H<sub>3</sub>PO<sub>4</sub>-HNO<sub>3</sub> the η of (II), which rises to a max. at 12 hr. nitration and then slowly falls, is 10 times > when H<sub>2</sub>SO<sub>4</sub>-HNO<sub>3</sub> is used, and the stability of the product is higher (max. decomp. point 170°). X-Ray diagrams of (II) (3 interference rings) differ from those (9 rings) of (I), but hydrolysis of (II) gives a product different from (I). Microscopical examination of the grains of (II) shows a yellow outer section [amylopectin nitrate (III)] with a dark inner kernel [amylose nitrate (IV)], and by freezing moist in liquid air and subsequent flotation, separation into a lighter portion (smaller N content) and a heavier portion (higher N content) is effected. Addition of COMe<sub>2</sub> causes swelling, and the inner kernels split up into small granules, which, unlike (III), go into solution as the [COMe<sub>2</sub>] is increased. The η of (II) is dependent on the composition of the nitrating mixture, duration and temp. of nitration, and the nature of (I). The η of (II) from sol. starch is only 0.1 that of ordinary (I), but is not related to the mol. (micelle) wt. of (I) as determined by osmotic pressure measurements. Samples of high mol. wt. give a product of lower η. In agreement with the above, separate nitration of amylopectin gives (III) of lower N content (11.82—12.05%) and very high η, whereas amylose gives (IV) with higher N content (13.45%) and low η. Previous heating of (I) with H<sub>2</sub>O at 90—130°/0.715—2.7 atm. causes a 10<sup>3</sup> increase in η of (II), but at 150—180°/4.7—10 atm., a sudden and rapid fall in η of (II) occurs.

J. W. B.

Phosphorus of starches. T. POSTERNAK (Helv. Chim. Acta, 1935, 18, 1351—1369).—A more detailed account of work previously summarised (A., 1934, 59, 390; 1935, 1549).

J. W. B.

"Bukuryo," sclerotia of *Pachyma Hoelen*, Rumph. I. Chemical structure of  $\beta$ -pachyman, the polysaccharide obtained from "Bukuryo," and its determination. K. TAKEDA (Mem. Tottori Agric. Coll., 1935, 3, 1—123).—Extraction of "Bukuryo" with EtOH-NaOH yielded  $\beta$ -pachyman (I),  $(C_6H_{10}O_5)_n$ , no m.p., but darkening at 230—235°,  $[\alpha]_D^{20} +24.78^\circ$  in 5% NaOH, mol. wt. probably < that of starch [*trinirate*, m.p. 195—199°,  $[\alpha]_D^{20} -63.63^\circ$  in  $C_5H_5N$ -EtOAc (3:2); *triacetate* (II), decomp. 255—258°,  $[\alpha]_D^{20} -68.75^\circ$  in  $CHCl_3$ ; Me<sub>2</sub> ether (III), m.p. 265—268°,  $[\alpha]_D^{20} -11.25^\circ$  in  $C_5H_5N$ - $C_6H_6$ ]. Hydrolysis of (I) with dil. or conc.  $H_2SO_4$  or dil. HCl yielded glucose (IV), whilst takadiastase gave (IV) and a disaccharide (*osazone*, m.p. 177°) similar to, but not identical with, gentiobiose. Hydrolysis with  $H_2C_2O_4$  or conc. HCl produced (IV) and an unstable *disaccharide*,  $C_{12}H_{22}O_{11}$ , m.p. 110°  $[\alpha]_D^{20} +76.7^\circ$  in  $H_2O$  (*osazone*, m.p. 167°), insol. in 95% EtOH, which on keeping decomposes to (IV). Neither fructose nor mannose was found in the hydrolytic products. Acetolysis of (I) using  $ZnCl_2$  yielded (II) and *biose octa-acetate*, m.p. 80—82°,  $[\alpha]_D^{20} +36.10^\circ$  in  $CHCl_3$ ,  $+25.3^\circ$  in  $C_6H_6$ ; hydrolysis of this yielded only (II). Acetolysis with  $HClO_4$  gave  $\beta$ -tetra-acetylglycuronic acid, and with  $H_2SO_4$  [using (II)], glucose  $\alpha$ -penta-acetate, m.p. 109—111°, was obtained. Hydrolysis of (III) with 5% HCl gave a 90% yield of 2:3:6-trimethylglucose, and with 1% MeOH-HCl, a 93% yield of 2:3:6-trimethylmethylglucoside. 2:3:4-Trimethylglucose was not detected. It is concluded that in the structure of (I), many  $\alpha$ - and  $\beta$ -glucofuranoses (1:4) are linked, commencing with the  $\alpha$ , at the first and fifth C. Two methods, the "alcohol" and the "enzyme," for the determination of (I) in "Bukuryo" are described. J. N. A.

"Bukuryo," sclerotia of *Pachyma Hoelen*, Rumph. VII. Production of tetra-acetylglycuronic acid by acetolysis of  $\beta$ -pachyman in the presence of perchloric acid. K. TAKEDA (J. Agric. Chem. Soc. Japan, 1934, 10, 1010—1013).—Two *acetates* were obtained: (a), m.p. 83—86°,  $[\alpha]_D^{20} +9.56^\circ$  in  $CHCl_3$ ,  $+8.47^\circ$  in  $C_6H_6$ , (b)  $C_{14}H_{18}O_{11}$ , m.p. 103—107°,  $[\alpha]_D^{20} +65.6^\circ$  in  $C_6H_6$ ,  $+66.2^\circ$  in  $CHCl_3$ ,  $+60.9^\circ$  in MeOH. (b) is probably tetra-acetylglycuronic acid and hydrolysis gave a syrup which yielded an *osazone*,  $C_{18}H_{20}O_5N_4$ , m.p. 167—174°. J. N. A.

Hydrolysis of cellulose and its oligosaccharides. K. FREUDENBERG and G. BLONQUIST (Ber., 1935, 68, [B], 2070—2082).—New data are recorded for  $[M]$  for cellotriase (I) and cellotetraose (II) and the velocities of hydrolysis of cellobiose (III), (I), (II), and cellulose (IV) are measured in 51%  $H_2SO_4$ , the changes being followed polarimetrically and by iodometric determination of liberated  $\cdot CHO$ . The hypothesis that from (I) onwards each unit with a terminal union reacts according to  $k$ , with all other unions according to  $k_n$ , is a suitable basis for calculation, but is an approximation, and it appears probable that the hydrolysis of (IV) and its oligosaccharides (V) is precisely similar to the fission of the polypeptides of glycine and, in a measure, to the cracking of hydrocarbons. The evidence that the

(V) contain only one type of structure, that of (III), from which a straight chain leads to the polysaccharide, which is thus an extrapolation of (V), is as follows. Methylcellobiose (VI) is hydrolysed to 1 mol. of tri- (VII) and 1 mol. of tetra- (VIII) -methylglucose. Methylcellotriase (IX) yields 2 mols. of (VII) and 1 mol. of (VIII), whereas methylcelloetraose gives 3 mols. of (VII) and 1 mol. of (VIII), and methylcellulose many mols. of (VII) and one of (VIII). (VII), (VIII), (III), (VI), and (IX) have been completely synthesised and their structure has been elucidated.  $[M]$  from (III) onwards changes almost additively by the val. of one intermediate section for (I), of two sections for (II), and so on.  $[M]$  of this intermediate section is nearly  $[M]$  of the unit of (IV). The yield of (III) leads to the conclusion that the biose union alone is constitution-chemically and configuratively present in (IV). The course of the hydrolysis of (I), (II), and (IV) can be adequately explained by the hypothesis that all unions are of a single type, that of (III). Evaluation of the graphs obtained polarimetrically shows that all unions are sterically similar. H. W.

Action of ethylene oxide on cellulose. I. N. I. NIKITIN and T. I. RUDNEVA (J. Appl. Chem. Russ., 1935, 8, 1023—1032).—Bleached cotton-wool (I) and  $(CH_2)_2O$  at 50° afford a product containing 1  $OH \cdot CH_2 \cdot CH_2 \cdot O \cdot$  (II) per 32  $C_6H_{10}O_5$  units; the proportion rises to 1:4—8 in presence of dil. alkalis, and attains a max. of 1:1.5 in presence of 18% NaOH or 35% KOH (50—60°; 15 min.). The products are much more readily hydrolysed and acetylated than is (I), but the velocity of benzoylation is not affected; they yield highly viscous solutions in NaOH, the viscosity rising with the no. of (II) introduced. R. T.

Celluloid formation. II. Effect of reaction medium on heterogeneous changes occurring in the fibrous state. M. WADANO, K. HESS, and C. TROGUS. III. Catalysed reactions in the fibrous state. Heterogeneous catalysis with a solid substrate and liquid catalyst. M. WADANO, C. TROGUS, and K. HESS. IV. Production of celluloid from cellulose nitrate and *l*- or *dl*-camphor. K. HESS, C. TROGUS, and M. WADANO (Z. physikal. Chem., 1935, B, 30, 159—182, 183—231, 232—235; cf. A., 1932, 568).—II. The reaction between cellulose nitrate (I) and camphor in presence of aliphatic alcohols as solvents is complete at such low camphor concns. that it can be effected at room temp. The X-ray diagrams and analysis of the solid phase show the existence of two new compounds, camphor-cellulose nitrate II (II) and camphor-cellulose nitrate III (III), in addition to the camphor-cellulose nitrate I (IV) previously observed. It seems probable that (III) corresponds with hydro-cellulose and (II) and (IV) correspond with natural cellulose. The camphor concn. at which reaction starts to proceed into the interior of the micelles increases with the size of the alkyl radical. The fact that the nature of the reaction product and the relation between the amount of camphor taken up and the camphor concn. vary with the solvent is possibly due to the first stage of the reaction being formation of

a double compound between the solvent and (I). Aromatic hydrocarbons promote the reaction of (I) with camphor in varying degrees.

III. The reaction of (I) with camphor in benzene solution in presence of ketones and alcohols has been studied. The effect of these substances on the concn. of camphor required for complete reaction is due to catalysis, and the varying fine structure of the product is determined by processes which are superimposed on the sorption of camphor.  $\text{COMe}_2$  and cyclohexanone are better catalysts than alcohols. For a camphor concn.,  $c$ , of 30% the amount taken up passes through a max. with increasing  $\text{COMe}_2$  concn.,  $C$ , whilst for const.  $C$  the amount of camphor taken up rises towards a limit with increase in  $c$ . When  $c$  is moderate and  $C$  small the product is (IV). (II) is obtained when  $C$  is  $\geq 1\%$ . If  $C$  is  $> 10\%$  and  $c = 5-20\%$ , the product is camphor-cellulose nitrate IV, which contains  $\text{COMe}_2$ . The formation of the various compounds of camphor and (I) is irreversible, and it is in general impossible to transform one into another. The catalytic action of  $\text{COMe}_2$  is attributed to its relatively rapid reaction with (I) to give a compound which reacts with camphor giving camphor-cellulose nitrate and re-forming  $\text{COMe}_2$ . With increasing  $C$  the swelling of the (I) fibres passes through a max., then through a min. EtOH and MeOH act similarly to  $\text{COMe}_2$  as catalysts. The presence of  $\text{H}_2\text{O}$  favours the formation of (II).

IV. The optical isomerides of camphor are identical in their behaviour towards (I). R. C.

**Reaction mechanism: action of fused sodium on mono-, di-, and tri-methylamines.** H. S. FRY and W. V. CULP (Rec. trav. chim., 1935, 54, 838—846).—Analogy with the reaction  $\text{RH}_n + n\text{NaOH}$

$\text{R(ONa)}_n + n\text{H}_2$  (A., 1928, 615) suggests the reaction  $\text{RH}_n + n\text{NaNH}_2 \rightarrow \text{R(NHNa)}_n + n\text{H}_2$ . Summation of the expected reaction stages leads to the equation  $\text{NH}_2\text{Me} + \text{NaNH}_2 \rightarrow \text{NaCN} + \text{NH}_3 + 2\text{H}_2$  for the interaction between  $\text{NH}_2\text{Me}$  and fused  $\text{NaNH}_2$  (in excess) at  $250^\circ$ . Determination of the  $\text{NH}_2\text{Me}$  used (liberated from  $\text{NH}_2\text{Me.HCl}$  by dropwise addition of  $10N\text{-NaOH}$ ),  $\text{NaCN}$  (Volhard),  $\text{NH}_3$  (absorbed in an excess of  $6N\text{-H}_2\text{SO}_4$ ), and  $\text{H}_2$  (no other gaseous products formed), gives 94% agreement with this equation. Similarly the mechanism  $\text{NHMe}_2 + 2\text{NaNH}_2 \rightarrow 2\text{NaCN} + \text{NH}_3 + 4\text{H}_2$  is verified to the extent of 97%, but the derived  $\text{NMe}_3 + 3\text{NaNH}_2 \rightarrow 3\text{NaCN} + \text{NH}_3 + 6\text{H}_2$  is invalid, since  $\text{NMe}_3$  does not react with fused  $\text{NaNH}_2$ . It is suggested that the initial stage  $\text{NMe}_2 + \text{NaNH}_2 \rightarrow [\text{NHMeR}_2 \cdot \text{NHNa}] \rightarrow \text{NHMeNa} + \text{NHR}_2$ , occurs with  $\text{NH}_2\text{Me}$  ( $\text{R}_2 = \text{H}_2$ ,  $K_b = 5.0 \times 10^{-4}$ ) and  $\text{NHMe}_2$  ( $\text{R}_2 = \text{MeH}$ ,  $K_b = 5.4 \times 10^{-4}$ ), but not with the more weakly basic  $\text{NMe}_3$  ( $\text{R}_2 = \text{Me}_2$ ,  $K_b = 5.9 \times 10^{-5}$ ). J. W. B.

**Thermal decomposition of triethylamine.**—See this vol., 33.

**Trichlorohydroxy-aliphatic amines.** F. D. CHATTAWAY and P. WITHERINGTON (J.C.S., 1935, 1623—1624).— $\gamma\gamma\gamma$ -Trichloro- $\alpha$ -amino- $\beta$ -hydroxypropane, m.p.  $123^\circ$  [oxalate, m.p.  $220^\circ$  (decomp.); sulphate, m.p.  $255^\circ$  (decomp)];  $\text{Ac}$  derivative, m.p.  $154^\circ$ ;  $\text{Ac}_2$  derivative, m.p.  $99^\circ$ ], is obtained from the hydrochloride (I), m.p.  $235^\circ$  (decomp.), which is pre-

pared by the reduction ( $\text{Sn-HCl}$ ) of  $\gamma\gamma\gamma$ -trichloro- $\alpha$ -nitro- $\beta$ -hydroxypropane. Similarly  $\gamma\gamma\delta$ -trichloro- $\alpha$ -amino- $\beta$ -hydroxy- $n$ -pentane, m.p.  $141^\circ$  (darkening) [hydrochloride (II), m.p. about  $231^\circ$  (decomp.); oxalate, m.p.  $232^\circ$  (decomp.); sulphate, m.p.  $235-240^\circ$  (decomp.);  $\text{Ac}$  derivative, m.p.  $109^\circ$ ;  $\text{Ac}_2$  derivative, m.p.  $136^\circ$ ], is obtained from the corresponding  $\text{NO}_2$ -compound. (I) with KCN yields  $\gamma\gamma\gamma$ -trichloro- $\beta$ -hydroxy- $n$ -propylcarbamide, m.p.  $175^\circ$ , and (II) similarly yields  $\gamma\gamma\delta$ -trichloro- $\beta$ -hydroxy- $n$ -amylcarbamide, m.p.  $175^\circ$ . F. N. W.

**Introduction of halogen or thiocyanate into organic compounds by means of dichloropentamethylenetetramine.** M. V. LICHOSCHERSTOV and T. D. ALDOSCHIN (J. Gen. Chem. Russ., 1935, 5, 981—985).—The reaction  $(\text{CH}_2)_5\text{N}_4\text{Cl}_2 + 2\text{MX} + 2\text{HR} \rightarrow 2\text{RX} + 2\text{MCl} + (\text{CH}_2)_5\text{N}_4\text{H}_2$  ( $\text{M} = \text{K}, \text{Na}$ ;  $\text{X} = \text{halogen or CNS}$ ;  $\text{R} = \text{aryl radical}$ ) is of general application, and affords high yields of relatively pure products in cases in which the ordinary methods do not do so (nitrophenols). R. T.

(A) Action of  $N$ -sulphuric acid and  $N$ -sodium hydroxide on glycine. (B) Interaction of glycine and glycyglycine with nicotine. I. S. JAIT-SCHNIKOV (J. Gen. Chem. Russ., 1935, 5, 967—969, 970—971).—(A) Formol-titratable  $N$  diminishes immediately after addition of glycine (I) to  $N\text{-H}_2\text{SO}_4$ , to attain a min. val. after 3 days, and then rises to a const. val. after 30 days at room temp.  $N\text{-NaOH}$  exerts a similar action, the min. val. being attained after 28 days. The phenomena are ascribed to transient formation of anhydride, peptide, or polymeride.

(B) (I) and glycyglycine combine with nicotine in presence of  $\text{CH}_2\text{O}$ . R. T.

**Determination of the sum of glycine and serine.** S. RAPOPORT (Biochem. Z., 1935, 281, 30—36).—The sum of the amounts of these acids (e.g., in protein hydrolysates) is determined, after removal of dicarboxylic  $\text{NH}_2$ -acids, by deamination with  $\text{NaNO}_2$  and oxidation (to  $\text{H}_2\text{C}_2\text{O}_4$ ) of the product with  $0.1N$  alkaline  $\text{KMnO}_4$ . The results are slightly  $>$  those obtained by other methods except with caseinogen, with which the vals. are much higher. At  $120^\circ$  in 5 hr. serine (I) is converted by  $\text{HI} + \text{P}$  into alanine (II), which is then determined by the method of Kendall *et al.* (A., 1931, 246), but this procedure gives inaccurate results when preformed (II) is present. Glycine is colorimetrically determined with the help of the blue colour produced on addition of conc.  $\text{H}_2\text{SO}_4$  and naphthoresorcinol, and hence (I) and glycine can be separately determined in sericin, the vals. being 8.71 and 1.69%, respectively. W. McC.

**Carbamido-acid and hydantoin of arginine.** W. R. BOON and W. ROBSON (Biochem. J., 1935, 29, 2573—2575).—Arginine on warming in aq. solution with  $\text{KCNO}$  gave carbamidoarginine, m.p.  $172^\circ$ , passing in warm acid solution into arginine-hydantoin, m.p.  $100^\circ$ . H. D.

**Conversion of arginine into citrulline.** K. DIRR and H. SPATH (Z. physiol. Chem., 1935, 237, 121—130; cf. A., 1934, 993).—The hydrochloride ( $\text{1H}_2\text{O}$ ), m.p.  $155^\circ$  (decomp.),  $[\alpha]_D^{25} + 13.0^\circ$ , of arginine-amide (I) [picrate, m.p.  $220^\circ$  (decomp.)] obtained from

the Me ester in MeOH and  $\text{NH}_3$ , and the *hydrochloride* ( $\text{1H}_2\text{O}$ ), decomp.  $260^\circ$ , of  $\alpha$ -monobenzoylarginine-amide (II) yield no citrulline (III) on hydrolysis and are not attacked by arginase (IV). Together with (I) *arginine-diketopiperazine*, decomp.  $316^\circ$ , is obtained. *Dibenzoylarginine Me ester hydrochloride* has m.p.  $171^\circ$ . (I) and (II) yield the  $\text{Bz}_3$  derivative of (I), m.p.  $245^\circ$ , which gives a 10% yield of the corresponding  $\text{Bz}_3$  derivative (V), m.p.  $220^\circ$ , of (II) on hydrolysis with conc.  $\text{HCl}$  at room temp., a substance, m.p.  $178^\circ$ , probably an inactive form of (V), being produced (sometimes) at the same time. Hot acid hydrolysis of (V) gives  $\text{BzOH}$ ,  $\text{NH}_3$ , ornithine, and proline, but no (III) or  $\text{CO}(\text{NH}_2)_2$ .  $\text{CH}_2\text{N}_2$  with  $\alpha$ -benzoylcitrulline gives the Me ester, decomp. about  $120^\circ$ , and  $\text{NH}_3$  converts the ester into the corresponding *amide* (VI), m.p. about  $140^\circ$ . Benzoylation of (VI) gives (V). It seems that in the biological conversion of arginine (VII) into (III) by deimidase and (IV) the attack on the guanidine residue must be preceded by blocking of the  $\text{CO}_2\text{H}$ . W. McC.

**Preparation of ornithine, ornithuric acid, and  $\alpha$ -benzoylornithine.** W. R. BOON and W. ROBSON (Biochem. J., 1935, 29, 2684—2688).—Improved methods (yields in brackets) for the prep. of the following are described: ornithuric acid (I) [68.5%] from arginine hydrochloride and [nearly theoretical] from carbamido-arginine (II); ornithine hydrochloride [nearly theoretical] from (II); and benzoylornithine [76%] from (I). J. N. A.

**Relationships between acidity and tautomerism.** IV. Effect of the cyano-group. F. ARNDT, H. SCHOLZ, and E. FROBEL (Annalen, 1935, 521, 95—121).—The behaviour of a series of CN-compounds towards  $\text{FeCl}_3$ , Br, and  $\text{CH}_2\text{N}_2$  shows that the acidifying action of CN exceeds that of any other simple C-containing substituent and approximates to that of  $\text{SO}_2$ . CN shows electromeric action in the form of "enotropic effect" and as conjugation partner; in both respects it is considerably inferior to keto-CO, but superior to ester CO.  $\text{CH}\cdot\text{CN}$  can therefore pass into  $\text{C}\equiv\text{C}\cdot\text{NH}$ , but a conjugation partner is necessary, which, as always, must not precede CN in the sequence of electromeric activity. A second CN, ester CO, or, in certain circumstances,  $\text{NO}$ , can function as conjugation partner for the eniminisation of CN. In addition, the prototropic expenditure of energy must be greatly decreased by strong acidification of the central CH to render eniminisation possible. Hence it does not occur with  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$  or  $\text{CH}_2(\text{CN})_2$ . In combination with keto-CO, CN behaves essentially as conjugation partner. The enimine group behaves towards  $\text{FeCl}_3$ , Br, and  $\text{CH}_2\text{N}_2$  similarly to the enol group and can, if it occurs, have a more or less considerable share of the empirical activity of the corresponding dissolved compound. With regard to acidifying action (inductive effort) and electromeric effect the sequences of substituents are, respectively,  $\text{NO}_2 > \text{SO}_2\text{OR} > \text{SO}_2\text{R} > \text{CN} > \text{CO}_2\text{R} > \text{CH}\cdot\text{O} > \text{CR}\cdot\text{O}$  and  $\text{CH}\cdot\text{O} > \text{CR}\cdot\text{O} > \text{ON} > \text{CO}_2\text{R} > \text{NO}_2$ .

Application of the Br titration method to the following compounds gives variable and non-reproducible results which frequently depend greatly on temp.

and solvent; the underlying reasons are fully discussed. Absorption of Br in some measure, however, invariably goes hand in hand with occurrence of a colour with  $\text{FeCl}_3$ .  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}_2\text{Me}$  gives a red colour with  $\text{FeCl}_3$  and immediately decolorises Br in MeOH, but not in  $\text{CHCl}_3$ . With  $\text{CH}_2\text{N}_2$  in  $\text{Et}_2\text{O}$  at  $-50^\circ$  it yields two substances, m.p.  $76^\circ$  and  $97-98^\circ$ ,

probably A and B, since the former passes into the latter when heated for some time at  $130^\circ$  and each forms the same compound with  $\text{NH}_3$ . The enimine or ester OH groups do not participate in the change. *p*-Toluenesulphonylacetonitrile (I), m.p.  $147-148^\circ$ , does not react with Br or  $\text{FeCl}_3$ ; in absence of catalyst it does not react with  $\text{CH}_2\text{N}_2$ , but after liberal addition of MeOH it slowly affords  $\alpha$ -*p*-toluenesulphonylpropionitrile, m.p.  $60^\circ$  (corresponding amide, m.p.  $168^\circ$ ), and the compound  $\text{N}\cdot\text{NMe} \text{---} \text{N}\cdot\text{CH} \text{---} \text{C}\cdot\text{CH}_2\cdot\text{SO}_2\cdot\text{C}_6\text{H}_4\text{Me}$ , m.p.  $162^\circ$ .

Its acidity is therefore due solely to  $\text{CH}$ . *Me p*-toluenesulphonylcianoacetate, m.p.  $79-80^\circ$ , from the Na derivative of (I) and  $\text{ClCO}_2\text{Me}$ , shows marked reaction with  $\text{FeCl}_3$  and decolorisation of Br; with  $\text{CH}_2\text{N}_2$  it yields the substance  $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\cdot\text{C}(\text{CN})\cdot\text{CNMe}$ , m.p.  $125-127^\circ$ , and *Me  $\alpha$ -cyano- $\alpha$ -p-toluenesulphonylpropionate*, m.p.  $101^\circ$ . The solid substance is therefore  $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\cdot\text{CH}(\text{CN})\cdot\text{CO}_2\text{Me}$ , and passes in solution completely or preponderatingly into the enimine form.  *$\alpha$ -Cyano- $\alpha$ -p-toluenesulphonylacetone*, m.p.  $122-123^\circ$ , from the Na derivative of (I) and  $\text{AcCl}$  in cold  $\text{Et}_2\text{O}$ , gives a moderate  $\text{FeCl}_3$  reaction, and immediately decolorises Br in  $\text{EtOH}$  or  $\text{CHCl}_3$ . In solution in  $\text{Et}_2\text{O}$  it is converted exclusively into the *enol ether*,  $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\cdot\text{C}(\text{CN})\cdot\text{CMe}\cdot\text{OMe}$ , m.p.  $124^\circ$ , whereas the solid when treated with  $\text{CH}_2\text{N}_2\cdot\text{Et}_2\text{O}$  affords also  *$\alpha$ -acetyl- $\alpha$ -p-toluenesulphonylpropionitrile*, m.p.  $150-151^\circ$ . *N*-Methylation is not observed. The solid substance is  $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\cdot\text{CHAc}\cdot\text{CN}$  and is partly enolised but not eniminised in solution.  $\text{CH}_2(\text{CN})_2$  does not react with Br or  $\text{FeCl}_3$  or with  $\text{CH}_2\text{N}_2$  in presence of MeOH. *p*-Toluenesulphonylmalononitrile, m.p.  $101-102^\circ$  after softening at  $93^\circ$ , from the Na compound of (I) and  $\text{CNBr}$ , gives considerable  $\text{FeCl}_3$  reaction and immediately decolorises Br in  $\text{EtOH}$  or  $\text{CHCl}_3$ . With  $\text{CH}_2\text{N}_2$  at  $-50^\circ$  it yields small amounts of *p*-toluenesulphonylmethylmalononitrile, m.p.  $103^\circ$ , whereas under the customary conditions some *N*-methylation is observed. Hence the solid is  $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\cdot\text{CH}(\text{CN})_2$  and becomes eniminised in solution. *Me dicyanoacetate*, m.p.  $65^\circ$ , gives strong  $\text{FeCl}_3$  reaction and decolorises Br. With  $\text{CH}_2\text{N}_2$  at  $-50^\circ$  it gives a non-cryst. product with 6.3% NMe and 12.0% OMe (of which 10.9% is present as  $\text{CO}_2\text{Me}$ ).  *$\alpha\alpha$ -Dicyanoacetone*, m.p.  $141^\circ$ , from  $\text{CHNa}(\text{CN})_2$  and  $\text{AcCl}$  [*p*-nitrophenylhydrazones, m.p.  $144^\circ$  (decomp.)], gives a marked  $\text{FeCl}_3$  reaction and immediately decolorises a little Br. *O*-Methylation predominates with  $\text{CH}_2\text{N}_2$ , but some *N*-methylation is observed. An ethereal solution of  $\text{CH}(\text{CN})_3$  gives an intense  $\text{FeCl}_3$  reaction and absorbs much Br. The product formed with  $\text{CH}_2\text{N}_2$  gives about half the calc. NMe val., showing that NH is formed and resembles enolic OH in behaviour towards  $\text{FeCl}_3$ . H. W.

**Determination of thiol and disulphide compounds, with special reference to cysteine and cystine. III. Reaction between thiol compounds and mercuric chloride.** K. SHINOHARA (J. Biol. Chem., 1935, 111, 435—442).—Cysteine or  $\text{SH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  reacts rapidly with  $\text{HgCl}_2$  at  $p_H$  5, giving a mercaptide of the type  $\text{Hg}(\text{S}\cdot\text{R}\cdot\text{CO}_2\text{H})_2$ , followed by a slow reaction giving  $\text{CO}_2\text{H}\cdot\text{R}\cdot\text{S}\cdot\text{Hg}\cdot\text{S}\cdot\text{R}\cdot\text{CO}_2\text{H}\cdot\text{HgCl}$ .

F. A. A.

**Optical rotatory dispersion in the carbohydraate group. VI. Amide rotation rule.** T. L. HARRIS, E. L. HIRST, and C. E. WOOD (J.C.S., 1935, 1658—1662; cf. A., 1935, 568).—The rotatory dispersion of *d*-dimethoxysuccinamide, *d*-dimethoxysuccinimethylamide, and 1:2:3:5-trimethylarabonamide (all obeying the amide rule) is controlled by the induced dissymmetry, and can be represented by a one-term Drude-Natanson equation. Similar examination of 4:6-dimethylmannonamide, which obeys the amide rule in EtOH but not in  $\text{H}_2\text{O}$ , shows that special stereochemical arrangements of the substituent groups may give rise to an induced activity opposite in sign to that of the normal amide. Data for various  $\lambda$  for the above compounds and for *Me d*-dimethoxysuccinate, b.p.  $120^\circ/12$  mm., with  $\text{H}_2\text{O}$  and EtOH as solvents are given.

F. N. W.

**Action of magnesium phenyl bromide on  $\alpha$ -bromobutyrdimethylamide.** S. P. TI (Bull. Soc. chim., 1935, [v], 2, 1799—1800; cf. A., 1931, 1279).—The reaction products of  $\text{MgPhBr}$  and  $\alpha$ -bromobutyrdimethylamide, b.p.  $123$ — $124^\circ/17$  mm., are butyrdimethylamide, *croton*dimethylamide (impure), b.p. about  $200^\circ$ , and a little  $\text{COPhPr}^+$  and  $\beta$ -dimethylamino- $\alpha$ -diphenylbutanol, m.p.  $58^\circ$  [picrate, m.p.  $155^\circ$ ; perchlorate, m.p.  $182^\circ$ ; *Ac* derivative (picrate, m.p.  $138^\circ$ )].

H. G. M.

**Reactions of sulphuryl diamide (sulphamide).** F. C. WOOD (Nature, 1935, 136, 837).—*Dixanthyl sulphamide*, m.p.  $182$ — $184^\circ$ , is obtained by adding a solution of xanthhydrol (I) in EtOH to one of sulphamide in aq. AcOH. Condensation products have also been obtained with (I) and  $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\cdot\text{NH}_2$ , m.p.  $209^\circ$ ,  $m\text{-C}_6\text{H}_4(\text{SO}_2\cdot\text{NH}_2)_2$ , m.p.  $170^\circ$ , and  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\cdot\text{NH}_2$ , m.p.  $198^\circ$ . These general reactions can be used for the determination of sulphamides and sulphonamides.

L. S. T.

**Determination of glutamine in presence of asparagine.** H. B. VICKERY, G. W. PUCHER, H. E. CLARK, A. C. CHIBNALL, and R. G. WESTALL (Biochem. J., 1935, 29, 2710—2720).—The amide group is completely hydrolysed when glutamine (I) is heated at  $100^\circ$  for 2 hr. at  $p_H$  6.5. The increase in  $\text{NH}_2\cdot\text{N}$  that occurs gives the amount of (I)  $\text{NH}_2\cdot\text{N}$  in the extract of the plant tissue. The decrease in  $\text{NH}_2\cdot\text{N}$  of an extract on hydrolysis under these conditions is a valuable qual. criterion of the presence of (I). Interference from asparagine is negligible, for it requires heating for 3 hr. at  $100^\circ$  with  $\text{N}\cdot\text{H}_2\text{SO}_4$ , whilst the effect of  $\text{CO}(\text{NH}_2)_2$  and allantoin can be easily detected. Data on the stability of (I) with regard to temp. and  $p_H$  are given. The chief products hydrolysis of (I) at essentially neutral reaction are  $\text{NH}_3$  and pyrrolidonecarboxylic acid.

J. N. A.

**Dicyanodiamide.** F. CHASTELLAIN (Helv. Chim. Acta, 1935, 18, 1287—1302).—Hydrolysis of dicyanodiamide (I) with a slight excess of acid at  $50$ — $80^\circ$  gives a quant. yield of guanylcarbamide (II), but with insufficient acid further hydrolysis to  $\text{NH}_2\cdot\text{C}(\text{NH}_2)_2$  occurs. Hydrolysis of (I) with 1% NaOH at  $100^\circ$  has been quantitatively studied by determination of the  $\text{NH}_3$  evolved (cf. B., 1926, 505),  $\text{CO}(\text{NH}_2)_2$  (Fosse),  $\text{NH}_2\cdot\text{CN}$  (Perotti), and unchanged (I). The increase in the  $\text{NH}_3$  evolved is rapid during the first 2 hr. and thereafter becomes linear with time. The amount of  $\text{NH}_3$  evolved is equally dependent on the concn. of (I) and of NaOH, and is the same whether the mol. ratio (I)/NaOH ( $r$ ) is  $a$  or  $1/a$ . The  $\text{CO}(\text{NH}_2)_2$  formed [only slightly increased by excess of NaOH, but greatly increased by increasing the mol. proportion of (I)] increases to a max. at about 3 hr. and then decreases linearly with time. The sum  $\text{NH}_3\cdot\text{N} + \text{CO}(\text{NH}_2)_2\cdot\text{N}$  increases to a const. val. for any particular val. of  $r$ , and this const. val. itself increases from 16.5% of total N when  $r=5$  to 60% when  $r=0.5$ , and then remains approx. const. to  $r=0.2$ . The initial stage is the depolymerisation of (I) to  $\text{NH}_2\cdot\text{CN}$ , which reaches max. concn. after  $< 1$  hr., and disappears after 5 hr. ( $r=1$ ), and no (I) could be detected after 9 hr. During the first ten hr. only  $\text{CO}(\text{NH}_2)_2$  is hydrolysed, hydrolysis of melamine [formed from (I) and  $\text{NH}_2\cdot\text{CN}$ ] to (finally)  $(\text{HCNO})_3$ , requiring more drastic conditions. No (II),  $\text{NH}_2\cdot\text{CO}\cdot\text{NH}\cdot\text{CN}$ , or  $\text{NH}(\text{CO}\cdot\text{NH}_2)_2$  could be detected in the alkaline hydrolysis. These and earlier results are discussed and it is concluded that (I) is tautomeric,

solely as the former in alkaline and neutral solution and probably in the solid state, and as the latter in acid solution.

J. W. B.

**Photochemical and thermal decomposition of azomethane.**—See this vol., 37.

**Iron-cyanogen compounds. VI. Action of oxalates on the blue iron-cyanogen compounds.** M. KOHN (Monatsh., 1935, 66, 393—405; cf. A., 1924, i, 21).—Sol. and ordinary Prussian-blue (I) dissolve completely in  $\text{K}_2\text{C}_2\text{O}_4$  with formation of  $\text{K}_3\text{Fe}_2(\text{C}_2\text{O}_4)_3$  and  $\text{K}_4\text{Fe}(\text{CN})_6$ ; Turnbull's blue (II) is mainly but not completely sol., leaving a residue of white  $\text{Fe}_3\text{Fe}(\text{CN})_6$ . The action of  $\text{H}_2\text{O}_2$  on a mixture of  $3\text{FeSO}_4 + 2\text{K}_3\text{Fe}(\text{CN})_6$  [(II)], whereby complete reaction should lead to  $\text{OH}\cdot\text{Fe}^{\text{III}}[\text{Fe}^{\text{III}}\text{Fe}(\text{CN})_6]_2$ , or on a mixture of  $2\text{FeSO}_4 + \text{K}_4\text{Fe}(\text{CN})_6$  which similarly should give  $(\text{OH})_2\text{Fe}^{\text{III}}_2[\text{Fe}(\text{CN})_6]$  gives in each case blue preps. of insol. basic (I), which are converted by  $\text{K}_2\text{C}_2\text{O}_4$  into  $\text{Fe}(\text{OH})_3$  in theoretical amount,  $\text{K}_4\text{Fe}(\text{CN})_6$ , and  $\text{K}_3\text{Fe}^{\text{III}}(\text{C}_2\text{O}_4)_3$ . Oxidation of a mixture of  $\text{FeSO}_4$  and  $\text{K}_4\text{Fe}(\text{CN})_6$  by  $\text{H}_2\text{O}_2$  affords a basic (I), colloidal sol. in  $\text{H}_2\text{O}$ , which when treated with  $\text{K}_2\text{C}_2\text{O}_4$  gives  $\text{K}_3\text{Fe}^{\text{III}}(\text{C}_2\text{O}_4)_3$ ,  $\text{K}_4\text{Fe}(\text{CN})_6$ , and considerably more  $\text{Fe}(\text{OH})_3$  than is expected from theory, since the unused  $\text{K}_4\text{Fe}(\text{CN})_6$  is oxidised to  $\text{K}_3\text{Fe}(\text{CN})_6$  and the  $\text{OH}^+$  thus liberated is consumed by the blue ppt. For this reason basic (I) results from sol. (I) by the action of  $\text{H}_2\text{O}_2$  in presence of excess of  $\text{K}_4\text{Fe}(\text{CN})_6$ . Basic (I) is not formed in appreciable amount from sol. (I) under the influence of  $\text{H}_2\text{O}_2$ .

(I) is transformed by  $\text{KHC}_2\text{O}_4$  into a colloidal, blue solution and, if large amounts of  $\text{KHC}_2\text{O}_4$  are used, also converted into  $\text{H}_4\text{Fe}(\text{CN})_6$  and  $\text{K}_3\text{Fe}(\text{C}_2\text{O}_4)_3$ , whereby pale yellowish-green solutions which are sensitive to light result.

H. W.

**Dihydroxides of tertiary arsines, arsonium derivatives, and their salts.** G. A. RAZUVAEV, V. S. MALINOVSKI, and D. A. GODINA (J. Gen. Chem. Russ., 1935, 5, 721—727).— $\text{AsMe}_3$  in  $\text{Et}_2\text{O}$  and  $\text{HNO}_3$  yield the *mononitrate*, m.p.  $127^\circ$ , of  $\text{AsMe}_3(\text{OH})_2$ ; the free hydroxide readily eliminates  $\text{H}_2\text{O}$  to yield  $\text{AsMe}_3\text{O}$ .  $\text{AsMe}_4\text{I}$  affords  $\text{AsMe}_4\text{NO}_3$ , m.p.  $268-270^\circ$ , with  $\text{AgNO}_3$ , and  $\text{AsMe}_4\text{OH}$  with  $\text{AgOH}$ . The following compounds have been prepared analogously:  $\text{AsPhMe}_2\text{O}$ , m.p.  $157-161^\circ$ ,  $\text{OH}\cdot\text{AsPhMe}_2\text{NO}_3$ , m.p.  $149-150^\circ$ ,  $\text{AsPhMe}_3\text{OH}$ , m.p.  $106-116^\circ$  (*nitrate*, m.p.  $195-196^\circ$ ),  $\text{AsPh}_2\text{Me}(\text{OH})_2$  (*nitrate*, m.p.  $106-107^\circ$ ),  $\text{AsPh}_2\text{Me}_2\text{I}$ , m.p.  $211-213^\circ$ ,  $\text{AsPh}_2\text{Me}_2\text{OH}$ , m.p.  $120-135^\circ$  (*nitrate*, m.p.  $149-151^\circ$ ),  $\text{AsPh}_2\text{MeNO}_3$ , m.p.  $100^\circ$ ,  $(\text{AsPh}_2\text{OH})_2\text{SO}$ , m.p.  $195^\circ$ ,  $\text{AsR}_2\text{Me}$ , b.p.  $170^\circ/20\text{ mm.}$ ,  $\text{AsR}_2\text{Me}_2\text{I}$ , m.p.  $186-187^\circ$ ,  $\text{AsR}_2\text{MeOH}$  (*nitrate*, m.p.  $147^\circ$ ) ( $\text{R}=\text{cyclohexyl}$ ).

R. T.

**Preparation of germanium alkyl or phenyl trihalides,  $\text{RGeX}_3$ , and of germanium methylene hexachloride.** A. TCHAKIRIAN and M. LEWINSOHN (Compt. rend., 1935, 201, 835—837).—Good yields of  $\text{GeRX}_3$  are obtained by heating  $\text{Cs}[\text{GeCl}_3]$  (A., 1931, 322) with alkyl or aryl halides (iodides best). Thus at  $110^\circ$   $\text{EtI}$  affords  $\text{GeEtCl}_3$  (60% yield) and  $\text{PhI}$  at  $250^\circ$  gives  $\text{GePhCl}_3$  (80%). With  $\text{CH}_3\text{I}_2$  at  $200^\circ$  is obtained *germanium methylene hexachloride*, b.p.  $110^\circ/18\text{ mm.}$  (80%). Hydrolysis of these affords  $\text{McGeO}_2\text{H}$  and *germanomalonic acid*,  $\text{CH}_2(\text{GeO}_2\text{H})_2$ , reconverted into the chlorides by conc.  $\text{HCl}$ .

J. W. B.

**Preparation of lead diethyl dichloride.** A. J. JAKUBOVITSCH and I. PETROV (J. pr. Chem., 1935, [ii], 144, 67—68).—Passage of  $\text{HCl}$  into a solution of  $\text{PbEt}_4$  in  $\text{PhMe}$  at  $90^\circ$  leads to mixtures of  $\text{PbEt}_2\text{Cl}_2$  and  $\text{PbCl}_2$ , the composition of which varies with the duration of the action (cf. Gilman *et al.*, A., 1933, 900). Grüttner's method (A., 1916, i, 799) is trustworthy.

H. W.

**Dimethylcyclohexanes.** O. MILLER (Bull. Soc. chim. Belg., 1935, 44, 513—522; cf. A., 1933, 815).—Hydrogenation of *p*-xylene in  $\text{AcOH}$  with a Pt-black catalyst at room temp. gives mainly *cis*-, m.p.  $-91.6^\circ$ , b.p.  $124.59^\circ/760\text{ mm.}$ , and a little *trans*-1:4-dimethylcyclohexane, m.p.  $-37.2^\circ$ , b.p.  $119.63^\circ/760\text{ mm.}$ , separated by repeated fractional distillation. At  $200^\circ$  (and without  $\text{AcOH}$ ) the latter is the chief product. With a  $\text{Ni-Al}_2\text{O}_3$  catalyst at  $180^\circ$  the *trans*-isomeride is mainly formed together with some methylcyclohexane (I). Similarly hydrogenation of *m*-xylene yields *cis*-, m.p.  $-100^\circ$ , b.p.  $124.9^\circ/760\text{ mm.}$ , and *trans*-1:3-dimethylcyclohexane, m.p.  $-79.4^\circ$ , b.p.  $120.40^\circ/760\text{ mm.}$ , the latter being the chief product both at  $20^\circ$  and at  $180^\circ$ . With a  $\text{Ni-Al}_2\text{O}_3$  catalyst some (I) is also formed. In each case the *trans*-configuration has been assigned to the more volatile isomeride. 1:1-Dimethylcyclohexane, m.p.  $-34.1^\circ$ , b.p.  $119.8^\circ/760\text{ mm.}$  (A., 1932, 372), is most readily obtained by hydrogenation of dimethyl-

dihydroresorcinol in  $\text{EtOAc}$  with an active Pt catalyst. The *d*, *n*, and  $\eta$  of these compounds are recorded.

H. G. M.

**Constituents of the unsaponifiable fraction of wheat-germ oil. Vitamin-E.**—See A., 1935, 1551.

**The hydrocarbon  $\text{C}_6\text{D}_6$ .** H. ERLÉNMEYER and H. LONECK (Helv. Chim. Acta, 1935, 18, 1464—1466).—Distillation of dry  $\text{C}_6(\text{CO}_2)_6\text{Ca}_3$  with  $\text{Ca}(\text{OD})_2$  (from  $\text{Ca}$  and  $\text{D}_2\text{O}$ ) gives pure  $\text{C}_6\text{D}_6$ , b.p.  $79.4^\circ/760\text{ mm.}$ , m.p.  $6.8^\circ$  (cf. Wilson, A., 1935, 1198).

J. W. B.

**Fluorinated chlorobenzenes.** H. S. BOOTH, H. M. ELSEY, and P. E. BURCHFIELD (J. Amer. Chem. Soc., 1935, 57, 2064—2065).—The prep. of *m*-chlorofluorobenzene, b.p.  $127.6^\circ/760\text{ mm.}$ , m.p.  $<-78^\circ$ , and 2:4:6-trichlorofluorobenzene, b.p.  $208.4^\circ/760\text{ mm.}$ , m.p.  $11.2^\circ$ , is described. V.p. of these compounds at  $0-130^\circ$  have been measured.

E. S. II.

**Iodoxy-group and its relations.** I. MASSON, E. RACE, and (in part) F. E. POUNDER (J.C.S., 1935, 1669—1679).— $\text{PhIO}_2$  (I) (modified prep.) is not identical with *diphenyliodonium periodate*, m.p.  $129^\circ$  (decomp.); it is quantitatively nitrated (methods described) to *m*- $\text{IO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NO}_2$ , m.p.  $37.9^\circ$ , is amphoteric, and yields the following salts: *sulphate*, m.p.  $127^\circ$  (decomp.), *perchlorate*, explosive decomp. at room temp., *nitrate*, and *phosphate*. With cold aq.  $\text{NaOH}$ , (I) first reacts as an acid of apparent  $K 10^{10}$ , forming a *phenyliodoxylate* (II) ( $\text{PhIO}_2+\text{OH}^- \rightleftharpoons \text{PhIO}_2\cdot\text{OH}^-$ ) which rapidly gives  $\text{NaIO}_3$  and  $\text{Ph}_2\text{IO}\cdot\text{OH}$  (III) or  $\text{Ph}_2\text{I}(\text{OH})_3$  [*Ac* derivative (IV), m.p.  $114^\circ$  (decomp.); *carbonate*, amorphous]; with aq. alkali at  $100^\circ$ , (I) or (III) yields the iodate and  $\text{C}_6\text{H}_6$ . This and other evidence shows the  $\cdot\text{IO}_2$  to be a *m*-directing, strongly cationoid dipole. Structures are suggested for (I), (II), and (IV).

F. N. W.

**Nitration of hydrocarbons by nitrogen peroxide in the gaseous phase, with and without the action of ultra-violet light.** P. P. SCHORIGIN and A. V. TOPTSCHEV (J. Gen. Chem. Russ., 1935, 5, 549—554).— $\text{PhMe}$  and  $\text{NO}_2$  at  $14^\circ$  afford  $\text{CH}_2\text{Ph}\cdot\text{NO}$  and  $\text{C}_6\text{H}_4\text{Me}\cdot\text{NO}_2$ ; the yields of both are increased by ultra-violet light, and fall with rise in temp. The yields of  $\text{NO}_2$ -derivatives of  $\text{C}_6\text{H}_6$  and *cyclo*- and *n*-hexane are unaffected by ultra-violet light, whence it is concluded that this influences only those substrates capable of tautomeric change.

R. T.

**Benzotrifluoride and its halogenated derivatives.** H. S. BOOTH, H. M. ELSEY, and P. E. BURCHFIELD (J. Amer. Chem. Soc., 1935, 57, 2066—2069).—The prep. of  $\text{CPhF}_3$  from  $\text{CPhCl}_3$  and  $\text{SbF}_3$  is described. The following compounds have been prepared: *m*-, b.p.  $100.9^\circ$ , m.p.  $-81.5^\circ$ , and *p*- $\text{C}_6\text{H}_4\text{F}\cdot\text{CF}_3$ , b.p.  $102.8^\circ$ , m.p.  $-41.7^\circ$ ; *o*-, b.p.  $152.8^\circ$ , m.p.  $-7.4^\circ$  to  $-7.6^\circ$ , *m*-, b.p.  $138.4^\circ$ , m.p.  $-55.4^\circ$ , and *p*- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{CF}_3$ , b.p.  $139.3^\circ$ , m.p.  $-34.0^\circ$ ; 3:4- $\text{C}_6\text{H}_3\text{Cl}_2\cdot\text{CF}_3$ , b.p.  $173.5^\circ$ , m.p.  $-12.3^\circ$  to  $-12.5^\circ$ .

E. S. II.

**Condensations of alcohols with aromatic hydrocarbons in presence of aluminium chloride.**

**II. Condensation of secondary alcohols with benzene and toluene.** I. TZUKERVANIK and K. TOKAREVA (J. Gen. Chem. Russ., 1935, 5, 764—766).—

$C_6H_6$  and  $Pr^{\beta}OH$  in presence of  $AlCl_3$ , afford  $PhPr^{\beta}$  and  $C_6H_5Pr^{\beta}$ , b.p. 205–210°; with  $PhMe$  the product is  $p-C_6H_4MePr^{\beta}$ , and with  $Bu^{\beta}OH$ ,  $PhBu^{\beta}$  and  $C_6H_5MeBu^{\beta}$  are obtained. The reaction is  $ROH + AlCl_3 \rightarrow AlCl_2 \cdot OR$  (I) +  $HCl$ ; (I) +  $C_6H_6 \rightarrow PhR + AlCl_3 \cdot OH$ . R. T.

**Influence of structure on the polymerisation of substituted styrenes.** P. P. SOHORIGIN and N. V. SOHORIGINA (J. Gen. Chem. Russ., 1935, 5, 555–561).—The polymeride of *o*-tolylethylene is more elastic than is that of styrene, whilst those of *m*- and *p*-tolyl- and 1-naphthyl-ethylene are less so. R. T.

**Optical rotation of phenylethylmethyloctylmethane [ $\alpha$ -phenyl- $\gamma$ -methylundecane].** P. A. LEVENE and S. A. HARRIS (J. Biol. Chem., 1935, 111, 735–738).— $l-C_6H_5 \cdot CH_2 \cdot CHMe \cdot CH_2 \cdot MgBr$  and  $C_8H_{17} \cdot CHO$  give  $\alpha$ -phenyl- $\gamma$ -methylundecan- $\epsilon$ -ol, b.p. 183–184°/5 mm.,  $[\alpha]_D^{20} -2.64^\circ$ , converted by cold  $HI$  into the iodide, which, when hydrogenated (Raney Ni) in ligroin- $MeOH$ - $NaOH$ , affords  $\alpha$ -phenyl- $\gamma$ -methylundecane, b.p. 143–145°/2 mm.,  $[\alpha]_D^{20} -1.12^\circ$ , and thence ( $H_2$ - $PtO_2$ ;  $AcOH$ - $EtOAc$ )  $\alpha$ -cyclohexyl- $\gamma$ -methylundecane, b.p. 147°/3 mm.,  $[\alpha]_D^{20} -0.44^\circ$ . The contribution of  $C_6H_{11}$  to  $[M]$  is much < that of  $Pr^{\beta}$  in this series.  $[\alpha]$  are max. vals. for the homogeneous liquids. R. S. C.

**Laws of substitution in the sulphonation of naphthalene and its derivatives.** V. N. UMATZEV (J. Gen. Chem. Russ., 1935, 5, 653–660).—Substitution takes place according to the same laws as for  $C_6H_6$ , on the assumption that  $C_{10}H_8$  exists in three tautomeric forms, containing two aromatic nuclei, or one aromatic and one hydroaromatic nucleus. R. T.

**Nitration of 1-ethylnaphthalene.** G. LEVY (Compt. rend., 1935, 201, 900–902).— $1-C_{10}H_7Et$  when nitrated (cf. A., 1933, 57) gives an inseparable mixture of isomerides, reduced ( $Fe$ - $AcOH$ ) to 4-ethyl- $\alpha$ -naphthylamine, an oil ( $Ac$  derivative, m.p. 148.5°; hydrochloride), the sulphate of which with 1%  $H_2SO_4$  at 200° gives 4-ethyl- $\alpha$ -naphthol (cf. A., 1933, 1287). J. L. D.

**Methylethylnaphthalenes. III. Synthesis of 2-methyl-6-ethylnaphthalene.** O. BRUNNER and F. GROF (Monatsh., 1935, 66, 433–437).—Application of Reformatski's method to  $p-C_6H_4Et \cdot CHO$  and  $(HMeBr \cdot CO_2Et)$  leads to  $Et \alpha$ -methyl- $p$ -ethylcinnamate, b.p. 159–160°/11 mm., reduced by  $Na$  and  $EtOH$  to  $\gamma$ - $p$ -ethylphenyl- $\beta$ -methylpropanol (I), b.p. 140°/10 mm. (I) is transformed successively into  $\gamma$ - $p$ -ethylphenyl- $\beta$ -methyl- $n$ -propyl bromide, b.p. 141–142°/10 mm., and the corresponding nitrile, which is hydrolysed by boiling 10%  $KOH$ - $EtOH$  to  $\gamma$ - $p$ -ethylphenyl- $\beta$ -methyl- $n$ -butyric acid, b.p. 185–187°/10 mm. The acid and conc.  $H_2SO_4$  at 100° afford 4-keto-2-methyl-6-ethyl-1:2:3:4-tetrahydronaphthalene, b.p. 143–148°/11 mm., reduced (Clemmensen) to 2-methyl-6-ethyl-1:2:3:4-tetrahydronaphthalene, b.p. 140–145°/10 mm., dehydrogenated by  $S$  at 270–300° to 2-methyl-6-ethylnaphthalene, b.p. 145–150°/11 mm. (picrate, m.p. 100–101°; styphnate, m.p. 138–139°). H. W.

**Sulphonation of naphthalene. I. Determination of the relative proportions of naphthalene-**

**1- and 2-sulphonic acids.** R. LANTZ (Bull. Soc. chim., 1935, [v], 2, 1913–1932).—Under closely defined conditions  $1-C_{10}H_7 \cdot SO_3H$  (I) is brominated with loss of  $SO_3H$  to an insol. substance which is determined by  $CrO_3$ -oxidation (cf. B., 1932, 590), whilst  $2-C_{10}H_7 \cdot SO_3H$  (II) is brominated without loss of  $SO_3H$  and remains sol., thus permitting the determination of (I) and (II) in mixtures. H. G. M.

**Substitution in polycyclic systems. I. Nitration of fluorene and 9-bromofluorene.** S. V. ANANTAKRISHNAN and E. D. HUGHES (J.C.S., 1935, 1607–1609).—Nitration of fluorene (cf. A., 1930, 1425) yields 2:5- and 2:7-dinitrofluorene, m.p. 205–300° (decomp.) (lit. 269° and 334°). Mild nitration ( $HNO_3$  in  $Ac_2O$ ; 1 hr.; 0°) of 9-bromofluorene (I) gives 9-bromo-2-nitrofluorene (II); more vigorous treatment (2 hr. at 0°, followed by 15 hr. at room temp.) gives 9-bromo-2:5- (III), m.p. 199°, and -2:7-dinitrofluorene (IV), m.p. 255° (decomp.). Nitration of (I) in  $AcOH$  yields (IV) and 7-bromo-2-nitrofluorenone (?), whilst oxidation ( $Na_2Cr_2O_7$  in  $AcOH$ ) of (II), (III), and (IV) gives 2-nitro-, 2:5- and 2:7-dinitro-fluorenone, respectively. (III) and (IV) are also obtained by nitration ( $HNO_3$  in  $Ac_2O$ ) of (II). F. N. W.

**Influence of poles and polar linkings on the course pursued by elimination reactions. XXIII. Stable derivatives of the tervalent carbon compound of Ingold and Jessop.** E. D. HUGHES and K. I. KURIYAN (J.C.S., 1935, 1609–1611).—9-Bromo-2-nitrofluorene with  $Me_2S$  in  $MeNO_2$  yields 2-nitrofluorenyl-9-dimethylsulphonium bromide (I), m.p. 130° (decomp.). (I) or the corresponding picrate, m.p. 185° (decomp.), with alkali in  $H_2O$ ,  $EtOH$ , or  $COMe$ , yields dimethylsulphonium 9-2-nitrofluorenylidide, m.p. 300°, which decomposes in boiling  $MeNO_2$  solution forming 2:2'-dinitrobisdi-phenylene-ethylene (II), with liberation of  $Me_2S$ . (II) is oxidised ( $Na_2Cr_2O_7$ - $AcOH$ ) to 2-nitrofluorenone. Nitration [ $HNO_3$  (d 1.5) at -15°] of fluorenyl-9-dimethylsulphonium picrate yields 2:7-dinitrofluorenyl-9-dimethylsulphonium picrate (III), m.p. 180° (decomp.), converted by aq. alkali into dimethylsulphonium 9-2:7-dinitrofluorenylidide, which with  $HBr$ - $COMe$ , yields 2:7-dinitrofluorenyl-9-dimethylsulphonium bromide (IV), m.p. about 230°, and when boiled in  $MeNO_2$  gives 2:2':7:7'-tetranitrobisdi-phenylene-ethylene (V), m.p. >300°. (III) when refluxed with  $HBr$ - $AcOH$  (30 min.) gives 9-bromo-2:7-dinitrofluorene (VI), whilst (IV) with  $CrO_3$ - $AcOH$  yields 2:7-dinitrofluorenone and when heated alone forms (VI) with liberation of  $Me_2S$ . (V) is oxidised to 2:7-dinitrofluorenone.  $Me_2Se$  and 9-bromofluorene in  $MeNO_2$  give fluorenyl-9-dimethylselenonium bromide, m.p. 134–135° (corresponding picrate, m.p. 143°). F. N. W.

**Compounds related to the sterols, bile acids, and oestrus-producing hormones. VII. A.** COHEN, J. W. COOK, and C. L. HEWITT (J.C.S., 1935, 1633–1637).—2-Methyl-1-allyl-3:4-dihydrophenanthrene (I) (picrate, m.p. 75–76°) is obtained from  $CH_2=CH \cdot CH_2 \cdot MgBr$  and 1-keto-2-methyl-1:2:3:4-tetrahydrophenanthrene (II) (modified prep.). 2-Methyl-1- $n$ -propylphenanthrene, m.p. 65° [picrate, m.p.

121.5—122°;  $s\text{-C}_6\text{H}_3(\text{NO}_2)_3$  complex, m.p. 131°, is obtained from (I) either by heating with Se (320°, 15 hr.) or by heating in saturated HCl-AcOH solution (100°, 1 hr.). 2-Methyl-1- $\Delta^7$ -butenyl-3:4-dihydrophenanthrene, b.p. 155—160°/0.3 mm. (picrate, m.p. 77—78°), contaminated with 2-methyl-3:4-dihydrophenanthrene results from the interaction of (II) and  $\text{CH}_2\text{:CH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{MgBr}$ , and when cyclised with  $\text{H}_2\text{SO}_4\text{-AcOH}$  (1:20) (100°, 2.25 hr.) yields principally methylhexahydrochrysene. 1-( $\beta$ -5-Tetralylethyl)cyclohexanol, b.p. 175—180°/0.4 mm. (3:5-dinitrobenzoate, m.p. 124—125°), obtained by the interaction of cyclohexanone and Mg  $\beta$ -5-tetralylethyl chloride, yields 1-( $\beta$ -5'-tetralylethyl)- $\Delta^1$ -cyclohexene (III), b.p. 140—150°/0.05 mm., when heated with  $\text{KHSO}_4$  (160—170°, 1 hr.). (III) when cyclised with  $\text{AlCl}_3$  (0°, 7.5 hr.) gives a mixture of dodecahydrochrysene, which is partly hydrogenated (300—310°, 14 hr., Se) to *s*-octahydrochrysene, m.p. 136—138° (picrate, m.p. 139—140°), and a hydrocarbon, b.p. 123—130°, which is dehydrogenated (Pt-black; 300—320°, 3 hr.) to 4:5-benzhydryndene-1-spirocyclohexane, m.p. 56—57° (picrate, m.p. 125—126°). F. N. W.

**The alleged dihydrophenylbenzamidine.** A. KIRSSANOV and I. IVASTCHENKO (Bull. Soc. chim., 1935, [v], 2, 1944—1950).—Contrary to the views of Bernthsen *et al.* (A., 1880, 639) no dihydrophenylbenzamidine (I) is obtained when phenylbenzamidine (II) (improved prep.) is reduced by Na-Hg, the only products being PhCHO,  $\text{NH}_2\text{Ph}$ ,  $\text{NHPh}\cdot\text{CH}_2\text{Ph}$ ,  $\text{CH}_2\text{Ph}\cdot\text{NH}_2$ , and unchanged (II). The product regarded by Bernthsen as (I) is considered to be purified (II). (I) has therefore never been prepared.

H. G. M.

**Reactivity of halogen compounds. III, IV.**—See A., 1935, 1465.

**Derivatives of 6-bromo- and 4:6-dibromo-*m*-toluidine.** G. D. PARKES and E. D'A. BURNEY (J.C.S., 1935, 1619—1621).—The following *m*-toluidines, prepared by suitable modifications of ordinary methods, are described: *o*-, m.p. 146°, *m*-, m.p. 114°, and *p*-nitrobenz-, m.p. 148°; benz-6-bromo-, m.p. 123° (lit. 98°); *o*-, m.p. 163°, *m*-, m.p. 185.5°, and *p*-nitrobenz-6-bromo-, m.p. 258°; benz-4:6-dibromo-, m.p. 131°; *o*-, m.p. 203°, *m*-, m.p. 207°, and *p*-nitrobenz-4:6-dibromo-, m.p. 182.5°. 6-Bromo-, m.p. 191°, and 4:6-dibromo-*m*-tolylcarbamide, m.p. 218°, are obtained from the appropriate toluidine, KCNO, and warm 0.5*N*-HCl.  $\text{CO}(\text{NH}_2)_2$  when heated with excess of the appropriate base yields *s*-bis-6-bromo-, m.p. 276°, and 6-bis-4:6-dibromo-*m*-tolylcarbamide, m.p. 297°. 6-Bromo-, m.p. 143°, and 4:6-dibromo-*m*-tolueneazo- $\beta$ -naphthol, m.p. 193°, were prepared from the appropriate diazotised base and  $\beta\text{-C}_{10}\text{H}_7\text{OH}\cdot 2\text{N}\cdot\text{NaOH}$ . The following were prepared from the appropriate aldehyde and 6-bromo-*m*-tolylhydrazine hydrochloride obtained by reduction of diazotised 6-bromo-*m*-toluidine with  $\text{SnCl}_2\text{-HCl}$ : benzaldehyde-, m.p. 154°; *o*-, m.p. 175.5°, *m*- (I), m.p. 188°, and *p*-nitrobenzaldehyde-6-bromo-*m*-tolylhydrazone, m.p. 171.5°. The following were prepared by similar methods: benzaldehyde-, m.p. 109°; *o*-, m.p. 180°, *m*- (II), m.p. 204°, and *p*-nitrobenzaldehyde-4:6-dibromo-*m*-tolylhydrazone, m.p. 221°. *m*-

Nitrobenzaldehyde-*m*-tolylhydrazone with Br-AcOH affords  $\alpha$ -bromo-*m*-nitrobenzaldehyde-4:6-dibromo-*m*-tolylhydrazone, m.p. 191°, also obtained by bromination of (I) and (II).  $\alpha$ -Bromobenzaldehyde-, m.p. 122°, and  $\alpha$ -bromo-*o*-nitrobenzaldehyde-4:6-dibromo-*m*-tolylhydrazone (III), m.p. 151°, were similarly prepared.  $\alpha$ -Bromo-*p*-nitrobenzaldehyde-4:6-dibromo-*m*-tolylhydrazone when warmed with  $\text{EtOH-H}_2\text{O-NH}_3$  yields *p*-nitrobenzenyl-4:6-dibromo-*m*-tolylhydrazidine, m.p. 207°. The corresponding *m*- $\text{NO}_2$ -compound, similarly prepared, has m.p. 155°. (III) when warmed with just sufficient EtOH for dissolution yields 3-keto-1:3-endo-4':6'-dibromo-*m*-tolylimino-1:2-dihydro-1:2-benzisodiazole 1-oxide (IV), which explodes at 126°. H. G. M.

**Synthesis and chemical properties of  $\alpha$ -ethylenic carbimides,  $\text{R}\cdot\text{CH}:\text{CR}'\cdot\text{N}:\text{C}:\text{O}$ .** J. HOCH (Compt. rend., 1935, 201, 733—735).—*N*-Carbethoxyketimines (A., 1935, 1483) under reduced pressure in presence of kieselguhr at 400° afford carbimides. The following are prepared: 8- $\Delta^7$ -heptenyl-, b.p. 55—56°/17 mm.,  $\Delta^{1:2}$ -cyclohexenyl- (I), b.p. 61—63°/18 mm., 2-methyl- $\Delta^{1:2}$ -cyclohexenyl-, b.p. 73—74°/18 mm.,  $\alpha$ -phenylvinyl-, b.p. 99°/25 mm., and  $\alpha$ -phenyl- $\Delta^2$ -propenyl-carbimide, b.p. 110—112°/18 mm. They decolorise Br rapidly and with  $\text{NH}_2\text{Ph}$  in anhyd.  $\text{Et}_2\text{O}$  afford phenylcarbimides, m.p. 102°, 197°, 170°, 142°, and 185°, respectively, which are easily decomposed by dil. HCl into ketones and  $\text{NHPh}\cdot\text{CO}\cdot\text{NH}_2$ . (I) with  $\text{NH}_3$  gives  $\Delta^{1:2}$ -cyclohexenylcarbamide, m.p. 144°, with  $\text{N}_2\text{H}_4$ , hydrazine- $\alpha\beta$ -dicarboxydicyclohexenylamide, m.p. 186°, and with  $\text{NHPhMe}$ , *N*-cyclohexenyl-*N*'-phenylmethylcarbamide, m.p. 88°. With EtOH,  $\text{Pr}^i\text{OH}$ , and PhOH, (I) affords Et, b.p. 148—149°/26 mm.,  $\text{Pr}^i$ , b.p. 147°/23 mm., and Ph  $\Delta^{1:2}$ -cyclohexenylcarbamate, m.p. 106—107°, respectively, and with  $\text{CPh}_2\cdot\text{NH}$ , *N*-cyclohexenyl-*N*'-diphenylmethylenecarbamide, m.p. 119°. J. L. D.

**Rearrangement of thiocyanates into thiocarbimides.** E. BERGMANN (J.C.S., 1935, 1361—1362). If the change  $\text{CH}_2\text{:CH}\cdot\text{CH}_2\cdot\text{SCN} \rightarrow \text{CH}_2\text{:CH}\cdot\text{CH}_2\cdot\text{N}:\text{C}:\text{S}$  proceeds by attachment of N to terminal C and rupture between  $\text{CH}_2$  and S, cinnamyl thiocyanate (I), m.p. 68° (prepared from  $\text{CHPh}\cdot\text{CH}\cdot\text{CH}_2\text{Br}$  and KSCN), should when heated in vac. give  $\text{CHPh}(\text{NCS})\cdot\text{CH}:\text{CH}_2$ ; actually cinnamylthiocarbimide (II), b.p. 162°/12 mm., is formed. The structure of (I) is proved by hydrogenation to  $\gamma$ -phenylpropyl thiocyanate, b.p. 180°/30 mm., also obtained from  $\text{CH}_2\text{Ph}\cdot[\text{CH}_2]_2\cdot\text{Br}$  (III) and  $\text{NH}_4\text{SCN}$ ; that of (II) by reaction with  $\text{NH}_2\text{Ph}$  to form *s*-phenylcinnamylthiocarbamide, m.p. 119°, also obtained from  $\text{NPh}:\text{C}:\text{S}$  and  $\text{CH}_2\text{Ph}\cdot\text{CH}\cdot\text{CH}_2\cdot\text{NH}_2$  (IV); and that of (IV) confirmed by hydrogenating the phthalimide, from which it is prepared, to phthal- $\gamma$ -phenylpropylimide, m.p. 61°, also obtained from (III), and thus excluding the alternative structure  $\text{NH}_2\cdot\text{CHPh}\cdot\text{CH}:\text{CH}_2$ .

E. W. W.

**Substitution in arylsulphon-1- and -2-naphthalides.** R. CONSDEN and J. KENYON (J.C.S., 1935,

1591—1596).—*m*-Nitrobenzenesulphon-1-naphthalide (I), m.p. 162—164° [obtained from  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub> and *m*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·SO<sub>2</sub>Cl (II)], is nitrated (a) by AcOH—conc. HNO<sub>3</sub> giving 2:4-dinitro-1-*m*-nitrobenzenesulphon-naphthalide, m.p. 185—188° [hydrolysed by conc. H<sub>2</sub>SO<sub>4</sub> to 1:2:4-C<sub>10</sub>H<sub>5</sub>(NH<sub>2</sub>)(NO<sub>2</sub>)<sub>2</sub>], and (b) by ice-cold fuming HNO<sub>3</sub>, and (c) by AcOH—fuming HNO<sub>3</sub> on the water-bath giving the 2:4:5-(NO<sub>2</sub>)<sub>3</sub>-derivative, m.p. 215° (decomp.) (C<sub>5</sub>H<sub>5</sub>N salt, m.p. 170—175°), also obtained from 5-nitro-1-*m*-nitrobenzenesulphon-naphthalide, m.p. 208—210°, and AcOH—HNO<sub>3</sub>. (I) when refluxed with CHCl<sub>3</sub>—Br gives 4-bromo-1-*m*-nitrobenzenesulphon-naphthalide, m.p. 174—176° (hydrolysed by H<sub>2</sub>SO<sub>4</sub> to 4:1-C<sub>10</sub>H<sub>6</sub>Br·NH<sub>2</sub>), and in C<sub>5</sub>H<sub>5</sub>N with Br gives the 2:4-Br<sub>2</sub>-derivative, m.p. 232—233°, also obtained from 2:4:1-C<sub>10</sub>H<sub>5</sub>Br<sub>2</sub>·NH<sub>2</sub> (improved prep.) and (II). 4-Nitro-1-*p*-toluenesulphon-naphthalide with Br in C<sub>5</sub>H<sub>5</sub>N (but not CHCl<sub>3</sub>) yields its 2-Br-derivative, m.p. 193—195°, hydrolysed to 2:4:1-C<sub>10</sub>H<sub>5</sub>Br(NO<sub>2</sub>)·NH<sub>2</sub>. *p*-Toluenesulphon-1-naphthalide with AcOH—conc. HNO<sub>3</sub> affords its 2:4-(NO<sub>2</sub>)<sub>2</sub>- and 2-NO<sub>2</sub>-derivative, m.p. 154°, hydrolysed to 1:2-C<sub>10</sub>H<sub>6</sub>(NH<sub>2</sub>)·NO<sub>2</sub>. Nitration of 2:4-dinitro- $\alpha$ -naphthol with fuming HNO<sub>3</sub> (with or without AcOH) yields the 2:4:5- and 2:4:7-(NO<sub>2</sub>)<sub>3</sub>-derivatives in the ratio of about 5:2. *p*-Toluenesulphon-2-naphthalide (III) with Br—CHCl<sub>3</sub> yields its 1-Br-derivative. 1:3:2-C<sub>10</sub>H<sub>5</sub>Br<sub>2</sub>·NH<sub>2</sub> when refluxed (2 hr.) with EtOH—conc. HCl granulated Sn affords 3-bromo- $\beta$ -naphthylamine, m.p. 173° (*Ac* derivative, m.p. 177°), the *p*-toluenesulphonyl derivative, m.p. 127—129°, of which is nitrated in AcOH to 3-bromo-1-nitro-2-*p*-toluenesulphon-naphthalide, m.p. 237—239° (decomp.), also obtained from the appropriate nitro-compound with C<sub>5</sub>H<sub>5</sub>N—Br, reduced (Sn—HCl or Zn—AcOH) to 3-bromo-2-*p*-toluenesulphonyl-1:2-naphthylenediamine, m.p. 185°, and hydrolysed (ice-cold H<sub>2</sub>SO<sub>4</sub>) to 3-bromo-1-nitro- $\beta$ -naphthylamine (IV), m.p. 105° (*Ac* derivative, m.p. 136°). This with boiling *N*-NaOH affords 3-bromo-1-nitro- $\beta$ -naphthol, m.p. 131° (decomp.). (IV) is reduced with Sn—HCl to 3-bromo-1:2-naphthylenediamine, m.p. 85°, which with benzil in hot EtOH gives a quinoxaline derivative, m.p. 195—199°. 1:6-Dinitro-2-*p*-toluenesulphon-naphthalide with Br—C<sub>5</sub>H<sub>5</sub>N gives its 3-Br-derivative, m.p. 228—231° (decomp.), hydrolysed to 3-bromo-1:6-dinitro- $\beta$ -naphthylamine, m.p. 238—241° [*Ac* derivative, m.p. 273—277° (decomp.)]. (III) in C<sub>5</sub>H<sub>5</sub>N with I, ICl, or ICl<sub>3</sub> affords 1-iodo-2-*p*-toluenesulphon-naphthalide, m.p. 126—127°, from which the base could not be obtained owing to its instability (cf. J.C.S., 1885, 47, 520), and which when warmed with AcOH—NaNO<sub>2</sub> during 3 hr. affords the corresponding 1-NO<sub>2</sub>-derivative. The following were obtained by similar methods: 3-iodo-2-*p*-toluenesulphonamidodiphenyl, m.p. 114—115°; 3-iodo-4-*p*-toluenesulphonamidodiphenyl, m.p. 109—115°; 2-iodo-*p*-toluenesulphon-*p*-toluidide, m.p. 127—123°.

H. G. M.

**Ditolyl series. IV. Separation of *dl*-6-bromo-6'-amino-2:2'-dimethyldiphenyl into its optical antipodes.** A. ANGELETTI [in part with C. MIGLIARDI] (Gazzetta, 1935, 65, 819—823).—For the prep. of 6-bromo-6'-nitro-2:2'-dimethyldiphenyl (I),

the diazotisation of the 6-NH<sub>2</sub>-compound is best effected in HBr. (I) is reduced (SnCl<sub>2</sub>) to *dl*-6-bromo-6'-amino-2:2'-dimethyldiphenyl (II), m.p. 77—78°, which is resolved by *d*-tartaric acid into the *l*- (III), m.p. 77—78°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> —5.32°, and *d*-, m.p. 77—78°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> +5.04°, forms. (II) is converted into *dl*-, m.p. 109—110°, and (III) into *l*-, m.p. 109—110°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> —6.2°, -6:6'-dibromo-2:2'-dimethyldiphenyl. E. W. W.

**Alkylated ethylenediamine derivatives. IV. Reaction between  $\alpha\beta$ -bis(benzylideneamino)-ethane, phenylcarbimide, and water.** J. VAN ALPHEN (Rec. trav. chim., 1935, 54, 885—887; cf. A., 1935, 1118).—Interaction of equimol. proportions of PhNCO and (·CH<sub>2</sub>·N·CHPh)<sub>2</sub> (I) in moist Et<sub>2</sub>O affords *s*-phenyl- $\beta$ -benzylideneaminoethylcarbamide (II), hydrolysed by dil. HCl to  $\beta$ -( $\gamma$ -phenylcarbamido)-ethylamine (*Bz* derivative, m.p. 210°), and reduced (Na—EtOH) to the hydrochloride of benzyl- $\beta$ -( $\gamma$ -phenylcarbamido)ethylamine (*Bz* derivative, m.p. 160°). With an excess of PhNCO (I) gives 2-keto-3:4-diphenyl-1- $\beta$ -( $\gamma$ -phenylcarbamido)ethyl-1:3-diazocyclobutane, NPh< $\begin{smallmatrix} \text{CHPh} \\ \text{CO} \end{smallmatrix}$ >N·C<sub>2</sub>H<sub>4</sub>·NH·CO·NHPh, m.p. 208° (decomp.) [also by action of PhNCO on (II)], hydrolysed by boiling dil. HCl to PhCHO and NHPh·CO·NHR, and reduced (Na—EtOH) to NHPh·CO·NHR·CH<sub>2</sub>Ph (R=C<sub>2</sub>H<sub>4</sub>·NH·CO·NHPh).

J. W. B.

**Preparation of *m*- and *p*-phenylenediethylamine and benzo-hexamethyleneimine from the three phenylenediacetonitriles.** P. RUGGLI, B. B. BUSSEMAKER, W. MÜLLER, and A. STAUB (Helv. Chim. Acta, 1935, 18, 1388—1395).—Reduction of *m*- and *p*-phenylenediacetonitrile, in EtOH saturated with NH<sub>3</sub>, with H<sub>2</sub>—Ni at 90—100°/70 atm. affords, respectively, *m*-[dihydrochloride + H<sub>2</sub>O, m.p. 300—302° (block)]; *platinichloride*, m.p. 242° (decomp.); *Bz*<sub>2</sub> derivative, m.p. 181°, and *p*-phenylene- $\beta\beta'$ -diethylamine, b.p. 130°/3 mm., m.p. 36° (*dihydrochloride*; *platinichloride*; *picrate*, decomp. 246°; *Ac*<sub>2</sub>, m.p. 210°, and *Bz*<sub>2</sub>, m.p. 225°, derivatives). Similar reduction of *o*-phenylenediacetonitrile gives *s*-homotetrahydroisoquinoline (von Braun *et al.*, A., 1926, 178) (*Bz*, m.p. 100°, and *Ac*, m.p. 70°, derivatives). A mechanism is suggested.

J. W. B.

**Interaction between aromatic diamines and ethyl acetoacetate.** O. G. BACKEBERG (J.C.S., 1935, 1568—1570).—Primary aromatic diamines with CH<sub>2</sub>Ac·CO<sub>2</sub>Et (I) yield  $\beta$ -phenylaminocrotonic esters and no acetoacetylides. *m*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> when heated with (I) on the water-bath (2 hr.), or when heated to 200° and rapidly poured into boiling (I), yields *Et m*-phenylenebis- $\beta$ -aminocrotonate. These reactants, however, when heated under seal gave 5- or 7-amino-2-hydroxylepidine (cf. A., 1898, i, 450). *m*-Aminoacetanilide and (I) when heated on the water-bath yield *Et*  $\beta$ -3-acetamidophenylaminocrotonate, m.p. 92°. *p*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> when heated to 200° and poured into boiling (I), or when heated with (I) on the water-bath (2 hr.) or at 150° (½ hr.) [but not at 170° (4 hr.)], yields *Et p*-phenylenebis- $\beta$ -aminocrotonate, m.p. 135° (cf. A., 1887, 247) (insol. in NaOH—H<sub>2</sub>O; gives dark red coloration with FeCl<sub>3</sub>—EtOH). By similar methods *p*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)·NHAc

and (I) yield *Et*  $\beta$ -4-acetamidophenylaminocrotonate, m.p. 185° (hydrolysed by boiling MeOH), but when heated under seal at 140° for 5 hr. affords some  $p$ -C<sub>6</sub>H<sub>4</sub>(NHAc)<sub>2</sub>. Dianisidine when refluxed with (I) in MeOH yields *Et* 3:3'-dimethoxydiphenylene-4:4'-bis- $\beta$ -aminocrotonate, m.p. 132—134°. Similarly tolidine and (I) afford *Et* 3:3'-dimethyldiphenylene-4:4'-bis- $\beta$ -aminocrotonate, m.p. 129—130°, whilst benzidine and (I) give a little *Et* diphenylene-4:4'-bis- $\beta$ -aminocrotonate, m.p. 99.5—100°, and mainly a double compound (NH<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·C<sub>6</sub>H<sub>4</sub>·NHX)<sub>2</sub>·NHX·C<sub>6</sub>H<sub>4</sub>·C<sub>6</sub>H<sub>4</sub>·NHX (X = CMe·CH·CO<sub>2</sub>Et), m.p. 134° (cf. A., 1899, i, 366), which, although readily dissociated, could not be separated into its components, and with C<sub>6</sub>H<sub>5</sub>-Ac<sub>2</sub>O gave *Et* 4-acetamidodiphenyl-4'- $\beta$ -aminocrotonate, m.p. 201°, readily hydrolysed to monoacetylbenzidine.

H. G. M.

**Reduction of azoxy-compounds in relation to that of diazonium derivatives.** D. BIGIARI and C. ALBANESE (Gazzetta, 1935, 65, 773—788).—NaHSnO<sub>2</sub> reacts at once with  $p$ -C<sub>6</sub>H<sub>4</sub>Me·N<sub>2</sub>·OH and  $p$ -OMe·C<sub>6</sub>H<sub>4</sub>·N<sub>2</sub>·OH, but KHSnO<sub>2</sub> only very slowly with the *o*-isomerides, or with 2:4:5-C<sub>6</sub>H<sub>2</sub>Me<sub>3</sub>·N<sub>2</sub>·OH. NaHSnO<sub>2</sub> reduces dimethylaminoazoxybenzene slowly to dimethylaminoazobenzene, and *pp'*-dihydroxyazoxybenzene to azophenol. Azoxybenzene, and the  $\alpha$ - and  $\beta$ -forms of its  $p$ -NH<sub>2</sub>-,  $p$ -Br-,  $p$ -OH-,  $p$ -CO<sub>2</sub>H-,  $p$ -Me,  $p$ -OEt-, and *oo'*-Me<sub>2</sub> derivatives, are reduced by NaHSnO<sub>2</sub> with varying ease to azo-compounds. Na<sub>3</sub>AsO<sub>3</sub> does not reduce  $\alpha$ - or  $\beta$ -benzeneazoxyphenol; these are, however, reduced by FeSO<sub>4</sub>, as is  $p$ -OH·C<sub>6</sub>H<sub>4</sub>·N<sub>2</sub>·Ph, which gives NH<sub>2</sub>Ph and  $p$ -NH<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·OH. A new test for small amounts of isodiazo-compounds in solution is to dip filter-paper into the latter, to which AcOH and  $\beta$ -C<sub>10</sub>H<sub>7</sub>·OH or *R*-salt are added; the paper removed and exposed to the air develops a red stain. This reaction is given only very slowly by phenylnitroamine; the last, and its NO-derivative, are reduced to isodiazo-compounds fairly rapidly by NaHSnO<sub>2</sub>, but only very slowly by Na<sub>3</sub>AsO<sub>3</sub>.

E. W. W.

### The azo-group as a chelating group. I. Metallic derivatives of *o*-hydroxyazo-compounds.

(MISS) M. ELKINS and L. HUNTER (J.C.S., 1935, 1598—1600).—The following Cu<sup>II</sup>, Ni, and Co<sup>III</sup> salts of some *o*-monohydroxyazo-compounds are described. They are insol. in H<sub>2</sub>O, sparingly sol. in polar solvents, readily sol. in non-polar solvents, and are chelated. They have the annexed structure, in which

the arrangement of the aryl groups about the azo-group is *trans*. Decomp. of the metallic

complexes by cold acid always regenerates the original azo-compound, and this supports the view that all stable azo-compounds are *trans*. *Cu*, m.p. 230°, *Ni*, m.p. 216°, and *Co* 3-benzeneazo-*p*-tolylloxide, m.p. 202°; *Cu*, m.p. 242°, *Ni*, m.p. 242—243°, and *Co* 3-*p'*-tolueneazo-*p*-tolylloxide, m.p. 200—201°; *Cu*, m.p. 221°, *Ni*, m.p. 214° (impure), and *Co* 3-*m'*-tolueneazo-*p*-tolylloxide, m.p. 187°; *Cu*, m.p. 243°, *Ni*, decomp. 295—310° (impure), and *Co* 2:4-bisbenzeneazophenoxide, m.p. 180—185°; *Cu*, m.p. 295°, *Ni*, m.p. 290° (dark green; gives brown solutions in C<sub>6</sub>H<sub>6</sub>, PhMe, and CHCl<sub>3</sub>), and

*Co* 1-benzeneazo- $\beta$ -naphthoxide, m.p. 221°; *Cu*, m.p. 237°, *Ni*, m.p. 293° (olive-green; gives brown solutions in C<sub>6</sub>H<sub>6</sub>, PhMe, and CHCl<sub>3</sub>), and *Co* 2-benzeneazo- $\alpha$ -naphthoxide, m.p. 199°. No metallic derivatives could be obtained from *p*-hydroxyazo-compounds, as chelation is impossible.

H. G. M.

**Azo-dyes and their intermediates. XVI. Reactions of tetrazo-compounds of the benzene and naphthalene series. *peri*-Disazo-dyes. III.** P. RUGGLI and E. CASPAR (Helv. Chim. Acta, 1935, 18, 1414—1420).—*m*-Xylylene-4:6-diamine hydrochloride (improved prep.) with NaNO<sub>2</sub>·HBF<sub>4</sub> at -10° gives the *bisdiazonium borofluoride*, which couples with 6:2-C<sub>10</sub>H<sub>6</sub>Br·OH in NaOAc-AcOH to give *m*-xylylene-4:6-bisazo-6'-bromo- $\beta$ -naphthol, is converted by CuSO<sub>4</sub>·KCN at 0° into 4:6-dimethylisophthalodinitrile, and by SH·CH<sub>2</sub>·CO<sub>2</sub>H into the unstable *bisazo-compound*, C<sub>6</sub>H<sub>2</sub>Me<sub>2</sub>(N=N·S·CH<sub>2</sub>·CO<sub>2</sub>H)<sub>2</sub>, which decomposes in H<sub>2</sub>O to give *m*-xylylene-4:6-dithioglycolic acid. Similarly 1:8-C<sub>10</sub>H<sub>6</sub>(NH<sub>2</sub>)<sub>2</sub> affords its *bisdiazonium borofluoride*, which couples with (I) to give naphthylene-1:8-bisazo-6'-bromo- $\beta$ -naphthol.

J. W. B.

**Chromium compounds from salicylic acid-azo-dyes and from *o*-methoxybenzoic acid.** K. BRASS and W. WITTENBERGER (Ber., 1935, 68, [B], 1905—1912).—Introduction of Cr into salicylic acid-azo-dyes can be effected by Cr alum, but not by K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> unless a reducing agent such as OH·CHMe·CO<sub>2</sub>H is present. The azo-dyes from *o*-OH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H and *m*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·NH<sub>2</sub> (I), NH<sub>2</sub>Ph, *o*-C<sub>6</sub>H<sub>4</sub>Me·NH<sub>2</sub>, and benzidine, respectively, are converted into the corresponding lakes by heating their solutions, after neutralisation with NaOH, with Cr alum (Cr:dye:Na::1:1:1). In the lakes, dye:Cr:H<sub>2</sub>O=2:1:2. They are stable at 130°, and Cr can be removed from them by boiling AcOH, leaving the homogeneous dye acid. H<sub>2</sub>O cannot be directly determined in them with accuracy, and attempts to displace it by NH<sub>3</sub> lead to adducts in which 2NH<sub>3</sub> is very firmly retained. These and the lakes are therefore formulated according to A and B, respectively:

Repetition of the work of Morgan *et al.* (A., 1924, i, 1359) shows that (I) prepared under their conditions contains unchanged dye, after removal of which the residue has the same composition as that obtained by the authors' method. Methylation of (I) is not effected with Me<sub>2</sub>SO<sub>4</sub> or ethylation with EtBr, and coupling of *o*-OMe·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H with *m*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·N<sub>2</sub>Cl does not lead to the methylated dye. In a simpler case the action of Cr alum on *o*-OMe·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H affords the compound OH·Cr(O·CO·C<sub>6</sub>H<sub>4</sub>·OMe)<sub>2</sub>·H<sub>2</sub>O, suggesting the analogous structure OH·Cr(O·CO·C<sub>6</sub>H<sub>4</sub>·OH)<sub>2</sub>·H<sub>2</sub>O for Barbieri's chromisalicylic acid. Similar structures can be assigned to the lakes, but their difficult solubility in alkali is hard to explain.

H. W.

**Oxidation of hydrohalides of phenylhydrazine in presence of copper salts.** A. B. BRUKEV and L. S. SOBOROVSKI (J. Gen. Chem. Russ., 1935, 5, 1024—1028).— $\text{NHPh}\cdot\text{NH}_2$  in aq.  $\text{HCl}$  and  $\text{CuCl}_2$  form the compound  $\text{NHPh}\cdot\text{NH}_2\cdot\text{HCl}\cdot\text{CuCl}_2$  decomp. at  $150^\circ$ , converted by excess of  $\text{Cu}^{\text{II}}$  or by atm.  $\text{O}_2$  into  $\text{PhCl}$  and  $\text{N}_2$ . When  $\text{F}$  is taken in place of  $\text{Cl}$  in the above reaction the sole products are  $\text{C}_6\text{H}_6$  and  $\text{N}_2$ . R. T.

**Aryldiazonium chloride-heavy metal chloride double salts and the preparation of organo-tin compounds through diazo-compounds.** A. N. NESMEJANOV, K. A. KOZESCHKOV, and V. A. KLIMOVA [with, in part, N. K. GRIP] (Ber., 1935, 68, [B], 1877—1883).—The synthesis of organo-mercury substances from diazonium compounds (A., 1929, 711) is an example of a general reaction,  $(\text{RN}_2\text{Cl})_m\text{XCl}_n + 2m/p\text{M}^{(p)} = \text{R}_m\text{X}^{(n)}\text{Cl}_{n-m} + m\text{N}_2 + 2m/p\text{M}^{(p)}\text{Cl}_p$ . Double salts are obtained by mixing cold solutions of the heavy metal chloride ( $\text{ZnCl}_2$ ,  $\text{CdCl}_2$ ,  $\text{SnCl}_4$ ,  $\text{PbCl}_4$ ,  $\text{PtCl}_4$ ,  $\text{TiCl}_3$ ,  $\text{BiCl}_3$ ,  $\text{FeCl}_3$ ,  $\text{AuCl}_3$ ) in  $\text{HCl}$  ( $d=1.19$ ) and the requisite aryldiazonium chloride ( $\text{Ph}$ ,  $o$ -,  $m$ -, and  $p$ - $\text{C}_6\text{H}_4\text{Me}$ ,  $p$ - $\text{OH}\cdot\text{C}_6\text{H}_4$ ,  $p$ - $\text{OMe}\cdot\text{C}_6\text{H}_4$ ,  $o$ -,  $m$ -, and  $p$ - $\text{C}_6\text{H}_4\text{Cl}$ ,  $p$ - $\text{C}_6\text{H}_4\text{Br}$ ,  $p$ - $\text{C}_6\text{H}_4\text{I}$ ,  $o$ -,  $m$ -, and  $p$ - $\text{NO}_2\cdot\text{C}_6\text{H}_4$ ) in about 5*N*- $\text{HCl}$ . For details the original must be consulted. Decomp. of  $(\text{RN}_2\text{Cl})_2\text{SnCl}_4$  is effected by its gradual addition to a well-stirred suspension of the metallic powder in the solvent heated at the requisite temp. The best solvent is usually  $\text{EtOAc}$  at its b.p.  $\text{Sn}$  powder is more effective than  $\text{Zn}$  dust or  $\text{Cu}$  powder. The sole organo-metallic product is  $\text{SnR}_2\text{Cl}_2$  except when  $\text{R} = o\text{-CO}_2\text{Me}\cdot\text{C}_6\text{H}_4$ . Small yields of  $\text{PbPh}_3\text{Cl}$  and  $\text{PbPh}_2\text{O}$  are obtained by decomp. of  $(\text{RN}_2\text{Cl})_2\text{PbCl}_4$ . H. W.

**Action of bromine on 2- and 4-nitro- $\alpha$ -naphthylamines.** R. CONSDEN and J. KENYON (J.C.S., 1935, 1596—1597).— $4:1\text{-NO}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{NH}_2$  (I) with  $\text{Br}$  in  $\text{CHCl}_3$  yields  $2:4$ -dibromo-1-naphthalenediazoperbromide (II), decomp.  $128\text{--}136^\circ$  according to rate of heating, but no  $\text{HBr}$ . (II) is converted into  $1:2:4\text{-C}_{10}\text{H}_5\text{Br}_3$  when heated, treated with  $\text{C}_2\text{H}_5\text{N}$ , or boiled with  $\text{Ac}_2\text{O}$  or  $\text{AcOH}$ , and was also obtained from diazotised  $2:4:1\text{-C}_{10}\text{H}_5\text{Br}_2\cdot\text{NH}_2$  and  $\text{HBr}\cdot\text{Br}$  (cf. J.C.S., 1883, 43, 4). (I) when heated (water-bath, 30 min.) with  $\text{Br}\cdot\text{AcOH}$  yields a little (II), but chiefly  $4:2:1\text{-NO}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{Br}\cdot\text{NH}_2$  (4c derivative, m.p.  $235\text{--}236^\circ$ ), which with  $\text{Br}$  in  $\text{CHCl}_3$  or  $\text{CHCl}_3\text{-AcOH}$  yields (II).  $2:1\text{-NO}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{NH}_2$  with  $\text{Br}$  in  $\text{AcOH}$  or  $\text{CHCl}_3$  yields  $2:4:1\text{-NO}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{Br}\cdot\text{NH}_2$  (J.C.S., 1910, 97, 1709), which with excess of  $\text{Br}$  yields (II).  $o$ - and  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$  with  $\text{Br}$  yield  $\text{Br}$ -derivatives and no diazo-perbromides. H. G. M.

**Alkylation of phenols.** I. TZUKERVANIK and Z. NAZAROVA (J. Gen. Chem. Russ., 1935, 5, 767—770).—Amylene hydrate,  $\text{PhOH}$ , and  $\text{AlCl}_3$  in light petroleum yield a mixture of amylphenol and  $\text{C}_5\text{H}_{11}\text{Ph}$ .  $\text{PhOH}$  and  $\text{Bu}^n\text{OH}$  yield chiefly  $\text{C}_6\text{H}_4\text{Bu}^n\cdot\text{OH}$ , together with  $\text{PhBu}^n$  and  $\text{C}_6\text{H}_5\text{Bu}^n$ , in amounts increasing with the relative amount of  $\text{AlCl}_3$  present.  $\text{PhOH}$  and  $\text{Bu}^s\text{OH}$  under similar conditions yield chiefly  $\text{C}_6\text{H}_4\text{Bu}^s\cdot\text{OBu}^s$ , b.p.  $230^\circ$ , together with  $\text{C}_6\text{H}_4\text{Bu}^s\cdot\text{OH}$  and  $\text{PhBu}^s$ ;  $\text{PhOH}$  and  $\text{Pr}^s\text{OH}$  give similarly  $\text{C}_6\text{H}_4\text{Pr}^s\cdot\text{OPr}^s$ , b.p.  $232^\circ$ ,  $\text{C}_6\text{H}_4\text{Pr}^s\cdot\text{OH}$  (I), and  $\text{PhBr}^s$ , whilst  $\text{Pr}^s\text{OH}$

and  $\text{PhOMe}$  afford chiefly  $o$ - and  $p\text{-C}_6\text{H}_4\text{Pr}^s\cdot\text{OMe}$ , together with  $\text{C}_6\text{H}_3\text{Pr}^s\cdot\text{OMe}$  and (I). R. T.

**Action of isobutylene on phenyl methyl ethers, and the structure of *tert*-butylphenyl methyl ethers.** B. M. DUBININ (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 263—266).—The substance obtained from isobutylene and  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{OMe}$  (A., 1933, 60) is 3-*tert*-butyl-*p*-tolyl Me ether, since it is also obtained from  $\text{Bu}^n\text{Br}$  and  $1:4:3\text{-C}_6\text{H}_3\text{Me}(\text{OMe})\cdot\text{MgBr}$  (cf. A., 1894, i, 449). Nitration affords the 5- $\text{NO}_2$ -derivative, m.p.  $93.5^\circ$ , and then  $1:3:5:4\text{-C}_6\text{H}_2\text{Me}(\text{NO}_2)_2\cdot\text{OMe}$  by elimination of the  $\text{Bu}^n$ . The  $\text{Bu}^n$  groups in the  $\text{Bu}^n_1$  (I) and  $\text{Bu}^n_2$  (II) derivatives of  $1:3\text{-C}_6\text{H}_4(\text{OMe})_2$  are given the 4 and 4:6 positions, respectively, since nitration of (I) affords 4-nitro-6-*tert*-butylresorcinol Me<sub>2</sub> ether (III), m.p.  $99\text{--}100^\circ$ , and then  $4:6:1:3\text{-C}_6\text{H}_2(\text{NO}_2)_2(\text{OMe})_2$ ; (II) also affords (III). The blue colour produced in the prep. of (III) from (I), but not from (II), is due to the presence of a free position *p* to an  $\text{OMe}$  in (I) (cf. A., 1920, i, 37; 1921, i, 240; 1922, i, 135).

P. G. C.

**Compounds of bivalent carbon. XI. Carbon monoxide acetal fission of esters and amides of diphenoxycetic acid during chemical reactions. XII. Thermal carbon monoxide acetal fission of diphenoxycetic acid and its derivatives. XIII. Diphenoxymethylchloride (formyl chloride diphenyl acetal) and its transformation into tetraphenoxymethylene (dicarbon monoxide tetraphenyl acetal).** H. SCHEIBLER and M. DEPNER (Ber., 1935, 68, [B], 2136—2143, 2144—2151, 2151—2153).—XI. *Ph diphenoxycetate*, m.p.  $95^\circ$ , could not be obtained by heating  $\text{CH}(\text{OPh})_2\cdot\text{CO}\cdot\text{NH}_2$  with  $\text{PhOH}$  or  $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{Et}$  with  $\text{PhOAc}$ , but is readily prepared by the successive action of  $\text{SOCl}_2$  and  $\text{PhOH}$  on the acid in  $\text{Et}_2\text{O}\text{-C}_6\text{H}_5\text{N}$ . It is converted by excess of  $\text{NaOEt}$  in boiling  $\text{C}_6\text{H}_6$  into  $\text{HCO}_2\text{Et}$ ,  $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{Et}$ , and  $\text{C}(\text{OPh})_2\cdot\text{C}(\text{OEt})_2$ , whereas  $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{Et}$  and  $\text{KOPh}$  in boiling  $\text{C}_6\text{H}_6$  afford  $\text{HCO}_2\text{Et}$  and (after treatment of the non-volatile portion with  $\text{H}_2\text{O}$ )  $\text{HCO}_2\text{H}$  and  $\text{PhOH}$ , whilst in boiling  $\text{EtOH}$  the products are  $\text{HCO}_2\text{H}$  and  $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{H}$ . The change is therefore:  
 $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{Et} + \text{KOPh} \rightarrow$

The CO acetal fission is also observed during the action of  $\text{NEt}_3\cdot\text{MgBr}$  on  $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{Et}$ , whereby a neutral product, b.p.  $85^\circ/15\text{ mm.}$ , possibly *Ph Et*<sub>2</sub> orthoformate, and, probably,  $\text{CH}(\text{OPh})_2\cdot\text{CO}\cdot\text{NEt}_3$  are obtained. Higher yields of these compounds are obtained when the reaction product is heated with  $\text{EtOH}$  at  $150^\circ$ , whereby  $\text{PhOEt}$  is also produced.

$\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{Ph}$  is much more stable than the  $\text{Et}$  ester, but in  $\text{C}_6\text{H}_6$  at  $150^\circ$  gives  $\text{HCO}_2\text{H}$  and  $\text{PhOH}$  (?  $\text{HCO}_2\text{Ph}$ ). Only elimination of  $\text{PhOH}$  is observed by the action of  $\text{NEt}_3\cdot\text{MgBr}$  on *diphenoxycetdiethylamide*, m.p.  $137^\circ$  [from  $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{Et}$  and  $\text{NHEt}$ , in  $\text{EtOH}$  at  $100^\circ$ ].

XII.  $\text{CH}(\text{OPh})_2\cdot\text{CO}_2\text{H}$  passes at  $120^\circ$  into  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{HCO}_2\text{Ph}$ ,  $\text{Ph}_2\text{CO}_3$ , and, probably, *diphenoxymaleic anhydride*, m.p.  $153^\circ$ ; CO acetal fission has only a

subordinate part in the change.  $\text{CH}(\text{OPh})_2 \cdot \text{CO}_2\text{Et}$  is comparatively thermostable, but the following thermolabile derivatives have been examined. *Diphenoxyacetyl chloride* (II), obtained by cautious treatment of the acid with  $\text{SOCl}_2$  in  $\text{C}_6\text{H}_6$ , passes at  $170\text{--}180^\circ$  into  $\text{CO}$  and  $\text{CHCl}(\text{OPh})_2$ , probably with intermediate production of  $\text{C}(\text{OPh})_2$  and  $\text{HCOCl}$ . *Acetic diphenoxyacetic anhydride* [attempted prep. from (II) and  $\text{AgOAc}$  or from  $\text{AcCl}$  and  $\text{CH}(\text{OPh})_2 \cdot \text{CO}_2\text{Ag}$ ] is decomposed in  $\text{Et}_2\text{O}$  into  $\text{AcOH}$  and  $\text{C}(\text{OPh})_2 \cdot \text{CO}$ . (II) and  $\text{NaN}_3$  in  $\text{C}_6\text{H}_6$  give  $\text{NaCl}$ ,  $\text{C}(\text{OPh})_2 \cdot \text{CO}$ , and  $\text{N}_3\text{H}$ .  $\text{CH}(\text{OPh})_2 \cdot \text{CO}_2\text{Ph}$  is produced by the action of  $\text{Ag}_2\text{O}$  (II) in  $\text{C}_6\text{H}_6$ ,  $\text{PhOH}$ , resulting from hydrolysis, reacting with  $\text{C}(\text{OPh})_2 \cdot \text{CO}$  or unchanged  $\text{CH}(\text{OPh})_2 \cdot \text{COCl}$ .  $\text{C}(\text{OPh})_2 \cdot \text{CO}$  does not appear to be formed intermediately by the action of  $\text{CH}(\text{OPh})_2 \cdot \text{COCl}$  on  $\text{PhOH}$  in presence of  $\text{C}_6\text{H}_5\text{N}$ . Elimination of  $\text{HCl}$  from  $\text{CH}(\text{OPh})_2 \cdot \text{COCl}$  occurs under the influence of  $p\text{-OH} \cdot \text{C}_6\text{H}_4 \cdot \text{N} \cdot \text{NPh}$ , whereby the compound  $\text{C}_{12}\text{H}_{11}\text{ON}_2\text{Cl}$  separates and, on exposure to moisture,  $\text{CH}(\text{OPh})_2 \cdot \text{CO}_2\text{H}$  is formed, presumably from  $\text{C}(\text{OPh})_2 \cdot \text{CO}$ . *Triphenylmethyl diphenoxyacetate*, m.p.  $112^\circ$ , from  $\text{CH}(\text{OPh})_2 \cdot \text{CO}_2\text{Ag}$  and  $\text{CPh}_3\text{Cl}$  in anhyd.  $\text{Et}_2\text{O}$ , decomposes at  $160^\circ$ /high vac. into  $\text{CO}_2$ ,  $\text{CHPh}_3$ , and  $\text{C}(\text{OPh})_2$ .

XIII. Treatment of  $\text{CHCl}(\text{OPh})_2$  with  $\text{CNaPh}_3$  in  $\text{Et}_2\text{O}$  under  $\text{N}_2$  leads to  $\text{CHPh}_3$  and  $\alpha\beta\beta$ -tetraphenoxymethylene (dicarbon monoxide  $\text{Ph}_4$  acetal), m.p.  $168^\circ$ , which readily reduces alkaline  $\text{KMnO}_4$ , unites energetically with  $\text{Br}$  in  $\text{CHCl}_3$ , and is converted by 30%  $\text{HBr}$  in  $\text{AcOH}$  into  $\text{CH}(\text{OPh})_2 \cdot \text{CO}_2\text{Ph}$ . H. W.

Ester enolates and ketal acetals. XIX. *Diphenylketendiphenylacetal*, and *phenyldiphenylvinyl ether*. H. SCHEIBLER and M. DEPNER (Ber., 1935, 68, [B], 2154—2157).— $\text{CH}(\text{OPh})_2 \cdot \text{CO}_2\text{Et}$  is transformed by  $\text{MgPhBr}$  in  $\text{Et}_2\text{O}$  into  $\alpha$ -hydroxy- $\beta$ -diphenoxy- $\alpha$ -diphenylethane (hydroxydiphenylacetaldehyde  $\text{Ph}_2$  acetal) (I), m.p.  $103^\circ$ , converted by  $\text{SOCl}_2$  in  $\text{Et}_2\text{O}$ - $\text{C}_5\text{H}_5\text{N}$  into  $\alpha$ -chloro- $\beta$ -diphenoxy- $\alpha$ -diphenylethane (II), decomp.  $>100^\circ$ . (II) is transformed by  $\text{C}_6\text{H}_6$ -quinoline, less advantageously by  $\text{Ag}_2\text{CO}_3$ ,  $\text{AgCN}$ , or  $\text{Hg}(\text{CN})_2$ , into  $\alpha\alpha$ -diphenoxy- $\beta\beta$ -diphenylethane (diphenylketen  $\text{Ph}_2$  acetal) (III), b.p.  $185^\circ/0.5$  mm., m.p.  $112^\circ$ , also obtained from (I),  $\text{P}_2\text{O}_5$ , and  $\text{NET}_3$  in  $\text{C}_6\text{H}_6$  at  $150^\circ$ . (III) is hydrolysed by  $\text{EtOH}$ - $\text{HCl}$  to  $\text{PhOH}$  and  $\text{CHPh}_2 \cdot \text{CO}_2\text{Et}$ , and by  $\text{HBr}$ - $\text{AcOH}$  to *Ph diphenylacetate*, m.p.  $65^\circ$ , also obtained with  $\text{C}_6\text{H}_5\text{Br}_3 \cdot \text{OH}$  from (III) and  $\text{Br}$  in  $\text{CCl}_4$ . (II) with  $\text{MgPhBr}$  in  $\text{Et}_2\text{O}$  or with  $\text{Zn}$  dust and  $\text{C}_5\text{H}_5\text{N}$  affords  $\alpha\alpha$ -diphenylvinyl *Ph ether*, m.p.  $60^\circ$ . H. W.

Behaviour of bromine derivatives of guaiacol towards nitrating agents. L. C. RAIFORD and R. E. SILKER (Proc. Iowa Acad. Sci., 1934, 41, 171).—4 : 5 : 6-Tribromoguaiacol could not be nitrated, either with  $\text{HNO}_2$  (cf. Zincke, A., 1900, i, 545) or with  $\text{HNO}_3$ . The *Ac* and *Bz* derivatives, with fuming  $\text{HNO}_3$  at room temp., give 4 : 5 : 6-tribromo-3-nitro-2-methoxyphenyl acetate and *m*-nitrobenzoate, respectively. CH. ABS. (r)

Metallic derivatives of 2-nitroso-5-methoxy- and of 3-chloro-2-nitroso-5-methoxy-phenol. H. H. HODGSON and W. E. BATTY (J.C.S., 1935, 1617—1619).—2-Nitroso-5-methoxyphenol (I) exists in

the *NO*-form in  $\text{C}_6\text{H}_6$  and in the quinoneoxime form in  $\text{EtOH}$ , whereas its 3-*Cl*-derivative (II) is always in the *NO*-form and is highly chelated, being sparingly sol. in  $\text{H}_2\text{O}$  and readily sol. in  $\text{C}_6\text{H}_6$ . The following salts of (I) ( $\text{X}=\text{C}_7\text{H}_6\text{O}_3\text{N}$ ) and (II) ( $\text{Y}=\text{C}_7\text{H}_5\text{O}_3\text{NCl}$ ) are described; they are sol. in org. solvents ( $\text{C}_6\text{H}_6$  and  $\text{CHCl}_3$ ) and probably are co-ordination compounds:  $\text{HgX}_2$ , m.p.  $201^\circ$ ;  $\text{HgY}_2$ ;  $\text{AlXCl}_2$ ;  $\text{AlYCl}_2$ ;  $\text{SnXCl}_2$ , m.p.  $147^\circ$ ;  $\text{SnYCl}_2$ ;  $\text{Fe}(\text{OH})\text{X}_2$ ;  $\text{FeX}_3$ ;  $\text{Fe}(\text{OH})\text{Y}_2$ ;  $\text{FeY}_3$ ;  $\text{CoX}_3$ ;  $\text{CoY}_3$ ;  $\text{NiX}_2$ ;  $\text{NiY}_2$ ; and the following double compounds with salicylaldehyde ( $=\text{S}$ ):  $\text{NaX} \cdot \text{S}$ ;  $\text{NaY} \cdot \text{S}$ ;  $\text{KX} \cdot \text{S}$ ; and  $\text{KY} \cdot \text{S}$ . The following salts are insol. in org. solvents and probably are normal salts (non-co-ordinated):  $\text{NaX}$ ;  $\text{NaY}$ ;  $\text{KX}$ ;  $\text{KY}$ ;  $\text{AgX}$ ;  $\text{AgY}$ ;  $\text{ZnX}_2$ ;  $\text{ZnY}_2$ ;  $\text{CdX}_2$ ;  $\text{CdY}_2$ ;  $\text{PbX}_2$ ;  $\text{PbY}_2$ ;  $\text{MnX}_2$ ;  $\text{MnY}_2$ ;  $\text{UO}_2\text{X}_2$ ;  $\text{UO}_2\text{Y}_2$ . The *Ag* and *Hg* salts of 2-nitroso-3-ethoxyphenol described by Kietaihl (A., 1899, i, 343) are really those of 2-nitroso-5-ethoxyphenol. Wool mordanted with  $\text{Fe}^{II}$  salts is dyed bluish-green with nitrosophenol solutions: the colour lake is decolorised by acids, restored by  $\text{NH}_3$ , and destroyed by  $\text{SnCl}_2$ . H. G. M.

Dimorphism of trinitroresorcinol, bromobenzylhydrazine, and benzaldehyde-*p*-nitrophenylhydrazine.—See this vol., 16.

Diaryls and their derivatives. IV. Oxidation of  $\beta$ -naphthol-6-sulphonic acid and 2 : 6-dihydroxynaphthalene. V. Optical activity of 2 : 2'-dihydroxy-1 : 1'-dinaphthylsulphonic acids. I. S. JOFFE (J. Gen. Chem. Russ., 1935, 5, 877—885, 950—955).—IV [with S. G. KUZNETZOV]. 2 : 2'-Dihydroxy-1 : 1'-dinaphthyl-6 : 6'-disulphonic acid (I), obtained in 90% yield from  $\text{Na}\beta$ -naphthol-6-sulphonate and aq.  $\text{FeCl}_3$  ( $20\text{--}25^\circ$ ; 20 days), yields 2 : 2'-dihydroxy-1 : 1'-dinaphthyl when heated with  $\text{H}_2\text{SO}_4$  ( $170\text{--}180^\circ$ ; 12 hr.), and 2 : 6 : 2' : 6'-tetrahydroxy-1 : 1'-dinaphthyl (II), m.p.  $318\text{--}320^\circ$ , when heated with  $\text{KOH}$  ( $320\text{--}330^\circ$ ; 15 min.). (II) may also be obtained from dil. aq. 2 : 6- $\text{C}_{10}\text{H}_6(\text{OH})_2$  and  $\text{FeCl}_3$  at room temp.; excess of  $\text{FeCl}_3$  leads to the production of the corresponding octahydroxytetra-naphthyl. (II) in aq.  $\text{NaOAc}$  and  $p\text{-NO}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{N}_2\text{Cl}$  yield the 5-*p*-nitrobenzeneazo-derivative, m.p.  $179\text{--}183^\circ$ .

V. [with I. V. GRATSCHEV]. The brucine salt of (I) is separable into two fractions,  $[\alpha]_D^{20} -43^\circ$  and  $-65^\circ$  in 50%  $\text{EtOH}$ , which yield two *Na* salts of (I),  $[\alpha]_D^{20} -154^\circ$  and  $+166^\circ$  in  $\text{H}_2\text{O}$ , when hydrolysed with 0.05*N*- $\text{NaOH}$  in presence of  $\text{CHCl}_3$ ; the analogous products from the corresponding 7 : 7'-disulphonate have  $[\alpha]_D^{20} -312^\circ$  and  $+259^\circ$ . The free acids do not exhibit optical activity, and both the acids and their salts readily racemise in aq. solution. R. T.

Application of the Raman effect to the *cis-trans* isomerism of methylcyclohexanols.—See this vol., 11.

Benzyl formate. R. HOLTZ (J. Appl. Chem. Russ., 1935, 8, 1014—1015).— $\text{CH}_2\text{Ph} \cdot \text{OH}$  and  $\text{HCO}_2\text{H}$  (21% excess) at the b.p. of the mixture, and in presence of sufficient  $\text{CaCl}_2$  to bind the  $\text{H}_2\text{O}$  produced, afford  $\text{HCO}_2 \cdot \text{CH}_2\text{Ph}$  in 91% yield, and of high purity.

R. T.

Synthesis of  $\beta$ -phenylbutyl alcohol. S. P. LAGEREV (J. Gen. Chem. Russ., 1935, 5, 515—516).—

Mg,  $\text{CH}_2\text{PhI}$ , and  $\text{EtCHO}$  afford  $\beta$ -phenylbutyl alcohol, b.p. 124—127°/25 mm. (benzoate, m.p. 115—116°), which with  $\text{HBr}$  in  $\text{Et}_2\text{O}$  yields the bromide, b.p. 112°/15 mm. R. T.

Semipinacolic deamination of  $\beta$ -amino- $p$ -tolyl- and  $\alpha$ -anisyl- $\alpha$ -phenylpropanol. Exclusive preferential migration of phenyl. M. TIFFENEAU, J. LEVY, and E. DITZ (Bull. Soc. chim., 1935, [v], 2, 1871—1876).—Treatment of the  $\alpha$ - and  $\beta$ -forms of  $p$ - $\text{C}_6\text{H}_4\text{Me}\cdot\text{CPh}(\text{OH})\cdot\text{CHMe}\cdot\text{NH}_2$  in  $\text{AcOH}$  with  $\text{NaNO}_2\text{--H}_2\text{O}$  yields  $p$ -tolyl  $\alpha$ -phenylethyl ketone, m.p. 43° (semicarbazone, m.p. 148°), also obtained by methylation of  $p$ - $\text{C}_6\text{H}_4\text{Me}\cdot\text{CO}\cdot\text{CH}_2\text{Ph}$ . Similarly the  $\alpha$ -form of  $p$ - $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CPh}(\text{OH})\cdot\text{CHMe}\cdot\text{NH}_2$  in  $\text{AcOH}$  and  $\text{NaNO}_2\text{--H}_2\text{O}$  yield  $p$ -anisyl  $\alpha$ -phenylethyl ketone, m.p. 55° (cf. lit.) also obtained by methylation of  $p$ - $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{CH}_2\text{Ph}$ . In each case only the Ph has migrated during deamination. H. G. M.

Formation of a single diastereoisomeride in the action of organo-magnesium derivatives on amino-ketones. M. TIFFENEAU, J. LEVY, and E. DITZ (Bull. Soc. chim., 1935, [v], 2, 1848—1855; cf. A., 1930, 470).—The action of  $\text{MgRBr}$  on ketones  $\text{R}'\cdot\text{CO}\cdot\text{CHMe}\cdot\text{NH}_2$  (I) (R different from  $\text{R}'$ ) which have an asymmetric C adjacent to the CO gives rise to only one of the two possible diastereoisomeric products. The other is obtained by inverting the order in which the substituents are attached to the new asymmetric centre. A further example is given (cf. loc. cit.).  $p$ -Tolyl  $\alpha$ -aminoethyl ketone and  $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{MgBr}$  (II) yield solely  $\beta$ -amino- $\alpha$ - $p$ -tolyl- $\alpha$ -anisylpropanol, m.p. 90° (hydrochloride, m.p. 260°; picrate, m.p. 217°); the corresponding  $\beta$ -compound, m.p. 84° (hydrochloride, m.p. 242°; picrate, m.p. 197°), is obtained from anisyl  $\alpha$ -aminoethyl ketone and  $p$ - $\text{C}_6\text{H}_4\text{Me}\cdot\text{MgBr}$ . (II) and  $\omega$ -aminoacetophenone (which contains no asymmetric C) give the same  $\beta$ -amino- $\alpha$ -phenyl- $\alpha$ -anisylethanol, m.p. 100°, as do  $\omega$ -amino- $p$ -methoxyacetophenone and  $\text{MgPhBr}$ . An improved method is described for the prep. of the oximino-ketones which on reduction yield the ketones (I). These exist only as hydrochlorides, the free bases cyclising to the corresponding dihydropyrazines. H. G. M.

Deamination of  $\alpha$ -amino- $\beta$ -phenylpropan- $\beta$ -ol and  $\alpha$ -amino- $\beta$ -phenylbutan- $\beta$ -ol. Exclusive preferential migration of phenyl. M. TIFFENEAU and H. CAHNMANN (Bull. Soc. chim., 1935, [v], 2, 1876—1882).— $\text{OH}\cdot\text{CPhMe}\cdot\text{CH}_2\cdot\text{NH}_2$  [prepared from  $\text{COPh}\cdot\text{CH}_2\cdot\text{NH}_2$  and  $\text{MgMeI}$ , and together with some  $\beta$ -phenylallylamine, b.p. 90—92°/14 mm. (hydrochloride, m.p. 143—144°; methiodide, m.p. 160°, also obtained from  $N$ -methyl- $\beta$ -phenylallylamine), by reduction with  $\text{Na}\text{--EtOH}$  of  $\text{OH}\cdot\text{CPhMe}\cdot\text{CH}_2\cdot\text{N}\cdot\text{OH}$ , obtained from  $\text{COPh}\cdot\text{CH}_2\cdot\text{NOH}$ ] is deaminated by  $\text{AcOH}\text{--H}_2\text{O}\text{--NaNO}_2$  to  $\text{CH}_2\text{Ph}\cdot\text{COMe}$ . Similarly  $\text{OH}\cdot\text{CPhEt}\cdot\text{CH}_2\cdot\text{NH}_2$ , b.p. 137—146°/15 mm. (hydrochloride, m.p. 184.5—185°; prepared, together with some  $\beta$ -phenyl- $\Delta^8$ -butenylamine, b.p. 110—115°/15 mm. [hydrochloride, m.p. 166.5—167° (corr.)], by reduction of the product obtained from  $\text{COPh}\cdot\text{CH}_2\cdot\text{N}\cdot\text{OH}$  and  $\text{MgEtBr}$ ], is deaminated by  $\text{AcOH}\text{--H}_2\text{O}\text{--NaNO}_2$  to  $\text{CH}_2\text{Ph}\cdot\text{COEt}$  [semicarbazone,

m.p. 156.5—157° (cf. lit.)]. In each case only the Ph has migrated during the deamination. H. G. M.

Action of magnesium phenyl bromide on  $\alpha$ -dibenzoylglyceraldehyde. Formation of a single diastereoisomeride:  $\alpha$ - $d$ -dibenzoylphenylglycerol. M. TIFFENEAU, I. S. NEUBERG-RABINOVITCH, and H. CAHNMANN (Bull. Soc. chim., 1935, [v], 2, 1866—1871).— $\alpha$ -Dibenzoylglyceraldehyde and  $\text{MgPhBr}$  (1 mol.) give a single  $d$ -dibenzoylphenylglycerol (laevorotatory), which with  $\text{BzCl}$  and  $\text{C}_5\text{H}_5\text{N}$  gives solely laevorotatory  $\alpha$ - $d$ -tribenzoylphenylglycerol, m.p. 147°, converted into  $\alpha$ - $d$ -phenylglycerol, m.p. 105—106° (corr.),  $[\alpha]_{\text{D}}^{20} + 21.1^\circ$  and  $[\alpha]_{\text{D}}^{19.5} + 18.4^\circ$  in  $\text{H}_2\text{O}$ . H. G. M.

Cubebin. VII. [Criticism of] a new structural formula proposed for cubebin. VIII. Identity of cubebinolide with hinokinin. E. MAMELI (Gazzetta, 1935, 65, 877—885, 886—888).—VII. The objections of Ginzberg *et al.* (A., 1934, 302) to the formula proposed (A., 1913, i, 47; 1922, i, 347) for cubebin (I), and their new formula, are criticised and the earlier structure is upheld.

VIII. Cubebinolide (*loc. cit.*) is identical with the hinokinin (II) of Yoshiki and Ishiguro (J. Pharm. Soc. Japan, 1933, 53, 11); properties and derivatives are compared. The extraction of (II) from the conifer *Chamaecyparis obtusa*, Sieb. and Zucc., shows that the occurrence of (I) and its derivatives is not restricted to the angiosperms. E. W. W.

"Plane-radial" compounds. I. Hexahydroxymethylbenzene and its derivatives. II. Hexathiomethylbenzene and its thioethers. H. J. BACKER (Rec. trav. chim., 1935, 54, 833—837, 905—915).—I.  $\text{C}_6(\text{CH}_2\text{Br})_6$  (I) (A., 1935, 1487) is converted by boiling  $\text{KOAc}\text{--Ac}_2\text{O}$  into the  $\text{Ac}_6$  derivative, m.p. 163°, hydrolysed by  $\text{KOH}\text{--EtOH}$  to hexahydroxymethylbenzene, m.p. 310—311° (crystallographic data) {hexanitrate, m.p. 176.5° (decomp.); hexapropionate, m.p. 90—100° [from (I)– $\text{EtCO}_2\text{Na}\text{--}(\text{EtCO})_2\text{O}$ ];  $\text{Me}_6$ , m.p. 100°,  $\text{Et}_6$ , m.p. 93°, and  $\text{Ph}_6+2\text{PhMe}$ , and solvent-free, m.p. 223°, ethers [all from (I) by the action of  $\text{NaOR}\text{--ROH}$ ]}. II. Interaction of  $\text{C}_6(\text{CH}_2\text{Br})_6$  and  $\text{CS}(\text{NH}_2)_2$  in  $\text{EtOH}$  affords hexaisothiocarbamidomethylbenzene, decomp. 290°, as its hydrobromide, m.p. 250° (decomp.), hydrolysed by  $\text{NaOH}$  to hexathiomethylbenzene, m.p. 225—226° [ $\text{Na}+36\text{H}_2\text{O}$ , and  $\text{Pb}+3\text{H}_2\text{O}$ , salts:  $\text{Me}_6$ , m.p. 220—222°;  $\text{Et}_6$ , m.p. 131°;  $\text{Pr}_6$ , m.p. 55.5°;  $\text{Pr}^i_6$ , m.p. 232—232.5°;  $\text{Bu}^n_6$ , m.p. 34—34.5°; m.p. 94°; sec.- $\text{Bu}_6$ , m.p. 172°;  $\text{Bu}^i_6$ , m.p. 304° (decomp.)]; ( $n\text{-C}_5\text{H}_{11}$ ) $_6$ , m.p. 25.5—26°; ( $\text{CMe}_2\text{Et}$ ) $_6$ , m.p. 295°; ( $n\text{-C}_6\text{H}_{13}$ ) $_6$ , m.p. 11.5—12°;  $\text{Ph}_6+\text{PhMe}$  and solvent-free, m.p. 191—192°; ( $p\text{-C}_6\text{H}_4\text{Me}$ ) $_6$ , m.p. 183—184°; ( $p\text{-C}_6\text{H}_4\text{Cl}$ ) $_6$ , m.p. 179—180°; ( $p\text{-C}_6\text{H}_4\text{Bu}^i$ ) $_6$ , m.p. 182—183°, and ( $\text{CH}_2\text{Ph}$ ) $_6+\text{PhMe}$ , m.p. 148°, thioether, all formed by the action of  $\text{NaOEt}\text{--RSH}$  on  $\text{C}_6(\text{CH}_2\text{Br})_6$ ]. The close packing of branched-chain alkyl groups greatly raises the m.p., and with the  $n$ -alkyl thioethers, the m.p. is lower the longer is the normal C chain. Crystallographic data (TERPSTRA) are given for some of the above compounds. J B

Action of carbonyl chloride, chloromethyl chloroformates and carbonates on cholesterol.

A. KLING and M. ROUILLY (Compt. rend., 1935, 201, 782—784; cf. A., 1934, 216).—Cholesterol in warm  $\text{CHCl}_3$  reacts with  $\text{COCl}_2$  to give a *chlorocarbonate* (I), m.p.  $114^\circ$ .  $\text{ClCO}_2\text{Me}$  does not react;  $\text{ClCO}_2\text{CH}_2\text{Cl}$ ,  $\text{ClCO}_2\text{CHCl}_2$ , and  $\text{ClCO}_2\text{CCl}_3$  give a highly unstable product, *cholesteryl dichloromethyl carbonate*, m.p.  $85^\circ$ , and *cholesteryl  $\text{CCl}_3$  carbonate*, m.p.  $107^\circ$ , respectively.  $\text{CO}(\text{O}-\text{CCl}_3)_2$  similarly affords (I) (cf. A., 1920, i, 805). This reaction may account for the toxicity of these substances when inhaled.

J. L. D.

**Hydrogenation under the action of selenium.**  
I. Action of selenium on cholesterol at  $230^\circ$ .

C. DORÉE and V. A. PETROV (J.C.S., 1935, 1391—1393).—After 10 hr., cholesterol is partly converted by Se at  $230^\circ$  into *cholestanone* (I) (*semicarbazone*, m.p.  $234$ — $238^\circ$ ), with small quantities of *cholestanol* and *cholestenone*; after 25 hr., 10% of (I) is formed. With  $\text{NHPh}\cdot\text{NH}_2$  in  $\text{AcOH}$ ,

(I) forms a *tetrahydrocarbazole* derivative, m.p.  $180$ — $181^\circ$  (*picrate*, m.p.  $209$ — $210^\circ$ ), which from ease of formation and surface film area probably has the angular structure (A).

E. W. W.

**Sitostanol and stigmastanol.** B. E. BENGTSSON (Z. physiol. Chem., 1935, 237, 46—51).—The probability of the identity of ordinary dihydrositosterol with tetrahydrostigmastanol is advanced. "Ordinary" and  $\gamma$ -sitostane can be differentiated by their mixed m.p. with stigmastane. Fucostanol is not identical with stigmastanol (cf. A., 1934, 1347).

F. O. H.

**Phytosterol of wheat-germ oil.**—See A., 1935, 1551.

**Constitution of vitamin- $\text{D}_2$ .** A. WINDAUS and W. THIELE (Annalen, 1935, 521, 160—175).—Treatment of calciferyl acetate with maleic anhydride in boiling  $\text{C}_6\text{H}_6$  affords an *adduct*, m.p. (indef.)  $189$ — $196^\circ$ , hydrolysed and then converted by  $\text{CH}_2\text{N}_2$  into  $\alpha$ -*calciferyl acetate  $\text{Me}_2$  maleate* (I), m.p.  $141^\circ$ ,  $[\alpha]_D^{20} +170.8^\circ$  in  $\text{CHCl}_3$ , which absorbs 2 O when titrated with  $\text{BzO}_2\text{H}$ . The filtrates from (I) when treated with  $\text{KOH}$ - $\text{MeOH}$  give a sparingly sol. *K* salt, from which  $\text{AcOH}$  liberates  $\beta$ -*calciferol-maleic acid* (II), m.p.  $196^\circ$  (decomp.), the *Me* ester, m.p.  $67$ — $68^\circ$ , of which is converted by  $\text{Ac}_2\text{O}$  into  $\beta$ -*calciferyl acetate  $\text{Me}_2$  maleate*, m.p.  $94$ — $95^\circ$ ,  $[\alpha]_D^{20} -158.3^\circ$  in  $\text{CHCl}_3$ , which absorbs 3 O from  $\text{BzO}_2\text{H}$ . The adducts can be distilled in a vac. without decomp. Hydrogenation (Pd in  $\text{COMe}_2$ ) of (I) gives the  $\text{H}_2$ -derivative (III), m.p.  $112^\circ$ ,  $[\alpha]_D^{20} +167.8^\circ$  in  $\text{CHCl}_3$ , which absorbs 1.16—1.33 O and is further reduced (Pt in  $\text{AcOH}$ ) to the  $\text{H}_4$ -compound. Similarly (II) gives a  $\text{H}_2$ -derivative, m.p.  $193^\circ$  (decomp.) [ $\beta$ -*dihydrocalciferyl acetate  $\text{Me}_2$  maleate* (IV), m.p.  $86$ — $86.5^\circ$ ,  $[\alpha]_D^{20} -144.7^\circ$  in  $\text{CHCl}_3$ , which absorbs 2 O from  $\text{BzO}_2\text{H}$ ], and a non-cryst.  $\text{H}_4$ -derivative, converted by acetylation and methylation into  $\beta$ -*tetrahydrocalciferyl acetate  $\text{Me}_2$  maleate*, m.p.  $122^\circ$ ,  $[\alpha]_D^{20} -51.5^\circ$  in  $\text{CHCl}_3$ , which absorbs Br but is only slowly attacked by  $\text{O}_3$ .

Ozonisation of (III) or (IV) in  $\text{CHCl}_3$  followed by reductive or oxidative fission of the ozonide yields a

ketone,  $\text{C}_{19}\text{H}_{34}\text{O}$  (*semicarbazone*, m.p.  $225^\circ$ ; *oxime*, m.p.  $129.5^\circ$ ). Hydrolysis of (I) gives  $\alpha$ -*calciferol*-

*maleic acid*, m.p.  $146$ — $147^\circ$  (decomp.), dehydrogenated by Pd-C at  $330$ — $340^\circ$  to  $\text{C}_{10}\text{H}_8$ , and  $\beta$ - $\text{C}_{10}\text{H}_7\text{CO}_2\text{H}$ , and by Se at  $280$ — $325^\circ$  to 2:3- $\text{C}_{10}\text{H}_6\text{Me}_2$ . The structures A and B are therefore assigned to *calciferol* and the  $\text{H}_2$ -adduct, respectively.

H. W.

**Reaction of carboxylic acid chlorides with metallic hydrides.** O. NEUNHOEFFER and F. NERDEL (J. pr. Chem., 1935, [ii], 144, 63—66; cf. Wohl *et al.*, A., 1912, i, 161).—Freshly prepared  $\text{CuH}$  is red to chocolate-brown, and even when moist with  $\text{Et}_2\text{O}$  cannot be handled without some danger, whereas the aged product is black and almost non-dangerous. Its complete purification from compounds of P is extremely difficult. Interaction of  $\text{CuH}$  and  $\text{BzCl}$  in presence of  $\text{Et}_2\text{O}$  in an inert atm. affords  $\text{EtOBz}$  in widely varying yield, but no  $\text{PhCHO}$ . Since in presence of  $\text{C}_6\text{H}_6$  or *cyclohexane* in place of  $\text{Et}_2\text{O}$  there is no formation of  $\text{EtOBz}$ , its production must be ascribed to fission of  $\text{Et}_2\text{O}$ . Reaction between  $\text{CuH}$  and acid chloride is accompanied by evolution of  $\text{H}_2$ . Since the amount thus liberated + that evolved on subsequent addition of  $\text{HCl}$  equals the total H present, it follows that none is expended in reduction. Since  $\text{CuH}$  is very sensitive to  $\text{Cl}^+$ , the  $\text{BzCl}$  used is first shaken with  $\text{CaCO}_3$  and a trace of  $\text{C}_2\text{H}_5\text{N}$  is added to accelerate the change; under these conditions  $\text{CuH}$  is almost completely stable to  $\text{BzCl}$ , and evolution of  $\text{H}_2$  does not occur until  $\text{HCl}$  is added.  $\text{CaH}_2$  and  $\text{LiH}$  are more stable than  $\text{CuH}$ .  $\text{AcCl}$ ,  $\text{CHPh}\cdot\text{CH}\cdot\text{COCl}$ , and adipyl chloride behave similarly to  $\text{BzCl}$ .

H. W.

**Nitration of benzoic and toluic acids.** A. GIACALONE (Gazzetta, 1935, 65, 840—844).—Nitration at  $0$ — $5^\circ$  of *m*-toluic acid (20 g.) with  $\text{KNO}_3$  in  $\text{H}_2\text{SO}_4$  gives 4-nitro- (12 g.) and 2-nitro- (6 g.) without 6-nitro-*m*-toluic acid. Similar nitration of  $\text{BzOH}$  and of *o*- and *p*-toluic acid gives products more readily purified than those obtained in the usual manner.

E. W. W.

**Effect of substituents on organic reactions.**—See A., 1935, 1465.

**Electrolytic preparation of anthranilic acid.** J. W. SHIPLEY and J. M. CALHOUN (Canad. J. Res.,

1935, 13, B, 123—132).— $\text{o-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  is reduced electrolytically (92% yield) in  $\text{EtOH-H}_2\text{SO}_4$  with a Pb cathode to the  $\text{NH}_2$ -acid. The effects of varying temp., c.d., electrolyte composition, and quantity of current have been measured and optimum conditions determined. The  $\text{CO}_2\text{H}$  is not reduced.

F. R. S.

**Novocaine oxide.** W. KEIL (Arch. exp. Path. Pharm., 1935, 179, 425—426).—Novocaine (I) with  $\text{H}_2\text{O}_2$  for 48 hr. yields *novocaine oxide* (II),  $\text{C}_{12}\text{H}_{22}\text{O}_5\text{N}_2$ , a "genalkaloid" (isolated as *picrate*, m.p.  $172^\circ$ ). In its anaesthetic actions on the rabbit's cornea and human skin, (II) has respectively 50 and 25% of the activity of (I).

F. O. H.

**Hydrolysis of phenylalanine.**—See A., 1935, 1465.

**Maximum rotations of carboxylic acids containing a phenylethyl group.** P. A. LEVENE and S. A. HARRIS (J. Biol. Chem., 1935, 111, 725—733).—The max.  $[\alpha]_D$  of  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CHMeEt}$  is determined and that of related compounds calc. In the series,  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CHMe}\cdot[\text{CH}_2]_n\cdot\text{CO}_2\text{H}$ , there is periodic fluctuation of  $[\alpha]$  as  $n$  increases from 0 to 3.  $\gamma$ -Phenyl- $\alpha$ -methylbutyric acid, resolved by the cinchonidine salt in  $\text{COMe}_2$ , has  $[\alpha]^{20} = -28.75^\circ$ .  $\alpha$ -Phenyl- $\gamma$ -methylpentane, from (a) the alcohol and cold HI, followed by  $\text{H}_2$ -Raney Ni in 10%  $\text{NaOH-MeOH}$ , or (b)  $\text{l-C}_5\text{H}_{11}\cdot\text{MgBr}$  and  $\text{PhCHO}$ , has  $[\alpha]^{25} = -5.52^\circ$ .  $\zeta$ -Phenyl- $\delta$ -methylhexoic acid, b.p.  $152\text{—}154^\circ$  (or  $162^\circ$ )/1 mm.,  $[\alpha]_D^{15} = -1.60^\circ$ , is obtained from (a)  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CHMe}\cdot[\text{CH}_2]_2\cdot\text{MgBr}$  and  $\text{CO}_2$ , or (b)  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CHMe}\cdot\text{CH}_2\text{Br}$  and  $\text{CH}_2(\text{CO}_2\text{Et})_2$  and leads to the *Et* ester, b.p.  $122^\circ/5$  mm.,  $[\alpha]^{25} = -3.71^\circ$ , and  $\zeta$ -phenyl- $\delta$ -methylhexan-2-ol, b.p.  $155^\circ/10$  mm.,  $[\alpha]^{25} = -5.27^\circ$ .  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CHMe}\cdot[\text{CH}_2]_3\cdot\text{MgBr}$  and  $\text{CO}_2$  give  $\zeta$ -phenyl- $\delta$ -methylheptoic acid, b.p.  $172^\circ/2.5$  mm.,  $[\alpha]^{25} = -3.27^\circ$ . Hydrogenation ( $\text{PtO}_2$ ) in  $\text{AcOH}$  affords  $\epsilon$ -cyclohexyl- $\gamma$ -methylhexoic acid, b.p.  $180^\circ/10$  mm.,  $[\alpha]_D = -1.18^\circ$ , and  $\zeta$ -cyclohexyl- $\delta$ -methylheptoic acid, b.p.  $136\text{—}140^\circ/0.3$  mm.,  $[\alpha]^{25} = -1.41^\circ$ .  $[\alpha]$  are max. vals. for the homogeneous liquids.

R. S. C.

**Catalytic hydrogenation of ethyl cinnamate under pressure.** S. P. LAGEREV (J. Gen. Chem. Russ., 1935, 5, 517—518).—*Et* cinnamate yields  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$ , but not  $\delta$ -phenylbutyl alcohol, when heated with  $\text{H}_2$  (12 hr.;  $250^\circ/220$  atm.) in presence of Cr-Cu catalyst in an Fe autoclave.

R. T.

**Steric factor in organic chemical reactions.**

**I. Influence of esterification on mode of addition of bromine to  $\beta$ -phenylpropionic acid.** P. R. AYYAR (J. Indian Inst. Sci., 1935, 18, A, 123—127).—Addition of Br to  $\text{CPh}\cdot\text{CH}\cdot\text{CO}_2\text{H}$  (I) at  $0^\circ$  in the dark affords *cis*- and *trans*- $\text{CPhBr}\cdot\text{CBr}\cdot\text{CO}_2\text{H}$  in the ratio 3 : 2, whereas at  $0\text{—}25^\circ$  in diffused daylight the ratio is 2 : 1. Using the *Me* ester of (I), the ratios under the above conditions are 1 : 2 and 1 : 3, respectively.

P. G. C.

**Synthesis of a methyloctahydrophenanthrene-carboxylic acid and of 4-methylphenanthrene.** G. DARZENS and A. LEVY (Compt. rend., 1935, 201, 730—733).— $\beta$ -Chloromethyltetrahydronaphthalene (cf. A., 1931, 208) with  $\text{CHNa}(\text{CO}_2\text{Et})_2$  gives *Et*, tetrahydronaphthylmethylmalonate, b.p.  $179^\circ/1.5$

mm. (the acid, m.p.  $123^\circ$ , loses  $\text{CO}_2$  in vac. at  $170^\circ$  to give  $\beta$ -tetrahydronaphthylpropionic acid, m.p.  $127^\circ$ ), the Na derivative of which affords (cf. A., 1935, 975) an allyl derivative, b.p.  $189\text{—}190^\circ/2$  mm. [acid, an oil, which loses  $\text{CO}_2$  in vac. at  $170\text{—}180^\circ$  to give  $\beta$ -tetrahydronaphthyl- $\alpha$ -allylpropionic acid (I), an oil]. (I) with  $\text{AcOH-H}_2\text{SO}_4$  at  $50^\circ$  gives a lactone, b.p.  $187^\circ/2$  mm., and 4-methyloctahydrophenanthrene-2-carboxylic acid, m.p.  $148\text{—}149^\circ$ , which with Se at  $300\text{—}350^\circ$  gives 4-methylphenanthrene, m.p.  $116^\circ$  (cf. A., 1931, 1282; 1932, 608).

J. L. D.

**Addition of halogens to unsaturated acids and esters.** **V. Bromination of *m*-methoxycinnamic acid and its ethyl ester.** J. I. JONES and T. C. JAMES (J.C.S., 1935, 1600—1604).—*m*-Methoxycinnamic acid (I) when brominated in  $\text{AcOH}$  in the dark (cf. A., 1928, 519), in boiling  $\text{AcOH}$  in sunlight, or in  $\text{CCl}_4$  or  $\text{CHCl}_3$  at  $0^\circ$  in the dark, affords 6-bromo-3-methoxycinnamic acid (II), and when brominated in boiling  $\text{MeOH}$  in sunlight, or  $\text{MeOH}$  in the cold and dark, yields the *Me* ester of (II). (I) when treated with Br and dry  $\text{CCl}_4$  at the b.p. in bright sunlight yields  $\alpha\beta$ -dibromo- $\beta$ -3-methoxyphenylpropionic acid (III), m.p.  $167^\circ$ , also obtained, but less readily, when (I) is brominated in  $\text{CCl}_4$  in the cold in sunlight, or in boiling  $\text{CS}_2$ . Bromination of (I) in boiling  $\text{CHCl}_3$  in sunlight gives a mixture consisting mainly of (II). (III) is unaffected by boiling  $\text{EtOH}$ , and is oxidised by  $\text{KMnO}_4$  to *m*- $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  (IV). Bromination of the *Et* ester of (I) in  $\text{AcOH}$  or  $\text{CHCl}_3$  in the cold and dark gives only the *Et* ester of (II), but in  $\text{CCl}_4$  in strong sunlight gives the *Et* ester, m.p.  $58^\circ$ , of (III). (II) in boiling  $\text{CCl}_4$  with Br in strong sunlight yields  $\alpha\beta$ -dibromo- $\beta$ -6-bromo-3-methoxyphenylpropionic acid, m.p.  $163^\circ$ , also obtained by bromination of (III). (III) with  $\text{KOH-EtOH}$  affords  $\alpha$ -bromo-*m*-methoxycinnamic acid (V), m.p.  $122^\circ$  (A., 1934, 72), and  $\alpha$ -bromo-*m*-methoxyallicinnamic acid, m.p.  $91^\circ$ , separated by means of their Ba salts and also obtained by removal of  $\text{HBr}$  from the ester of (III). The *allo*-acid, when kept in the solid state or in  $\text{CCl}_4$  solution, in strong sunlight, or when heated during several hr. at  $150^\circ$ , is converted into (V). (V) when boiled with  $\text{KOH-EtOH}$  during 4 hr. yields *m*-methoxyphenylpropionic acid, m.p.  $109^\circ$ , which with  $\text{K}_2\text{CO}_3\text{-I-KI-H}_2\text{O}$  affords  $\alpha\beta$ -di-iodo-*m*-methoxycinnamic acid, m.p.  $142^\circ$ , and is hydrogenated (colloidal Pd "protected" by Na protalbate) to *m*-methoxyallicinnamic acid (VI), m.p.  $109\text{—}110^\circ$ , converted on long exposure to sunlight into (I). (VI) with  $\text{CHCl}_3\text{-Br}$  in the cold and dark affords 6-bromo-3-methoxyallicinnamic acid, m.p.  $133^\circ$ , oxidised by  $\text{KMnO}_4$  to (IV).

H. G. M.

**Preparation of fluorinated arylamides [of 2 : 3-hydroxynaphthoic acid].**—See B., 1935, 1132.

**Reaction of Grignard reagents with some succinic anhydrides.** C. WEIZMANN, (MRS.) O. BLUM-BERGEMANN, and F. BERGMANN (J.C.S., 1935, 1370—1371).— $(\text{CH}_2\text{CO})_2\text{O}$  treated with the Mg derivative of 1- or 2- $\text{C}_{10}\text{H}_7\text{-Br}$  yields  $\beta$ -(1- or  $\beta$ -(2-naphthoyl)propionic acid. Phenylsuccinic anhydride with  $\text{MgPhBr}$  and with the Mg derivative of 1- $\text{C}_{10}\text{H}_7\text{-Br}$  gives  $\alpha\gamma\gamma$ -triphenyl-, m.p.  $162^\circ$ , and  $\alpha$ -phenyl- $\gamma\gamma$ -di-(1-naphthyl)-*n*-butyrolactone, m.p.  $211^\circ$ , the last being accompanied by an acid, reduced to a

substance, b.p. 265—270°/1.4 mm. 3-Phenyl- $\Delta^4$ -tetrahydrophthalic anhydride and MgPhBr form an acid product, and a triphenyltetrahydrophthalide, 2-(diphenylmethylol)-6-phenyl- $\Delta^4$ -tetrahydrobenzoic acid lactone, m.p. 227°.

E. W. W.

**Hydrolysis of cyclopentanedicarboxylic esters.**  
—See A., 1935, 1465.

**Configurations of the  $\Delta^2$ -tetrahydro- and hexahydro-terephthalic acids.** W. H. MILLS and G. H. KEATS (J.C.S., 1935, 1373—1375).—"Fumaroid"  $\Delta^2$ -tetrahydroterephthalic acid (I), m.p. 228° ( $Me_2$  ester, m.p. 11°, b.p. 152—154°/30 mm.), is resolved into optical antimerides, and is thus the *trans*-form. The *brucine* salt,  $[\alpha]_D^{25} -117^\circ$ , gives 1-*trans*- $\Delta^2$ -tetrahydroterephthalic acid, m.p. 222°,  $[\alpha]_D^{25} -279^\circ$ ; an impure *d*-acid,  $[\alpha]_D^{25} +132^\circ$ , is also obtained. The "maleinoid" form, m.p. 161°, is not resolvable, and must be the *cis*-acid (II) ( $Me_2$  ester, b.p. 148°/30 mm.). (I) and (II) are hydrogenated (Pt) to *trans*- and *cis*-hexahydroterephthalic acid, respectively, m.p. 309° and 167°; the conclusions of Malachowski *et al.* (A., 1934, 1350) are thus confirmed. The primary and secondary dissociation consts. of (I) and (II) at 22° are: (I),  $K_1 1.18 \times 10^{-4}$ ,  $K_2 1.19 \times 10^{-5}$ ; (II),  $K_1 0.82 \times 10^{-4}$ ,  $K_2 0.81 \times 10^{-5}$ . The vals. of  $K_1/K_2$  indicate that the distance between dissociating H atom and negative charge on  $CO_2H \cdot C_6H_4 \cdot CO_2-$  is approx. 8.2 Å. in both (I) and (II) (cf. A., 1931, 1126); this is in agreement with models.

E. W. W.

**Grignard reactions with phthalic anhydride.** C. WEIZMANN, E. BERGMANN, and F. BERGMANN (J.C.S., 1935, 1367—1370).— $o$ - $C_6H_4(CO_2O)$  and its derivatives, including 4-methoxyphthalic anhydride, m.p. 97°, b.p. 202°/25 mm. (obtained from 4-hydroxyphthalic anhydride, b.p. 250—255°/24 mm., prepared from the acid, and  $CH_3N_2$ ), react with MgRBr to form derivatives of  $o$ - $C_6H_4(COR) \cdot CO_2H$  and of  $o$ - $C_6H_4(CR_2OH) \cdot CO_2H$  or its lactone. The following are new.  $o$ - $\beta$ -Naphthoylbenzoic acid, m.p. 128° (decomp.) (as hydrate), 168° (anhyd.); *di*- $\beta$ -naphthoylphthalide; *o*-(6-methoxy-2-naphthoyl)-, m.p. 166°, *o*-9-phenanthroyl-, m.p. 174—175°, 4(5?)-methoxy-2-benzoyl-, m.p. 167°, 4(5?)-methoxy-2- $\alpha$ -naphthoyl-, m.p. 196°, and tetrachloro-*o*-4-anisoyl-, m.p. 186—187°, -benzoic acid; tetrachlorodi-4-bromophenylphthalide, m.p. 144—145° (decomp.); and 2- $\alpha$ - (I), m.p. 228—229°, and 2- $\beta$ -naphthoyl-, m.p. 240°, and 2-4'-methoxybenzoyl-, m.p. 234°, -3-naphthoic acid. With  $AlCl_3$  and NaCl, *o*- $\alpha$ -naphthoylbenzoic acid yields naphthacenequinone, new m.p. 276°. In  $H_2SO_4$ , (I) condenses to 1:2:6:7-dibenzanthraquinone, m.p. 227°.

E. W. W.

**Synthesis of rotenone and its derivatives.**  
**VII. Tetrahydrotubaic acid.** A. ROBERTSON and G. L. RUSBY (J.C.S., 1935, 1371—1373).—A new synthesis of tetrahydrotubaic acid (I), of which the *Ac*, derivative, new m.p. 140—141°, is obtained by oxidation ( $KMnO_4$ ) of the *Ac*, derivative, m.p. 47.5°, of tetrahydrotuba-aldehyde (2:4-dihydroxy-3-isoamylbenzaldehyde) (II), m.p. 112.5° (semicarbazone, m.p. 198°), (II) being prepared  $[Zn(CN)_2]$  from tetrahydrotubanol (A., 1933, 1169). The orientation of (I) is established by converting (II) ( $MeI$ - $K_2CO_3$  in  $Ac_2O$ )

into 2-hydroxy-4-methoxy-3-isoamylbenzaldehyde, b.p. 180°/15 mm. (semicarbazone, m.p. 193°), since this condenses with  $\omega$ -methoxyacetoveratrone to 3:7:3':4'-tetramethoxy-8-isoamylflavylum chloride (ferrichloride, m.p. 131—132°); (III) is acetylated, oxidised, and deacetylated to 2-hydroxy-4-methoxy-3-isoamylbenzoic acid. The azlactone of asaraldehyde (A., 1932, 860) is converted by NaOH,  $SO_2$ , and HCl into 2:4:5-trimethoxyphenylpyruvic acid, m.p. 198°, of which the oxime treated with  $Ac_2O$  yields 2:4:5-trimethoxyphenylacetone nitrile, m.p. 85°, hydrolysed to the -acetic acid, new m.p. (hydrate) 81°, (anhyd.) 106°.

E. W. W.

**Synthesis in the sex hormone group.** A. COHEN (Nature, 1935, 136, 869—870; A., 1935, 752).—At room temp., 1-vinylnaphthalene readily combines with maleic anhydride (I) giving dihydrophenanthrene-1:2-dicarboxylic anhydride (II), m.p. 186—189° (decomp.), dehydrogenated (Pt-black; 300°) to phenanthrene-1:2-dicarboxylic anhydride, m.p. 310° (corr.) (Fieser *et al.*, *ibid.*, 1495). Dehydration 6-methoxy-1-naphthylethyl alcohol yields 1-vinyl-6-methoxynaphthalene, m.p. 41—42° (picrate, m.p. 114.5°), which combines with (I) forming the OMe-derivative of (II), m.p. 171—175° (decomp.). This is dehydrogenated by Pt-black at 280—300° to 7-methoxyphenanthrene-1:2-dicarboxylic anhydride, m.p. 260° (corr.).

L. S. T.

**Diphenylmalonic acid.** H. J. MORSMAN (Helv. Chim. Acta, 1935, 18, 1466—1468).—Prolonged shaking with  $H_2O$  converts  $CPh_2(COCl)_2$  into cryst. diphenylmalonic acid, m.p. indefinite owing to rapid loss of  $CO_2$  to give  $CHPh_2 \cdot CO_2H$ .

J. W. B.

**Degradation of  $\gamma$ -truxillic acid to a diphenylcyclobutanemonocarboxylic acid.** XVIII. R. STOERMER and H. STROH [with, in part, H. ALBERT]. Unique position of  $\epsilon$ -truxillic acid; truxilketones. XIX. R. STOERMER and K. CRUSE. Semitruxonic acids of the truxillic acid series and the missing truxone, *peri*-truxone. XX. R. STOERMER and F. MÖLLER (Ber., 1935, 68, [B], 2102—2111, 2117—2124, 2125—2134).—XVIII. The degradation of  $\gamma$ -truxillic acid without contraction of the ring is effected through the stages:  $>CH \cdot CO_2H \rightarrow >CH \cdot CMe_2 \cdot OH \rightarrow >C \cdot CMe_2 \rightarrow >CO$ . Treatment of Et H  $\gamma$ -truxillate (I) with  $MgMeI$  affords 3 $\epsilon$ - $\alpha$ -hydr-

axisopropyl-2 $\epsilon$ -4'-diphenylcyclobutane-1 $\epsilon$ -carboxylic acid (II), m.p. 198° (*Me*, m.p. 102—103°, and *Et*, m.p. 77—78°, ester). Similar treatment of the *Et*, ester leads to 1 $\epsilon$ :3 $\epsilon$ -di- $\alpha$ -hydroxyisopropyl-2 $\epsilon$ :4'-diphenylcyclobutane (tetramethyl- $\gamma$ -truxilldiol), m.p. 127—128°, with the lactone (III), m.p. 148°, and ester of (II) into which they are converted by hydrolysis. Under similar conditions, Et H  $\alpha$ -truxillate (IV), m.p. 171°, best obtained by partial esterification of the corresponding acid, is transformed into 3 $\epsilon$ - $\alpha$ -hydroxyisopropyl-2 $\epsilon$ :4'-diphenylcyclobutane-1 $\epsilon$ -carboxylic acid (V), m.p. 174—175° (*Me* ester, m.p.

81—82°). (I), Mg, and EtBr give 3 $\epsilon$ - $\alpha$ -hydroxy- $\alpha$ -ethyl-*n*-propyl-2 $\epsilon$ : 4'-diphenylcyclobutane-1'-carboxylic acid, m.p. 216—217° (*Me* ester, m.p. 141°); 3 $\epsilon$ - $\alpha$ -hydroxy- $\alpha$ -ethyl-*n*-propyl-2 $\epsilon$ : 4'-diphenylcyclobutane-1'-carboxylic acid has m.p. 151° (*Me* ester, m.p. 97—98°). Treatment of (II), (III), or (V) with AcOH at 210° yields 3-isopropylidene-2 $\epsilon$ : 4'-diphenylcyclobutane-1'-carboxylic acid (VI), m.p. 143—144°

(sparingly sol. *Na* salt), best obtained by passing HCl rapidly through a solution of (II) in boiling conc. HCl. It is thus established that there is no alteration in the spatial distribution of the other groups around the cyclobutane ring. Bromination of (VI) in CHCl<sub>3</sub> affords a single, saturated bromolactone [probably (VII)], m.p. 157—158°, which is not debrominated in acid or neutral solution, but with Zn and AcOH or Al-Hg yields small amounts of (VI) and is converted by red P and HI (*d* 1.5) into a Br-free lactone, m.p. 161—162°, probably formed by ring fission, and an acid, C<sub>20</sub>H<sub>21</sub>O<sub>2</sub>I, m.p. 210—211° (*Na* salt); treatment of it with alkali gives a CO-acid, an unsaturated acid, and a OH-lactone of unexplained structure. Treatment of the diol with AcOH at 210° yields 1:3-dusopropylidene-2 $\epsilon$ : 4'-diphenylcyclobutane, b.p. 202°/11 mm., ozonised to (?) isopropylidenediphenylcyclobutanone, m.p. 106—109°. Proof that the acid (VI) contains a semicyclic double linking is afforded by the production of CMe<sub>2</sub> after ozonisation. The ozonide decomposes very rapidly in CHCl<sub>3</sub>, AcOH, or EtOAc, and when treated with alkali gives phenylbenzylsuccinic acid (VIII), m.p. 183—184° (*Me* ester, m.p. 125°). If ozonisation is effected in EtOAc and the product is immediately catalytically hydrogenated, diphenylcyclobutanonecarboxylic acid (IX), m.p. 98° (*Me* ester, m.p. 72°; *p*-nitrophenylhydrazine, m.p. 184°), is almost quantitatively obtained; it appears unsaturated towards KMnO<sub>4</sub> and reduces ammoniacal Ag solution, but does not give the Angeli-Rimini test or colour fuchsin-H<sub>2</sub>SO<sub>3</sub>. If the ozonide is kept overnight, it yields an isomeric acid, m.p. 141—142° (*Me* ester, m.p. 64°), stable in hot C<sub>6</sub>H<sub>6</sub> or AcOH, but readily transformed by boiling H<sub>2</sub>O or aq. media, or by dissolution in cold Na<sub>2</sub>CO<sub>3</sub> or NH<sub>3</sub> and pptn. with acid, into (IX). Reduction of (IX) with a large excess of Zn and HCl leads to 2:4-diphenylcyclobutane-1-carboxylic acid, m.p. 111—112° (anilide, m.p. 165—166°).

XIX.  $\epsilon$ -Truxillic acid (X) is converted by boiling Ac<sub>2</sub>O into the polymeric  $\epsilon$ -anhydride, transformed by warm NH<sub>2</sub>Ph into a mixture of (X), its dianilide, and anilic acid. Repeated distillation of (X) under 0.4 mm. yields *peri*- and  $\gamma$ -truxillic anhydride, thus affording the first instance of a change of the  $\epsilon$ -configuration. *Me H*  $\epsilon$ -truxillate (XI), m.p. 131° (*Na* and *Ca* salts), obtained by the action of HNO<sub>3</sub> on *Me*  $\epsilon$ -truxillanilate or by half-hydrolysis of Me<sub>2</sub>  $\epsilon$ -truxillate, passes when heated into MeCl and CHPh:CH·CO<sub>2</sub>H.

It is considered therefore that monomeric  $\epsilon$ -truxillic anhydride cannot exist. Interaction of MgMeI and

(XI) gives comparatively very large quantities of  $\epsilon$ -tetramethyltruxilldiol, m.p. 146°, and 3 $\epsilon$ - $\alpha$ -hydroxy-isopropyl-2 $\epsilon$ : 4'-diphenylcyclobutane-1'-carboxylic acid (XII), m.p. 145° (*Ca* salt), which gives CHPh:CH·CO<sub>2</sub>H and a non-cryst., non-hydrolysable substance of high b.p. when its dehydration is attempted by the methods used for the  $\gamma$ -acid (see above). Unexpectedly, treatment of (XI) with MgPhBr leads to (X) and 1 $\epsilon$ : 3 $\epsilon$ -dibenzoyl-2 $\epsilon$ : 4'-diphenylcyclobutane (XIII), m.p. 207—208°, which passes when heated with KOH-EtOH and NH<sub>2</sub>OH, but not with KOH-EtOH only, into an isomeric truxillketone, m.p. 222°; both ketones yield Ph styryl ketone when cautiously distilled under atm. pressure.

Treatment of  $\gamma$ -truxillic anhydride (XIV) with AlCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> at 100° gives 3 $\epsilon$ -benzoyl-2 $\epsilon$ : 4'-diphenylcyclobutane-1'-carboxylic acid (XV), m.p. 227° [sparingly sol. *Na* and NH<sub>4</sub> salts; phenylhydrazine, m.p. 100° (much decomp. with production of lactam); *Me*, m.p. 169°, and *Et*, m.p. 162°, ester], which is depolymerised when heated or treated with conc. H<sub>2</sub>SO<sub>4</sub> to CHPh:CH·CO<sub>2</sub>H and CHPh:CHBz. The corresponding chloride, m.p. 150—152°, is transformed by AlCl<sub>3</sub> and C<sub>6</sub>H<sub>6</sub> into much non-cryst. matter and a substance, m.p. 92—93°. The behaviour of (XIV) towards AlCl<sub>3</sub> and C<sub>6</sub>H<sub>6</sub> depends greatly on the quality of the AlCl<sub>3</sub>, temp., and duration of action. With somewhat weathered AlCl<sub>3</sub>, a truxillketone, m.p. 77—78°, and a substance (C<sub>11</sub>H<sub>6</sub>O<sub>2</sub>)<sub>n</sub>, m.p. 195° (possibly Stobbe's truxillketone D), are obtained in small yield.

XX. Treatment of  $\gamma$ -truxillic acid with HCl and cold MeOH gives the *Me H* ester (very sparingly sol. *Na* salt), converted by SOCl<sub>2</sub> in boiling C<sub>6</sub>H<sub>6</sub> into the corresponding chloride, m.p. about 86°, which is transformed by AlCl<sub>3</sub> in CS<sub>2</sub> into *Me*  $\gamma$ -truxonate. The latter is hydrolysed by KOH-EtOH to  $\gamma$ -truxonic acid (XVI), m.p. 152° (*Me* ester, m.p. 127—128°; oxime, m.p. 207°; amide, m.p. 236—237°; phenylhydrazine, m.p. 225°). *Me H*  $\alpha$ -truxillate, m.p. 195° (very sparingly sol. *Na* salt), is similarly transformed through the chloride into *Me*  $\alpha$ -truxonate, m.p. 186°, hydrolysed by alkali to (XVI), but by boiling AcOH containing a little H<sub>2</sub>SO<sub>4</sub> and H<sub>2</sub>O to  $\alpha$ -truxonic acid (XVII), m.p. 216° (sparingly sol. *Na*, *Ca*, and NH<sub>4</sub> salts; phenylhydrazine, m.p. 239°), converted by SOCl<sub>2</sub> in C<sub>6</sub>H<sub>6</sub>, and thence by AlCl<sub>3</sub> in CS<sub>2</sub>, into  $\alpha$ -truxone. *peri*-Truxillic anhydride, m.p. 287°, is best obtained by heating the  $\gamma$ -anhydride under N<sub>2</sub> at about 280°, and converting the crude product by NH<sub>3</sub>-EtOH into

peri-truxillamic acid (XVIII), m.p. 256.5° (decomp. in sealed capillary) ( $\text{NH}_4$  salt), which is boiled in

$\text{AcOH}$  or treated with  $\text{HNO}_2$  in  $\text{AcOH}$ . It is transformed by  $\text{CH}_2\text{N}_2$  in  $\text{C}_2\text{H}_4(\text{OH})_2$  into *Me H* peri-truxillamate, m.p. 197—198°, which with  $\text{HNO}_2$  in  $\text{AcOH}$  affords homogeneous *Me H* peri-truxillate. Treatment of (XVIII) with conc.  $\text{NH}_3$  at 110° gives unimol. peri-truxillimide, m.p. 237°, and epitruixill-b-amic acid (XIX), m.p. 263°, whereas with boiling 10%  $\text{NaOH}$  it yields epitruixillic acid, m.p. 286°. With  $\text{CH}_2\text{N}_2$  in  $\text{MeOH}$  (XIX) gives *Me* epitruixillamate, m.p. 228°, transformed by  $\text{HNO}_2$  in  $\text{AcOH}$  into *Me H* epitruixillate, m.p. 204.5°, identical with that obtained by half-hydrolysis of  $\text{Me}_2$  epitruixillate. The isomeric b-ester (XX), m.p. 141° (sparingly sol. *Na* salt), is obtained by saturating a suspension of the *epi*-acid in  $\text{MeOH}$  at 20° with  $\text{HCl}$ . (XX) is converted by  $\text{SOCl}_2$  and thence by the Friedel-Crafts reaction into *Me* epitruixonate, m.p. 106—107°, smoothly hydrolysed by  $\text{KOH-MeOH}$  to epitruixononic acid (XXI), m.p. 160° [oxime, m.p. 260° (decomp.)]. peri-Truxonic acid (XXII), m.p. 221—224° [phenylhydrazone, m.p. 189° (indef.)], is obtained among other products by the action of  $\text{AlCl}_3$  in  $\text{CS}_2$  on peri-truxillic anhydride and is converted through the chloride into peri-truxone, m.p. 194°, transformed by  $\text{NHPh-NH}_2$  in  $\text{AcOH}$  into the monophenylhydrazone, m.p. 217°, and by  $\text{NHPh-NH}_2$  in  $\text{N}_2$  at 150—160° into the diphenylhydrazone, m.p. about 280° (decomp.). Its isomerisation into  $\alpha$ -truxone by conc.  $\text{HCl}$  at 180° could not be established definitely. H. W.

**Phenylbenzylsuccinic acids.** R. STÖRMER and H. STROH (Ber., 1935, 68, [B], 2112—2116).— $\text{Et}_3\alpha$ -phenyl- $\beta$ -benzylethane- $\alpha\beta\beta$ -tricarboxylate, b.p. 232°/3 mm., m.p. 48°, from  $\text{CHPhBr}\cdot\text{CO}_2\text{Et}$  and  $\text{CH}_2\text{Ph}\cdot\text{CH}(\text{CO}_2\text{Et})_2$ , is hydrolysed by 18%  $\text{HCl}$  at 180—190° to phenylbenzylsuccinic acid (I), m.p. 176° (*Me* ester, m.p. 89—90°), whereas hydrolysis with  $\text{AcOH}$  and 50%  $\text{H}_2\text{SO}_4$  at 120° leads to the isomeric phenylbenzylsuccinic acid (II), m.p. 183—184° (*Me* ester, m.p. 125°, identical with that obtained by degradation of diphenylcyclobutanonecarboxylic acid obtained from  $\alpha$ - or  $\gamma$ -truxillic acid (preceding abstract). Short treatment of (II) with boiling  $\text{AcCl}$  leads to the corresponding anhydride, m.p. 92°, whereas (I) with warm  $\text{AcCl}$  affords a non-cryst. mixture of anhydrides converted by  $\text{H}_2\text{O}$  into a mixture of (I) and (II). Boiling  $\text{Ac}_2\text{O}$  containing  $\text{NaOAc}$  converts either acid into phenylbenzylangelic-lactone (III),  $\text{CH}_2\text{Ph}\cdot\text{CH}(\text{CO})\text{CPh}\cdot\text{CMe}>\text{O}$  m.p. 96° hydro-

lysed by  $\text{KOH-MeOH}$  to  $\beta$ -phenyl- $\alpha$ -benzyl-lævulic acid, m.p. 120—121° (*Me* ester, m.p. 81—82°), transformed by  $\text{NHPh-NH}_2$  in  $\text{AcOH}$  into 2:5-diphenyl-4-benzyl-6-methylpyridazin-3-one, m.p. 148—149°, and oxidised by  $\text{NaOBr}$  to (I). The change is therefore  $\text{CO}_2\text{H}\cdot\text{CH}(\text{CH}_2\text{Ph})\cdot\text{CHPh}\cdot\text{CO}_2\text{H} \rightarrow \text{CO}_2\text{H}\cdot\text{CH}(\text{CH}_2\text{Ph})\cdot\text{CPhAc}\cdot\text{CO}_2\text{H} \rightarrow \text{CO}_2\text{H}\cdot\text{CH}(\text{CH}_2\text{Ph})\cdot\text{CHPhAc} \rightarrow$  (III). This view is supported by the observation that whereas  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  is stable towards boiling  $\text{Ac}_2\text{O}$  containing  $\text{NaOAc}$ ,  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{H}$  is converted into  $\text{CH}_2\text{Ph}\cdot\text{COMe}$  in very good yield. H. W.

**Oxidation of bisphenylpyruvic [ $\alpha$ -hydroxy- $\gamma$ -keto- $\beta$ -phenyl- $\alpha$ -benzylglutaric] acid.** J. JARROUSSE (Compt. rend., 1935, 201, 676—677).—Bisphenylpyruvic acid with  $\text{KMnO}_4$  in alkali at 0° affords  $\alpha\gamma$ -diketo- $\beta\delta$ -diphenylvaleric acid, which easily loses  $\text{CO}_2$  to give  $\beta$ -keto- $\alpha\gamma$ -diphenylbutaldehyde, m.p. 114° [semicarbazone, m.p. 200° (decomp.)], oxidised by I in presence of  $\text{Na}_2\text{CO}_3$  to a substance, m.p. 190° (decomp.). J. L. D.

**Lichen substances. LIX. Non-existence of  $\gamma$ -collatolic acid. LX. Microphylllic acid and its fission products. LXI. Olivetoric acid.** III. Y. ASAHINA and F. FUJIKAWA (Ber., 1935, 68, [B], 2020—2021, 2022—2025, 2026—2028).—LIX (cf. A., 1933, 713).— $\alpha$ -Collatolic acid (I) in moderately conc.  $\text{NaHCO}_3$  solution is slowly converted into  $\beta$ -collatolic acid (II). (II) is not a natural product, but is formed during the alkaline hydrolysis of *Me*  $\alpha$ -collatolate. *Me*  $\beta$ -collatolate, m.p. 75°, is formed by the restricted action of  $\text{CH}_2\text{N}_2$  on (II), whereas prolonged action gives the *Me* ester *Me*<sub>2</sub> ether (III), m.p. 114°, also obtained similarly from (I).  $\gamma$ -Collatolic acid is (II) more or less contaminated with (I), since homogeneous (II) can be isolated therefrom by crystallisation from  $\text{C}_6\text{H}_6$ , and treatment of it with an excess of  $\text{CH}_2\text{N}_2$  gives (III). (II) has therefore structure A.

LX (cf. A., 1935, 490). Microphylllic acid (IV), m.p. 116°, is transformed by boiling  $\text{HCO}_2\text{H}$  into olivetonide (V) and olivetonide *p*-Me ether (VI). (IV) and  $\text{Ac}_2\text{O}$  containing a little conc.  $\text{H}_2\text{SO}_4$  afford anhydrodiacetylmicrophylllic acid, m.p. 98°. Hydrolysis of (IV) with 11%  $\text{NaOH}$  gives (VI) and olivetonic acid (VII), m.p. 159—160° (*Me* ester, m.p. 85—86°), also obtained by the action of  $\text{KOH}$  on (V). (IV) is decomposed by excess of  $\text{CH}_2\text{N}_2$ , but treatment with  $\text{Ag}_2\text{O}$  and  $\text{MeI}$  gives *Me* microphyllate *Me*<sub>2</sub> ether (VIII), m.p. 89—90°, hydrolysed by boiling 95%  $\text{HCO}_2\text{H}$  to olivetonide *Me*<sub>2</sub> ether, m.p. 94° [also obtained by treatment of (VI) with  $\text{Ag}_2\text{O}$  and  $\text{MeI}$ ], and olivetonide *o*-Me ether, m.p. 146—147°, converted by  $\text{CH}_2\text{N}_2$  into (VIII). The following derivatives of (V) and (VII) are described: *p*-acetylolivetonic acid, m.p. 55°, and its *o*-Me ether, m.p. 84°, obtained by means of  $\text{Ag}_2\text{O}$  and  $\text{MeI}$ ; diacetylolivetonic acid, m.p. 59°; *o*-acetylolivetonic acid *p*-Me ether, m.p. 60—61°;

olivetononic acid *p*-, m.p. 94—95°, and *o*-Me ether, m.p. 119—120°; *Me olivetonate Me ether*, m.p. 80°.

LXI. Extraction of the thalli of *Parmelia olivetorum*, Nyl, with Et<sub>2</sub>O and treatment of the extract with NaHCO<sub>3</sub> yields (?) chloroatranorin and olivetoric acid, m.p. 150—151°. The latter is converted by cautious treatment with CH<sub>3</sub>N<sub>3</sub> into the *Me* ester, m.p. 134°, and by Ag<sub>2</sub>O and MeI into *Me olivetorate Me<sub>2</sub> ether*, m.p. 44—7.5°, alkaline hydrolysis of which affords olivetonic acid *Me<sub>2</sub> ether*, m.p. 92°, and olivetolcarboxylic acid *o*-Me ether, m.p. 105°. H. W.

Bile acids. XLVII. Preparation of the compound C<sub>24</sub>H<sub>30</sub>O<sub>10</sub>N<sub>2</sub> (bilianic acid series). M. SCHENCK (Z. physiol. Chem., 1935, 237, 105—112).—The ketolactamtricarboxylic acid, C<sub>24</sub>H<sub>35</sub>O<sub>8</sub>N (A., 1931, 841), purified by KMnO<sub>4</sub> in aq. Na<sub>2</sub>CO<sub>3</sub>, yields with 57% HNO<sub>3</sub> the compound C<sub>24</sub>H<sub>30</sub>O<sub>10</sub>N<sub>2</sub> (I), which with hot 90% H<sub>2</sub>SO<sub>4</sub> affords the "β-acid," (C<sub>24</sub>H<sub>30</sub>O<sub>10</sub>N<sub>2</sub>, decomp. 203° (A., 1930, 1435), and with hot HCl, the aminoamide, C<sub>24</sub>H<sub>38</sub>O<sub>11</sub>N<sub>2</sub>. The data support a lactamamide rather than the amino-nitrile structure for (I) (cf. A., 1932, 742).

F. O. H.

Cannizzaro reaction. C. D. NENITZESCU and I. GAVAT (Bul. Soc. Chim. Romania, 1934, 16, [A], 42—46).—The velocity of the Cannizzaro reaction with PhCHO in 80% MeOH at 20° is greatly increased by increase in the concn. of KOH from 0.5*N* to 1.6*N* and slightly (catalytically) by Cu at 50°. NMe<sub>4</sub>Et·OH effects the reaction, but Na<sub>2</sub>CO<sub>3</sub> and Na<sub>2</sub>HPO<sub>4</sub> do not. Equimol. mixtures of PhCHO with CH<sub>3</sub>O or OMe·C<sub>6</sub>H<sub>4</sub>·CHO give both pairs of acids and alcohols. A large excess of CH<sub>3</sub>O gives almost exclusively HCO<sub>2</sub>H and the aromatic alcohol (CH<sub>3</sub>·Ph·OH, OMe·C<sub>6</sub>H<sub>4</sub>·CH<sub>2</sub>·OH, or *m*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CH<sub>2</sub>·OH).

R. S. C.

Nitrones. A new transposition reaction. II. III. Transformation [of oximes] into cyano-derivatives of anils. Simple method of preparing these substances. V. BELLAVITA (Gazzetta, 1935, 65, 889—897, 897—906).—II. Action of KCN in MeOH on the corresponding *N*-phenylaraldoximes, CH<sub>3</sub>R·NPh·O, gives the following *N*-phenylimides, OMe·CR·NPh. *Me benzoate*- (I), b.p. 170—175°/9 mm., *Me p-chlorobenzoate*- (II), b.p. 212°/8 mm. (obtained from *N*-phenyl-*p*-chlorobenzaldoxime, m.p. 153—154°), *Me anisate*- (III), b.p. 212°/8.5 mm.; *Me cinnamate*- (IV), m.p. 70°, *Me piperonylate*-, b.p. 224°/4 mm., and *Me piperonylacrylate*-, b.p. 242°/5 mm., *N*-phenylimides. These are hydrolysed to the ester (or acid), and aniline; (I) to (IV) also give the anilide.

III. *N*-Phenylbenzaldoxime triturated with KCN in MeOH at room temp. yields ω-cyanobenzaldanil, (N·CPh·NPh, m.p. 73.5°, an intermediate compound of the reaction described in the preceding abstract. The following are prepared similarly. ω-Cyano-*p*-chlorobenzaldanil, m.p. 108° (converted by KOH·EtOH into Et *p*-chlorobenzoate-*N*-phenylimide, b.p. 190—192°/10 mm.); ω-cyano-*o*-, -*m*-, and -*p*-nitrobenzaldanil, m.p. 105—106°, 101—102°, and 126.5°, respectively; ω-cyanosalicylaldanil, m.p. 96°; ω-cyanocinnamaldanil, m.p. 73—74°; ω-cyanoanisaldanil, m.p. 119°; ω-cyanopiperonaldanil, m.p. 139—140°;

and ω-cyanopiperonylacaldanil, m.p. 160—161°. These compounds are converted by acid into NH<sub>2</sub>Ph and RCN, and by KOH·R'OH into OR'·CR·NPh and KCN (R'=Me or Et).

E. W. W.

Iodination and nitration of *p*-phenoxybenzaldehyde. K. H. SLOTTA and K. H. SOREMB (Ber., 1935, 68, [B], 2059—2066).—*p*-Phenoxybenzaldehyde (I), b.p. 174—176°/12 mm. (prep. in 80% yield from Ph<sub>2</sub>O described), is converted by gradual addition of ICl in AcOH at 50° and subsequent heating of the mixture at 110—120° with occasional addition of *i*-iodophenoxybenzaldehyde (II), m.p. 65—67° (NaHSO<sub>3</sub> compound; phenylhydrazone, m.p. 150°), oxidised by CrO<sub>3</sub> in AcOH to *p*-4'-iodophenoxybenzoic acid, m.p. 215°. Iodination of (I) could not be effected with I+HIO<sub>3</sub> in aq. EtOH and (II) is not formed by treatment of *p*-C<sub>6</sub>H<sub>4</sub>I·OPh with AlCl<sub>3</sub>, HCl, and HCN. Nitration of (II) with conc. H<sub>2</sub>SO<sub>4</sub>·HNO<sub>3</sub> (*d* 1.41) gives a complex mixture of products, whereas addition of (II) to HNO<sub>3</sub> (*d* 1.410) at 15° affords *p*-4'-nitrophenoxybenzaldehyde, m.p. 107—108° (phenylhydrazone, m.p. 160°), also obtained with *p*-2'-nitrophenoxybenzaldehyde, m.p. 84—86°, from *p*-C<sub>6</sub>H<sub>4</sub>Cl·NO<sub>2</sub> and *p*-OH·C<sub>6</sub>H<sub>4</sub>·CHO. Under defined conditions (I) is transformed by H<sub>2</sub>SO<sub>4</sub>·HNO<sub>3</sub> into 3:2':4'-trinitro-4-phenoxybenzaldehyde (III), m.p. 169° (phenylhydrazone, m.p. 190—192°), also obtained by nitration of 2':4'-dinitro-4-phenoxybenzaldehyde; its constitution follows from its non-identity with 2':4':6'-trinitro-4-phenoxybenzaldehyde, m.p. 128° (phenylhydrazone, m.p. 225°), derived from picryl chloride and *p*-OH·C<sub>6</sub>H<sub>4</sub>·CHO. Oxidation of (III) with CrO<sub>3</sub> in AcOH affords 3:2':4'-trinitro-4-phenoxybenzoic acid, m.p. 205—207°, converted by NaOH into 2:4-(NO<sub>2</sub>)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·OH and 3-nitro-4-hydroxybenzoic acid.

H. W.

Synthesis of polyterpenoid compounds. II. J. W. COOK and C. A. LAWRENCE (J.C.S., 1935, 1637—1638; cf. A., 1935, 756).—β-Δ<sup>1</sup>-cyclohexenylethyl bromide (improved prep.) when heated (water-bath; 120 hr.) with CHK(CO<sub>2</sub>Et)<sub>2</sub> in C<sub>6</sub>H<sub>6</sub> affords Et β-(Δ<sup>1</sup>-cyclohexenylethyl)malonate, b.p. 148°/1—1.5 mm., hydrolysed to the acid, m.p. 123—124°, which when heated at 180° for ½ hr. and distilled in vac. yields γ-Δ<sup>1</sup>-cyclohexenylbutyric acid, b.p. 122—125°/0.8 mm. (*p*-phenylphenacyl ester, m.p. 79.5—81°). This was converted into the acid chloride which with CS<sub>2</sub>·SnCl<sub>4</sub> at -7° to -10° yields Δ<sup>9:10</sup>-α-octalone (A., 1933, 704).

H. G. M.

Nitro- and bromonitro-derivatives of *p*-aminoacetophenone. C. W. RAADSVELD (Rec. trav. chim., 1935, 54, 813—827).—With HNO<sub>3</sub> (*d* 1.52) at -15° to -20° *p*-C<sub>6</sub>H<sub>4</sub>Ac·NHAc affords its 3-NO<sub>2</sub> and 3:5-(NO<sub>2</sub>)<sub>2</sub>-derivatives, but with HNO<sub>3</sub>·Ac<sub>2</sub>O at 0° a 90% yield of the 3-NO<sub>2</sub>-compound (I) is obtained. With HNO<sub>3</sub>·H<sub>2</sub>SO<sub>4</sub> at 100° picric acid is the only product isolated. *Me p*-acetylphenylcarbamate, m.p. 162° [obtained from *p*-C<sub>6</sub>H<sub>4</sub>Ac·NH<sub>2</sub> (II) and ClCO<sub>2</sub>Me·Na<sub>2</sub>CO<sub>3</sub> in boiling Et<sub>2</sub>O], with HNO<sub>3</sub> (*d* 1.45) gives its 2-NO<sub>2</sub>-derivative (III), m.p. 107°, but with HNO<sub>3</sub> (*d* 1.52) at 0° the 2:6-(NO<sub>2</sub>)<sub>2</sub>-derivative (IV), m.p. 213°, is obtained. Et *p*-acetylphenylcarbamate, m.p. 159°, and its 2-NO<sub>2</sub>- (V), m.p. 111°, and 2:6-(NO<sub>2</sub>)<sub>2</sub>-derivative (VI), m.p. 176°, are similarly obtained.

If the nitration products of these carbamates are heated to 50° before pouring on ice, *substances*, m.p. 200° and 135°, respectively (from the Me ester), and m.p. 153° and 113° (Et ester), are obtained. Nitration of *N*-4-acetylphenyl-*N'*-ethylcarbamide, m.p. 157° [from (II) and EtNCO in dry C<sub>6</sub>H<sub>6</sub> at 100°] with HNO<sub>3</sub> (*d* 1.45) at 0° affords *N*-(2-nitro-4-acetyl)-*N'*-nitro-*N'*-ethylcarbamide, C<sub>6</sub>H<sub>4</sub>Ac(NO<sub>2</sub>)·NH·CO·NEt·NO<sub>2</sub> (VII), m.p. 91°, whereas HNO<sub>3</sub> (*d* 1.52) gives the corresponding 2 : 6-*NO*<sub>2</sub>-nitroamine (VIII), m.p. 120° (decomp.), converted by the appropriate ROH, respectively, into carbamates. Hydrolysis of (VII) with boiling aq. COMe<sub>2</sub>, or (III) or (V) with conc. H<sub>2</sub>SO<sub>4</sub> at 100°, or of (I) with boiling 6*N*-HCl, affords 3-nitro-4-aminoacetophenone (VIII), the 3 : 5-(*NO*<sub>2</sub>)<sub>2</sub>-derivative, m.p. 176° (*Ac* derivative, m.p. 222°; cf. above), being obtained similarly from (IV) or (VI). Bromination of *p*-C<sub>6</sub>H<sub>4</sub>Ac·NHAc gives the 3-Br-compound, hydrolysed by 6*N*-HCl to the hydrochloride, decomp. <100° (Raiford *et al.*, A., 1928, 303, give m.p. 155—156°), of 3-bromo-4-aminoacetophenone, but with Br·AcOH at 100° the ω-Br-compound is obtained. *p*-C<sub>6</sub>H<sub>4</sub>Ac·NH<sub>2</sub> with CH<sub>2</sub>Br·COCl·AcOH·NaOAc at 0° gives *p*-bromoacetamidoacetophenone, m.p. 157°. With HNO<sub>3</sub> (*d* 1.52) at -10° to -15°, 3-bromo-4-acetamidoacetophenone gives its 5-*NO*<sub>2</sub>-derivative, m.p. 203°, hydrolysed (conc. H<sub>2</sub>SO<sub>4</sub> or 6*N*-HCl in presence of EtOH) to 3-bromo-5-nitro-4-aminoacetophenone, m.p. 181°, also obtained by the action of Br·AcOH on (VIII). The structures of these derivatives are confirmed by elimination of the NH<sub>2</sub> group after diazotisation, to give known COPhMe derivatives.

J. W. B.

**Derivatives of *p*-aminoacetophenone.** C. W. RAADSVELD (Rec. trav. chim., 1935, 54, 827—832).—Condensation of *p*-C<sub>6</sub>H<sub>4</sub>Ac·NH<sub>2</sub> (I) with the appropriate carbimide affords *p*-acetylphenylcarbamide, m.p. 183° (lit., m.p. 148°), *s*-*p*-acetylphenylphenyl-, m.p. 195°, and *s*-*p*-acetylphenyl- $\alpha$ -naphthylcarbamide, m.p. 209°. With PhNCS a *substance*, m.p. 195° (not the thiocarbamide), is obtained. Condensation of (I) with the appropriate aromatic compound containing reactive Cl affords *p*-(2 : 4-dinitroanilino)-, m.p. 192° (lit., m.p. 185°), *p*-(2 : 4 : 6-trinitroanilino)-, and *p*-(2 : 4-dinitro- $\alpha$ -naphthylamino)-, m.p. 162°, -acetophenone. With CO(NH<sub>2</sub>)<sub>2</sub> at 200—215° (I) gives a *substance*, decomp. 280° (block), and, with CS<sub>2</sub>·EtOH·KOH, a yellow *substance*, m.p. 230—235°. The following ketazines (with N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>SO<sub>4</sub>) and phenylhydrazones are prepared: the *ketazine* of 3-nitro-4-amino-, m.p. 350° (*phenylhydrazone*, m.p. 135—138°); 3-nitro-4-acetamido-, m.p. 270° (*phenylhydrazone*, m.p. 160°); 3 : 5-dinitro-4-amino-, m.p. 345° (*phenylhydrazone*, m.p. 245°); 3-bromo-4-acetamido-, m.p. 80°; 5-bromo-3-nitro-4-amino-, m.p. 315° (*phenylhydrazone*, m.p. 80°); and 5-bromo-3-nitro-4-acetamido-, m.p. > 350°, -acetophenone.

J. W. B.

**Bromination of cholestanone and coprostanone;  $\Delta^{1:2}$ -cholesten-3-one.** A. BUTENANDT and A. WOLFF (Ber., 1935, 68, [B], 2091—2094).—The action of 1 mol. of Br on 3-keto-compounds of the sterol group results preferentially in substitution at C<sub>2</sub> or C<sub>4</sub> according as the initial ketone belongs to

the dihydrocholesterol (*allo* or *trans*) or the coprosterol (*cis*) series. Treatment of coprostanone with Br in AcOH containing traces of HBr gives 4-bromo-coprostanone, m.p. 110—111°, converted by boiling anhyd. C<sub>5</sub>H<sub>5</sub>N into cholestenone, m.p. 79—80° (yield 30%). Under similar conditions, cholestanone affords 2-bromocholestanone, m.p. 169—170° (apparently not homogeneous), largely resinified by boiling quinoline and transformed by boiling anhyd. C<sub>5</sub>H<sub>5</sub>N into a *compound*, m.p. > 300°. It is converted by AcOH·KOAc at 200° into  $\Delta^{1:2}$ -cholesten-2-one, m.p. 111—112°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -32.1° in EtOH (*oxime*, m.p. 146—147°).

H. W.

**Substituted unsaturated cyclic ketones.** A. COHEN and J. W. COOK (J.C.S., 1935, 1570—1572).—Unsaturated cyclic ketones are obtained by elimination of HCl from nitrosochlorides and hydrolysis of the resulting oximes. 1- $\beta$ -Phenylethyl- $\Delta^1$ -cyclohexene nitrosochloride, m.p. 139—140° (lit. 118—119°), when boiled with C<sub>5</sub>H<sub>5</sub>N for 2.5 hr. yields 2- $\beta$ -phenylethyl- $\Delta^2$ -cyclohexenoneoxime, m.p. 118—120°, hydrolysed by boiling 6*N*-H<sub>2</sub>SO<sub>4</sub> to the *ketone*, b.p. 125—130°/0.7 mm. (*semicarbazone*, m.p. 188—190°). Similarly 1-( $\beta$ -1'-naphthylethyl)- $\Delta^1$ -cyclopentene nitrosochloride, m.p. 108—110° (obtained from the cyclopentene, AcOH, Et<sub>2</sub>O, amyl nitrite, and HCl), when boiled with C<sub>5</sub>H<sub>5</sub>N for 5 min. affords 2-( $\beta$ -1'-naphthylethyl)- $\Delta^2$ -cyclopentenoneoxime, m.p. 106.5—107.5°, hydrolysed to the *ketone*, b.p. 165—167°/0.3 mm. (*semicarbazone*, m.p. 226—227°), which gave no oestrous response when injected into ovariectomised mice. All attempts to cyclise these ketones failed.

H. G. M.

**Benzanthrone derivatives. III. Autoxidisable dihydrobenzanthrone.** E. CLAR (Ber., 1935, 68, [B], 2066—2070; cf. A., 1932, 1134).—Benzanthrone (I) is reduced by Zn dust in boiling AcOH to dihydrobenzanthrone (II), m.p. 150—152° when rapidly heated under CO<sub>2</sub> in a sealed capillary, which is very sensitive to air, adds 2 O in xylene, immediately decolorises 2 Br, and becomes disproportioned by strong acids or weak bases or when heated at 150° to (I) and 9-hydroxy-1 : 10-trimethylenephenanthrene. Oxidation is accelerated by light and occurs most rapidly in AcOH, but then requires only 1.6 O. A peroxide could not be isolated, but the solutions retain peroxidic properties. Apparently in xylene the active O is imparted to the hydrocarbon and does not further affect unaltered (II), whereas in AcOH H<sub>2</sub>O<sub>2</sub> is formed which transforms (II) into (I). (II) gives an *acetate*, m.p. 159—161° in sealed capillary filled with CO<sub>2</sub>. The intermediate occurrence of an orange colour during the reduction of (I) indicates the possible formation of a H<sub>1</sub>-derivative similar to that, m.p. 120—125° in sealed tube under CO<sub>2</sub>, obtained by mixing equimol. amounts of (I) and (II) in hot AcOH under CO<sub>2</sub>. Bz-1-Bromodihydrobenzanthrone has m.p. 167° (decomp.).

H. W.

**Condensation of phthalic anhydride with *s*-octahydrophenanthrene.** E. DE B. BARNETT, N. F. GOODWAY, and C. A. LAWRENCE (J.C.S., 1935, 1684).—*s*-Octahydrophenanthrene and *o*-C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O with AlCl<sub>3</sub> in C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub> yield *o*-1 : 2 : 3 : 4 : 5 : 6 : 7 : 8-octahydrophenanthroylbenzoic acid (I), m.p. 200°.

Similarly the corresponding 4':5'-dichloro-octahydro-phenanthrolylbenzoic acid, m.p. 276° (decomp.), is obtained from 4:5-dichlorophthalic anhydride, but the product from 3:6-dichlorophthalic anhydride could not be crystallised. (I) when heated (water-bath) during 15 hr. with activated Zn dust, NaOH, and  $\text{NH}_3\cdot\text{H}_2\text{O}$  yields  $\omega$ -1:2:3:4:5:6:7:8-octahydrophenanthryl-o-toluic acid, m.p. 192°, cyclised by cold, conc.  $\text{H}_2\text{SO}_4$  to octahydro-1:2:3:4-dibenzanthrone (II), m.p. 200°, converted by  $\text{Ac}_2\text{O}\cdot\text{C}_5\text{H}_5\text{N}$  into octahydro-1:2:3:4-dibenzanthranyl acetate, m.p. 214°. (II) is oxidised by boiling  $\text{CrO}_3\text{--AcOH}\cdot\text{H}_2\text{O}$  to octahydro-1:2:3:4-dibenzanthraquinone (III), m.p. 234°, and when boiled (3 hr.) with activated Zn dust,  $\text{EtOH}$ ,  $\text{H}_2\text{O}$ , and  $\text{KOH}$  is reduced to octahydro-1:2:3:4-dibenzanthracene, m.p. 129°. Attempts to dehydrogenate this with  $\text{Se}$ , and (III) with  $\text{Br}$ , failed to yield any pure products. H. G. M.

**Carvacrol. V. Benzyl ethers of acylated methylisopropylphenols.** H. JOHN and P. BEETZ (J. pr. Chem., 1935, 144, 49—53).—The following ethers are obtained in about 85% yield by the action of  $\text{CH}_3\text{PhCl}$  or  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\text{Cl}$  on the K salt of the requisite phenol: *p*-acetothymyl  $\text{CH}_2\text{Ph}$ , m.p. 71°, and *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2$ , m.p. 104°, ether; *p*-propiothymyl  $\text{CH}_2\text{Ph}$ , m.p. 64°, and *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2$ , m.p. 110°, ether; *p*-butyrothymyl  $\text{CH}_2\text{Ph}$ , m.p. 47°, and *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2$ , m.p. 91°, ether; *p*-isovalerothymyl  $\text{CH}_2\text{Ph}$ , m.p. 40°, and *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2$ , m.p. 84°, ether; *p*-benzoylthymyl *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2$ , ether, m.p. 91°; *p*-acetocarvacryl  $\text{CH}_2\text{Ph}$ , m.p. 64°, and *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2$ , m.p. 114°, ether; *p*-propiocarvacryl *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2$ , ether, m.p. 128°. Glyceryl  $\alpha$ -di-*p*-acetothymyl ether, m.p. 109°, from *p*-acetothymol,  $\text{OH}\cdot\text{CH}_2(\text{CH}_2\text{CH}_2)_2$ , and  $\text{KOH}\text{--EtOH}$ , and glyceryl  $\alpha$ -di-*o*-nitro-*p*-acetylthymyl ether, m.p. 95°, are described. H. W.

**Action of organo-magnesium compounds on adiponitrile.** A. COMPERE (Bull. Soc. chim. Belg., 1935, 44, 523—526).—Adiponitrile with  $\text{MgEtBr}$  and  $\text{Et}_2\text{O}$  yields  $\text{C}_8\text{H}_{10}$ , 1-imino-2-cyanocyclopentane, and decane- $\gamma$ -dione; with  $\text{MgPhBr}$  it gives  $\text{COPh}\cdot(\text{CH}_2)_4\cdot\text{COPh}$  and a little  $\text{Ph}_2$ , and with  $\text{CH}_2\text{Ph}\cdot\text{MgBr}$  it gives  $\alpha$ -diphenyloctane- $\beta$ -dione, m.p. 72° (disemicarbazone, m.p. 210°). H. G. M.

**7-Hydroxy-1-keto-1:2:3:4-tetrahydrophenanthrene.** A. BUTENANDT and G. SCHRAMM (Ber., 1935, 68, [B], 2083—2091).—Unlike 1-keto-1:2:3:4-tetrahydrophenanthrene, 7-hydroxy-1-keto-1:2:3:4-tetrahydrophenanthrene (I) is physiologically inactive according to the Allen-Doisy method. 1:6- $\text{NH}_2\cdot\text{C}_{10}\text{H}_7\cdot\text{SO}_3\text{H}$  is heated with  $\text{KOH}$  at 250—310° and the product is treated with cold  $\text{Ac}_2\text{O}$ , thus giving 1:6- $\text{NHAc}\cdot\text{C}_{10}\text{H}_7\cdot\text{OH}$ , m.p. 214°, in 36% yield. It is converted by  $\text{Me}_2\text{SO}\text{--NaOH}$  into 1:6- $\text{NHAc}\cdot\text{C}_{10}\text{H}_7\cdot\text{OMe}$ , m.p. 140°, hydrolysed by  $\text{HCl}\text{--EtOH}$  to 6-methoxy- $\alpha$ -naphthylamine (II), m.p. 74° [hydrochloride, m.p. 205—220° (decomp.)], whence 6-methoxy- $\alpha$ -naphthonitrile, m.p. 79°. Treatment of (II) in the usual manner but at the lowest possible temp. gives 1:6- $\text{C}_{10}\text{H}_7\cdot\text{I}\cdot\text{OMe}$  (in 55% yield), the Grignard compound from which is transformed by  $\text{CHO}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$  or  $\text{CHO}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CO}_2\text{MgI}$  into  $\gamma$ -6-methoxy-1-naphthylbutenoic acid, m.p. 156° [Me

ester (III), m.p. 60°].  $\gamma$ -Hydroxy- $\gamma$ -6-methoxy-1-naphthyl-*n*-butyric acid and the corresponding lactone, m.p. 114°, are obtained as by-products. Hydrogenation of (III) in  $\text{AcOH}$  ( $\text{Pt}$  or  $\text{Pd}$ ) and hydrolysis of the product gives  $\gamma$ -6-methoxy-1-naphthyl-*n*-butyric acid, m.p. 149°, cyclised by  $\text{SnCl}_4$  at 105° to 7-methoxy-1-keto-1:2:3:4-tetrahydrophenanthrene, m.p. 101°, which with  $\text{HBr}$  ( $d$  1.48) in boiling  $\text{AcOH}$  yields (I), m.p. 232° (slight decomp.) (*Bz* derivative, m.p. 212°). *Et succinaldehyde semicarbazone* has m.p. 133°. H. W.

**Manufacture of polynuclear cyclic ketones.**—See B., 1935, 1133.

**Sex hormone. VIII. Preparation of testosterone by use of mixed esters.** L. RUZICKA, A. WETTSTEIN, and H. KAGI. IX. *trans*- $\Delta^4$ -Dehydroandrosterone and the preparation of *trans*- $\Delta^5$ -dehydroandrosterone from stigmaterol. L. RUZICKA, W. FISCHER, and J. MEYER. X. Preparation of 17-methyltestosterone and other androstene and androstane derivatives. Relationship between chemical constitution and male hormone activity. L. RUZICKA, M. W. GOLDBERG, and H. R. ROSENBERG (Helv. Chim. Acta, 1935, 18, 1478—1482, 1483—1487, 1487—1498).—VIII. With  $\text{BzCl}\cdot\text{C}_5\text{H}_5\text{N}$  *trans*- $\Delta^5$ -androstene-3:17-diol 3-monoacetate (A., 1935, 1371) gives its 17-benzoate, m.p. 180—182°, hydrolysed by  $\text{KOH}\text{--MeOH}$  at room temp. to the 3:17-diol 17-mono-benzoate, m.p. 220.5—222°. Addition of  $\text{Br}\text{--AcOH}$ , followed by oxidation with  $\text{CrO}_3\text{--90\% AcOH}$ , and debromination of the product with  $\text{NaI}\text{--EtOH}\cdot\text{C}_6\text{H}_6$  and 2%  $\text{Na}_2\text{SO}_3$  gives the 17-monobenzoate, m.p. 194—196° (corr.), of 17-hydroxy- $\Delta^4$ -androstene-3-one (testosterone), which is obtained by hydrolysis with 2%  $\text{KOH}\text{--MeOH}$ .

IX. *trans*- $\Delta^5$ -Dehydroandrosterone (I) (A., 1935, 1125) in  $\text{Et}_2\text{O}$  with  $\text{EtOH}$  saturated with  $\text{HCl}$  at 0° gives its hydrochloride, m.p. 156—157°, converted by  $\text{KOAc}\text{--EtOH}$  into *trans*- $\Delta^4$ -dehydroandrosterone, m.p. 128.5—130° [rather less active than (I)]. Oxidation of stigmateryl acetate (hydrobromide, m.p. 160.5—161.5°) by bromination,  $\text{CrO}_3$ , and debromination (as for cholesteryl acetate) also gives (I). Stigmaterol with an excess of  $\text{HCl}\text{--Et}_2\text{O}$  gives its hydrochloride (*Ac* derivative, m.p. 183—183.5°).

X. (I) (semicarbazone, m.p. 267°) with  $\text{MgMeI}$  or  $\text{MgEtI}$  affords, respectively, *trans*- $\Delta^5$ -17-methyl- (II), m.p. 204°, and -17-ethyl-androstene-3:17-diol, m.p. 173°. (II) is converted by bromination, oxidation with  $\text{CrO}_3$ , and debromination with  $\text{Zn}$  into 17-hydroxy-17-methyl- $\Delta^4$ -androstene-3-one (17-methyl-testosterone), m.p. 163—164°. Oxidation of methyl-androstanediol (A., 1935, 1125) with  $\text{CrO}_3\text{--AcOH}$ , gives 17-hydroxy-17-methyl-androstan-3-one, m.p. 192—193° (semicarbazone, m.p. 235—236°). Reduction of *trans*-androstene-3-one (3-hydroxy- $\alpha$ -allocholan-17-one) (III) (semicarbazone, m.p. 282—283°) with  $\text{H}_2\text{--PtO}_2$  in  $\text{AcOH}$  and hydrolysis (some acetate formed) gives *trans*-androstane-3:17-diol, m.p. 168° (*Ac* derivative, m.p. 127—128°). With  $\text{MgMeI}$  or  $\text{MgEtI}$  (III) gives, respectively, *trans*-17-methyl-, m.p. 211—212°, and -17-ethyl-androstane-3:17-diol (IV), m.p. 204—205°. Oxidation of (IV) with  $\text{CrO}_3\text{--}$

AcOH affords 17-hydroxy-17-ethylandrostan-3-one, m.p. 137—138°. Androsterone and MgEtI afford cis-17-ethylandrostan-3:17-diol, m.p. 143—144°. The relationship between physiological activity (on the basis of both the cock's comb and rat tests) and (a) the *cis*- or *trans*-configuration, or the presence of a double linking at C<sub>5</sub>, or (b) the nature and configuration of substituents at C<sub>3</sub> and C<sub>17</sub>, for these and other known androstane derivatives, is summarised and discussed.

J. W. B.

**Sexual hormones and related substances. V. *epi*Dihydrocinchol and its oxidation to 3-*epi*-hydroxyætiolchohan-17-one (androsterone).** W. DIRSCHERL (Z. physiol. Chem., 1935, 237, 52—56).—Oxidation of dihydrocinchol (I) (from hydrolysis of acetyldihydrocinchol; A., 1935, 1242) by CrO<sub>3</sub> yields dihydrocinchone, m.p. 163° (all m.p. corr.), [α]<sub>D</sub><sup>20</sup> +42° in CHCl<sub>3</sub>, which on reduction (Pt-H<sub>2</sub>) affords *epidihydrocinchol* (II), m.p. 206°, [α]<sub>D</sub><sup>20</sup> +26° in CHCl<sub>3</sub> [obtained directly from (I) by reduction with NaOEt at 215° and subsequent isolation as digitonide]. Oxidation of the *Ac* derivative, m.p. 90°, [α]<sub>D</sub><sup>20</sup> +28.4° to +29.4° in CHCl<sub>3</sub>, of (II) with CrO<sub>3</sub> yields 3-*epi*acetoxyætiolchohan-17-one, the *semicarbazone*, m.p. 284—285°, of which is converted by AcOH-HCl followed by hydrolysis into 3-*epi*hydroxyætiolchohan-17-one (cf. *ibid.*; A., 1934, 1221).

F. O. H.

**Dehydroandrosterone.** A. BUTENANDT, H. DANNENBAUM, G. HANISCH, and H. KUDSZUS (Z. physiol. Chem., 1935, 237, 57—74).—Dehydroandrosterone (I) (A., 1935, 413, 1125) [benzoate, m.p. 250° (all m.p. uncorr.); *acetate*, m.p. 168—169°, [α]<sub>D</sub><sup>20</sup> +3.9° in EtOH; *oxime*, m.p. 188—191°; *semicarbazone*, decomp. 262—264°] exists in polymorphic modifications, e.g., m.p. 137—138° and 180°, the latter showing marked depression on irradiation by arc or sun-light. All forms have [α]<sub>D</sub><sup>20</sup> +10.9° ± 0.7° in EtOH. (I) is separated from the CHCl<sub>3</sub>-sol. unsaponifiable matter of men's urine by pptn. with digitonin; this yields a cryst. mixture from which cholesterol and, by means of the *semicarbazone*, (I) are isolated. Treatment of (I) with MeOH-HCl, pptn. by digitonin, etc. affords the chloroketone, C<sub>19</sub>H<sub>27</sub>OCl (A., 1935, 413), also prepared by treating (I) with SOCl<sub>2</sub> in presence of dry CaCO<sub>3</sub> and Et<sub>2</sub>O. Hydrogenation (Pd-CaCO<sub>3</sub>) of (I) in MeOH yields *iso*androsterone (A., 1935, 1033). Cholesteryl acetate in AcOH treated with Br followed by CrO<sub>3</sub> yields, on debromination etc., 2.78% of (I) and 3-hydroxy-Δ<sup>5:6</sup>-cholenic acid, m.p. 224° (cf. A., 1935, 1125) (3-OAc-acid, m.p. 181°, and its *Me* ester, m.p. 156—157°). Similarly 3-hydroxy-Δ<sup>5</sup>-bisorcholenic acid (A., 1933, 1290) was prepared from stigmasterol. Both (I) and its acetate have approx.  $\frac{1}{3}$  the activity of androsterone by the cock's-comb assay; the benzoate is much less active than (I).

F. O. H.

**Androstenedione. Genesis of reproductory hormones.** A. BUTENANDT and H. KUDSZUS (Z. physiol. Chem., 1935, 237, 75—88).—Dehydroandrosterone (I) (cf. preceding abstract) with Br and CrO<sub>3</sub> yields a product which on debromination (Zn) affords Δ<sup>4</sup>-androstene-3:17-dione (II), m.p. 173—174°, [α]<sub>D</sub><sup>20</sup> +185°, absorption max. at 235 mμ [*di-*

*oxime*, m.p. 143° (uncorr.)] (cf. A., 1935, 1125, 1242). (II) has no sp. progesterone activity, whilst the cock's-comb test indicates a ratio of activities for (I), (II), and androstanediol (A., 1935, 1033) of 1:3:9 (cf. A., 1935, 1285). (II), unlike related compounds, is more active by the "capon unit" than the "mouse unit." The physiological activity of (II) appears to be especially of a "male" character; its relation to other sex hormones and its possible conversion into testosterone (A., 1935, 1370) and, by loss of CH<sub>4</sub>, into æstrone are discussed.

F. O. H.

**Testosterone. Conversion of dehydroandrosterone into androstenediol and testosterone. Preparation of testosterone from cholesterol.** A. BUTENANDT and G. HANISCH (Z. physiol. Chem., 1935, 237, 89—97).—Testosterone (I) (A., 1935, 1033) is identical with Δ<sup>4</sup>-androsten-17-ol-3-one (*ibid.*, 1370), and hence can be synthesised from cholesterol. Growth of cocks' combs indicates that the ratio of activities of (I), androstanediol, and androsterone is approx. 6:2:1. (I) has also a much greater action on the genital organs of male rats.

F. O. H.

**Catalytic hydrogenation of progesterone.** A. BUTENANDT and G. FLEISCHER (Ber., 1935, 68, [B], 2094—2097).—Hydrogenation of progesterone (PtO<sub>2</sub> in AcOH) gives a mixture of diols (I) oxidised by CrO<sub>3</sub> in AcOH to *allopregnan*dione and *pregnan*-dione. Similar reduction of *pregnen*-3-ol-20-one affords (I) almost exclusively. In acid solution, therefore, the compounds behave as expected from their constitutions. Contrary to Slotta *et al.* (A., 1935, 128), there is no evidence of the production of a new diketone, m.p. 188°.

H. W.

**New members of the androsterone group.** A. BUTENANDT, K. TSCHERNING, and G. HANISCH (Ber., 1935, 68, [B], 2097—2102).—*iso*Androsterone (I) is reduced by Na and Pr<sup>o</sup>OH or by Al-Hg to *isoandrostanediol* (II) [*alloætiolchohan*-3:17-diol], m.p. 164°, [α]<sub>D</sub><sup>20</sup> +4.2° (*diacetate*, m.p. 123—124°), which does not yield a sparingly sol., additive compound with digitonin and which somewhat exceeds (I) in physiological activity. *iso*Androstanediol *diacetate* is partly hydrolysed and the monoacetate is oxidised by CrO<sub>3</sub> to androstan-17-ol-3-one acetate, the *semicarbazone* of which is hydrolysed to *androstan*-17-ol-3-one (III) [*alloætiolchohan*-17-ol-3-one], m.p. 178°, [α]<sub>D</sub><sup>20</sup> +32.4° in EtOH (*acetate*, m.p. 157°; *oxime*, m.p. 209°), also obtained, together with (II), by hydrogenation (Pd sponge in Et<sub>2</sub>O) of testosterone (IV). Physiologically (III) is more active than androsterone. Reduction of (IV) with Al(OPr<sup>o</sup>)<sub>3</sub> affords Δ<sup>4:5</sup>-*androstene*-3:17-diol, m.p. 155.5°, which gives a yellow colour with C(NO<sub>2</sub>)<sub>4</sub>, a violet colour with CCl<sub>3</sub>·CO<sub>2</sub>H, and an additive compound with digitonin; it has little physiological activity.

H. W.

**Examination of products obtained in the preparation of ketones by the Friedel-Crafts reaction from acid chlorides and ethers of phenols. Synthesis of ketones of the naphthalene series.** P. E. POPOV (J. Gen. Chem. Russ., 1935, 5, 986—992).— $\alpha$ -C<sub>10</sub>H<sub>7</sub>·OMe and AcCl in CS<sub>2</sub> with AlCl<sub>3</sub> afford chiefly 1-methoxy-4-acetylnaphthalene, to-

gether with 2:4-diacetyl- $\alpha$ -naphthol, m.p. 139—140°, also obtained from 4-acetyl- $\alpha$ -naphthol as above. Under analogous conditions,  $\alpha$ -C<sub>10</sub>H<sub>7</sub>·OEt and BzCl yield chiefly 1-ethoxy-4-benzoylnaphthalene, together with 4-benzoyl-, m.p. 164—165°, and 2:4-dibenzoyl- $\alpha$ -naphthol, m.p. 138—139°. 2-Acetyl- $\alpha$ -naphthol and BzCl with AlCl<sub>3</sub> afford 4-benzoyl-2-acetyl- $\alpha$ -naphthol, m.p. 131—132°. R. T.

**2:6-Dibenzoylquinol.** O. DISCHENDORFER and A. VERDINO (Monatsh., 1935, 66, 255—285).—Doebner and Wolff's reaction product from  $p$ -C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> and BzCl (A., 1879, 638) is not, as regarded by Bogert and Howells (A., 1930, 477), 2:5-dibenzoylquinol (I) (cf. this vol., 82), but 2:6-dibenzoylquinol (II), as is shown by synthesis. The formation of (II) rather than (I) is in any case to be expected. (I) is prepared by Doebner's method. It is oxidised by alkaline KMnO<sub>4</sub> to BzOH, the absence of C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub> showing the absence of condensed rings. It gives Ac<sub>2</sub>, m.p. 146°, and  $\alpha$ -Br-, m.p. 140—141°, derivatives, and a Me<sub>1</sub> ether (III), new m.p. 101° (Ac derivative, m.p. 105°), and is oxidised by the method of Bogert (*loc. cit.*) to 2:6-dibenzoylbenzoquinone (IV), new m.p. 162°. To establish that the second Bz in (II) is not attached to a C of the first Bz, C<sub>6</sub>H<sub>5</sub>, BzCl, and AlCl<sub>3</sub> were heated at 190—200°, and gave 1:3-C<sub>6</sub>H<sub>4</sub>Bz<sub>2</sub> and some 1:3:5-C<sub>6</sub>H<sub>3</sub>Bz<sub>3</sub>. Attempted synthesis from  $m$ -C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub> failed. 5-Nitrosophthalic acid was converted into the chloride, and this by C<sub>6</sub>H<sub>6</sub> and AlCl<sub>3</sub> in CS<sub>2</sub> into 5-nitro-1:3-dibenzoylbenzene, m.p. 130°. This is reduced by Na in MeOH to 3:5:3':5'-tetrabenzoylazoxybenzene, m.p. 202° to a cloudy liquid, clearing at 219°, and by SnCl<sub>2</sub> in AcOH to 3:5-dibenzoylaniline (V), m.p. 129—130° [hydrochloride, m.p. about 185°; sulphate; Ac, m.p. 147°, and Bz, m.p. 152—153°, derivatives; 2:4:6-Br<sub>3</sub>-derivative, m.p. 235° (Ac derivative, m.p. 215°)]. The benzylidene derivative, m.p. 124°, of (V) is converted by HNO<sub>3</sub> into 2:4(or 2:6)-dinitro-3:5-dibenzoylaniline, m.p. 197°. Diazotisation of (V) yields 3:5-dibenzoylphenol (VI), m.p. 135° (Ac derivative, m.p. 138—139°; 2:4:6-Br<sub>3</sub>-derivative, m.p. 216°). Attempts to isolate the 4-O<sub>2</sub>-derivative of (VI) having failed, (VI) was oxidised by K<sub>2</sub>S<sub>2</sub>O<sub>8</sub> [which converts *o*-cresotic acid into 2:5-dihydroxy-3-methylbenzoic acid (Ac<sub>2</sub> derivative, m.p. 150°)], and gave a very small quantity of (IV), identical with that obtained from (I). As additional evidence, 2-hydroxy-5-methoxybenzophenone was condensed with benzoin to 5-methoxy-7-benzoyl-2:3-diphenylcoumarone (VII), m.p. 155°, together with 2-hydroxy-5-methoxy-4(or 6)-desylbenzophenone, m.p. 232° (decomp.) (Ac derivative, m.p. 168°). Oxidation (CrO<sub>3</sub>) of (VII) gives (III), identical with that from (I). Thus the structure of (I) is established, and the other compounds described by Bogert (*loc. cit.*) are 2:6-dibenzoylquinol Me<sub>2</sub> ether, 2-anilino-3:5-dibenzoylquinol, and the triacetate of 2-hydroxy-3:5-dibenzoylquinol; the views of Bogert (*loc. cit.*) on the structure of Koznievski and Marchlevski's "Pechmann dye" now lose their foundation. E. W. W.

**Quinoid oxidation products in the brazilin series.** T. PFEIFFER and P. SCHNEIDER [with, in

part, H. KOBBS] (J. pr. Chem., 1935, [ii], 144, 54—62).—The main product of the oxidation of trimethyldeoxybrazilin is the colourless trimethylbrazilone, but small amounts of a red quinone (I), C<sub>17</sub>H<sub>14</sub>O<sub>5</sub>, m.p. 241° (yellow Ac derivative, m.p. 158—160°; violet monoxime), are also produced. The colour, solubility in KOH-EtOH with transient green colour, and degradation by H<sub>2</sub>O<sub>2</sub> to 2-hydroxy-4-methoxybenzoic acid establish the constitution A for it, thus supporting Robinson's formulation of brazilin. Reductive acetylation (Ac<sub>2</sub>O-NaOAc-Zn dust) of

(I) leads to the substance (II), m.p. 139°, the structure assigned to which is supported by the observation that 2-phenylindan-1-one is smoothly converted into an Ac derivative, C<sub>6</sub>H<sub>4</sub><CH<C(OAc)>CPh, m.p. 109—110°, into which it is readily re-converted by hydrolysis with 30% KOH-MeOH. Bromotrimethyldeoxybrazilin (Pfeiffer *et al.*, A., 1934, 780) is similarly oxidised to a Br-quinone, C<sub>17</sub>H<sub>13</sub>O<sub>5</sub>Br, m.p. 215° (Ac derivative, m.p. 208—210°). H. W.

**Reaction of glyoxal with dimethyldihydroresorcinol.** A. REZEK (Bull. Soc. Chim. Yougoslav., 1935, 6, 115—120).—Methone and glyoxal in EtOH-Et<sub>2</sub>O at the b.p. in presence of P<sub>2</sub>O<sub>5</sub> yield  $\alpha\alpha\beta\beta$ -tetra-(2-hydroxy-6-keto-4:4-dimethyl-3:4:5:6-tetrahydrophenyl)ethane, m.p. 235—236°. R. T.

**Diene synthesis.** B. A. ARBUZOV, E. P. SALMINA, and O. M. SCHAPSCHINSKAJA (Trans. Butlerov Inst. Chem. Tech. Kazan, 1934, No. 2, 9—18).—Condensation could not be effected of maleic anhydride with 1-vinylnaphthalene (I) at 100° or with Ph<sub>2</sub> at 170—215°, or between benzoquinone and Ph<sub>2</sub>. Citraconic anhydride did not react with CPh<sub>2</sub>·CH<sub>2</sub> at 150°. During the prep. of (I) by the method of Tiffeneau and Daudel (A., 1908, i, 972),  $\alpha$ -1-naphthylethyl alcohol, m.p. 64°, b.p. 170—175°/35—40 mm., was obtained. CH. ABS. (r)

**Halochromism of 5-benzoyl-1:4-naphthaquinol.** R. SCHOLL, J. DONAT, and S. HASS (Ber., 1935, 68, [B], 2034—2039).—5-Benzoyl-1:4-naphthaquinol (I) does not resemble 1-benzoylanthraquinone and -anthraquinol in yielding halochromic salts of a furan derivative when treated with Al powder in conc. H<sub>2</sub>SO<sub>4</sub>, but nevertheless forms strongly halochromic salts. 5-Benzoyl-1:4-naphthaquinone, m.p. 152°, obtained in 25% yield by oxidation of 1-C<sub>10</sub>H<sub>7</sub>Bz in AcOH by CrO<sub>3</sub> at low temp., is reduced by SnCl<sub>2</sub> in EtOH to (I), m.p. 194—196°. With HClO<sub>4</sub> in COMe<sub>2</sub> (I) yields a violet-blue, lustrous perchlorate C<sub>17</sub>H<sub>12</sub>O<sub>3</sub>·HClO<sub>4</sub>, from which it is regenerated in 90% yield by treatment with H<sub>2</sub>O and COMe<sub>2</sub> containing NaOAc. The less definite hydrochloride, sulphate, and mol. compound with SnCl<sub>4</sub> are described, all blue crystals with metallic lustre. Oxidation of 1-benzoyl-2-methylnaphthalene affords 5-benzoyl-6-

*methyl-1:4-naphthaquinone*, m.p. 146°, whilst *1-benzoyl-2:6-dimethylnaphthalene*, m.p. 83—84° (whence *5-benzoyl-2:6-dimethyl-1:4-naphthaquinone*, m.p. 169°), is obtained from 2:6-C<sub>10</sub>H<sub>6</sub>Me<sub>2</sub>, BzCl, and AlCl<sub>3</sub> in CS<sub>2</sub>.

[With A. KELLER.] 1:1':4:4'-Tetrahydroxy-2:2'-dinaphthyl and the corresponding diquinone in AcOH give the *quinhydrone*, C<sub>20</sub>H<sub>12</sub>O<sub>4</sub>, decomp. about 200°. H. W.

**Constitution of alkannin, shikonin, and alkanan.** H. BROCKMANN (Annalen, 1935, 521, 1—47). Alkannin (I) is *l*-2- $\alpha$ -hydroxy-8-methyl- $\Delta^7$ -pentenylnaphthazarin; shikonin (II) is the *d*-form, mixed with 20% of the *dl*-form, which is named shikalkin. (I), m.p. 148°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -167° in C<sub>6</sub>H<sub>6</sub>, -226° in CHCl<sub>3</sub> (3 active H; Bz<sub>2</sub> derivative, m.p. 174—175°), best extracted from the roots of *Alkanna tinctoria* by ligroin, contains < 0.1% of *alkannan* (III) [2-*isohexylnaphthazarin*], m.p. 97—98°, [ $\alpha$ ] 0°, from which it is separated by adsorption from C<sub>6</sub>H<sub>6</sub> by kieselguhr. (I) is decomposed by long heating in Ac<sub>2</sub>O, but can be crystallised therefrom, and with Ac<sub>2</sub>O-NaOAc (short heating) or Ac<sub>2</sub>O-C<sub>6</sub>H<sub>5</sub>N gives the *Ac*<sub>3</sub> derivative (IV), m.p. 132°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -110° in C<sub>6</sub>H<sub>6</sub>. With Zn-Ac<sub>2</sub>O it gives a *substance*, C<sub>20</sub>H<sub>21</sub>O<sub>8</sub>, m.p. 147°, [ $\alpha$ ] 0°, probably a mixture. (I) sublimes unchanged at 140—150°/0.001 mm., but at 200°/760 mm. gives H<sub>2</sub>O and 5-methylquinizarin, m.p. 246—247°, which is readily obtained from diacetylnaphthazarin by condensation with piperylene in EtOH at 100° and aerial oxidation of the product in 2N-NaOH. When distilled with Zn dust, (I) gives 1- and 2-methylanthracene and C<sub>10</sub>H<sub>8</sub> [which last proves the two-ring structure of (I)]. With KMnO<sub>4</sub> in aq. alkali or COMe<sub>2</sub> (I) gives only AcOH and maleic acid, and with O<sub>3</sub> in AcOH a product oxidised by KMnO<sub>4</sub> to 0.8 mol. of COMe<sub>2</sub>, which is obtained to the same extent from (I) by the Kuhn-Roth method, proving the presence of CMe<sub>2</sub> in (I). (IV) and O<sub>3</sub> in CHCl<sub>3</sub> give a little 3:6-dihydroxyphthalic acid, establishing the naphthazarin grouping in (I). (I) and 10% HCl-MeOH at room temp. (15—18 hr.) yield 2- $\alpha$ -methoxy-8-methyl- $\Delta^7$ -pentenylnaphthazarin [*Me ether* of (I)] (V), m.p. 105°, sublimes at 140—150°/0.001 mm. (2 active H); complete racemisation occurs in this reaction, indicating the  $\alpha$ -position of the aliphatic OH, which is confirmed by the sparing solubility of (I) in aq. Na<sub>2</sub>CO<sub>3</sub>. The *dl*- $\alpha$ -*Et*, m.p. 83°, and *Pr*<sup>a</sup> *ether*, m.p. 57—58°, are similarly prepared. Hydrogenation of (I) is very rapid at first [1 mol.; formation of the quinol, which is very rapidly oxidised by air to (I)], then slower (further 2 mols.), and thereafter still slower. The second stage in the reduction (PtO<sub>2</sub>) in AcOH or other solvents gives (III) and other products. Intermediate reduction products could not be isolated. Hydrogenation of (V) is similar; absorption of 3 mols. gives (III), but at the 2 mol. stage some *dihydroalkannin Me ether* [2- $\alpha$ -methoxy-8-methyl-*n*-amylnaphthazarin], m.p. 50—51°, is obtained. This *ether* with KMnO<sub>4</sub> gives  $\alpha$ -methoxy- $\epsilon$ -methyl-*n*-hexoic acid (VI), the presence of which in the products is proved by formation of 8-methylvaleraldehyde (VII) (2:4-dinitrophenylhydrazones, m.p. 95°) therefrom by distillation with PbO<sub>2</sub> and dil. H<sub>3</sub>PO<sub>4</sub>.

The  $\alpha$ -position of the OH is thus proved. (VI), b.p. 123—124°/10 mm. (*p*-C<sub>6</sub>H<sub>4</sub>Br-CO-CH<sub>2</sub> ester, m.p. 74—75°), is synthesised from NaOMe and *Me*  $\alpha$ -bromo- $\epsilon$ -methyl-*n*-hexoate, b.p. 88—90°/10 mm., obtained by Br and red P at 100°; when mixed with other acids, it cannot be detected by conversion into (VII) by distillation with Cu, but the PbO<sub>2</sub>-H<sub>3</sub>PO<sub>4</sub> method is effective.

(III), m.p. 99°, sublimes at 120—140°/0.001 mm. (2 active H; *Ac*<sub>2</sub> derivative, m.p. 99—101°), gives only 0.23 mol. of COMe<sub>2</sub> (Kuhn-Roth), with Ac<sub>2</sub>O-Zn gives 1:4:5:8-tetra-acetoxy-2-8-methyl-*n*-amylnaphthalene, m.p. 170°, and with SnCl<sub>2</sub> the 1:4:5:8-(OH)<sub>4</sub>-compound, m.p. 65—66° [oxidised by air to (III) (only)]; with KMnO<sub>4</sub> it gives  $\epsilon$ -methyl-*n*-hexoic acid (*p*-C<sub>6</sub>H<sub>4</sub>Br-CO-CH<sub>2</sub> ester, m.p. 75°). With acids other than HCl or with 2N-NaOH at 100° (I) yields anhydroalkannin [2-8-methyl- $\Delta^7$ -pentadienylnaphthazarin], m.p. 155°, sublimes at 140—145°/0.001 mm. [gives 0.85 mol. of COMe<sub>2</sub> (Kuhn-Roth); 2 active H], which is hydrogenated (PtO<sub>2</sub>) in AcOH to (III). With SnCl<sub>4</sub> in C<sub>6</sub>H<sub>6</sub> or CHCl<sub>3</sub> (I) gives cycloalkannin [1:4:5-trihydroxy-8:8-dimethyl-5:6:7:8-tetrahydroanthraquinone] (VIII), m.p. 79—80°, sublimes at 140—145°/0.001 mm., [ $\alpha$ ]<sub>D</sub><sup>20</sup> -59.2° in C<sub>6</sub>H<sub>6</sub>.

(II), obtained by ligroin from the roots of *Lithospermum erythrorhizon*, has m.p. 143°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> +135° in C<sub>6</sub>H<sub>6</sub>, gives a product, m.p. 146—147°, only after sublimation and repeated crystallisation, is identical with (I) in absorption spectrum, is hydrogenated as is (I), gives the inactive *Me ether*, and with SnCl<sub>2</sub> affords the impure *isomeride* [cycloshikonin], m.p. 79—80°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> +51.2° in C<sub>6</sub>H<sub>6</sub>, of (VIII). The *racemate* of (VIII) has m.p. 86°. The relationship of (I) and (II) is proved by mixed m.p. determinations, which show a *racemate*, m.p. 148°, to be a stable compound. Absorption spectra and changes of colour with *pH* are recorded. (I) and (II) have lower oxidation potentials than naphthazarin, in spite of the  $\alpha$ -OH in the side chain, showing that they exist mainly in 5:8-dihydroxy-2-alkyl-1:4-quinone form with relatively little, if any, of the 6-alkyl form. M.p. are corr.

R. S. C.

**Some examples of substitution addition in the anthraquinone series.** C. MARSCHALK (Bull. Soc. chim., 1935, [v], 2, 1809—1830).—Na quinizarin-2-sulphonate (I), Na<sub>2</sub>CO<sub>3</sub>, KCN, and H<sub>2</sub>O at 90° (30 min.) yield a dicyano-leuco-compound oxidised by (NH<sub>4</sub>)<sub>2</sub>S<sub>2</sub>O<sub>8</sub> to 1:4-dihydroxy-2:3-dicyanoanthraquinone (II), m.p. > 300°, also obtained, but less readily, from quinizarin and conc. KCN. (II) on hydrolysis with 90% H<sub>2</sub>SO<sub>4</sub> yields the anhydride of 1:4-dihydroxyanthraquinone-2:3-dicarboxylic acid (+H<sub>2</sub>O) (III), readily obtained from the anhydride and by oxidation of 1:4-dihydroxy-2:3-dimethylanthraquinone with H<sub>2</sub>SO<sub>4</sub>-H<sub>3</sub>BO<sub>3</sub>-NaNO<sub>2</sub> at 140—150° (8 hr.). This establishes the constitution of (III). (I) and NaOH-KCN at room temp. yield 1:4-dihydroxy-2-cyanoanthraquinone (IV), m.p. 228—229°, hydrolysed to the corresponding *amide*, m.p. > 300°, and acid (V). (IV) and Na<sub>2</sub>SO<sub>3</sub>-H<sub>2</sub>O at 80° yield 1:4-dihydroxy-3-cyanoanthraquinone-2-sulphonic acid (VI), also obtained from (I), Na<sub>2</sub>CO<sub>3</sub>-KCN-H<sub>2</sub>O, and air, and desulphonated to (IV) by

treatment with  $\text{Na}_2\text{S}_2\text{O}_4$  followed by oxidation. Both (IV) and (VI) with alkaline KCN give (II). (III) is decarboxylated to (V) (a) when heated with  $\text{H}_2\text{SO}_4\text{--H}_3\text{BO}_3$  at  $200^\circ$ , (b) when boiled with aq. NaOH, and (c) when treated below  $4^\circ$  during 1 hr. with  $\text{Na}_2\text{CO}_3\text{--Na}_2\text{S}_2\text{O}_4\text{--H}_2\text{O}$  followed by oxidation with NaOH-air. Prolonged boiling with NaOH and treatment with excess of  $\text{Na}_2\text{S}_2\text{O}_4$  at room temp. results in the loss of both  $\text{CO}_2\text{H}$ . (V), its amide and Et ester with KCN each yield products hydrolysed to (III), and Na quinizarin-2:6-disulphonate and KCN give a product which contains both S and N. Similarly 1-amino-4-hydroxyanthraquinone-2-sulphonic acid and the corresponding -3-sulphonic acid with KCN- $\text{Na}_2\text{CO}_3\text{--H}_2\text{O}$  at  $90\text{--}95^\circ$  afford 1-amino-4-hydroxy-2:3-dicyanoanthraquinone, m.p.  $< 300^\circ$ , oxidised by  $\text{H}_2\text{SO}_4\text{--MnO}_2$  to (II), and hydrolysed by  $\text{H}_2\text{SO}_4$  at  $140\text{--}150^\circ$  to 1-amino-4-hydroxyanthraquinone-2:3-dicarboxylic acid (anhydride). No reaction occurs with 1-amino-4-methoxyanthraquinone-2-sulphonic acid. cycloPontadiene reacts with (I) (with loss of  $\text{SO}_3\text{H}$ ), (IV), (V), quinizarin, and naphthazarin in aq. alkaline sol., but not in org. solvents. These are not considered to be normal "diene" reactions. The colours and colour reactions of the foregoing products are described.

H. G. M.

**Kinetics of sulphonation [of anthraquinone].**—See A., 1935, 1465.

**Turpentine oil. I. Laricinolic acid.** F. TROST (Annali Chim. Appl., 1935, 25, 496—504).—From laricinolic acid (I), m.p.  $146\text{--}147^\circ$  (block),  $[\alpha]_{\text{D}}^{20} -48.5^\circ$  in EtOH (from larch turpentine) (A., 1900, i, 680), were prepared: Me ester; retene, m.p.  $124^\circ$  (picrate, m.p.  $99^\circ$ ), by dehydrogenation by Se (A., 1928, 51); retenequinone, m.p.  $196\text{--}197^\circ$  (A., 1885, 905); the abietic acid, m.p.  $160\text{--}164^\circ$ , of Steele (A., 1922, i, 739); various isomerides formed during distillation and by treatment with AcOH and HCl; the additive compound, m.p.  $213.5\text{--}215^\circ$  of Me ester and maleic anhydride (A., 1932, 1254) and the derived anhydride-carboxylic acid, m.p.  $227\text{--}228^\circ$  (ibid.). The relation of (I) (for which the name "laricinic acid" is proposed) to abietic acids is discussed.

F. O. H.

**Synthesis of dl-piperitone (dl- $\Delta^1$ -p-menthen-3-one).** J. WALKER (J.C.S., 1935, 1585—1586).—Me  $\beta$ -chloroethyl ketone, Et  $\alpha$ -isopropylacetoacetate, and NaOEt give Et  $\Delta^1$ -p-menthen-3-one-4-carboxylate, b.p.  $155\text{--}165^\circ/16$  mm., hydrolysed (MeOH-KOH) to dl-piperitone, identical (oxime) with the racemised natural product.

F. R. S.

**Synthesis of dl-fenchone.** G. KOMPPA and A. KLAMI (Ber., 1935, 68, [B], 2001—2003).—dl-Camphenonic acid is converted by  $\text{SOCl}_2$  into dl-camphenonyl chloride, b.p.  $135\text{--}137^\circ/9$  mm., m.p.  $33^\circ$ , transformed by H, in xylene containing Pd- $\text{BaSO}_4$  at  $150^\circ$  into 1-ketofenchone (I), b.p.  $127\text{--}128^\circ/18$  mm. (monosemicarbazone, m.p.  $238^\circ$ ; monoxime, m.p.  $102\text{--}103^\circ$ ), which readily passes into a polymeride, m.p.  $240^\circ$ . Reduction of (I) in AcOH containing  $\text{PtO}_2\text{--FeSO}_4$  gives dl-fenchone (II) and  $\omega$ -hydroxyfenchone (III), b.p.  $134\text{--}135^\circ/17$  mm. (oxime, m.p.  $140^\circ$ ). (III) and  $\text{PCl}_5$  in  $\text{CHCl}_3$  afford  $\omega$ -chlorofenchone, b.p.  $121\text{--}123^\circ/18$  mm., from which

(II) is derived by treatment with Zn dust in boiling AcOH.

H. W.

**Snitter's camphenilene.** G. GRATTON and J. L. SIMONSEN (J.C.S., 1935, 1621—1623).—By elimination of HCl from camphenyl chloride, a hydrocarbon closely agreeing in physical properties with santene and Snitter's hydrocarbon (A., 1933, 1300) has been obtained. Oxidation ( $\text{O}_3$ ) shows it to be not homogeneous and to consist mainly of santene, giving acidic products,  $\text{CH}_2\text{O}$ , a ketone,  $\text{C}_8\text{H}_{12}\text{O}$  [2:4-dinitrophenylhydrazones (I), m.p.  $114\text{--}115^\circ$ ], and a hydrocarbon,  $\text{C}_9\text{H}_{14}$ , m.p.  $42^\circ$  (apocyclene). (I) differs from methylnorcamphor-2:4-dinitrophenylhydrazones, m.p.  $116\text{--}117^\circ$ . Snitter's hydrocarbon is probably mainly apocyclene.

F. R. S.

**Transition in camphor and chemically related compounds.**—See this vol., 12.

**Caryophyllenes. III.** G. R. RAMAGE and J. L. SIMONSEN (J.C.S., 1935, 1581—1584).—Ozonolysis of  $\beta$ -caryophyllene nitrosite in EtOAc- $\text{CCl}_4$  gives  $\text{CH}_2\text{O}$  and the  $\alpha$ -dinitro-ketone,  $\text{C}_{14}\text{H}_{22}\text{O}_5\text{N}_2$ , m.p.  $161.5^\circ$ ,  $[\alpha]_{\text{D}}^{25} -33.6^\circ$  in  $\text{CHCl}_3$  (phenylsemicarbazone, decomp.  $224^\circ$ ; 2:4-dinitrophenylhydrazones, decomp.  $225^\circ$ ), and in AcOH forms an isomeric  $\beta$ -dinitro-ketone, decomp.  $155^\circ$ , easily converted into the  $\alpha$ -form. The  $\alpha$ -ketone and  $\text{C}_2\text{H}_5\text{N}$  yield a nitro-ketone, m.p.  $69^\circ$ ,  $[\alpha]_{\text{D}}^{25} -114^\circ$  in  $\text{CHCl}_3$  (semicarbazone, m.p.  $186\text{--}187^\circ$ ), oxidised ( $\text{O}_3$ ) to a diketo-monocarboxylic acid,  $\text{C}_{14}\text{H}_{21}\text{O}_4$ , of which the Me ester, b.p.  $194\text{--}195^\circ/15$  mm. (bis-2:4-dinitrophenylhydrazones, decomp.  $108\text{--}110^\circ$ ), is identical with that obtained by Semmler and Mayer (A., 1912, i, 120). The constitution of the caryophyllenes is discussed.

F. R. S.

**Constituents of natural phenolic resins. III. Synthesis of dehydro-"sulphite-liquors lactone" dimethyl ether and some observations on the structure of podophyllotoxin.** R. D. HAWORTH, T. RICHARDSON, and G. SHELDRIK (J.C.S., 1935, 1576—1581).—Et  $\beta$ -(3:4-dimethoxybenzoyl)propionate, m.p.  $57\text{--}58^\circ$ , with  $\text{HCO}_2\text{Et}$  gives Et  $\beta$ -(3:4-dimethoxybenzoyl)- $\beta$ -hydroxymethylenepropionate, m.p.  $114\text{--}116^\circ$ , and with  $\text{Et}_2\text{C}_2\text{O}_4$  forms Et  $\beta$ -(3:4-dimethoxybenzoyl)- $\Delta^8$ -crotonolactone- $\gamma$ -carboxylate, m.p.  $154\text{--}156^\circ$ , neither ester giving well-defined reduction products.  $\beta$ -3:4-Dimethoxybenzoyl- $\alpha$ -(3':4'-dimethoxybenzylidene)- $\beta$ -methylenepropionic acid, m.p.  $157\text{--}158^\circ$ , obtained from the corresponding -propionic acid and aq.  $\text{CH}_2\text{O}$ , is converted (MeOH-HCl) into the lactone of the  $\beta$ -chloromethylpropionic acid, m.p.  $183\text{--}184^\circ$  (which with MeOH gives the lactone of the  $\beta$ -methoxymethylpropionic acid, m.p.  $145^\circ$ ), and Me 6:7-dimethoxy-1-(3':4'-dimethoxyphenyl)-2-chloromethylnaphthalene-3-carboxylate, m.p.  $176\text{--}177^\circ$ , the corresponding acid (I), m.p.  $244\text{--}245^\circ$ , being cyclised to 4':5':6:7-tetramethoxybenzo-3:4-fluorene-1-carboxylic acid, m.p.  $303\text{--}305^\circ$  (Me ester, m.p.  $202\text{--}204^\circ$ ). (I) or its Me ester and NaOH give the lactone of 6:7-dimethoxy-1-(3':4'-dimethoxyphenyl)-2-hydroxymethylnaphthalene-3-carboxylic acid (dehydro-sulphite-liquors lactone" Me, ether), m.p.  $215\text{--}216^\circ$ .

The Na salt of  $\beta$ -(3:4:5-trimethoxybenzoyl)propionic acid, m.p.  $121\text{--}122^\circ$ , obtained from Et 3:4:5-

trimethoxybenzoylacetate,  $\text{CH}_3\text{Br}\cdot\text{CO}_2\text{Et}$ , and  $\text{NaOEt}$ , with piperonal and  $\text{Ac}_2\text{O}$  forms the  $\gamma$ -lactone of  $\beta$ -(3:4:5-trimethoxybenzoyl)- $\alpha$ -(3':4'-methylene-dioxybenzylidene)-propionic acid, m.p. 161—162°, hydrolysed to the acid, m.p. 183—184°, which is converted into the  $\beta$ -methylene-propionic acid, m.p. 169—170°. A similar series of reactions leads to 6:7-methylenedioxy-1-(3':4':5'-trimethoxyphenyl)-2-chloromethylnaphthalene-3-carboxylic acid, m.p. > 300°, and the lactone of the 2-hydroxymethylnaphthalene-3-carboxylic acid (II), m.p. 288—289°. (II) differs from the lactone obtained from dehydroanhydro-piropodophyllin (III), and this is evidence in favour of the Borsche-Spath formula for podophyllotoxin. Oxidation ( $\text{KMnO}_4$ ) of (II) gives 6:7-methylenedioxy-1-(3':4':5'-trimethoxyphenyl)naphthalene-2:3:dicarboxylic acid (anhydride, m.p. 299—300°;  $\text{Me}_2$  ester, m.p. 206—207°), identical with the oxidation product of (III). F. R. S.

**Complete deoxidation of resins by catalytic hydrogenation.** H. I. WATERMAN, J. F. CLAUSEN, and A. J. TULLENERS (Rec. trav. chim., 1935, 54, 701—710).—Brown colophony resin, consisting chiefly of abietic acid (I), is completely freed from O when heated to about 400° with  $\text{H}_2$  (initial pressure about 100 kg. per sq. cm.) in presence of a Mo or Ni catalyst. The temp. at which  $\text{H}_2$  is mainly absorbed depends on the nature of the catalyst. The products are stable, partly aromatic, and free from olefines even when a low initial  $\text{H}_2$  pressure (10 kg. per sq. cm.) is used. Two compounds,  $\text{C}_{19}\text{H}_{34}$  and  $\text{C}_{20}\text{H}_{36}$ , closely related to (I) ( $\text{C}_{20}\text{H}_{30}\text{O}_2$ ) in structure have been isolated. They were examined by the method of Waterman *et al.* (B., 1932, 536). H. G. M.

**Resinic acids of *Pinus sylvestris* resin.** I, II. P. S. PISCHTSCHIMUKA (J. Gen. Chem. Russ., 1935, 5, 738—751, 752—763).—I. The chief, if not only, acidic constituent of the fresh resin is  $\text{C}_{19}\text{H}_{29}\cdot\text{CO}_2\text{H}$  (I), m.p. 138°, the following salts of which are described:  $\text{MgR}_2$ ,  $\text{CaR}_2$ ,  $\text{BaR}_2$ ,  $\text{PbR}_2$ , m.p. 190°,  $\text{CuR}_2$ ,  $\text{HgR}_2$ ,  $\text{NaR}_2\cdot 3\text{HR}$ ,  $\text{CaR}_2\cdot 2\text{HR}$ , m.p. 160°,  $\text{BaR}_2\cdot 2\text{HR}$ , m.p. 158° ( $\text{R} = \text{C}_{19}\text{H}_{29}\cdot\text{CO}_2$ ). The acid from a 14-year-old sample of resin crystallised in hexagonal plates,  $[\alpha]_D^{25} = -30.36^\circ$  in EtOH, which passed at 118° into lentiform crystals, m.p. 157°.  $[\alpha]_D$  (in EtOH) of (I) changes from  $-61.7^\circ$  to  $+42.5^\circ$  when it is heated at 120° in  $\text{CO}_2$ , and again changes to  $-32.7^\circ$  at 145°. In xylene solution at 130°  $[\alpha]_D$  approaches zero after 5 hr., and attains a max. val. of  $+40^\circ$  after 24 hr., falling to  $+30.8^\circ$  after 48 hr., whilst at 200° and 250°  $[\alpha]_D$  tends to a const. val. of  $+10^\circ$ . The I val. of (I) corresponds with the presence of two ethylenic linkings. (I) is readily oxidised by atm.  $\text{O}_2$ , but not by  $\text{HNO}_3$ . It is suggested that abietic acid has the structure (II), readily changing to (III).

II. (I) and 33%  $\text{HNO}_3$  or (I) in ligroin and conc.  $\text{HNO}_3$  at 50—60° yield a dibasic acid (IV),

$\text{C}_{20}\text{H}_{22}\text{O}_9\text{N}_2$ , sintering at 128°, which readily adsorbs org. vapours. Attempts at elucidating the structure of (IV) were not successful. R. T.

**Sanguisorbigenin.** T. MATSUKAWA (J. Pharm. Soc. Japan, 1934, 54, 965—979; cf. Kodako and Abe, A., 1934, 175).—Pure sanguisorbigenin (I),  $\text{C}_{30}\text{H}_{46}\text{O}_2$  [monoacetate (II), m.p. 324°], has m.p. 275—276°, and contains one double linking. (I), with  $\text{AcOH-HCl}$ , yields acetylsanguisorbigenin lactone, decomp. 323°, which is hydrolysed to the parent lactone, m.p. 301°. (II) and  $\text{CrO}_3$  afford  $\beta$ - or  $\delta$ -hydroxy-acetylsanguisorbigenin lactone, decomp. 268° (acetate, m.p. 287°), which contains a *tert.*-OH. When heated, (I) yields sanguisorbigenol, m.p. 206° (acetate, m.p. 185—186°), a triterpene alcohol. When oxidised with  $\text{CrO}_3$ , (I) yields sanguisorbigenone, m.p. 159° and 229° (double m.p.) (monoxime, decomp. 281°). The *Me* ester (III), m.p. 207—209°, of (I) yields sanguisorbigenone *Me* ester, m.p. 216° (monoxime, decomp. 243°), on oxidation; hence the OH is *sec.* (I) is not hydrogenated with Pt-black. Methylation of (II) or acetylation of (III) affords acetylsanguisorbigenin *Me* ester, m.p. 243—245°. CH. ABS. (r)

**Toad poisons. I. Dehydrogenation of cinobufagin by selenium.** R. TSCHESCHE and H. A. OFFE (Ber., 1935, 68, [B], 1998—2000; cf. A., 1932, 397).—Dehydrogenation of cinobufagin (improved method of isolation from Ch'an Su) with Se at 270—330° gives very small amounts of methyleyclopentenophenanthrene, thus proving the poison to have the ring system of the sterols and bile acids. H. W.

**Constituents of red sandalwood. Homoptero-carpin.** H. LEONHARDT and E. OEOHLER (Arch. Pharm., 1935, 273, 447—452).—1-Dihydrohomoptero-carpin (modified prep.), m.p. 153—154°,  $[\alpha]_D^{20} = -5.8^\circ$  (2:4-dinitrophenylhydrazone, decomp. 292°), with  $\text{CrO}_3\text{-AcOH}$  or  $\text{BzO}_2\text{H}$  gives dihydrohomoptero-carpone (I),  $\text{C}_{17}\text{H}_{16}\text{O}_5$ , m.p. 178.5° [2:4-dinitro-, decomp. 258°, and *p*-nitro-phenylhydrazone, decomp. 148°; oxime, decomp. 225° (2:4-dinitrophenylhydrazone, decomp. 199°)]. (I) is a 1:4-quinone and with  $\text{Zn-Ac}_2\text{O-NaOAc}$  yields a quinol diacetate, m.p. 122—123°, sol. only in hot NaOH. R. S. C.

**Manchurian kaoliang.**—See this vol., 124.

**Acetylation of lignin.** F. KOMAROV and G. FILIMONOVA (J. Appl. Chem. Russ., 1935, 8, 1033—1042).— $\rightarrow$  5.6—6.6% of the OH-groups of sulphate lignin (I) are acetylated by treatment with  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$ , or with  $\text{Ac}_2\text{O}$  in  $\text{AcOH}$  in presence of catalysts ( $\text{H}_2\text{SO}_4$ ,  $\text{ZnCl}_2$ ,  $\text{H}_3\text{PO}_4$ ) (18—20°; 90 min.); in absence of catalysts the latter reaction takes place only at the b.p. of the mixture. Decomp. of (I), or elimination of Me groups, does not occur during the above reactions. The products are sparingly sol. in org. solvents. R. T.

**Hydrogenation of furfuraldehyde.** I. G. ROBERTI (Annali Chim. Appl., 1935, 25, 530—540).—Reduction of furfuraldehyde to furfuryl alcohol (I) at  $\rightarrow$  200° and under pressures of  $\text{H}_2$  of approx. 100 atm. with Ni, Cu, and Cu chromite (II) catalysts was investigated. With (II), an almost quant. formation of (I) occurs, but (II) rapidly loses its catalytic activity (cf. A., 1934, 1225). The influence of reagents

(e.g., CaO, AcOH) on the above hydrogenation catalysts is discussed. F. O. H.

**Hydrolysis of phenyl furyl ketimine.**—See this vol., 34.

**$\gamma$ -Tetrahydropyranaldehyde.** V. PRELOG and E. CERKOVNIKOV (Coll. Czech. Chem. Comm., 1935, 7, 430—435).—Catalytic reduction (poisoned Pd) of the chloride of  $\gamma$ -tetrahydropyran carboxylic acid (I) affords  $\gamma$ -tetrahydropyranaldehyde (II), b.p. 74—77°/11 mm. (phenylhydrazone, m.p. 93—94°; 2:4-dinitrophenylhydrazone, m.p. 163°; semicarbazone, m.p. 191°), also obtained by heating the mixed Ba salts of (I) and HCO<sub>2</sub>H. On keeping, (II) deposits a trimeride, m.p. 221°, depolymerised by heat. Condensation of (II) with rhodanine affords the substance, C<sub>9</sub>H<sub>11</sub>O<sub>6</sub>NS<sub>2</sub>, m.p. 254°, converted by aq. NaOH into  $\beta$ -4-tetrahydropyran- $\alpha$ -thionpropionic acid, O<CH<sub>2</sub>CH<sub>2</sub>>CH·CH<sub>2</sub>·CS·CO<sub>2</sub>H, m.p. 151—152°.

P. G. C.

**Condensation of benzoin with quinol.** O. DISCHENDORFER (Monatsh., 1935, 66, 201—217).—The alkali-sol. product obtained by Japp *et al.* (J.C.S., 1899, 75, 1035) by condensation of benzoin (I) with resorcinol (II) in H<sub>2</sub>SO<sub>4</sub> is proved to be 5-hydroxy-2:3-diphenylcoumarone, new m.p. 163°, since its Bz derivative, m.p. 122°, is oxidised (CrO<sub>3</sub>) to 2:5-dibenzoyloxybenzophenone, m.p. 118°, which is hydrolysed to 2-benzoylquinol. The alkali-insol. product, obtained by using excess of (I), is *s*-tetraphenyl-1:2:4:5-p-difuranobenzene (III) (cf. A., 1933, 1302), new m.p. 281° (cf. *loc. cit.*). (III) is oxidised (CrO<sub>3</sub>) to the Bz<sub>2</sub> derivative, m.p. 220—221°, of 2:5-dibenzoylquinol, m.p. 203° (Ac<sub>2</sub> derivative, m.p. 209°), different from the compound to which Bogert and Howells (A., 1930, 477) incorrectly ascribe this structure (cf. this vol., 78). With Br in C<sub>6</sub>H<sub>6</sub> at 100°, (III) yields a *meso*-Br<sub>2</sub>-derivative, m.p. 384—388°,

(III.)

(IV.)

which is also obtained from (I) and 2:5-dibromoquinol in H<sub>2</sub>SO<sub>4</sub>, and is oxidised (CrO<sub>3</sub> in PhNO<sub>2</sub>-AcOH) to the Bz<sub>2</sub> derivative, m.p. 317°, of 3:6-dibromo-2:5-dibenzoylquinol, m.p. 288° (decomp.). The position of Br is confirmed by oxidation (KMnO<sub>4</sub>-NaOH), which gives BzOH, without the Br-acids which would result from a bromophenyl compound. A third product from (I) and (II), recovered from the mother-liquors, is *as*-tetraphenyl-1:2:4:5-p-difuranobenzene (IV) (cf. A., 1933, 1302), m.p. 264—265°; this is oxidised (CrO<sub>3</sub>) to the Bz<sub>2</sub> derivative, m.p. 276°, of 2:3-dibenzoylquinol, m.p. 188°, which with N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O yields 5:8-dihydroxy-1:4-diphenylphthalazine, m.p. 315° (decomp.). E. W. W.

**Configuration of dioxan and the *cis*- and *trans*-naphthadioxans.** J. BOESEKEN, F. TELLEGEN, and P. H. HENRIQUEZ (Rec. trav. chim., 1935, 54, 733—739).—The dipole moments, given in parentheses in Debye units, of the following compounds have been

measured with the apparatus previously described (cf. A., 1935, 598): dioxan (0.3); 2:3-dichloro- (I) (1.6), 2:3:5:6-tetrachloro-, m.p. 60° (0), m.p. 100° (1.85°), m.p. 144° (1.05), and 2:2:3:5:5:6-hexachloro-dioxan (0); thioxan (0.47); selenoxan (0.30); *cis*-, m.p. 111° (1.9), and *trans*-naphthadioxan, C<sub>10</sub>H<sub>8</sub>O<sub>2</sub>, m.p. 136° (0.72). These last two isomerides were obtained from (I) and glycol (II), and from glyoxal and (II), and correspond with the *cis*- and *trans*-decalins. The configuration of these compounds is discussed (cf. A., 1935, 15). H. G. M.

**Unequal reactivity towards organometallic compounds of the carbonyl group in succinmethylimide and in *N*-methylpyrrolidone.** R. LUKES and K. SMOLEK (Coll. Czech. Chem. Comm., 1935, 7, 476—481; cf. A., 1929, 576, 935; 1930, 1296).—Succinmethylimide with CH<sub>3</sub>Ph·MgCl in cold dry C<sub>6</sub>H<sub>6</sub>-Et<sub>2</sub>O rapidly gives 2-benzyl-1-methyl-5-pyrrolone, whereas *N*-methylpyrrolidone with MgEtBr gives 1:2-dimethyl- $\Delta^2$ -pyrroline only after many hr. The difference is explained in terms of the polarities of the mol. groupings. J. L. D.

**Action of Grignard reagent on the amido-group. VIII. Action of organo-magnesium compounds on ethyl 1-methyl-2-pyrrolone-5-acetate.** R. LUKES and J. PREUCIL (Coll. Czech. Chem. Comm., 1935, 7, 482—490; cf. A., 1932, 521).—Et 1-methyl-2-pyrrolone-5-acetate (I) with MeMgI in C<sub>6</sub>H<sub>6</sub>-Et<sub>2</sub>O gives Et 1:2-dimethylpyrrole-5-acetate, b.p. 135—136°/20 mm. [the acid, m.p. 119.5° (decomp.), is decarboxylated to give 1:2:5-trimethylpyrrole]. Similarly, with Mg *n*-hexyl bromide and MgPhBr, (I) yields Et 1-methyl-2-hexylpyrrole-5-acetate, b.p. 184—185°/21 mm. (acid, m.p. 89—91°, which when heated gives 5-hexyl-1:2-dimethylpyrrole, b.p. 171—172°/71 mm.), and Et 2-phenyl-1-methylpyrrole-5-acetate, b.p. 208—210°/18 mm. [acid, m.p. 157° (decomp.), decarboxylated to 5-phenyl-1:2-dimethylpyrrole, m.p. 50—51°], respectively. In no case was a diketone isolated (cf. A., 1932, 621). MgRX does not attack the ·CO<sub>2</sub>Et because this is probably in close electronic association with N. J. L. D.

**Basic properties of pyrroles.** P. PRATESI (Gazzetta, 1935, 65, 658—668).—When pyrroles form salts, the using of the unshared N electrons converts the aromatic into a conjugated olefinic structure, the stability of which is increased by substituents. Thus 2:3:4-trimethylpyrrole forms a *hydrochloride* and a *ferrocyanide*; 2:4-dimethyl-3-ethylpyrrole can be recovered from HCl solution (as can 2:3:5-trimethyl-4-ethylpyrrole), and forms a *ferrocyanide*; these salts are monomeric. The *ferrocyanide* of 1-methyl-2:5-diethylpyrrole is contaminated with that of a polymeride. 2-Methylpyrrole is polymerised by HCl and H<sub>4</sub>Fe(CN)<sub>6</sub>. E. W. W.

**Molecular compounds of pyrrole.** M. DEZELIĆ (Annalen, 1935, 520, 290—300).—Mixed m.-p. curves of the binary mixtures of various pyrrole derivatives (A) and acidic compounds (B) show the existence of the following compounds. Et 3-acetyl-2:4-dimethylpyrrole-5-carboxylate gives compounds with

$\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{H}$ , m.p.  $85\cdot3^\circ$ ,  $\text{PhOH}$ , m.p.  $93^\circ$ , picric acid, m.p.  $97\cdot8^\circ$ , all of type  $AB$ , salicylic acid,  $AB$ , m.p.  $107^\circ$ , and  $AB_2$ , m.p.  $113^\circ$ ,  $o$ -, m.p.  $108\cdot5^\circ$ ,  $m$ -, m.p.  $139^\circ$ , and  $p\text{-C}_6\text{H}_4(\text{OH})_2$ , m.p.  $153^\circ$ , all of type  $AB_2$ . No compounds are formed with  $\text{AcOH}$ ,  $\text{BzOH}$ , or succinic acid. Et 2:4-dimethylpyrrole-5-carboxylate gives a compound  $AB_2$ , m.p.  $100^\circ$ , with picric acid (initial polymerisation to  $B_2$ ), but not with  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{H}$ ,  $\text{BzOH}$ ,  $\text{PhOH}$ , salicylic acid, or  $o$ -,  $m$ -, or  $p\text{-C}_6\text{H}_4(\text{OH})_2$ . Et 3-aldehyde-2:4-dimethylpyrrole-5-carboxylate gives compounds with  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{H}$ , m.p.  $74\cdot5^\circ$ , salicylic acid, m.p.  $135^\circ$ , picric acid, m.p.  $97^\circ$ , and  $o$ -, m.p.  $114^\circ$ , and  $m\text{-C}_6\text{H}_4(\text{OH})_2$ , m.p.  $111^\circ$ , all of type  $AB$ , and of type  $AB_2$  with  $p\text{-C}_6\text{H}_4(\text{OH})_2$ , m.p.  $142^\circ$ : no compound with  $\text{BzOH}$ . Et 4-aldehyde-2:5-dimethylpyrrole-3-carboxylate gives compounds with salicylic acid,  $AB$ , m.p.  $111\cdot5^\circ$ , and  $AB_2$ , m.p.  $111^\circ$ , and  $m$ -, m.p.  $98^\circ$ , and  $p\text{-C}_6\text{H}_4(\text{OH})_2$ , m.p.  $117\cdot5^\circ$  (type  $AB$ ), but not with  $o\text{-C}_6\text{H}_4(\text{OH})_2$ . Constitutions are briefly discussed.

J. W. B.

Yellow coloration produced by ultra-violet light on mixtures of pyridine with sugars, monohydric alcohols, and acetone. R. CANTENI (Helv. Chim. Acta, 1935, 18, 1420—1427).—The relative effects of various concns. of the above-named substances on (a) the velocity of formation of the yellow colour, and (b) the fading of this yellow colour, produced by ultra-violet irradiation of  $\text{C}_5\text{H}_5\text{N}$  have been investigated quantitatively by colorimetric comparison with 1 vol.-% solutions of  $\text{C}_5\text{H}_5\text{N}$  in  $\text{H}_2\text{O}$ . The main conclusions are as follows: glucose, galactose, sucrose, and lactose accelerate colour formation and retard fading, but their effect is < that of fructose. Pure  $\text{MeOH}$  is almost without influence on colour formation, but has a greater retarding action on fading than has fructose. Pure  $\text{EtOH}$  retards colour formation, but the colour is more stable in  $\text{EtOH}$  than in  $\text{MeOH}$ .  $\text{COMe}_2$  has a powerful inhibiting effect on colour formation.

J. W. B.

**4-Bromopyridine.** J. P. WIBAUT, J. OVERHOFF, and H. GELDOF (Rec. trav. chim., 1935, 54, 807—812).—4-Hydroxypyridine with  $\text{POBr}_3$  and  $\text{PBr}_5$  at  $130\text{--}140^\circ$  affords (together with some 2:4:6-tribromopyridine) 4-bromopyridine (I), b.p.  $27\cdot5\text{--}30^\circ/0\cdot4\text{ mm.}$ , f.p.  $0\text{--}1^\circ$ , also obtained by the action of  $\text{NaNO}_2$ -conc.  $\text{HBr}$  on 4-nitroaminopyridine (Koenigs *et al.*, A., 1924, i, 989), and characterised as its picrate, sinters  $135\text{--}140^\circ$ , m.p.  $223^\circ$  (decomp.), mercurichloride, darkens  $130\text{--}140^\circ$ , decomp.  $> 270^\circ$ , and platinichloride. (I) is very unstable and is converted in the dark at  $0^\circ$ , and even in  $\text{Et}_2\text{O}$  solution, into a yellowish-brown substance which may be 4-bromo- $N$ -4'-pyridylpyridinium bromide (platinichloride, decomp.  $> 325^\circ$ ; platinibromide; mercurichloride, m.p. approx.  $221^\circ$ ). When heated with aq.  $\text{NH}_3$  (d 0.9) at  $200^\circ$ , (I) is converted into 4-aminopyridine.

J. W. B.

**2-Aminopyridine series.** III. 2-Salicylamidopyridine and its electrolytic reduction to 2-*o*-hydroxybenzylaminopyridine. K. FEIST, W. AWE, and W. VOLKSEN (Arch. Pharm., 1935, 273, 476—478; cf. A., 1935, 92).—Electrolytic reduction of 2-salicylamidopyridine in  $\text{EtOH}\text{--}\text{H}_2\text{SO}_4$  gives

2-*o*-hydroxybenzylaminopyridine, m.p.  $105^\circ$  (picrate, m.p.  $185\text{--}186^\circ$ ), thus proving the structure of the amide. Similar reduction of 2-pyridylphthalimide causes fission.

R. S. C.

**Hydroxyquinolines. I. Iodo-derivatives of 8-hydroxyquinoline.** F. PIRRONE and A. CHERUBINO (Gazzetta, 1935, 65, 743—754).—An extended account of work previously published (A., 1934, 418). 5-Iodo-8-hydroxyquinoline (I), new m.p.  $125\text{--}127^\circ$  (picrate, new m.p.  $170\text{--}172^\circ$ ; sulphate, new m.p.  $209\text{--}211^\circ$ ; 1-MeI derivative, new m.p.  $134\text{--}137^\circ$ ; chloroacetate, m.p.  $157\text{--}158^\circ$ ; Co salt), when prepared in aq.  $\text{EtOH}$ , using I and KI, is accompanied by 5:7-di-iodo-8-hydroxyquinoline, m.p.  $185\text{--}187^\circ$ . Using I in  $\text{EtOH}$  in presence of  $\text{NaOAc}$ , only (I) is formed.

E. W. W.

**Absorption spectra in relation to the constitution of derivatives of isatin and carbostyryl.** R. G. AULT, E. L. HIRST, and R. A. MORTON (J.C.S., 1935, 1653—1657).—Absorption spectra of isatin (I) and derivatives have been measured under rigidly controlled conditions, and show that (I) and its *O*- and *N*-ethers all possess similar spectra. There is sufficient difference between the spectra of the lactam and lactim derivatives in the hydroxyquinoline series to permit the use of absorption spectra in structural determinations. (I) and  $\text{CH}_2\text{N}_2$  yield 3-hydroxy-, m.p.  $360^\circ$ , and 3-methoxy-quinoline, m.p.  $191^\circ$ . *N*-Methylisatin and  $\text{CH}_2\text{N}_2$  give 3-methoxy-1-methylquinoline, m.p.  $42^\circ$ , and *O*-methylisatin forms 3-hydroxy-2-methoxyquinoline, m.p.  $83\text{--}84^\circ$ .

F. R. S.

***p*-Dimethylaminobenzylidenequinaldine. Action of chromophoric and auxochrome groups.** H. RUPE, H. HAGENBACH, and A. COLLIN (Helv. Chim. Acta, 1935, 18, 1395—1413).—The following salts of 2-*p*-dimethylaminostyrylquinoline (I), m.p.  $183\cdot5\text{--}184\cdot5^\circ$  (Noelting *et al.*, A., 1906, i, 886; Pfeiffer *et al.*, A., 1925, i, 411, give m.p.  $177\text{--}179^\circ$ ), are prepared pure: colourless dihydrochloride; bluish-violet monohydrochloride, m.p.  $239\text{--}240^\circ$ ; almost colourless diperchlorate; reddish-violet monopерchlorate, m.p.  $229\text{--}230^\circ$  (decomp.), and monopicrate, m.p.  $167\text{--}168^\circ$ . With MeI in  $\text{MeOH}$  at  $100^\circ$  (I) gives a mixture of a pale yellow methiodide,  $\text{C}_9\text{H}_6\text{N}\cdot\text{CH}\cdot\text{CH}\cdot\text{C}_6\text{H}_4\cdot\text{NMe}_3\text{I}$  (II), decomp.  $250\text{--}251^\circ$ , synthesised by condensation of *p*-aldehydophenyltrimethylammonium iodide, m.p.  $144^\circ$  (decomp.), and quinaldine in  $\text{EtOH}$ -piperidine, and a bluish-red methiodide,  $\text{NMe}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}\cdot\text{CH}\cdot\text{C}_9\text{H}_6\text{NMeI}$  (III), m.p.  $253\text{--}254^\circ$  (decomp.), synthesised from quinaldine methiodide and *p*- $\text{NMe}_2\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$  (IV). With 1 mol. of  $\text{Me}_2\text{SO}_4$  in  $\text{H}_2\text{O}$  (I) gives red 2-*p*-dimethylaminostyrylquinoline methosulphate, m.p.  $242\text{--}243^\circ$  (decomp.), of type (III), synthesised from 2-methylquinoline methosulphate, m.p.  $223\text{--}224^\circ$  (decomp.), and (IV), whereas condensation of *p*-dimethylaminobenzaldehyde methosulphate, m.p.  $154^\circ$ , and quinaldine give the colourless  $\beta$ -2-quinolylstyryltrimethylammonium methosulphate, m.p.  $201\cdot5\text{--}202\cdot5^\circ$  (decomp.), of type (II). With 2 mols. of  $\text{Me}_2\text{SO}_4$  (I) gives its colourless dimethosulphate, m.p.  $252\text{--}253^\circ$  (decomp.). Thus salts of type (II) and the bis-quaternary salts are colourless, and those of type (III) are coloured.

Reduction of (I) with  $H_2$ -Ni in EtOAc-EtOH first saturates the ethylenic linking and yields, finally, 2- $\beta$ -p-dimethylaminophenylethyl-1:2:3:4-tetrahydroquinoline, m.p. 68—68.5° (dihydrochloride, m.p. 210—211°; diperchlorate, m.p. 157—158°; dimethiodide, m.p. 158—159°; NO-, m.p. 90.5—91°, and Bz, m.p. 120.5—121.5°, derivatives). With MgPhBr in Et<sub>2</sub>O (I) affords a 1:4-adduct, 2-( $\beta$ -p-dimethylaminophenyl- $\beta$ -phenylethylidene)-1:2-dihydroquinoline (V), m.p. 125° [dihydrochloride; diperchlorate, m.p. 192—194°

(decomp.); methiodide, m.p. 125—126° (decomp.); NO-derivative, m.p. 195—196° (decomp.); N-methyl dimethiodide (annexed formula), m.p. 206—208° (decomp.); and N-methyl diperchlorate, m.p. 216—217° (decomp.), and a substance, m.p. 194.5° [perchlorate, m.p. 207—208°; dimethiodide, m.p. 196—197° (decomp.)], which is not isomeric with (V), and gives no NO- or Bz derivative. The relationship of colour to constitution is discussed. J. W. B.

**Reaction products of indoles with diazo-esters.** R. W. JACKSON and R. H. MANSKE (Canad. J. Res., 1935, 13, B, 170—174).—Addition of  $CHN_2 \cdot CO_2Et$  and indole gives, after hydrolysis, indolyl-3-acetic acid (I), and indylene-1:3-diacetic acid, m.p. 242°, hydrolysed to 3-methylindolyl-1-acetic acid, m.p. 178°. Indole and Et<sub>2</sub> diazosuccinate similarly form indolyl-3-succinic acid, m.p. 199°. No substitution occurs in position 2. Hydrolysis of Et<sub>2</sub>  $\beta$ -cyano-propionacetal to the acid, and further hydrolysis (HCl) to the semialdehyde of succinic acid, followed by condensation with  $NHPh \cdot NH_2$ , and treatment with  $H_2SO_4$ , leads by the Fischer synthesis to (I). F. R. S.

**Colour and constitution of indole derivatives.** C. TOFFOLI (Gazzetta, 1935, 65, 647—658).—Theoretical. The colour, and changes of colour on salt-formation, of various indoles, e.g., o-3-(2-methylindolyl)phenyl 3-(2-methylindolyl) ketone (A., 1934, 1110), and  $\alpha$ -3:3'-di-indolyl- and -3-indolyl-3'-indolidene-ethane (*ibid.*, 1113), are discussed on the basis of the Bonino model for pyrrole (A., 1933, 886), and of Burawoy's theories (A., 1931, 144, 544; 1932, 791). Salt-formation disturbs the aromatic character of indoles, and introduces chromophoric conjugated systems. E. W. W.

**Preparation and properties of mesochloroacridine and acridone, and their derivatives.** N. S. DROZDOV and N. S. LEZNOVA (J. Gen. Chem. Russ., 1935, 5, 690—700).—Mesochloroacridine (I) yields acridone (II), together with the hydrochloride (III) of a double salt of (I) and (II), when boiled with dil. HCl; (III) readily decomposes in aq.  $NH_3$  or boiling  $H_2O$  to yield (II). 4'-Methoxydiphenylamine-2-carboxylic acid and excess of  $POCl_3$  in xylene yield 5-chloro-3-methoxyacridine (IV), m.p. 154°, the hydrochloride of which is obtained by boiling with dil. HCl; with a limited amount of  $POCl_3$  the product is 3-methoxyacridone. 5-Chloro-1-nitro-7-methoxyacridine (V), m.p. 226°, and its hydrochloride are prepared analogously. o- $C_6H_4Cl \cdot CO_2H$ , 4-nitro-2-aminoanisole, KOH, and CuO in iso- $C_5H_{11} \cdot OH$  (140°; 10 hr.)

give 5'-nitro-2'-methoxydiphenylamine-2-carboxylic acid (VI), m.p. 234°, from which 4-nitro-1-methoxyacridone (VII), m.p. 281° (decomp.), may be prepared by heating with conc.  $H_2SO_4$  or with  $POCl_3$ . On chlorination, (VII) yields the corresponding 5-chloroacridine (VIII), m.p. 173° (hydrochloride), also obtained directly from (VI) and excess of  $POCl_3$ . 4-Chloro-4'-methoxydiphenylamine-2-carboxylic acid, m.p. 189°, prepared from 3:6-dichlorobenzoic acid, p-anisidine, KOH, and CuO in glycerol (140°; 10 hr.), affords similarly 1-chloro-7-methoxyacridone, m.p. > 300° and 1:5-dichloro-7-methoxyacridine (IX), m.p. 205—206° (hydrochloride). The hydrochlorides of (IV) and (IX) are hydrolysed when boiled with dil. HCl, under which conditions those of (V) and (VIII) are converted into the corresponding acridones. The above observations do not support the view that acridol is an intermediate stage in the conversion of mesochloroacridines into acridones. R. T.

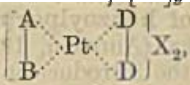

**Antimalarial drugs. Syntheses in the acridine series.** J. C. FELDMAN and E. L. KOPELOVITSCH (Arch. Pharm., 1935, 273, 488—495).—2:5- $C_6H_3Cl_2 \cdot CO_2H$  (prepared from o- $C_6H_4Me \cdot NO_2$  by way of 5-chloro-o-toluidine and 2:5- $C_6H_3MeCl_2$ ) with p-OMe- $C_6H_4 \cdot NH_2$ ,  $K_2CO_3$ , and a little Cu in iso- $C_5H_{11} \cdot OH$  at 130—135° gives 5-chloro-2-p-anisylaminobenzoic acid, m.p. 185—186°, converted by  $POCl_3$  at 100—123° into 5:7-dichloro-3-methoxyacridine, m.p. 203—204°, which with  $NH_2 \cdot CHMe \cdot [CH_2]_3 \cdot NEt_2$  yields 7-chloro-5- $\delta$ -diethylamino- $\alpha$ -methyl-n-butylamino-, m.p. 221—222°, and with  $NH_2 \cdot [CH_2]_3 \cdot NEt_2$  7-chloro-5- $\gamma$ -diethylaminopropyl-3-methoxyacridine dihydrochloride, m.p. 246—247°.  $C_6H_3MeCl_2$  with  $Cl_2 \cdot Fe$  gives a mixture, m.p. 80—81°,  $C_6H_3MeCl_2$ , converted by  $HNO_3$  into a mixture of 2:4:6- and 2:4:5- $C_6H_3Cl_3 \cdot CO_2H$  (I). (I) leads to 4:5-dichloro-2-p-anisylaminobenzoic acid, m.p. 233—234°, 5:7:8-trichloro-3-methoxyacridine, m.p. 192—193°, and 7:8-dichloro-5- $\delta$ -diethylamino- $\alpha$ -methylbutylaminoacridine dihydrochloride, m.p. 236—237°. The three acridine bases are less effective antimalarials than is acrichine (atebrine). R. S. C.

**3-Phenyl-1- $\beta$ -phenylethylpyrazol-5-one.** E. VOTOČEK and O. WICHTERLE (Coll. Czech. Chem. Comm., 1935, 7, 388—391).—3-Phenyl-1- $\beta$ -phenylethylpyrazol-5-one (I), m.p. 145.5° (methiodide, m.p. 174—175°), is obtained from  $CH_3Ph \cdot CH_2 \cdot NH \cdot NH_2$  and  $COPh \cdot CH_2 \cdot CO_2Et$ . (I) with  $NaNO_2 \cdot HCl$  affords a NO-derivative, m.p. 138—139°, converted by Zn-AcOH into the compound  $RH \cdot N \cdot R' \left( R = CH_2Ph \cdot CH_2 \cdot N \begin{array}{c} \text{N} = CPh \\ \text{CO} \cdot C \end{array} \right)$ , m.p. 165°, and an  $NH_2$ -derivative (not isolated) of (I). P. G. C.

**Asymmetric platinum atom. VII. A new type of optically active compound.** H. REIHLEN, G. SEIPEL, and E. WEINBRENNER (Annalen, 1935, 520, 256—269).—Dichloro-1-phenylethylenediamine-platinum (I) (A., 1935, 1132) boiled with 2:2'-dipyridyl affords dipyridyl-1-phenylethylenediamineplatinum chloride (II) +  $2H_2O$  and +  $3H_2O$ ,  $[M]_D + 90^\circ$  (platinohydrochloride), which is a racemate of the active Pt centre [denoted by ( $\pm$ )Pt]. With dil.  $HNO_3 \cdot NaNO_3$  it gives the ( $\pm$ )Pt nitrate, partly separated by shaking

with  $\text{H}_2\text{O}$  at  $10\text{--}15^\circ$  into the less sol., stable (+)Pt nitrate (III),  $[M]_D +115^\circ$ ,  $[\Delta\text{Pt}]_D +25^\circ$ , whereas the mother-liquor affords only the racemate from the readily racemised (–)Pt salt. With 1 mol. of Na *d*-bromocamphor- $\pi$ -sulphonate (IV) in  $\text{H}_2\text{O}$ , (II) gives the ( $\pm$ )Pt *d*-bromocamphor- $\pi$ -sulphonate chloride  $+3\text{H}_2\text{O}$ ,  $[M]_D +363^\circ$  ( $273^\circ +90^\circ$ ), but the gelatinous ( $\pm$ )Pt *di-d*-bromocamphor- $\pi$ -sulphonate,  $[M]_D +622^\circ$ , obtained by evaporation of (II) with 2 mols. of (IV), slowly affords crystals of the (+)Pt *d*-bromocamphor- $\pi$ -sulphonate chloride (V)  $+3\text{H}_2\text{O}$ ,  $[M]_D +392^\circ$ ,  $[\Delta\text{Pt}]_D +25^\circ$  to  $29^\circ$ , converted by dil.  $\text{HNO}_3\text{--NaNO}_3$  into (III). The mother-liquor of (V) with (IV) gives the (–)Pt *di-d*-bromocamphor- $\pi$ -sulphonate  $+2\text{H}_2\text{O}$ ,  $[M]_D +604^\circ$ ,  $[\Delta\text{Pt}]_D -32^\circ$ . *o*-Phenanthroline (VI) with  $\text{K}_2\text{PtCl}_4$  in hot  $\text{H}_2\text{O}$  affords dichloro-*o*-phenanthrolineplatinum, converted by  $\text{l-NH}_2\cdot\text{CHPh}\cdot\text{CH}_2\cdot\text{NH}_2$  into *o*-phenanthroline-1-phenylethylenediamineplatinum chloride  $+2\text{H}_2\text{O}$ ,  $[M]_D +121^\circ$  [also from (I) and (VI)] (nitrate,  $[M]_D +119^\circ$ ; platinochloride; *di-d*-bromocamphor- $\pi$ -sulphonate  $+2\text{H}_2\text{O}$ ,  $[M]_D +666^\circ \pm 10^\circ$ ). Similarly dichloroethylenediamineplatinum with (I) affords 1-phenylethylenediamine-ethylenediamineplatinum chloride, partly separated by crystallisation into fractions of  $[M]_D +134^\circ$  and  $+120^\circ$ , whence are obtained the iodide,  $[M]_D +139^\circ$  and  $+110.5^\circ$  (pure,  $[M]_D +125^\circ$ , the *d*-compound,  $[M]_D -125^\circ$ , also being obtained), perchlorate,  $[M]_D +110^\circ$  and  $+142^\circ$ , and iodide perchlorate,  $[M]_D +142^\circ$ . Thus

in the spirans of type  either the four

N are not in the same plane as the Pt, or the four Pt–N linkings are not equiv. All  $[M]_D$  vals. are in  $\text{H}_2\text{O}$ .

J. W. B.

**Preparation of 2:2'-diquinolyl by catalytic dehydrogenation of quinoline.** J. P. WIBAUT, H. D. T. WILLINK, jun., and W. E. NIEUWENHUIS (Rec. trav. chim., 1935, 54, 804–807).—Dehydrogenation of quinoline (I) by heating at  $325\text{--}335^\circ$  with a Ni– $\text{Al}_2\text{O}_3$  catalyst affords 2:2'-diquinolyl [15% yield, calc. on (I) consumed]. Very poor yields are also obtained using 0.5% of an I catalyst, but with 2.0% I complete decomp. results.

J. W. B.

**Decolorisation of indigotin by alkyl- and aryl-sulphinic acids.** M. BAZLEN and F. SCHOLTZ (Ber., 1935, 68, [B], 2045).—Indigotin becomes decolorised when heated at  $180^\circ$  in glycerol with the Zn or Na salts of  $\text{MeSO}_2\text{H}$ ,  $\text{EtSO}_2\text{H}$ ,  $\text{PhSO}_2\text{H}$ , 1- or 2- $\text{C}_{10}\text{H}_7\cdot\text{SO}_2\text{H}$ ; the free acids cannot be used, since they become decomposed at temp. below that at which reducing action is developed. The colour returns when the solution is cooled and shaken with air. *p*- $\text{C}_6\text{H}_4\cdot\text{Me}\cdot\text{SO}_2\text{H}$ , *o*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\text{H}$ , benzanthrone-*Bz*-1-sulphinic acid, and anthraquinone-2-sulphinic acid behave similarly.

H. W.

**Manufacture of conversion products of N-nitroamines etc. [benztriazoles].**—See B., 1935, 1132.

**Fluorescence of derivatives of pyrimidine, purine, and pyrimidine.** H. VON EULER, K. M. BRANDT, and G. NEUMULLER (Biochem. Z., 1935, 281, 206–214).—The fluorescence (substance and solution) of alloxazine (I), 6:7-dimethoxy- (I) and

4:5-diamino-3-methyluracil (II), diisobarbituric acid (III) and its oxidised form (IV), diuracilpyridazine, the azine (A), m.p.  $268\text{--}269^\circ$  [from (II) by heating

in  $\text{CO}_2$  at  $190\text{--}200^\circ$  for 45 min. with  $\text{Bz}_2$ ], the azine (B), m.p.  $> 330^\circ$  [from (II) by boiling in  $\text{AcOH}$  for 20–30 min. with phenanthraquinone], dioxindole (V), and acridine has been examined,  $\phi_{\text{H}}$ -fluorescence curves being given for (I)–(V).

W. McC.

**Crystalline hypoxanthine.** H. STEUDEL (Z. physiol. Chem., 1935, 236, 228–229).—Pure cryst. xanthine (I) (prisms) is obtained from the sulphate after conversion into the compound with  $\text{NH}_3$ , and pure cryst. hypoxanthine (II) (rhombic plates) from the hydrochloride, in both cases by treatment with  $\text{NaOAc}$ . The cryst. form attributed by Horbaczewski (A., 1898, i, 50) to (I) is that of (II).

W. McC.

**Flavin syntheses. VIII. Synthesis of 6-methyl-9-1-d-ribitylisoalloxazine and other synthetic investigations in the flavin series.** P. KARRER and F. M. STRONG (Helv. Chim. Acta, 1935, 18, 1343–1351).—4-Nitro-*m*-toluidine (improved prep.) with  $\text{ClCO}_2\text{Et}$  in  $\text{CHCl}_3$  gives its carbethoxy-derivative, m.p.  $51\text{--}52^\circ$ , reduced ( $\text{H}_2\text{--PtO}_2$ ) to 3-carbethoxyamino-*p*-toluidine, m.p.  $120^\circ$ , converted successively by usual methods (cf. A., 1934, 1134) into 2-carbethoxyamino-*p*-tolyl-*d*-ribamine, m.p.  $153^\circ$ , and 6-methyl-9-*d*-riboflavin (I), m.p.  $282^\circ$ ,  $[\alpha]_D -84.6^\circ$  in 0.05*N*- $\text{NaOH}$ . 6-Nitro-2:4-dimethylaniline (by hydrolysis of its Ac derivative, m.p.  $176.5^\circ$ ; lit., m.p.  $172^\circ$ ) with  $\text{ClCO}_2\text{Et}$  gives a poor yield of its carbethoxy-derivative, m.p.  $135^\circ$  (lit.,  $125\text{--}126^\circ$ ), which is best obtained by the action of conc.  $\text{H}_2\text{SO}_4\text{--HNO}_3$  (*d* 1.40) at  $100^\circ$  on Et 2:4-dimethylphenylcarbamate, and is reduced ( $\text{H}_2\text{--Pt}$ ) to the 6- $\text{NH}_2$ -compound, m.p.  $99.5^\circ$ , from which 2-carbethoxyamino-3:5-dimethylphenyl-*d*-ribamine, m.p.  $139^\circ$ , is obtained. Alkaline hydrolysis of this gives only 1-*d*-ribityl-2-hydroxy-4:6-dimethylbenzimidazole, m.p.  $248^\circ$ . (I) exhibits good growth-promoting efficiency in  $10\text{--}20 \times 10^{-6}$  g. daily doses.

J. W. B.

**Synthesis of lactoflavins.** P. KARRER, B. BECKER, F. BENZ, P. FREI, H. SALOMON, and K. SCHÖPP (Helv. Chim. Acta, 1935, 18, 1435–1448).—In part a historical résumé of flavin syntheses. Details are given for the prep. of *d*-ribose (I) (270 g.) from *d*-arabinose (3 kg.) by the method used by Austin *et al.* (A., 1934, 759) for *l*-ribose. The production of  $\text{NH}_2\cdot\text{C}_6\text{H}_2\text{Me}_2\cdot\text{NH}\cdot\text{CH}_2\cdot[\text{CH}\cdot\text{OH}]_2\cdot\text{CH}_2\cdot\text{OH}$  by catalytic reduction of  $\text{NO}_2\cdot\text{C}_6\text{H}_2\text{Me}_2\cdot\text{N}\cdot\text{CH}\cdot[\text{CH}\cdot\text{OH}]_2\cdot\text{CH}_2\cdot\text{OH}$  (Kuhn *et al.*, A., 1935, 1382) is disputed, since these authors describe the condensation of 5-nitro-4-amino-*o*-xylene only with *l*-arabinose and not with *d*-ribose. The synthesis of 6:7-dimethyl-9-*d*-riboflavin (II), in good yield, by the following reaction sequence is detailed: *m*-xylene  $\rightarrow$  4- $\text{NO}_2$   $\rightarrow$  4- $\text{NH}_2$   $\rightarrow$  4- $\text{NH}\cdot\text{CO}_2\text{Et}$ -derivative  $\rightarrow$  4-carbethoxyamino-5-nitro-

*o*-xylene, reduced to the 5-NH<sub>2</sub>-compound, which condenses with (I) to give, after catalytic reduction of the product, 2-carbethoxyamino-4:5-dimethylphenyl-*d*-ribamine, hydrolysed and converted by the usual method (H<sub>3</sub>BO<sub>3</sub>) into (II). J. W. B.

**Constitution of bile pigment. XIV. Synthesis of glaucobilins. Urobilin and mesobiliviolin.** W. SIEDEL (Z. physiol. Chem., 1935, 237, 8—34).—Me neoxanthobilirubate (A., 1935, 994) in CHCl<sub>3</sub> with dry HCN and HCl affords 5-hydroxy-5'-aldehyde-3':4'-dimethyl-3-ethyl-4'-β-carbomethoxyethylpyrromethene, m.p. 205.5° (all m.p. corr.), hydrolysed to the corresponding acid (I), m.p. 257°. Similarly Me isoneoxanthobilirubate (II) gives 5-methoxy-5'-aldehyde-3':3'-dimethyl-4-ethyl-4'-β-carbomethoxy-methylpyrromethene, m.p. 218—220° [corresponding acid (III), m.p. 273°]. 5-Bromo-3:3'-dimethyl-4-ethyl-4'-β-carbomethoxyethylpyrromethene hydrobromide (A., 1935, 632) yields (cf. A., 1933, 404) 5-methoxy-3:3'-dimethyl-4-ethyl-4'-β-carboxyethylpyrromethene, m.p. 160.5—161.5° [Me ester, m.p. 76°, from CH<sub>3</sub>N<sub>2</sub> and isoneoxanthobilirubic acid (IV) Me ether]. Ferrobilin IX α-Me<sub>2</sub> ester in CHCl<sub>3</sub> treated with 2*N*-NaOH affords "analytical" glaucobilin IX α-Me<sub>2</sub> ester (V), m.p. 232°, identical (by optical and physical characteristics) with the synthetic product, m.p. 232—234° [formed by refluxing (I)+(IV) in MeOH with HBr], and giving no depression of m.p. with isoglaucobilin IX α-Me<sub>2</sub> ester, m.p. 232° [from (III)+neoxanthobilirubic acid (VI)]. Similarly (I)+(IV) refluxed in MeOH with HCl affords glaucobilin IX α, m.p. 316.3° (decomp.), showing no depression with the analytical compound, m.p. 318° (decomp.). (I)+(IV) heated in AcOH with 2*N*-HCl in presence of FeCl<sub>3</sub> yields ferrobilin IX α, m.p. 265° (recryst. from COMe<sub>2</sub>-AcOH, m.p. 270°) showing no depression with the analytical compound, m.p. 265°; a similar identity holds for the Me<sub>2</sub> ester (VII), m.p. 264°. Glaucobilin XIII α-Me<sub>2</sub> ester (VIII), m.p. 246—247°, prepared by heating (I)+(VI) in MeOH with HBr, differs from (V) in solubility, but has similar optical properties, whilst depression of the mixed m.p. is small (approx. 1°). Treatment of mesobilirubin XIII in AcOH with FeCl<sub>3</sub> followed by dry HCl yields ferrobilin XIII α, m.p. 275° [Me<sub>2</sub> ester, m.p. 282.5°, showing no depression with (VII)]. (IV) heated with HCO<sub>2</sub>H and Ac<sub>2</sub>O followed by MeOH-HCl affords glaucobilin III α-Me<sub>2</sub> ester, m.p. 238.5°, showing small (approx. 2°) and marked (approx. 13°) depressions with (V) and (VIII), respectively. Equiv. amounts of (I) and (IV) Me ether heated in AcOH yield 1'-hydroxy-8'-methoxy-1:3:6:7-tetramethyl-2:8-diethyl-4:5-di-(β-carboxyethyl)bilin [Me ether of (V)]. Equiv. amounts of (I) and isoneobilirubic acid in MeOH heated with HBr give mesobiliviolin (IX), which yields a violet CHCl<sub>3</sub> solution (absorption max. at 575 mμ) turned blue by HCl (560, 607 mμ), and a blue solution fluorescing red (630 mμ) with EtOH-Zn(OAc)<sub>2</sub>. Condensation in presence of HBr of aldehydoneobilirubic acid and (IV) in MeOH yields mesobilirhodin (X), which gives a red CHCl<sub>3</sub> solution (575 mμ) turned violet by HCl (496, 557, 605 mμ) and a greenish-brown fluorescent (510 mμ) solution with EtOH-Zn(OAc)<sub>2</sub>. Chromatographic analysis of

(IX) prepared by oxidation (FeCl<sub>3</sub>) of mesobilirubinogen indicates the presence of (X). The bearing of the data on the structure of bile pigments is discussed.

F. O. H.

**Synthesis of di-iminoporphyrins. I. H. FISCHER, H. HABERLAND, and A. MÜLLER (Annalen, 1935, 521, 122—128).**—Prolonged contact of 5:5'-dibromo-4:4'-dimethyl-3:3'-di-β-carboxyethylpyrromethene hydrobromide (I) with 25% NH<sub>3</sub> at room temp gives ββ-di-iminocoprophyrin II (cf. A.), m.p. 398—400° (ill-defined Cu salt; Me<sub>4</sub> ester, m.p. 250°, and its Cu salt, m.p. 312°). In spite of some doubt due to spectrochemical evidence, the structure A with 2 NH in place of 2 CH is preferred to a con-

stitution with 2 N, since the substance has an enhanced acid no. in comparison with coproporphyrin and does not give a hydrobromide or hydrochloride. Also there is no evidence of dehydrogenation during or subsequent to the synthesis, and (I) with NH<sub>2</sub>Me or NH<sub>2</sub>Et gives substances spectroscopically similar to (II). H. W.

**Synthesis of benzoylporphyrins. H. FISCHER and K. HANSEN (Annalen, 1935, 521, 128—156).**—Attempts, by the introduction of heavy residue, are described to determine whether the stability of the chlorophyll mol., apart from the influence of the complex metal, is due to the involved isocyclic ring system. 2:3-Dimethylpyrrole is converted by CH<sub>2</sub>N<sub>2</sub>·CO<sub>2</sub>Et and Cu powder into Et 2:3-dimethylpyrrole-5-acetate, b.p. 142°/16 mm., hydrolysed and decarboxylated to 2:3:4-trimethylpyrrole. Et 2-methyl-3-ethylpyrrole-5-acetate, b.p. 143°/14 mm., is obtained similarly. Saturation of a solution of 2-methyl-3-ethylpyrrole and anhyd. HCN in Et<sub>2</sub>O with HCl and subsequent hydrolysis of the imine hydrochloride affords 2-methyl-3-ethylpyrrole-5-aldehyde (I), m.p. 109° (corresponding aldazine, m.p. 162°). Et 2:5-dimethylpyrrole-3-carboxylate, BzCl, and AlCl<sub>3</sub> in CS<sub>2</sub> give Et 4-benzoyl-2:5-dimethylpyrrole-3-carboxylate, m.p. 135°. Et 3-benzoyl-2:4-dimethylpyrrole-5-carboxylate is hydrolysed to 3-benzoyl-2:4-dimethylpyrrole-5-carboxylic acid, m.p. 194° (decomp.), which passes at 200° into 3-benzoyl-2:4-dimethylpyrrole (II), m.p. 130°. 2:3-Dimethylpyrrole-5-aldehyde and (II) condense in EtOH containing HBr to 4-benzoyl-3':4:5:5'-tetramethylpyrromethene hydrobromide, m.p. 208° (decomp.), readily brominated in AcOH to 3-bromo-4'-benzoyl-3':4:5:5'-tetramethylpyrromethene hydrobromide, decomp. 193°; under similar conditions 4'-acetyl-3':4:5:5'-tetramethylpyrromethene hydrobromide, decomp. 212°, gives ill-defined products. The wide applicability of the method of condensation is illustrated by the prep. of 4'-benzoyl-3':5:5'-trimethyl-4-ethylpyrromethene hydrobromide, m.p. 224° (decomp.) (3-Br-derivative, decomp. 202°), from 2-methyl-3-ethylpyrrole-5-aldehyde and (II), of 4'-acetyl-3':5:5'-

trimethyl-4-ethylpyrromethane hydrobromide, m.p. 214° (decomp.), from (I) and 3-acetyl-2:4-dimethylpyrrole, of 4'-benzoyl-3:3':4:5:5'-pentamethylpyrromethane hydrobromide, m.p. 224° (decomp.), from (II) and 2:3:4-trimethylpyrrole-5-aldehyde, of 4'-benzoyl-3:3':5:5'-tetramethyl-4-ethylpyrromethane hydrobromide (III), m.p. 211° (decomp.), from 2:4-dimethyl-3-ethylpyrrole-5-aldehyde and (II), of 4'-benzoyl-3:3':5:5'-tetramethylpyrromethane hydrobromide, m.p. 189° (decomp.) (corresponding 4-Br-derivative which becomes discoloured at about 210°), and of 4'-benzoyl-3:3':5:5'-trimethyl-4-β-carboxyethylpyrromethane hydrobromide, m.p. 204° (decomp.) (corresponding 5-Br-derivative, which has no defined m.p.). If (II) is heated with 95% HCO<sub>2</sub>H and 48% HBr is then added, 4:4'-dibenzoyl-3:3':5:5'-tetramethylpyrromethane hydrobromide (IV), decomp. 225°, is obtained, also prepared in AcOH or from Et 3-aldehydo-2:4-dimethylpyrrole-5-carboxylate and (II). 4:4'-Dibenzoyl-3:3':5:5'-tetramethylpyrromethane, m.p. 209°, is very stable. Addition of an intimate mixture of (III), 5:5'-dibromo-4:4'-dimethyl-3:3'-di-β-carboxyethylpyrromethane hydrobromide, and

(·CH<sub>2</sub>·CO<sub>2</sub>H)<sub>2</sub> to boiling (·CH<sub>2</sub>·CO<sub>2</sub>H) gives, after treatment of the product with CH<sub>3</sub>N<sub>2</sub>, small amounts of 4-benzoyl-2:3:5:8-tetramethyl-1-ethyl-6:7-di-β-carbomethoxyethylporphin (cf. A; R=[CH<sub>2</sub>]<sub>2</sub>·CO<sub>2</sub>H), m.p. 263° (corr.), and mesoporphyrin 13, thus establishing the formation of cryptopyrrole-methene as intermediate product. Analogous treatment of (IV) and 5:5'-dibromo-4:4'-dimethyl-3:3'-di-β-carboxyethylpyrromethane hydrobromide leads to 1:4-dibenzoyl-2:3:5:8-tetramethyl-6:7-di-β-carbomethoxyethylporphin [dibenzoyldeuteroporphyrin Me<sub>2</sub> ether 13]

(cf. B: R=[CH<sub>2</sub>]<sub>2</sub>·CO<sub>2</sub>Me), m.p. 252° (corr.), which with Fe(OAc)<sub>2</sub> and NaCl in boiling AcOH affords the compound C<sub>46</sub>H<sub>40</sub>O<sub>6</sub>N<sub>4</sub>FeCl, m.p. about 290°; products, m.p. 183.5° (corr.) and 257° (corr.), respectively, are also obtained in the synthesis, which gives poor yields. Dibenzoyldeuteroporphyrin 5 is described.

Treatment of pyrrohaemin ester with Bz<sub>2</sub>O and SnBr<sub>4</sub> at 70° leads to benzoylpyrrohaemin Me ester 5 (V), m.p. 313° (corr.), less readily obtained by use of SnCl<sub>4</sub>; the corresponding free acid (VI) has m.p. > 320°. Treatment of (V) with AcOH, Fe(OAc)<sub>2</sub>, and NaCl in boiling CHCl<sub>3</sub> affords benzoylpyrrohaemin Me ester, C<sub>39</sub>H<sub>38</sub>O<sub>3</sub>N<sub>4</sub>FeCl. (V) and Cu(OAc)<sub>2</sub> in

C<sub>5</sub>H<sub>5</sub>N·AcOH give the Cu salt, C<sub>39</sub>H<sub>38</sub>O<sub>3</sub>N<sub>4</sub>Cu. Benzoylpyrrohaemin oxime has m.p. 224°, but reaction is not observed with the acid and p-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·NH·NH<sub>2</sub> or NH<sub>2</sub>·CO·NH·NH<sub>2</sub>. Reduction of (VI) gives α-hydroxybenzylpyrrohaemin, m.p. > 300°, which gives minimal amounts of new porphyrins with boiling Ac<sub>2</sub>O or (EtCO)<sub>2</sub>O and pyrrohaemin when treated with conc. H<sub>2</sub>SO<sub>4</sub> at 100°. Reduction of benzoylpyrrohaemin with Na and isoamyl alcohol is described.

H. W.

**Porphyrins. XXXV. Synthesis of porphin.** H. FISCHER and W. GLEIM (Annalen, 1935, 521, 157—160).—Slow addition of pyrrole-2-aldehyde in EtOH

to boiling HCO<sub>2</sub>H followed by protracted ebullition of the mixture gives very small amount of porphin (I), which darkens above 360° and blackens at 400°, and, in dioxan, closely resembles spectroscopically deoxoetioporphyrin. The Cu and Fe salts have been examined spectroscopically.

H. W.

**Optical absorption of porphyrins. III.**—See this vol., 8.

**Fluorescence spectra of chlorophyll pigments.**—See this vol., 125.

**Optical activity of hæmoglobin and its derivatives.**—See this vol., 92.

**Mechanism of oxidation of o-toluenesulphonamide to saccharin.** O. J. MAGIDSON and I. G. ZILBERG (J. Gen. Chem. Russ., 1935, 5, 920—923).—o-C<sub>6</sub>H<sub>4</sub>Me·SO<sub>2</sub>·NH<sub>2</sub> (I) in Ac<sub>2</sub>O and CrO<sub>3</sub> at -5° to 30° yield o-C<sub>6</sub>H<sub>4</sub>Me·SO<sub>2</sub>·NHAc, m.p. 132—134°, a substance (II), m.p. 174—176° (probably OAc·CH<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·SO<sub>2</sub>·NHAc), and a substance (III), m.p. 103—105°; in presence of H<sub>2</sub>SO<sub>4</sub> acetsaccharin is obtained in addition to the above products. (II) and (III) yield saccharin (IV) when oxidised with KMnO<sub>4</sub>, and (II) is probably an intermediate in the oxidation of (I) to (IV).

R. T.

**Fission of ketosulphidocarboxylic acids. II.**

**Aryl selenohalides. VI.** O. BEHAGEL and W. MÜLLER (Ber., 1935, 68, [B], 2164—2166; cf. A., 1935, 1237, 1257).—3-Keto-2:3-dihydro-1:4-benzo-

selenazine (I), C<sub>6</sub>H<sub>4</sub>·, m.p. 182°, obtained by

reduction of o-nitrophenylselenolacetic acid, is converted by Br in CHCl<sub>3</sub> into 1:1-dibromo-3-keto-2:3-dihydro-1:4-benzoselenazine (II), m.p. 211°, which loses HBr in boiling PhMe giving 2-bromo-3-keto-2:3-dihydro-1:4-benzoselenazine (III), m.p. 213—214°. Analogously 1:1-dichloro-3-keto-2:3-dihydro-1:4-benzoselenazine (IV), m.p. 222°, affords 2-chloro-3-keto-2:3-dihydro-1:4-benzoselenazine, m.p. 228°. Boiling H<sub>2</sub>O transforms (II) or (IV) into the corresponding oxide, m.p. (indef.) 160°. (III) condenses

with  $\text{SH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  in feebly acid solution to the acid,  $\text{C}_9\text{H}_7\text{Sc}(\text{NH}\cdot\text{CO})\text{CH}_2\text{S}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ , m.p. 209—210°, hydrolysed by alkali to (I),  $\text{H}_2\text{S}$ , and  $\text{H}_2\text{C}_2\text{O}_4$ .

**Amidation with sodium and potassium amides on  $\alpha$ - and  $\alpha'$ -aminoanabasine. IV. Nitration of  $\alpha'$ -aminoanabasine.** M. M. KATZNELSON and M. I. KABATSHNIK (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 169—172).—2-(2'-Amino-5'-pyridyl)piperidine (I), m.p. 109° ( $\alpha'$ -aminoanabasine; A., 1935, 223), with  $\text{HNO}_3$  (d 1.4)— $\text{H}_2\text{SO}_4$  at 0° affords the 2'-nitroamine isolated as its *sulphate* +  $\text{H}_2\text{O}$  and anhyd. (II), m.p. 233° (decomp.), converted by heating with conc.  $\text{H}_2\text{SO}_4$  at 70—80° into 2-(3'-nitro-2'-amino-5'-pyridyl)piperidine, m.p. 178.5—179°, also obtained, together with a substance,  $\text{C}_{10}\text{H}_9\text{O}_6\text{N}_3$ , m.p. 70°, by nitration of (I) at 70—90°. Diazotisation of (I) affords the corresponding 2'-OH-derivative (*Na* salt) isolated only as its *picrate*, m.p. 241° (decomp.), also obtained by heating (II) with  $\text{Ac}_2\text{O}$  and subsequent hydrolysis with boiling 5% aq.  $\text{NaOH}$ . [Note: the m.p. of the 3'- and 5'-pyridyl compounds (*loc. cit.*) should be interchanged; that of the former is 89.5—90°.] J. W. B.

**Cactus alkaloids. XV. Separation of the Anhalonium bases.** E. SPATH and F. BECKE (Monatsh., 1935, 66, 327—336).—Mescal buttons are extracted with pure  $\text{EtOH}$  at room temp. and, after removal of solvent, the extract is dissolved in  $\text{H}_2\text{O}$ , treated with excess of  $\text{KOH}$ , and exhaustively extracted with pure  $\text{Et}_2\text{O}$ . The extract is shaken with conc.  $\text{KOH}$ . The combined alkaline solutions are neutralised, rendered slightly alkaline with  $\text{K}_2\text{CO}_3$ , and extracted with  $\text{Et}_2\text{O}$ , thus giving all the phenolic alkaloids with small amounts of non-basic compounds. From them anhalamine is first separated as the hydrochloride. The free bases are isolated from the mother-liquors from this salt, distilled in a high vac., and pellotine is pptd. as the hydrochloride from their solution in  $\text{EtOH}$ - $\text{Et}_2\text{O}$ . The residual mixture of bases give a cryst. perchlorate which is not homogeneous. Treatment of the bases with  $\text{Et}_2\text{O}$  separates them into the sparingly sol. anhalonidine and anhalidine [*N*-methylanhalamine]. From the non-phenolic bases the bulk of the mescaline is first separated as the sulphate from  $\text{H}_2\text{O}$ ; from the mother-liquors anhalonine is isolated as the sparingly sol. hydrochloride. Anhalinine [*O*-methylanhalamine] is also isolated, whilst the final mother-liquors afford lophophorine, separated as the picrate. H. W.

**Alkaloids of *Papaver* types. I. Alkaloids of *P. armeniacum* and *P. orientale*.** R. KONOVALOVA, S. JUNUSOV, and A. OREKHOV (Ber., 1935, 68, [B], 2158—2163).—Percolation with  $\text{C}_2\text{H}_5\text{Cl}_2$  of the air-dried foliage of *P. orientale* which has been moistened with 10%  $\text{NH}_3$  leads to the isolation of thebaine and oripavine,  $\text{C}_{18}\text{H}_{21}\text{O}_3\text{N}$ , m.p. 200—201°,  $[\alpha]_D -211.8^\circ$  in  $\text{CHCl}_3$  (hydrochloride, m.p. 244—245°; methiodide, m.p. 207—208°), which dissolves in 10%  $\text{NaOH}$  giving a cryst. *Na* salt. It appears to be  $\text{C}_{18}\text{H}_{12}\text{O}(\text{NMe})(\text{OMe})\cdot\text{OH}$ . The presence of isothebaine could not be detected. Similar treatment of *P. armeniacum* yields armepavine (I),  $\text{C}_{19}\text{H}_{23}\text{O}_3\text{N}$ ,

m.p. 148—149° (or, + $\text{H}_2\text{O}$ , m.p. about 100°),  $[\alpha]_D -118.7^\circ$  in  $\text{CHCl}_3$  (hydrochloride, m.p. 151—152°; sparingly sol. oxalate, m.p. 211—212°; methiodide, m.p. 199—200°), which contains  $\text{NMe}$ , 2  $\text{OMe}$ , and  $\text{OH}$ . (I) is transformed by  $\text{MeI}$  and  $\text{NaOMe}$  in boiling  $\text{MeOH}$  into *O*-methylarmepavine methiodide, m.p. 120—122°. Treatment of (I) in  $\text{CHCl}_3$  with  $\text{ClCO}_2\text{Et}$  and  $\text{NaOH}$  gives an optically inactive oil, indicating that (I) may be a tetrahydroisoquinoline derivative. H. W.

**Alkaloid of chin-shih-hu.** K. K. CHEN and H. L. CHEN (J. Biol. Chem., 1935, 111, 653—658).—Chin-shih-hu from Szechuan contains 0.52% of alkaloids, mainly dendrobine (modified isolation),  $\text{C}_{16}\text{H}_{25}\text{O}_2\text{N}$ , m.p. 135°,  $[\alpha]_D -52^\circ$  in  $\text{EtOH}$  [hydrochloride, m.p. 193°,  $[\alpha]_D -40.3^\circ$ ; hydrobromide, m.p. 259—259.5°,  $[\alpha]_D -34.3^\circ$ ; hydriodide, m.p. 284—284.5°,  $[\alpha]_D -29^\circ$ ; nitrate, m.p. 198.5—199°,  $[\alpha]_D -30.2^\circ$ ; sulphate, m.p. 178°,  $[\alpha]_D -36.7^\circ$ ; oxalate, m.p. 137—138°,  $[\alpha]_D -50.8^\circ$ ; picrate, m.p. 210° (decomp.); flavianate, decomp. 212°; methiodide, m.p. 246°,  $[\alpha]_D -28.8^\circ$  in  $\text{EtOH}$ ; aurichloride, m.p. 183—184°; platinichloride, m.p. 283°.  $[\alpha]$  are in  $\text{H}_2\text{O}$ ]. The Kweichow variety contains another alkaloid, but no dendrobine. M.p. are corr. R. S. C.

**Alkaloid from *Trichodesma incanum*** D.C. I. G. MENSCHIKOV and V. RUBINSTEIN (Ber., 1935, 68, [B], 2039—2044).—Percolation of the dried plant with 95%  $\text{EtOH}$  containing 1% of  $\text{NH}_3$ , removal of the solvent, and extraction of the residue with dil.  $\text{HCl}$  followed by treatment of the acid solution with  $\text{NH}_3$  and  $\text{CHCl}_3$  yields trichodesmine (I),  $\text{C}_{13}\text{H}_{27}\text{O}_6\text{N}$ , m.p. 160—161° (decomp.),  $[\alpha]_D +38^\circ$  in  $\text{EtOH}$  [methiodide, m.p. 202° (decomp.)], which does not react with cold  $\text{HNO}_3$ , and hence contains *tert*.-N. Hydrolysis of (I) with 10%  $\text{NaOH}$  at 100° affords  $\text{COMeBu}^s$ , *r*-lactic acid, and trichodesmidine (II),  $\text{C}_8\text{H}_{13}\text{O}_2\text{N}$ , m.p. 117—118.5°,  $[\alpha]_D +50^\circ$  in  $\text{MeOH}$  (picrate, m.p. 142—143.5°), not identical with heliotridine. Hydrogenation of (II) readily affords the saturated hydroxytrichodesmidane (III),  $\text{C}_8\text{H}_{15}\text{ON}$ , m.p. 92—94° [picrate, m.p. 211.5—212.5° (decomp.)]. Treatment of (III) with conc.  $\text{H}_2\text{SO}_4$  at 165—170° and subsequent hydrogenation ( $\text{AdS}_4$ ) of the product leads to heliotridane. Heliotridine and (II) have therefore the same skeleton, and are differentiated from one another by the position of  $\text{OH}$  and possibly of the double linking. (I) is a complex ester of (II) and *r*-lactic acid and either  $\text{CHPr}^s\text{Ac}\cdot\text{CO}_2\text{H}$  or isovalerylacetic acid. The distribution of acid residues in the mol. cannot yet be established; since (I) does not give a colour with  $\text{FeCl}_3$ , it is probable that lactic acid esterifies the enolic  $\text{OH}$  of the tautomeric form of the  $\beta$ -CO-acid. H. W.

**Sinomenine. XLIV. Tuduranine, a new alkaloid from *Sinomenium acutum*.** K. GOTO (Annalen, 1935, 521, 175—184).—The mother-liquors from the extraction of sinomenine give the sparingly sol. tuduranine hydrochloride (I),  $\text{C}_{18}\text{H}_{19}\text{O}_3\text{N}\cdot\text{HCl}$ , m.p. 286° (decomp.),  $[\alpha]_D -148^\circ$  in  $\text{H}_2\text{O}+\text{MeOH}$ , from which the poorly cryst. tuduranine (II), m.p. about 125° after softening at 105°, is isolated. (II) contains 2  $\text{OMe}$ , but no  $\text{CH}_2\text{O}$ ., is freely sol. in alkali, but gives a feeble  $\text{FeCl}_3$  or diazo-reaction. The presence of

1OH is established by the isolation of *diacetyltuduranine*, m.p. 170°,  $[\alpha]_D^{25}$   $-321.71^\circ$  in MeOH, which does not combine with MeI, and is hydrolysed to *N-acetyltuduranine*, m.p. 277°,  $[\alpha]_D^{25}$   $-395.24^\circ$  in MeOH-CHCl<sub>3</sub>, whence *N-acetyltuduranine Me ether*, m.p. 189°,  $[\alpha]_D^{25}$   $-400.17^\circ$  in CHCl<sub>3</sub>. (II) and MeI in MeOH afford *N-methyltuduranine methiodide* (III), m.p. 224°. (II) gives a characteristic, fuchsin-red colour with CH<sub>2</sub>O-H<sub>2</sub>SO<sub>4</sub>. Spectroscopically, (I) is closely similar to morphothebaine Me<sub>2</sub> ether (III). The Hofmann degradation of *N-methyltuduranine Me ether methiodide*, m.p. 219°, however, affords successively *de-N-dimethyltuduranine Me ether (methiodide)*, m.p. 279° and *trimethoxyvinylphenanthrene*, m.p. 93-5°, with NMe<sub>3</sub>; the positions of the 3 OMe in the ether do not therefore coincide with those in (III) or *isothebaine Me ether*. (I) is transformed by NaOH and Et<sub>2</sub>SO<sub>4</sub> followed by KI into *N-ethyltuduranine Et ether ethiodide*, m.p. 238°,  $[\alpha]_D^{25}$   $-112.47^\circ$  in CHCl<sub>3</sub> (with some *N-diethyltuduranine Et ether ethiodide*, m.p. 163-164°, converted by the successive action of NaOH and EtI into *de-N-diethyltuduranine Et ether ethiodide*, m.p. 164°,  $[\alpha]_D^{25}$   $\pm 0^\circ$  (corresponding *hydriodide*, m.p. 163-164°), whence *dimethoxyethoxyvinylphenanthrene*, m.p. 148° after softening at 110°, and NEt<sub>3</sub>. The Hofmann degradation of (III) gives *de-N-dimethyltuduranine (methiodide)*, m.p. 259°, whence a compound, C<sub>18</sub>H<sub>16</sub>O<sub>3</sub>, m.p. 292-294°. Oxidation of (II) with

KMnO<sub>4</sub> gives very small amounts of an acid, m.p. about 263°, but no hemipinic or *metahemipinic* acid. The structure A is therefore assigned to (II). H. W.

**Sinomenine. XLII.** (+)- and (-)-**Bromothebenone.** K. GOTO, M. OGAWA, and J. SAITO (Bull. Chem. Soc. Japan, 1935, 10, 481-482; cf. A., 1935, 1138).—Dihydrode-*N*-methylmethoxydihydrosinomenine (I) and Br-AcOH give the (+)-1-*Br*-derivative (II), m.p. 192°,  $[\alpha]_D^{17}$   $+61.6^\circ$  in CHCl<sub>3</sub> [*hydrobromide*, m.p. 257° (decomp.); *methiodide*, m.p. 273°]. The methiodide of (I) and 25% KOH give (-)-1-*bromothebenone* (III), m.p. 70°,  $[\alpha]_D^{17}$   $-22.67^\circ$  in CHCl<sub>3</sub>. 1-Bromodimethoxydihydrosinomenine methiodide and 15% NaOH give 1-*bromode-N-methylmethoxydihydrosinomenine* (IV), m.p. 200-201°,  $[\alpha]_D^{17}$   $-8.67^\circ$  in CHCl<sub>3</sub>, the *methiodide*, decomp. 243°, of which with 11% NaOH affords (-)-1-*bromodehydrothebenone* (V), m.p. 145°,  $[\alpha]_D^{17}$   $-186.8^\circ$  in CHCl<sub>3</sub>. (-)-Dehydrosinomenine and Br-AcOH yield (-)-*iso*-9- or -10-*bromodehydrothebenone* (VI), m.p. 125-133°,  $[\alpha]_D^{17}$   $-113.3^\circ$  in CHCl<sub>3</sub>. The *stereoisomerides* are prepared from thebainone and admixture gives the *dl*-bases, (II), m.p. 175-177°, (III), m.p. 191-193°, (IV), m.p. 189-192°, (V), m.p. 159-162°, and (VI), m.p. 156-158°. R. S. C.

**Bitter principles of the Colombo root. III.** K. FEIST, E. KUNTZ, and R. BRACHVOGEL (Annalen, 1935, 521, 184-188; cf. A., 1935, 1245).—The discrepancies between the authors' observations and those of Wessely *et al.* (*ibid.*, 1432) are due to the use by the latter of insufficiently purified material. Columbin is very sensitive to alkali, and attempts to

methylate it by KOH-*p*-C<sub>6</sub>H<sub>4</sub>Me-SO<sub>3</sub>Me lead to *carboxyiso-V-columbin*, m.p. 194-195° (decomp.).

H. W.

**Alkaloids of *Duboisia Hopwoodii*.**—See this vol., 125.

**Alkaloids of European *Lycopodium* species.**—See this vol., 125.

**Influence of air on solutions of salvarsan derivatives.**—See this vol., 32.

**Arsenical derivatives of carbazole.** S. M. SOHERLIN and A. J. BERLIN (J. Gen. Chem. Russ., 1935, 5, 938-942).—Diazotised 3-aminocarbazole and Na<sub>3</sub>AsO<sub>3</sub> in presence of CuSO<sub>4</sub>-NH<sub>3</sub> yield *carbazyl-3-arsinic acid*, which yields *carbazyl-3-dichloroarsine* (I), m.p. 150°, when treated with SO<sub>2</sub> in conc. HCl-EtOH at room temp. in presence of I, and carbazole and AsCl<sub>3</sub> in the boiling solution. (I) and aq. NH<sub>3</sub> afford *carbazyl-3-arsinous acid*, m.p. 267-269°.

R. T.

**Action of alkyl iodides on heterocyclic organic arsenic compounds. I.** V. S. MALINOVSKI (J. Gen. Chem. Russ., 1935, 5, 510-514).—The Cl of 5-chloro- and 5-chloro-10-acetyl-5:10-dihydrophenarsazine, chlorophenoxarsine, and diphenylenechlorarsine in replaced by I when the compounds are heated with MeI, EtI, or *iso*-C<sub>5</sub>H<sub>11</sub>I in sealed tubes, products containing As<sup>V</sup> not being formed. 5:10-Dihydrophenarsazine oxide and MeI (6 hr.; 90°) afford an unidentified product, C<sub>14</sub>H<sub>15</sub>NAsI<sub>2</sub>, m.p. 138-142°, containing As<sup>V</sup>, whilst EtI and *iso*-C<sub>5</sub>H<sub>11</sub>I yield 5-iodo-5:10-dihydrophenarsazine. 5-Acetyl-5:10-dihydrophenarsazine and MeI give 5-methyl-5:10-dihydrophenarsazine methiodide.

R. T.

**Hydroxy-derivatives of 5-alkyl(aryl)-5:10-dihydrophenarsazine. II.** Synthesis and properties of monohydroxy-5-*R*-5-*R'*-5:10-dihydrophenarsazine. **III.** Synthesis of derivatives of the betaine type. G. A. RAZUVAEV and V. S. MALINOVSKI (J. Gen. Chem. Russ., 1935, 5, 570-574, 575-579).—II [with A. F. SHIGATSKH and Z. I. AZARCH]. The methiodides of 5-alkyl(aryl)-dihydrophenarsazines yield the following hydroxides and nitrates with AgOH and AgNO<sub>3</sub>, respectively: *monohydroxide* of 5:5-dimethyl-, m.p. 242° [*nitrate* (I), m.p. 258°; NO<sub>2</sub>-derivative (II)], of 5-phenyl-5-methyl-, m.p. 202-204° [*nitrate*, m.p. 210°; NO<sub>2</sub>-derivative (III), m.p. 120-124°], and of 5-methyl-5-isoamyl-5:10-dihydrophenarsazine, m.p. not given (*nitrate*, m.p. 191-193°). Attempts to reduce the NO<sub>2</sub> of (II) and (III) resulted in its elimination.

III [with S. E. ARKINA]. 5-Methyl-5:10-dihydrophenarsazine and CH<sub>2</sub>Cl-CO<sub>2</sub>H in C<sub>6</sub>H<sub>6</sub> at 90° yield 5-chloro-5-methyl-5:10-dihydrophenarsazinoacetic acid (IV), m.p. 237-238° [*Et* ester (V), m.p. 198°; *nitrate*, m.p. 179°; *platinichloride*, m.p. 138-140°; *picrate*, m.p. 199°]; the analogous 5-*Et* derivative, m.p. 201-204° (*nitrate*, m.p. 170°), is obtained similarly. (IV) or (V) afford an *anhydride* (VI), m.p. 199-203°, of the betaine type, when heated with aq. NaOH. The *dinitro*-derivative of (VI), m.p. 163-165° obtained from (IV) and HNO<sub>3</sub>, yields (VI) when reduced with Fe(OH)<sub>2</sub> in aq. NaOH.

R. T.

**Behaviour of *o*-toluidine with mercuric acetate.** L. VECCHIOTTI and (SIENA) A. AJUTO (*Gazzetta*, 1935, 65, 832—836; cf. A., 1929, 1091, 1492).—*o*-Toluidine (1 mol.) and  $\text{Hg}(\text{OAc})_2$  (3 mol.) at 30° form 3 : 5 : 6-tri*aceto*mercuri-*o*-toluidine, m.p. 161°, of which the structure is determined by converting the *Ac* derivative, m.p. 211°, by  $\text{Cl}_2$  and  $\text{KCl}$  in  $\text{AcOH}$  into 3 : 5 : 6-tri*chloro*-*o*-*acet*-toluidide, m.p. 190—191°, hydrolysed to 3 : 5 : 6-tri*chloro*-*o*-toluidine.

E. W. W.

**Mercuric salicylate and dithiosalicylate.** V. PAOLINI (*Gazzetta*, 1935, 65, 836—839).—The product from  $\text{HgO}$  and salicylic acid in  $\text{H}_2\text{O}$ , or from  $(\text{o-HI} \cdot \text{C}_6\text{H}_4 \cdot \text{CO}_2\text{H})_2\text{Hg}$  at 170°, is sol. in  $\text{NaOH}$ , and therefore regarded as an *anhydride* of (3-hydroxymercuri)-salicylic acid,  $\text{OH} \cdot \text{C}_6\text{H}_4 \cdot \text{CO} \cdot \text{Hg} \cdot \text{O}$ . Dithiosalicylic acid,  $[\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{S})]_2$ , reacts with  $\text{HgCl}_2$  to form compounds regarded as  $[\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})(\text{HgCl}) \cdot \text{S}]_2$  and  $\left[ \text{O} \cdot \text{CO} \cdot \text{Hg} \cdot \text{C}_6\text{H}_4(\text{OH}) \cdot \text{S} \right]_2$ .

E. W. W.

[Preparation of] mercurated hydroxyaryl sulphides. See B., 1935, 1119.

**Synthesis of organoselenenic compounds.** VII. Selenium diphenol. S. KIMATSU and I. SATODA (*J. Pharm. Soc. Japan*, 1935, 55, 58—66).—Diazotised bis-(4-aminophenyl) diselenide when treated with  $\text{KSeCN}$  yields bis-(4-selenocyanophenyl) diselenide, m.p. 161°, reduced ( $\text{Zn}$  dust-dil.  $\text{H}_2\text{SO}_4$ ) to diselenoguaiacol, m.p. 120—121° (*Me\_2* ether, m.p. 81°), which undergoes aerial oxidation to a substance, m.p. 247—248°. Bis-(3-aminophenyl) diselenide (prep. described), diazotised and coupled with  $\text{KSeCN}$ , affords bis-(3-selenocyanophenyl) diselenide, m.p. 96° (*Me\_2* ether, b.p. 129—130°/2—2.5 mm.), reduced, as above, to diselenoresorcinol, which is very unstable, being oxidised in air to a product, m.p. 123—124°.

CH. ABS. (r)

**Vanado-organic compounds.** I. A. V. KIRSAKOV and T. V. SAZONOVA (*J. Gen. Chem. Russ.*, 1935, 5, 936—962).— $\text{R}_2\text{VO}_4$  ( $\text{R} = \text{iso-C}_3\text{H}_7$ ) and  $\text{MgPhBr}$  at  $-20^\circ$  yield chiefly  $\text{Ph}_2$  and  $\text{V}_2\text{O}_5$ , together with traces of an  $\text{Et}_2\text{O}$ -sol. product, readily oxidised by atm.  $\text{O}_2$  to yield  $\text{V}_2\text{O}_5$ , and probably  $\text{VPh}_2 \cdot \text{O} \cdot \text{MgBr}$ . The corresponding reaction with  $\text{MgMeI}$  gives chiefly  $\text{C}_2\text{H}_5$ , without formation of org. V derivatives. The following salts of V are described:  $\text{Et}_2\text{VOH}$  ( $\text{o-OH} \cdot \text{C}_6\text{H}_3 \cdot \text{CO}_2\text{H}$ ),  $\text{VOH}$ , ( $\text{o-NH}_2 \cdot \text{C}_6\text{H}_3 \cdot \text{CO}_2\text{H}$ ),  $\text{VOH}$ , and  $(\text{CH}_3\text{CO}_2)_2\text{VOH}$ .

R. T.

**Antoclave splitting of protein by means of absolute methyl alcohol.** V. S. SAMKOV and V. A. VANOVA (*Compt. rend. Acad. Sci. U.R.S.S.*, 1935, 3, 317—320).—Protein of blood serum, heated with 5 parts of  $\text{MeOH}$  at 180°/30—60 atm. for 3 hr., affords  $\text{NH}_3$  and a residue which is separated into  $\text{H}_2\text{O}$ -sol. and  $\text{H}_2\text{O}$ -insol. fractions.  $\text{Et}_2\text{O}$  extraction of the former gives unidentified cyclopeptides and a cycloleucyltriazine,  $\text{OH} \cdot \text{C} \cdot \text{NH} \cdot \text{CH}_2 \cdot \text{C} \cdot \text{NH} \cdot \text{C} \cdot \text{OH}$ ; that of the latter affords a syrup (N, 8.35%; no  $\text{NH}_3$  or amide-N). Hydrolysis with 20%  $\text{H}_2\text{SO}_4$  is described; no chemical individuals are isolated. The results of the  $\text{MeOH}$  hydrolysis are compared with those obtained using  $\text{H}_2\text{SO}_4$ ,  $\text{K}_2\text{CO}_3$ , or  $\text{EtOH}$ .

P. G. C.

**Chemical groups of proteins which possess affinity for polysaccharides.** VI. Role of lysine, leucine, phenylalanine, aspartic acid, glutamic acid, asparagine, cystine, and tryptophan. S. J. VON PRZYŁECKI, H. RAFAŁOWSKA, and J. CICHOCKA. VII. Nature of the polysaccharide-guanidine complex. W. GIEDROYĆ, J. CICHOCKA, and E. MYSTKOWSKI (*Biochem. Z.*, 1935, 281, 420—422, 422—430).—VI. None of the investigated acids shows any detectable affinity for P-free polysaccharides either at  $p_{\text{H}}$  3, 4, 6.5, or 7. The ppt. obtained with dextrin never contained > 3.5%.

VII. P-free polysaccharoproteins do not arise by use of primary valencies between the arginine residue and the free  $\cdot\text{CHO}$  groups, but much more probably through the presence of residual affinity of the  $(\text{NH}_2)_2\text{C} \cdot \text{NH}$  group and the alcohol group of the polysaccharides.

P. W. C.

**Structure of the simplest proteins.** E. WALDSCHMIDT-LEITZ (*Monatsh.*, 1935, 66, 357—366).—The structure  $[\text{M} \cdot \text{A} \cdot \text{A}]_3 \cdot \text{P} \cdot \text{A} \cdot \text{A} \cdot \text{M} \cdot \text{A} \cdot \text{A}$  is assigned to clupeine [ $\text{A}$ =arginine,  $\text{P}$ =proline,  $\text{M}$ =aliphatic  $(\text{NH}_2)_1$ -acid residue].

H. W.

**Compounds of proteins with *o*-nitrophenols.** A. BOELLIGER (*Austral. J. Exp. Biol.*, 1935, 13, 189—191).—Globin, cdestin, and casein form compounds with picric acid, picrolonic acid, and 1 : 2 : 4- $\text{OH} \cdot \text{C}_6\text{H}_3(\text{NO}_2)_2$ . Under suitable conditions these compounds are saturated in respect of the nitrophenols and are then of approx. const. composition (cf. A., 1935, 879).

W. O. K.

**Ultra-carbon determination.** W. LUTTGENS and W. CHRISTIAN (*Biochem. Z.*, 1935, 281, 310—313).—The material is combusted in the usual Pregl manner, the  $\text{CO}_2$  formed is absorbed in 0.1N- $\text{NaOH}$ , and is determined in an aliquot manometrically after re-liberation with  $\text{H}_2\text{SO}_4$ . An example gives details of calculation of results.

P. W. C.

**Organic analysis. Determination of (A) sulphur, (B) copper, in organic compounds.** N. N. MELNIKOV (*J. Gen. Chem. Russ.*, 1935, 5, 839—840, S41—S42).—(A) 0.2—0.5 g. of substance is heated at 70—140° with 10—15 c.c. of  $\text{H}_3\text{PO}_4$  ( $d$  1.7), and 1.5—4 g. of  $\text{KMnO}_4$  are gradually added. The melt is heated 15 min. longer, excess of  $\text{KMnO}_4$  is removed by  $\text{H}_2\text{O}_2$ ,  $\text{H}_2\text{O}$  is added to 300—400 c.c., and  $\text{SO}_4^{2-}$  is determined by pptn. as  $\text{BaSO}_4$ . The method is not applicable to volatile compounds.

(s) 0.1—0.5 g. of substance is heated at 70—80° with 10—15 c.c. of conc.  $\text{H}_2\text{SO}_4$  and 1—4 g. of  $\text{KMnO}_4$ , excess of  $\text{KMnO}_4$  is removed by  $\text{H}_2\text{O}_2$  or  $\text{H}_2\text{C}_2\text{O}_4$ ,  $\text{H}_2\text{O}$  is added to 100—250 c.c., and  $\text{Cu}^{2+}$  is determined iodometrically.

R. T.

**Determination of small amounts of arsenic in organic materials.** K. WINTERFELD, E. DÖRFL, and C. RAUCH (*Arch. Pharm.*, 1935, 273, 457—467).—Org. matter is destroyed, the As distilled off as  $\text{AsCl}_3$ , collected and converted into  $\text{AsH}_3$ , which is collected in  $\text{HgCl}_2$  and determined by a modified I- $\text{Na}_2\text{S}_2\text{O}_3$  method.  $1.5 \times 10^{-4}$  g. of As can be thus determined.

R. S. C.

**Titrimetric determination of water and alcohols.**—See this vol., 41.

**Formaldehyde, alcohol, and acetone titrations.** Addendum. G. M. RICHARDSON (Proc. Roy. Soc., 1935, B, 119, 85—86; cf. A., 1934, 634).—In the titration of substances containing several acidic or basic groups the initial and end-points must be clearly defined. E. A. H. R.

**Determination of reducing sugars.**—See this vol., 126.

**Potentiometric determination of polypeptides and amino-acids.** E. W. BALSON, G. A. EARWICKER, and A. LAWSON (Biochem. J., 1935, 29, 2700—2704).—Titration of mixtures of  $\text{NH}_2$ -acids and polypeptides is carried out in 90% aq. EtOH: the degree of separation is discussed. As the  $p_H$  of the end-point for some mixtures varies over a range of 2 units depending on the proportions of the constituents, a potentiometric titration is used with a special method of differential plotting. J. N. A.

**Determination of benzene by the Pulfrich step-photometer.**—See this vol., 126.

**Determination of toluidines in aqueous solution.** D. CISMARU (Bul. Soc. Chim. Romania, 1934, 16, [A], 37—41).—Aq. *o*-, *m*-, or *p*-toluidine,  $\text{CuSO}_4$ , and 0.1N- $\text{NH}_4\text{CNS}$  give quantitatively salts,  $[\text{CuB}_t](\text{SCN})_2$ . The base is determined by filtration and titration of the excess of  $\text{NH}_4\text{CNS}$  in the filtrate. R. S. C.

**Spectrographic determination of phenol.**—See this vol., 126.

**Photo-electric determination of salicylic acid.** P. F. BECH (Dansk Tidsskr. Farm., 1935, 9, 289—302).—The depth of colour of the Fe-salicylic acid complex in aq. solution is measured photo-electrically with a previously calibrated apparatus. Improvements in the author's earlier method are described (Farm. Tidende, 1933, 446). The effects of excess of salicylic acid and EtOH and of varying  $p_H$  have been investigated. Reproducible results are obtainable so long as  $\text{Fe}^{+++}$  is in excess,  $[\text{EtOH}] \geq 8\%$ , and  $p_H < 2.2$ . M. H. M. A.

**Acid-base titration in alcohol-water mixtures.**

**III. Titration of alkaloids and alkaloid salts.** H. BAGGESGAARD-RASMUSSEN and F. REIMERS (Dansk Tidsskr. Farm., 1935, 9, 253—288; cf. A., 1934, 160).—The acidity consts.  $P_K$  for narcotine, papaverine, strychnine, morphine, codeine, brucine, cocaine, procaine, quinine, emetine, cinchonine, atropine, and ephedrine in 50% and 75% aq. EtOH have been determined colorimetrically and electrometrically, and the variation of  $P_K$  with  $[\text{EtOH}]$  is compared with that of indicator end-points. Most alkaloids lie on the border of practicable titration in 50% EtOH, but titration of alkaloid salts with bases is more accurate in aq. EtOH than in  $\text{H}_2\text{O}$ . J. A. S.

## Biochemistry.

**Gravimetric method for determining oxygen consumption in man.** J. P. HETTVER (J. Lab. Clin. Med., 1935, 20, 499—506). CH. ABS. (p)

**Respiration apparatus for small animals.** S. BELAK and A. ILLENYI (Biochem. Z., 1935, 281, 27—29). W. McC.

**Oxygen saturation of human arterial blood.** K. MATTHES (Arch. exp. Path. Pharm., 1935, 179, 698—711).—Continuous photo-electric recording (cf. A., 1934, 1377) indicates variations in arterial  $\text{O}_2$  saturation during inspiration of  $\text{O}_2$ -rich air, hyperventilation, respiratory failure, speaking, singing, etc. During the respiratory pause there is a fall in  $\text{O}_2$  saturation, the rate of which is a function of alveolar vol. The exact respiratory vol. being known, determinations of this rate for resting men during a series of respiratory pauses give the vol. of residual air and total capacity of the lungs. Tension, consumption, and velocity of transport of  $\text{O}_2$  during relaxation after heavy work are discussed. F. O. H.

**Thermochemistry of the oxygen-haemoglobin reaction. I. Direct measurements of the heat of reaction under various conditions.** F. J. W. ROUGHTON (Biochem. J., 1935, 29, 2604—2621).—The heat of reaction ( $Q$ ) of haemoglobin (I) with  $\text{O}_2$  is measured by shaking the solution of (I) with  $\text{O}_2$  in one Thermos flask and determining the temp. difference between this and another flask containing the same amount of fluid.  $Q$  is independent of the degree of  $\text{O}_2$  saturation of the blood, and is practically

the same in whole and laked blood and in purified (I) solutions.  $Q$  increases with increasing  $p_H$ , due partly to the difference between the  $Q$  for ionised (I) and that for non-ionised (I), and partly to secondary ionic reactions. H. D.

**Time course of heat effects in rapid chemical changes. I. Apparatus and methods. II. Reactions of haemoglobin with oxygen and carbon monoxide.** J. B. BATEMAN and F. J. W. ROUGHTON (Biochem. J., 1935, 29, 2622—2638). The earlier apparatus for measuring the heat effects in rapid chemical changes (A., 1930, 426) is modified so that the method will follow to within 1—2% the time course of the heat effects over a period of 0—0.01 sec. in which the total temp. change is  $< 0.01^\circ$ . The method is applied to the reaction of haemoglobin (I) with  $\text{O}_2$  and CO. With  $\text{O}_2$  the liberation of heat is complete within 0.008 sec., and with CO in approx. 0.05 sec. The half-reaction times for (I) with  $\text{O}_2$  and CO were 0.002 and 0.010 sec., respectively, in ordinary solutions of (I); in the intact corpuscles the times were 0.007 and 0.016 sec., respectively. The reaction rates as determined in this way agree with those obtained by Millikan's optical technique (A., 1934, 383). It is concluded that the primary combination of (I) with  $\text{O}_2$  or CO is not followed by any secondary reactions of appreciable heat effect.

**Action of some guanidine derivatives on constituents of blood.** K. TACHIBANA (Folia Pharmacol. Japon., 1935, 19, 365—376).—Decamethylene-

pentamethylene-, and cyclohexyl-guanidine had no effect on red cells in rabbits, but increased pseudo-eosinophile and blood platelets when low concns. were used. Higher concns. hindered leucocyte formation. CH. ABS. (p)

**Normal hæmatological standards.** E. E. OSGOOD (Arch. Int. Med., 1935, 56, 849—863).—From examinations of > 500 healthy persons of both sexes and of ages between 4 and 30, average vals. have been obtained for the erythrocyte, reticulocyte, and leucocyte counts, the hæmoglobin content and coeff., cell vol., vol. coeff., the colour, vol., and saturation indices, and sedimentation rate. H. G. R.

**Oxidation of hæmoglobin to methæmoglobin by oxygen. II. Relation between rate of oxidation and partial pressure of oxygen.** J. BROOKS (Proc. Roy. Soc., 1935, B, 118, 560—577).—The rate of oxidation of hæmoglobin (I) to methæmoglobin at  $p_H$  5.69 and 30° is unimol. with respect to the (I) concn. With varying  $O_2$  partial pressures ( $p$ ) the rate is a max. at  $p=20$  mm., being  $\propto$  the reduced (I) concn. and to  $p/(1+bp)$ . The rate-determining step is not the selective action of  $O_2$  with any of the intermediate compounds of (I) and  $O_2$ , and the effect of  $O_2$  appears to be threefold: (i) the determination of the concn. of the other reactant, (ii) oxidation of compounds containing  $Fe^{++}$ , (iii) an inhibiting effect on the oxidation. There is evidence of the presence of another inhibitor. F. A. A.

**Photochemical oxidation of hæmoglobin.** F. G. LENNOX (Austral. J. Exp. Biol., 1935, 13, 193—196).—The photochemical conversion of hæmoglobin into methæmoglobin is accelerated by KI and  $NH_4I$ . Free I is without effect either in presence or absence of KI. W. O. K.

**Optical activity of hæmoglobin and of derivatives: sulphur content.** S. SIMONOVITS and G. BALASSA (Biochem. Z., 1935, 281, 186—197; cf. A., 1931, 857).—Horse-blood hæmoglobin (I) exists in two forms containing, respectively, 0.43 and 0.49% of S, the CO compounds of these having  $[\alpha]_{589}^{20} +11.6^\circ$  and  $+12.3^\circ$  in  $H_2O$ , respectively (in 0.1% aq.  $NaHCO_3$  the val. is independent of the concn.). Horse oxyhæmoglobin (II) once cryst. has  $[\alpha]_{589}^{20}$  about  $+14.4^\circ$  and  $[\alpha]_{570}^{20}$  about  $+12.4^\circ$  in  $H_2O$  (1%), the vals. decreasing as the dilution increases. Repeated recrystallisation causes these vals. to decrease and the max. absorption of the transmitted light to increase. CO-(I) from cattle has  $[\alpha]_{589}^{20} +7.9^\circ$  in  $H_2O$  (1%). Horse-(I) once cryst. and reduced with  $Na_2S_2O_4$  has  $[\alpha]_{589}^{20}$  about  $+28.3^\circ$  in  $H_2O$  (5%). The S content of (II) is not altered by recrystallisation. W. McC.

**Osmotic equilibria of hæmocyanin in a gravitational field.** J. ROCHE, A. ROCHE, G. S. ADAIR, and M. E. ADAIR (Biochem. J., 1935, 29, 2576—2587).—Hæmocyanin (I), prepared from the blood of *Helix pomatia*, *Carcinus moenas*, and *Octopus vulgaris*, is placed in  $M/15$ -phosphate buffer solution in a collodion sac, and the pressure attained at equilibrium with a similar buffer solution measured. Samples of the solution are withdrawn from different depths and protein is determined refractometrically.

The ratio of concns. at 1 cm. distance apart varied between 1.004 and 1.019. The osmotic pressures of the (I) solutions are calc., correcting for variation in concn. with height in the sac; estimates of the mol. wts. of the (I) obtained from the three sources are comparable with those obtained by Svedberg (A., 1933, 171). H. D.

**State of phenol added to blood.** G. BARAC (Compt. rend. Soc. Biol., 1935, 120, 522—523).—PhOH can be recovered completely from blood by deproteinisation with  $CCl_3CO_2H$ , and is therefore not destroyed by the red corpuscles. It is distributed equally between the plasma and the corpuscles. Plasma-PhOH is not partly bound to the lipins, since it is separated completely from these by ultra-filtration. R. N. C.

**Plasma-lipins of normal men at different ages.** I. H. PAGE, E. KIRK, W. H. LEWIS, jun., W. R. THOMPSON, and D. D. VAN SLYKE (J. Biol. Chem., 1935, 111, 613—639).—Free and ester cholesterol, neutral fat, and total lipins were determined in the plasma, and frequency distribution curves were plotted. The individual vals. and their relative magnitudes showed no dependence on the age of the subject. There is an approx. reciprocal relationship between the amounts of cholesteryl esters and neutral fats in the lipin mixtures. The vals. are compared with those obtained by other workers. H. D.

**Influence of harmine on blood-sugar picture in rabbits.** K. TACHIBANA (Folia Pharmacol. Japon., 1935, 19, 346—354).—Harmine (2—50 mg. per kg.) causes a marked hyperglycæmia. This action is inhibited by ergotamine, yohimbine, or by double splanchnicotomy, is increased by small doses of pilocarpine, and is opposed by insulin. CH. ABS. (p)

**Residual carbon of blood in relation to sensitisation and anaphylactic shock.** F. DIEHL (Arch. exp. Path. Pharm., 1935, 179, 670—677).—The total blood-residual C compounds (I) (i.e., not pptd. by, e.g., phosphotungstic acid) increase on sensitisation of dogs by injection of horse-serum. This increase is restricted to the "known" (I) [e.g., sugar (II), lactic acid (III), total phenols, and  $NH_2-N$ , urea-N, and glyoxaline derivatives], the "unknown" (I) remaining unchanged. The marked increase in (I) produced by subsequent anaphylactic shock is mainly restricted to unknown (I). The changes in (II), (III), and hydrolysable reducing substances indicate that carbohydrate metabolism is involved. F. O. H.

**Blood modifications provoked by subcutaneous injection of glucose.** G. DELRUE and P. HOLLEBEKE (Compt. rend. Soc. Biol., 1935, 120, 529—530).—Subcutaneous injection of glucose in the rabbit increases total proteins; the increase of globulins is > that of serines, and the serine-globulin ratio falls. Cl and total bases show decreases of the same order. Creatine and  $PO_4'''$  are increased. R. N. C.

**Precipitation of serum-proteins with chloroform.** A. GRÖNWALL (Biochem. Z., 1935, 282, 85—87).—The extent of pptn. of proteins from human serum by mixtures (3:1) of  $CHCl_3$  and  $C_3H_{11}OH$

varies greatly with  $[H^+]$ , max. being observed at  $p_H$  4.3, 6.5, 8.4—8.7, and 9.4. W. McC.

**Form of the micelles of the stroma-proteins.** G. BOEHM (Biochem. Z., 1935, 282, 32—46; cf. A., 1932, 121).—A method for separating the proteins of the stroma of red blood-corpuscles (calf) from the hæmoglobin is described. The product is sol. in salt solutions of  $p_H$  6.5—7.1. The solutions exhibit streaming double refraction and contain thread-like micelles (length-width ratio several thousand to 1). Since the space requirements of the micelles are very great, concns.  $> 3$ —4% cannot be obtained without production of gels. It follows that the stroma-protein of the erythrocytes is not conc. in a membrane, but extends throughout their interior. W. McC.

**Blood-amino-nitrogen in health and disease.** A. SIMON and B. ZEMPLÉN (Arch. exp. Path. Pharm., 1935, 179, 712—716).—The  $NH_2$ -N contents of whole blood, corpuscles, and plasma (before and after hæmolysis) of 21 normal and 44 diseased persons are tabulated and discussed. F. O. H.

**Significance of post-operative rises in blood-non-protein-nitrogen.** H. A. DEROW (New England J. Med., 1935, 212, 509—511).—In patients with normal renal function the increases may result from an oliguria, increased destruction of body-protein, or post-renal anuria. CH. ABS. (p)

**State of combination of residual nitrogen [in blood-serum] in experimental uranium poisoning.** M. JACOBY (Biochem. Z., 1935, 281, 198—199; cf. A., 1934, 558).—In rabbits the proportion of urea-N in the residual N of blood-serum increases following subcutaneous administration of  $UO_2(NO_3)_2$ . W. McC.

**True and apparent creatine and creatinine of blood and urine.** H. BOHN, A. FRIEDSAM, and F. HAHN (Zentr. inn. Med., 1935, No. 22, 465—473).—For determination of true creatine (I) alone, hydrolysis of the blood filtrate or urine must take place at a moderate temp. (60°) in presence of HCl. The true val. for blood-(I) in health is about 33% of the usually accepted val. In high blood pressure associated with paleness, the true blood-(I) is reduced. The results of Linneweh (Klin. Woch., 1934, 13, 589) indicate that preformed blood-creatinine is not entirely composed of pseudo-creatinine. NUTR. ABS. (m)

**Does creatinine occur in normal blood?** F. LINNEWEH (Klin. Woch., 1935, 14, 293—294).—Creatinine (I) can be detected in normal blood, extracted, and purified by adsorption on Lloyd's reagent. (I) excretion is therefore probably due to the removal of (I) from the blood by the kidneys, rather than to formation from creatine (II). The adsorbate from blood contains no substance that interferes with (I) determination, since  $Et_2O$  extraction does not reduce the (I) val., and supplementary (I) is not formed from (II) during the process. R. N. C.

**Occurrence of acetylcholine in blood.** R. AMMON (Klin. Woch., 1934, 13, 1472).—The acetylcholine-like effect of blood or urine, with or without eserine (I), on leech-muscle is not considered to be due to acetylcholine (II), since hæmolysed blood without

(I) contracts the uneserinised muscle, and this action is not inhibited by atropine or destroyed by treating the blood or urine with NaOH. Types of blood in which corpuscular  $K >$  serum-K show a (II)-like action when hæmolysed. R. N. C.

**Total and reduced glutathione compared with oxygen content and capacity in the blood of pregnant and non-pregnant women.** F. W. OBERST and E. B. WOODS (Proc. Iowa Acad. Sci., 1934, 41, 166—167).—No relationship was apparent between the  $O_2$  content and  $O_2$  capacity of blood and the concn. of total or reduced glutathione (I). Vals. were similar in pregnant and non-pregnant women. Added (I) disappeared more rapidly from blood than from  $H_2O$  at 38°. Disappearance from blood was accelerated by NaF. CH. ABS. (p)

**Azotæmia and chloræmia in vitro.** J. LOISELEUR (Compt. rend. Soc. Biol., 1935, 120, 605—608).—Addition of urea (I) to blood *in vitro* causes a movement of Cl from the corpuscles to the plasma  $\propto$  the (I) added. Glycylglycine causes a movement of Cl into the corpuscles. R. N. C.

**Azotæmia and chloræmia in course of histolysis.** J. LOISELEUR (Compt. rend. Soc. Biol., 1935, 120, 675—678).—The corpuscular/plasma-Cl ratio in the blood depends on  $p_H$ , and is also influenced by the release of N compounds into the blood-stream from cell histolysis. It is inversely  $\propto$  the urea-N/total residual N ratio, and consequently falls on injection of peptone. Total blood-Cl falls in azotæmia, the fall being  $\propto$  the no. of mols. of N compounds. R. N. C.

**Blood-iodine; a new chemical method.** D. R. McCULLAGH (Cleveland Clin. Quart., 1935, 2, No. 1, 15—37).—Variations in blood-I under varying conditions are examined by the author's method (A., 1934, 1397). CH. ABS. (p)

**Effect of age on the plasma-calcium content of men.** E. KIRK, W. H. LEWIS, jun., and W. R. THOMPSON (J. Biol. Chem., 1935, 111, 641—642).—The plasma-Ca of normal adult men was independent of their ages. H. D.

**Iron in the blood. Comparison of values for hæmoglobin determined by the Newcomer method and calculated from the iron content.** H. W. JOSEPHS (Bull. Johns Hopkins Hosp., 1934, 56, 50—56).—Calc. vals. were the higher in most cases. CH. ABS. (p)

**Spectrographic micro-method for detection of pathological lead in peripheral blood.** H. BLUMBERG and T. F. MCN. SCOTT (Bull. Johns Hopkins Hosp., 1935, 56, 32—36).—A pathological finding is indicated when the Pb line 2833 Å. is detectable on the plate without the use of a lens. 0.1 c.c. of blood is examined. CH. ABS. (p)

**Blood chemistry of swine. II. Blood changes following ingestion of glucose.** D. F. EVELETH and M. W. EVELETH (J. Biol. Chem., 1935, 111, 753—756; cf. A., 1934, 543).—Feeding of glucose to fasting swine increases the serum-Mg and  $H_2C_2O_4$ , and decreases the inorg.  $PO_4'''$  and Ca. Ingestion of  $H_2O$  alone decreases the serum-sugar, Ca, Mg,  $H_2C_2O_4$ , and inorg.  $PO_4'''$ . J. N. A.

**Sodium, potassium, calcium, and inorganic phosphate of blood during prolonged fasting.** D. TORRISI (Arch. Fisiol., 1935, 34, 259).—In the serum of dogs and rabbits, during prolonged fasting, there is a progressive decrease in Na to  $\leq 21\%$  of normal. The other elements show irregular and minor changes.

NUTR. ABS. (m)

**Distribution of different fractions of acid-soluble phosphorus in the blood of dogs during intermediary metabolism, as observed on an empty stomach after introduction of glucose and radon.** A. A. ARAPOVA (Ann. Roentgenol. Radiol. U.S.S.R., 1934, 13, 338—351).—Fractions of ortho- and pyro-phosphates and sol. and insol. phosphoric esters occur in blood-vessels. No creatininephosphoric acid is found in blood. The sol. ester fraction (I) is the most changed in its passage through organs, and also after introduction of glucose. Introduction of Rn increases (I) in arterial blood and in eliminations of the kidney.

CH. ABS. (p)

**Conductivity of blood in the wave-length region 6—25 m.** F. GRAUL (Ann. Physik, 1935, [v], 24, 326—348).—The conductivity of ox, pig, and human blood shows no change with frequency between  $\lambda\lambda$  6 and 20 m.; at 20—25 m. it decreases, but the effect is detectable only with centrifuged blood. Its variation at 13.6 m. with time of centrifuging and with the low-frequency conductivity is in accord with theory.

J. W. S.

**Effect of pressure on the hydrogen-ion concentration of blood: use of glass electrodes.** A. THIEL and H. GEMSA (Biochem. Z., 1935, 282, 146—156).—At 37°, no change in the  $p_H$  of cattle blood occurred when it was subjected to  $N_2$  pressures up to 100 atm.

W. McC.

**Amphibian metamorphosis. X. Hydrogen-ion concentration of the blood of anuran larvæ during involution.** O. M. HELFF (Biol. Bull., 1932, 63, 405—418).—Blood- $p_H$  shows a steady decline (7.50  $\rightarrow$  7.18) in progressive stages of metamorphosis.

CH. ABS. (p)

**Calcium salts and blood coagulation.** J. MATUSEVICH (Semana med., 1935, 1, 1021—1024).—Oral administration of  $CaCl_2$  has no action, but  $Ca$  lactate +  $NH_4Cl$  shows a considerable effect with a max. after 8 days. Injected  $CaCl_2$  +  $Ca$  gluconate is effective in 2—4 hr., with a return to normal after 24 hr.

CH. ABS. (p)

**Acceleration of blood coagulation by acidic substances, especially pectin.** O. RIESSER [with A. NAGEL] (Arch. exp. Path. Pharm., 1935, 179, 748—760).—Oral and parenteral administration of pectin (I) to rabbits accelerates the rate of coagulation, the effect persisting for 4—5 hr. Galacturonic and lactic acids,  $AcOH$ , and, in small intravenous doses,  $HCl$  have a similar action. Intramuscular injection of the neutral salts, *in-vitro* addition of the acids, or injection of (I)-activated blood [in which (I) is not detectable] into other animals has no effect. The mechanism of the phenomenon is discussed.

F. O. H.

**Determination of velocity of blood coagulation.** O. RIESSER and A. NAGEL (Arch. exp. Path. Pharm.,

1935, 179, 743—747).—The blood is introduced into a capillary tube, kept at const. temp., and the course of coagulation followed by its movements in response to unilateral pressure. Rabbits' blood (ear) gave vals. of 3—3.5 min. for the initiation and 4—5 min. for the completion of coagulation.

F. O. H.

**Absence of correlation between lacto-gelification and protein disequilibrium of blood-serum.** G. LEFFROU and L. AUFFRET (Compt. rend. Soc. Biol., 1935, 120, 614—616).—There is no evidence of correlation between the time of lacto-gelification and the degree of protein disequilibrium.

R. N. C.

**Hæmostatic effect of ascorbic acid in hæmaturia.** A. KORANYI and A. BENTSÁTH (Orvosi Hetilap, 1935, 79, 378—379).—In some, but not in all, cases the hæmostatic action was accompanied by changes in composition of protein fractions in blood-plasma.

CH. ABS. (p)

**Effect of Röntgen rays on the appearance of complement-fixing bodies in the blood.** I. P. MISCHTSCHENKO and M. M. FOMENKO (Ann. Roentgenol. Radiol. U.S.S.R., 1934, 13, 327—336).—Complement-fixing bodies appeared in blood following X-irradiation.

CH. ABS. (p)

**"Serum sickness" in rabbits following the intravenous injection of various foreign sera: relation to precipitins.** D. KHORAZO (J. Immunol., 1933, 25, 113—120).—No differences in the rate of precipitin formation or disappearance of injected antigen from the blood could be associated with "serum sickness."

CH. ABS. (p)

**Precipitin reaction between type III pneumococcus polysaccharide and homologous antibody. II. Conditions for quantitative precipitation of antibody in horse sera. III. Theory of the reaction mechanism.** M. HEIDELBERGER and F. E. KENDALL (J. Exp. Med., 1935, 61, 559—562; cf. A., 1930, 1608).—II. The customary immunological procedure (2 hr. at 37° and overnight in oil) does not permit establishment of equilibrium, or max. pptn. of antibody-N. Analysis should be carried out at 0° and materials kept cold for  $\leq 24$  hr. The chemical method for determining antibody is an accurate measure and does not include non-sp. protein.

III. Antibody solutions and sera probably contain  $> 1$  antibody reactive with S III. The reaction between the sp. polysaccharide and homologous antibody is represented as a bimol. reaction, followed by a series of competing bimol. reactions dependent on the relative proportions of the components.

CH. ABS. (p)

**Anaphylactogenic properties of milk. Immunochemistry of the purified proteins and antigenic changes resulting from heat and acidification.** B. RATNER and H. L. GRUEHL (Amer. J. Dis. Children, 1935, 49, 287—306).—Casein and lactalbumin fractions of milk-proteins retain antigenic characteristics after drying, acidification, superheating, or evaporation. The whey fraction shows a marked loss of antigenic properties after evaporation or superheating. Loss of antigenic

properties of heated milk is due to coagulation of whey proteins. CH. ABS. (p)

**Anaphylactogenic properties of malted sugars and maize-syrup.** B. RATNER and H. L. GRUEHL (Amer. J. Dis. Children, 1935, 49, 307—317).—Allergy to carbohydrate food is due to added protein constituents rather than to the carbohydrate itself. Malt extracts and the barley-malts from which they are derived are highly anaphylactogenic and react specifically with hordein. Maize-syrups and pure "dextrimaltose" sugars are not anaphylactogenic. Addition of wheat germ or dried milk to non-anaphylactogenic converts them into active substances.

CH. ABS. (p)

**Protein reaction for the more definite identification of blood-stains.** V. TUMA (Chem. Listy, 1935, 29, 313—316).—Agglutination and pptn. reactions serve to distinguish dried human from animal blood-stains, and to determine the serological group to which the blood belongs. R. T.

**Test for occult blood, especially in urine.** W. J. STONE and G. T. BURKE (J. Amer. Med. Assoc., 1934, 102, 1549—1550).—The sediment from 15 c.c. of centrifuged urine is treated with 2 drops of a 1% solution of toluidine in MeOH and 3 drops of a 1:1 mixture of AcOH and H<sub>2</sub>O<sub>2</sub>. A greenish-blue colour lasting 1 min. develops in the presence of 100 blood-cells per c.c. of sediment. CH. ABS. (p)

**Determination of calcium and phosphate content of bones.** C. K. DEISCHER and W. M. McNABB (Analyst, 1935, 60, 750—751).—Ca is pptd. as CaC<sub>2</sub>O<sub>4</sub>, which is titrated with KMnO<sub>4</sub>. P is pptd. as NH<sub>4</sub> phosphomolybdate, which is dissolved in excess of standard NaOH. The excess of NaOH is titrated with HCl. J. S. A.

**Fluorine content of bones and teeth.** R. KLEMENT (Ber., 1935, 68, [B], 2012—2019).—Examination of the bones and teeth of many animals leads to the following mean vals. for F in the inorg. matter: land mammals, 0.05%; sea mammals, 0.55%; land birds, 0.11%; sea birds, 0.32%; fresh-H<sub>2</sub>O fish, 0.03%; sea-H<sub>2</sub>O fish, 0.43%. The differences between land and sea animals are attributed to the F content of sea-H<sub>2</sub>O exceeding that of fresh H<sub>2</sub>O. F replaces OH in the hydroxyapatite (I) of bones and teeth with formation of mixed crystals to a greater extent with sea than with land animals; this is still more marked in fossil bones. The hardness of tooth enamel is explained by a small content of org. matter which causes a greater development of the crystallites of (I). F is probably without biological significance. H. W.

**Lipin content of the jelly of Wharton.** E. M. BORD (J. Biol. Chem., 1935, 111, 667—669).—The mean lipin content of the jelly is 0.209%, which is < that of any other body-tissue. This agrees with Bloor's hypothesis that tissues of low physiological activity have a low lipin content. E. A. H. R.

**Lipins.** I. Amounts of lecithin, total and free cholesterol, and cholesteryl ester in the organs of guinea-pigs fed on a vitamin-C-free diet and the ratio among these lipins. II. Relationship between oxidation in the animal body and the

lipin contents of various organs. S. HONGO (Sei-i-Kwai Med. J., 1934, 53, No. 5, 1—22, 23—28).—I. On a dry-wt. basis organs of scorbutic guinea-pigs contained more lecithin (I) (notably in testicles, muscle, and kidney, but not liver and lungs) and more free cholesterol (II) (especially lungs, intestine, and kidneys) than normal animals. Intestine and kidneys have more total (II). The ratio of (I):(II) in intestine, kidney, and muscle is smaller in scorbutic animals.

II. Increased oxidation in rabbits injected with thyroideum is generally associated with a decrease in fat acids (III) and other lipins in various organs. In muscle (III) increased. In liver there is an increase in unidentified unsaponifiable substance without change in other lipins. Removal of thyroid increases (III) (except in the spleen) and other lipins without affecting the ratios in the various organs.

CH. ABS. (p)

**Eel oil. I. Fatty acids.** T. ONO (J. Agric. Chem. Soc. Japan, 1935, 11, 773—780).—The oil contains myristic, palmitic, and stearic acid, a saturated acid, m.p. 57—58°, probably the unsaturated acids, C<sub>14</sub>H<sub>26</sub>O<sub>2</sub>, C<sub>16</sub>H<sub>30</sub>O<sub>2</sub>, C<sub>18</sub>H<sub>34</sub>O<sub>2</sub>, C<sub>18</sub>H<sub>32</sub>O<sub>2</sub> (iso-acid), C<sub>16</sub>H<sub>28</sub>O<sub>2</sub>, C<sub>20</sub>H<sub>40</sub>O<sub>2</sub>, C<sub>22</sub>H<sub>44</sub>O<sub>2</sub>, and possibly C<sub>16</sub>H<sub>26</sub>O<sub>2</sub>, C<sub>20</sub>H<sub>30</sub>O<sub>2</sub>, and C<sub>16</sub>H<sub>24</sub>O<sub>2</sub>. The Carr-Price reaction is negative and is very weak even with the liver extract. W. McC.

**Renal threshold for glucose in man.** J. W. SHERRILL and E. M. MacKAY (Arch. Int. Med., 1935, 56, 877—883).—The average vals. found for diabetics and normal persons were 149 and 128 mg. per 100 c.c., respectively. It is suggested that the "normal val." is misleading and a normal average should not be given. H. G. R.

**Distribution of glycogen in the regions of the amphibian gastrula; micro-determination of glycogen.** N. G. HEATLEY (Biochem. J., 1935, 29, 2568—2572).—Tissue is fixed in EtOH and digested with KOH; glycogen (I) is pptd. with EtOH, hydrolysed with acid, and the sugars formed are determined by the Linderstrom-Lang method (A., 1931, 1455). During gastrulation of the embryo of *Triton alpestris* the quantities of (I) are in the order: dorsal ectoderm > ventral ectoderm > yolk endoderm. During invagination there is a loss of approx. 35% of (I) in the invaginating cells. H. D.

**Effects of repeated injections of glucose on the muscle-glycogen of the frog under normal conditions.** A. MOSCHINI (Compt. rend. Soc. Biol., 1935, 120, 531—533).—Repeated injections of glucose (I) increase muscle-glycogen (II), the increase depending on the total amount of (I) given when (II) is low, but when (II) reaches high vals. the increases produced by further doses of (I) are smaller, until a steady max. is attained. R. N. C.

**Effects of repeated injections of glucose on the muscle-glycogen of the frog, in different experimental states.** A. MOSCHINI (Compt. rend. Soc. Biol., 1935, 120, 533—535).—Glucose (I) increases muscle-glycogen (II) in frogs with muscles atrophied by prolonged fasting, to the same extent as in normal frogs. Section of the sciatic nerve has no

immediate effect, but when degeneration of the foot muscles sets in, the amount of glycogen taken up is decreased. (II) falls after pancreatectomy, but (I) injections still cause deposition and mask this effect.

R. N. C.

(A) Determination of fermentable carbohydrates in rabbit liver. (B) Isolation of a reducing dextrin. C. B. PURVES (Quart. J. Exp. Physiol., 1935, 24, 383—389, 391—395).—(A) The fermentable carbohydrate in liver could not be accounted for (by 25%) as glycogen and free sugar. The presence of a polysaccharide insol. in 90% EtOH, sol. in 32% EtOH, and destroyed during the glycogen determination, is postulated.

(B) The fermentable carbohydrate isolated was probably a mixture of dextrans containing free Cu-reducing groups.

CH. ABS. (p)

Colorimetric and iodometric determination of glutathione. K. UHLENBROOCK (Z. physiol. Chem., 1935, 236, 192—196; cf. A., 1935, 793; Fujita *et al.*, *ibid.*, 772).—For deproteinisation sulphosalicylic acid is much better than  $\text{HPO}_3$  and KCN should be replaced by  $\text{Na}_2\text{CO}_3$  in the method of Bierich *et al.* (A., 1933, 523), the apparatus of Lange (*ibid.*, 44) being used for measurement of the colour. Solutions should contain, per 100 c.c., 4.5—100 mg. of reduced glutathione (if < 4.5 mg. present larger vol. to be used). Results agree well with those obtained by titration with I for heart, muscle, lung, blood, brain, spinal cord, and spleen, but not for liver, kidney, and thymus. The last two contain substances which rapidly attack SH-compounds, and hence, with these organs, the colorimetric method cannot be applied. W. McC.

Bound water and phase equilibria in protein systems: ovalbumin and muscle. T. MORAN (Proc. Roy. Soc., 1935, B, 118, 548—559).—The bound  $\text{H}_2\text{O}$  of native (I) and denatured (II) ovalbumin at various temp. <  $0^\circ$  is dependent on the activity of  $\text{H}_2\text{O}$ . The chemically bound  $\text{H}_2\text{O}$  is approx. 0.26 g. per g. of protein for both (I) and (II), and for (I) the more loosely held  $\text{H}_2\text{O}$  is > for (II) at the higher activities. The bound  $\text{H}_2\text{O}$  of muscle at intermediate and high  $\text{H}_2\text{O}$  activities is approx. 0.40 g. per g. of dry solid. The eutectic temp. of muscle is about  $-37.5^\circ$ .

F. A. A.

Annelid muscle. I. Taurine in *Audouinia spirabanchus*, Moore. A. C. KURTZ and J. M. LUCK (J. Biol. Chem., 1935, 111, 577—584).—3% of taurine (I) was found in the muscle of *A. spirabanchus*, Moore, traces were found in *Nereis brandtii*, and none in *Glycera rugosa*, *Lumbricus* sp., *Urechis caupe*, and *Phoronopsis harmeri*. The possible function of (I) in maintaining the osmotic pressure of the muscle is discussed.

H. D.

Selenium in proteins from toxic foodstuffs. III. Removal of selenium from toxic protein hydrolysates. E. P. PAINTER and K. W. FRANKE (J. Biol. Chem., 1935, 111, 643—651).—The nature of the Se complex in toxic proteins is investigated. When the toxic proteins are hydrolysed, the Se may be extracted with BuOH. All the Se is completely pptd. by  $\text{HgCl}_2$ , but only partly by phosphotungstic acid and by Cu and Ag salts.

H. D.

Cryolysis, diffusion, and particle size. II. Investigations with myosin.—See this vol., 28.

Polysaccharoproteins. VI. State of glycogen in muscle. II. E. M. MISTKOVSKI, A. STILLER, and A. ZISMAN (Biochem. Z., 1935, 281, 231—237; cf. A., 1935, 1004).—Part of the glycogen (I) in the press-juice of rabbit, dog, and frog muscle exists irreversibly bound to myosin (II) and globulin-X (III). The amylase present degrades added (I) (at < the expected rate), but not the native bound (I), which also resists attack by ptyalin (IV). When the bound (I) is removed by alkaline hydrolysis it is attacked at the usual rate by amylase. The rate of hydrolysis of (I) by (IV) is reduced [extent of reduction  $\propto$  concn. of (II)] by adding (II), but appears to be increased by adding (III).

W. McC.

Protamines. VI. (i) Acid hydrolysis of salmine. M. YAMAGAWA and T. NISHIZAWA (J. Imp. Fisheries Inst. Japan, 1934, 30, 97—115).—Salmine prepared from *Oncorhynchus keta* is identical with that from Rhine salmon. All  $(\text{NH}_2)_1$ -acids are liberated by hydrolysis with  $4N\text{-H}_2\text{SO}_4$  for 8 hr., leaving a residue of di- and tri-arginide.

CH. ABS. (p)

Nature of the substance in fish meat which gives formaldehyde-like reactions. II. Squid (*Loligo bleekeri*, Keferstein) from Hokkaido. Y. HATTORI and T. HASELBE (J. Pharm. Soc. Japan, 1934, 54, 1081—1090).—The substance is identified as  $\text{NMe}_3\text{O}$ .

CH. ABS. (p)

Nuclein metabolism. VI. Constitution of the nucleic acids. K. MAKINO (Z. physiol. Chem., 1935, 236, 201—207; cf. A., 1935, 1003).—Samples of yeast-nucleic acid (I) differ greatly in regard to the ease with which they are degraded by alkali, there being no relation between age of sample and ease of hydrolysis. The reaction of purified nucleosides with  $\text{H}_3\text{BO}_3$  indicates that the deoxyribosides from thymus-nucleic acid (II) have the furan ring structure, and consequent changes are made in the proposed structural formulæ for (I) and (II). The criticisms of Klein *et al.* (*ibid.*, 510) are refuted.

W. McC.

Adenine nucleotide in tissues. II. In heart muscle. K. LOHMANN and P. SCHUSTER (Biochem. Z., 1935, 282, 104—108; cf. A., 1934, 1020).—Most of the adenine nucleotide (I) of rapidly removed calves' hearts occurs as adenylypyrophosphoric acid. A small amount of (I) is isolated as adenosinediphosphoric acid and adenylic acid.

W. McC.

Pigments of hair. H. ZWICKY and F. ALMASY (Biochem. Z., 1935, 281, 103—110).—Spectrophotometric examination of alkaline extracts of white, red, and black horse- and mule-hair indicate that, whilst two different pigments occur in the black hair (from different horses), one of them is indistinguishable from that which occurs in the red hair and in the hair from the darker parts of dappled horses.

W. McC.

Pigments of the bull-frog retina. G. WALD (Nature, 1935, 136, 832—833).—The substances and processes found in the retina and pigment epithelium of *Rana catesbiana* are identical with those in species of frogs previously examined (A., 1934, 913). The retina contains varying amounts of retinene (I) and

vitamin-A (II). With  $\text{SbCl}_3$ , (I) yields a sharp absorption band at 662–666  $\text{m}\mu$  and not at 655  $\text{m}\mu$ . Dark-adapted retinas contain only a trace of (II), which can be extracted in the dark by benzene without injury to the visual purple. Light bleaches the latter to visual yellow, after which benzene extracts a large amount of (I). Destruction of the visual purple in the dark with  $\text{CHCl}_3$  also liberates (I). Visual yellow thus appears to be simply free (I) (cf. *loc. cit.*). The (I) of bleached retinas is converted quantitatively into (II) by a thermal process in approx. 1 hr. in light or in darkness at 25°. In the isolated retina, (II) is the final product of the bleaching and fading reactions, but in the intact eye (II) is resynthesised to visual purple, thus completing the visual cycle.

L. S. T.

**Carotenoids of *Rana esculenta*.** O. BRUNNER and R. STEIN (Biochem. Z., 1935, 282, 47–50).—The liver, skin, fat glands, and ovaries contain  $\beta$ -carotene (I) and esterified lutein (II); the ovaries contain also free (II). About half of the total (I) and (II) occurs in the ovaries and about 25% in the liver. In liver, skin, and ovaries the contents of (I) and (II) are about equal, but the (II) content of the fat glands is much < the (I) content.

W. McC.

**Visual purple.** O. BRUNNER, E. BARONI, and W. KLEINAU (Z. physiol. Chem., 1935, 236, 257–262).— $\beta$ -Carotene, obtained from the retina by extraction with MeOH, is adsorbed by  $\text{Al}_2\text{O}_3$ . The light-absorption curve of the adsorbed material is similar, especially in the long-wave zone, to that of the visual purple. The retina contains no xanthophyll.

W. McC.

**Accumulation of acid dyes in the silkworm by different tissues according to the route of application.** P. P. GRASSE and L. LESPERON (Compt. rend., 1935, 201, 618–620).—Certain cells of the silkworm are stained by Congo-red, trypan-blue, trypan-red, and  $\text{NH}_4$  carminate, but the results depend on whether the dyes are injected or administered orally.

W. O. K.

**Progress of lactation in relation to the milk yield and the butter-fat percentage of milk produced by cows of the Shorthorn type.** C. D. OXLEY (J. Dairy Res., 1935, 6, 113–120).—The standard error of the mean of observations of milk yields and % of butter-fat in milking records is determined. The time lag between the period of max. yield and min. % of butter-fat is discussed.

A. G. P.

**Influence of diet on the antirachitic potency of cow's milk.** B. H. THOMAS and C. Y. CANNON (Iowa Agric. Exp. Sta. Rept. on Agric. Res., 1934, 49).—Irradiated dried moulds may be used as a supplement to rations for increasing the vitamin-D content of milk. The response is most marked during the first few days of feeding and subsequently declines. The efficiency of transfer of -D from diet to milk is very low.

CH. ABS. (p)

**Effect of diet on the milk: chemical modification and sensitisation to the alcohol test.** L. ECHENIQUE and B. SUAREZ (Compt. rend. Soc. Biol., 1935, 120, 570–572).—*Xanthium cavanillense* is

non-toxic to cows, and when introduced into their diet provokes an increase in Ca in the milk; its withdrawal causes Ca to return to normal. The coagulation reaction with EtOH becomes positive when Ca is high. Milk that is coagulated by EtOH is not coagulated by boiling when the normal % of Ca in the ash is increased by 4.6.

R. N. C.

**Effect of electrolytes on the synthesis of lactose.** D. MICHLIN and T. FETISSOVA (Biochem. Z., 1935, 282, 26–31; cf. A., 1934, 1033).—The synthesis of lactose (I) in mammary gland is reversed when hydration of the tissue occurs. Added electrolytes ( $\text{CaCl}_2 > \text{LiCl}, \text{NaCl}$ ) check hydration and prevent shifting of the equilibrium, hence increasing the amount of (I) produced or preventing reversal of the reaction.  $\text{K}_2\text{SO}_4$  acts in the same way, but  $\text{NH}_4\text{CNS}$  and sometimes KCl check the synthesis. The synthesis is inhibited at  $p_{\text{H}}$  9.5, but not at 4.8.

W. McC.

**Mineral constituents in fresh and canned milk.** A. J. HERMANO and S. CLARAVALL (Philippine J. Sci., 1935, 57, 323–328).—Ca, P, Fe, fat, protein, and lactose have been determined in fresh and canned samples of carabao's, goat's, and cow's milk.

H. G. R.

**Cow's milk in Manchuria and Mongolia. IV. Non-protein nitrogenous substance.** M. SUGIURA (J. Orient. Med., 1935, 22, 60).—Total N, non-protein-N, and protein in the milk from Manchu Mongol cows were < in milk from Japan, America, and Europe. Free  $\text{NH}_3$  and urea showed considerable variations, but the uric acid and purine bases were const.

NUTR. ABS. (m)

**Methylene-blue reduction test: its efficiency and interpretation under Philippine conditions.** J. B. UICHANCO (Philippine J. Sci., 1935, 57, 295–319).—The test has been compared with the standard plate method on samples of carabao milk and is recommended for use with slight modification to suit local conditions.

H. G. R.

**Determination of amylase in milk.** M. MANICATIDE, BRATESCU, and M. POPA (Compt. rend. Soc. Biol., 1935, 120, 657–658).—Human colostrum contains 1024–2048 Wolgemuth units of amylase (I) per c.c., normal milk, 250 units (average). Cows' milk contains scarcely any (I). (I) is destroyed by boiling or pasteurisation.

R. N. C.

**Extractives of peripheral lymph.** S. ASAKUMA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 136–137).— $\text{Et}_2\text{O}$ -sol. matter in lymph from the popliteal gland and of blood-serum from leg veins of rabbits averaged 285.8 and 244.6 mg. per 100 g. of fluid, respectively.

CH. ABS. (p)

**Hydrogen-ion concentration of peripheral lymph.** M. ARAKI and G. HŌJO (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 132–134).—The  $p_{\text{H}}$  of lymph from the popliteal gland of rabbits (7.90) was lowered by injection of strychnine and increased by that of veratrine.

CH. ABS. (p)

**Carbon dioxide content of lymph under different conditions.** G. HŌJO (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 140–144).—Lymph- $\text{CO}_2$  increased when rabbits were fastened

immovably. Vals. for efferent lymph from the popliteal gland were similar for both sides; those for thoracic duct and intestinal lymph were markedly < that in the legs. Intravenous injection of KCN and injection of pilocarpine hydrochloride by the ear vein lowered the  $\text{CO}_2$  content. Adrenaline had no action. CH. ABS. (p)

**Carbon dioxide content of peripheral lymph of rabbits.** K. TSUJI (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 135).—Average vals. for efferent and afferent lymph were 44.33 and 46.64 c.c. per 100 parts (?), respectively. CH. ABS. (p)

**Sulphates in lymph.** I. II. Sulphates in peripheral lymph after intravenous injection of aqueous phenol solution. S. MASUDA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 22—24, 25—28).—I. Small amounts of  $\text{SO}_4$  occur in serous fluids, chyle, and blood. Only ethereal  $\text{SO}_4$  (I) occurs in lymph. The (I) content in peripheral lymph is > that of chyle, and, in turn, > in blood.

II. Injection causes an increase in (I) content of the lymph. CH. ABS. (p)

**Lactic acid in peripheral lymph.** Y. HŌJO (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 115—121).—Average vals. for efferent and afferent lymph were 0.795 and 0.673 mg. per 100 c.c., respectively. Vals. were decreased by injection of aq. NaF, NaI, or  $\text{CH}_3\text{I} \cdot \text{CO}_2\text{H}$ . CH. ABS. (p)

**Lipase of peripheral lymph.** K. ISHINO (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 48—52).—The lipase occurs in the inflowing and outflowing lymph of the popliteal gland, there being usually more in the outflow. It is not affected by neutral salts or by weakly acid or alkaline media. CH. ABS. (p)

**Total protein, globulin, and albumin fractions of peripheral lymph.** B. NAKADA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 112—114).—Vals. per 100 c.c. of lymph were: total protein, 2123 mg. in efferent and 1890 mg. in afferent lymph, globulin, 757 and 715, albumin, 1689 and 1599 mg., respectively. CH. ABS. (p)

**Autolysis of lymph.** I. Reducing power. M. FUKUOKA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 92—93).—The reducing power varied with the individual rabbit, reached a max. on the 2nd day of autolysis, and subsequently declined. CH. ABS. (p)

**Fibrin content of lymph.** B. NAKADA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 63—64).—Average vals. were 276.7 mg. of fibrin per 100 c.c. of efferent, and 261.1 mg. for afferent, lymph. CH. ABS. (p)

**Non-protein-nitrogen of vascular lymph.** S. ASAKUMA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 46—47).—The average non-protein-N content of lymph was 0.504 and of blood-serum 0.513%. CH. ABS. (p)

**Resorption in the lymph passage.** I. Resorption of yatoconin by subcutaneous application. II. Resorption of colloidal silver. III. Resorption of starch. M. KOSAKA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 15—21

80—89, 152—160).—I. Injection is immediately followed by an increase in wt. and in Ca and P contents in the lymph gland.

II. The Ag content of the gland increased rapidly to a max. and subsequently declined. Ag is soon resorbed in the lymph passage, but part remains stored in the gland.

III. Injected starch was detected in the gland up to 4 hr. after treatment. Resorption was complete in 5.5—6.0 hr. Reducing substances in glands after hydrolysis reached a max. soon after injection. The max. for reducing substances before hydrolysis was reached somewhat later. CH. ABS. (p)

**Lymph obtained by the "Brunnenlymph" method of Watanabe.** Y. IWAKI (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 7—14).—Physical and chemical properties of the lymph are examined. Incoming lymph has the same physical properties as that from lymph glands. CH. ABS. (p)

**Decomposition of atropine in the peripheral lymph of the rabbit.** S. KIRIYAMA (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 68—79).—Decomp. of atropine sulphate by lymph occurs at room temp. and at 37°, but not at low temp. Outflowing lymph was more active than inflowing lymph. CH. ABS. (p)

**Alteration of lymph after death of animal.** Y. IWAKI (Arb. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 99—111).—Physical and chemical changes during 2 hr. after death are recorded. CH. ABS. (p)

**Lymph in experimental pneumonia.** J. S. DAVIS, jun., and A. J. DELARIO (J. Lab. Clin. Med., 1935, 20, 460—467).—The increase in lactic acid (I) content of lymph and the decrease in  $\text{CO}_2$  content tend to compensate for the loss of  $\text{Cl}'$ . The increase in (I) is the more important factor. The  $\text{O}_2$  tension of lymph is > doubled by  $\text{O}_2$  therapy. CH. ABS. (p)

**Relationship between sugar and urea contents of the blood and spinal fluid.** J. N. CUMINGS and E. A. CARMICHAEL (Brain, 1934, 57, 338—347).—Levels of sugar and urea in lumbar fluid do not rise in association with the normal rise in the blood. Only in abnormal conditions does the ventricular fluid-sugar increase with a rise in blood-sugar. CH. ABS. (p)

**Proteolytic power of saliva.** I. Proteolysis in saliva. II. Action of human saliva on proteins. P. FANTL and J. WEINMANN (Biochem. Z., 1935, 281, 37—41, 42—48).—I. The portion of human saliva which does not pass through filters contains enzymes which degrade the proteins of the saliva. The amount of enzymes present varies greatly from person to person, but remains almost const. in the individual.

II. Proteins (hen's egg, fibrin from human and horse blood) denatured by boiling or by pptn. at room temp. are not attacked by the enzymes of the saliva. W. McC.

**Significance of iron and copper in human bile.** E. S. JUDD and T. J. DRY (J. Lab. Clin. Med., 1935, 20, 609—615).—The Fe content of liver

ranged from 0.031 to 1.68 and that of Cu from 0.063 to 1.07 mg. per 100 g. Cu is normally excreted by liver. Fe is secreted in bile and resorbed from the intestine. CH. ABS. (p)

**Microchemical study of human biliary calculi.** T. W. RAY (J. Biol. Chem., 1935, 111, 689—697).—There is no essential difference in chemical composition chole between cholesterol-pigment-Ca stones and sterol-pigment stones. E. A. H. R.

**Concentration function of the gall-bladder: biliary glutathione.** G. BALTACEANO and C. VASILIU (Compt. rend. Soc. Biol., 1935, 120, 666—668).—The concn. of the glutathione in the vesical bile is > in the hepatic bile. R. N. C.

**Bile acids. XLVII.**  $C_{24}H_{36}O_{10}N_2$ .—See this vol., 74.

**Constituent of bile pigment. XIV.**—See this vol., 86.

**Gastric secretion. VI. Action of pilocarpine on the secretion of a transplanted gastric pouch without Auerbach's plexus.** E. KLEIN (Arch. Surgery, 1935, 30, 277—283).—Pilocarpine hydrochloride (I) in 7-mg. doses stimulates secretion of free acid. Smaller doses stimulate pepsin secretion only. Atropine (1 mg.) inhibits secretion caused by (I) but not that produced by histamine. CH. ABS. (p)

**Copper content of urine of normal children.** A. ROSS and I. M. RABINOWITCH (J. Biol. Chem., 1935, 111, 803—805).—Cu is a const. constituent of urine and the amounts found ranged between 0.04 and 0.52 mg. per litre. J. N. A.

**Detection of dinitrophenol and its derivatives in urine.** A. MEYER and H. DRUTEL (Bull. Soc. Chim. biol., 1935, 17, 1455—1461).—Interference by skatole, which, like 2:4-dinitrophenol (I), gives a pink coloration in the Meyer test for (I), may be avoided by using  $Hg(NO_3)_2$  as defecating agent and extracting (I) with  $Et_2O$  before reducing with Zn in  $AcOH$ . A. L.

**Urinary diastase.** F. ECKARDT (Deut. Arch. klin. Med., 1935, 177, 517—526).—Diastase, expressed as g. of starch hydrolysed by 1000 c.c. of urine at 37° in 3 hr., ranged from < 8 to > 600 (in adolescents 10—40, in old age < 8 to 20); the mean val. for all ages is about 20. The val. was uninfluenced by sex, but varied inversely with food consumption. Vals. in many different types of disease are given.

NUTR. ABS. (m)

**Variations in urinary reducing substances of two normal dogs maintained on bread diets.** E. P. LAUG and T. P. NASH, jun. (J. Nutrition, 1935, 10, 81—92; cf. A., 1935, 513).—Significant variations in the total, fermentable, non-fermentable, and hydrolysable reducing substances of urine are correlated with particular bread diets. A. G. P.

**Lipuria in dogs experimentally deprived of their dorso-lumbosacral marrow.** H. HERMANN, J. DECHAUME, and J. VIAL (Compt. rend. Soc. Biol., 1935, 120, 648—649).—Removal of the dorso-lumbosacral marrow induces an immediate increase in fat excretion, which disappears after 3—5 weeks, reappears after 3 months, and then persists.  $Et_2O$  extracts are

yellow when fresh, but extracts from urines of the first period of lipuria are decolorised by light; those from the second period are unaffected. The fat is free from N and P, and the acid contained in it is chiefly oleic acid. R. N. C.

**Biochemistry of allantoin. I. Effect of leucolysis on allantoin excretion. II. Amounts of allantoin in urine of various animals. III. Effect of thyroxine ingestion on allantoin excretion.** T. MIYAHARA (Sci-i-Kwai Med. J., 1934, 53, No. 8, 9—27, 28—41, 43—48).—I. When a leucopenia is produced in rabbits by injection of a phagolytic serum of goat, excretion of allantoin (I), uric acid (II), and total N (III) is increased. The ratios of (II):(III) and of (I):(III) also increase, whilst the uricolytic index is unchanged. The chief end-product of purine metabolism is (I) with (II) as intermediary.

II. Data are given for rabbit, guinea-pig, dog, pig, ox, rat, sheep, goat, and horse.

III. Injection of thyroxine (IV) increases the excretion of (III) and (I) and decreases that of (II). The uricolytic index is increased. (IV) increases the oxidation of (II) to (I). CH. ABS. (p)

**Action of colloidal substances on crystallisation, with reference to the problem of stone formation.** S. VON KÜTHY (Magyar orvosi Arch., 1934, 35, 289—297; Chem. Zentr., 1935, i, 2209).—Urine and bile are to be considered as supersaturated solutions, in which normally crystallisation or concrement formation should begin, but the colloidal or surface-active substances of high mol. wt. exert a protective action. Model experiments with  $PbI_2$  indicate the mechanism of this action of the colloids to be by selective adsorption in stages. R. N. C.

**Determination of lead in excreta and tissues.** R. A. KEHOE (Amer. J. Clin. Path., 1935, 5, 13—20).—Methods of prep. and ashing of samples are discussed and analytical methods are compared. For Pb in tissues spectrographic methods are the most satisfactory. CH. ABS. (p)

**Effect of external factors on perspiratio insensibilis.** A. VAN HARREVELD, B. W. GRUTTERINK, and A. K. M. NOYONS (Biochem. Z., 1935, 281, 1—26).—In man the phenomenon is practically unaffected by a  $\pm 35\%$  change in the humidity and a change of temp. within the range 20—28.5° or by changes in the thickness of the clothing. Only after attainment of equilibrium are trustworthy results obtained. The val. varies greatly in the individual at different times with const. atm. conditions.

W. McC.

**Changes in hydration of serum-colloids as a general feature of a disease.** K. SCHULHOF (Trans. Illinois State Acad. Sci., 1934, 27, 80).—Measurements of  $n$  and  $\eta$  of serum are utilised to assess the vol. occupied per g. of protein.

CH. ABS. (p)

**Azotæmia and elevation of the alkaline reserve in course of anuria.** R. HUGUENIN, R. TRUHART, and C. SANNIÉ (Compt. rend. Soc. Biol., 1935, 120, 717—719).—Blood-urea (I) is increased and the alkaline reserve is lowered in anuria.  $NaHCO_3$  increases the

alkaline reserve without affecting (I). Total Cl and the corpuscular/plasma-Cl ratio fall. R. N. C.

**Influence of 3:5-di-iodotyrosine on experimental arteriosclerosis.** A. OGATA, S. SANO, and K. MITSUI (J. Pharm. Soc. Japan, 1934, 54, 248—272).—The lipin content of blood was increased by feeding lanoline (I). Substitution of 3:5-di-iodotyrosine (II) hastened the restoration to normal lipin levels. The ratio of Et<sub>2</sub>O extract to body-wt. for mice fed with (I) indicates the decrease in wt. following administration of (II) to result from a decline in lipin content. CH. ABS. (p)

**Proteins of cancerous cells.** C. ACHARD and M. PIETRIE (Compt. rend., 1935, 201, 751—753; cf. A., 1935, 376).—Renal sarcomas of the ox and horse contain lipins (1.38—2.95%, largely cholesterol), globulins (2.6—4.2%) from which amides (0.48—0.67%) are isolated, and albumins (0.5—0.7%), which, although exhibiting the general properties of serum-albumins, possess a much smaller mol. (cf. A., 1933, 730). The residue insol. in H<sub>2</sub>O affords myxoprotein. J. L. D.

**Heavy water and tumour growth.** W. H. WOGLON and L. A. WEBER (J. Amer. Med. Assoc., 1934, 102, 1289—1290).—D<sub>2</sub>O had no effect on mouse sarcoma. CH. ABS. (p)

**Phosphorus in the blood-plasma of hens suffering from sarcoma.** F. PENTIMALLI and G. SCHMIDT (Biochem. Z., 1935, 282, 62—73).—The amounts of total, lipid, and acid-sol. P in the plasma of hens suffering from Rous sarcoma are > those in healthy hen plasma (30% increase in total P). The plasma of the diseased (but not that of the healthy) hens contains protein-P possibly derived from the tumours, although plasma from the muscles, but not that from the tumours, loses acid-sol. P. W. McC.

**Anomalous crystallisation of sodium chloride in normal and in sarcomatous blood-serum.** V. KILIAN (Acta Cancerologica, 1934, 1, 22—28).—After dilution of serum with 0.9% NaCl and subsequent evaporation, the form of crystallisation of NaCl from samples from sarcomatous chicken differed from that from normal samples. CH. ABS. (p)

**Enzymes in uterine cancer.** II. Lipase and lecithinase. III. Esterase. IV. Invertase. V. Antitrypsin. K. NAKAHORI (Japan. J. Obstet. Gynecol., 1934, 17, 419—445; cf. A., 1935, 514).—The distribution of the enzymes in human uterine cancer tissues, lymphatic glands, mucosa, and muscular layers of the uterus is examined. CH. ABS. (p)

**Influence of magnesium on growth of carcinoma, sarcoma, and melanoma in animals.** K. SUIGURA and S. R. BENEDICT (Amer. J. Cancer, 1935, 23, 300—310).—Effects of varying levels of dietary Mg on the growths are examined. Neoplasms as well as normal tissue require definite amounts of Mg for growth. CH. ABS. (p)

**Effect of intravenous injections of complex soluble salts of iron and ascorbic acid on tumours.** F. ARLOING, A. MOREL, and A. JOSSE-AND (Compt. rend., 1935, 201, 745—747).—Clinical

results obtained in the treatment of cancers by injections of mixed complex Fe and Ca salts of ascorbic acid are better than when Fe-Na salts are used (cf. A., 1935, 1401). J. L. D.

**Experimental tumours produced by decreased doses of coal tar. General action of the carcinogenic agent.** L. M. SCHABAD (Acta Cancerologica, 1934, 1, 56—77).—The carcinogenicity of tar is due to a general rather than to a local action.

CH. ABS. (p)

**Effect of certain polycyclic hydrocarbons on the growth of the Jensen rat sarcoma.** A. HADDOW (Nature, 1935, 136, 868—869).—Intra-peritoneal injections of colloidal preps. of 1:2:5:6-dibenzanthracene, 1:2-benzpyrene, 5:6-cyclopenteno-1:2-benzanthracene, and 1:2-benzanthracene, but not anthracene and phenanthrene, produce marked inhibition of growth of the implanted tumour in rats. Carcinogenic substances, like X-rays, may thus act primarily by producing a certain type of inhibition in the activity of the normal cell. L. S. T.

**The Costa reaction (200 cases).** R. H. KAMPMEIER (J. Lab. Clin. Med., 1935, 20, 531—538).—The ppt. formed in blood-serum by addition of procaine, Na citrate, and CH<sub>2</sub>O occurred in 70% of cases with pulmonary tuberculosis and in 90% of cases with malignant tumour. None appeared in syphilis. CH. ABS. (p)

**Calcium and inorganic phosphorus of blood-serum in dental caries.** C. G. KERLEY, E. J. LORENZE, and E. R. GODFREY (J. Pediat., 1935, 6, 665—666).—Serum-Ca and -inorg. P were within normal limits. NUTR. ABS. (m)

**Secretion of urine in diabetic coma.** R. A. MCCANCE and R. D. LAWRENCE (Quart. J. Med., 1935, 4, 53—79).—In diabetic coma there may occur disorganisation of renal function involving retention of urea, creatinine, and probably uric acid, of ketones, if present, and of sugar, if above the threshold. Urine may become acid (p<sub>H</sub> 5); excretion of NH<sub>3</sub> and salt is normal. CH. ABS. (p)

**Hæmochromatosis. I. Iron and sulphur content of the tissues. II. Results of spectrographic examination with special reference to copper and calcium.** H. RAMAGE and J. H. SHELDON (Quart. J. Med., 1935, 4, 121—129).—I. In 5 patients with hæmochromatosis there was a uniform increase in the Fe content, distributed over all the tissues except the blood, brain, and colon. Organs such as the liver, pancreas, and salivary glands may have 50—100-fold increase. Enormous deposits occurred also in the lymph glands, thyroid, pituitary, choroid plexuses, and heart. The somatic muscles contain nearly as much Fe as the liver. The total Fe (calc.) of the body is 25—50 g. There was no general increase in S content. The moderate increase in S in the alimentary canal, omentum, pancreas, and adrenal glands is probably related to deposits of hæmofuscin.

II. Spectrographic examination showed a two- or three-fold increase in Cu in the liver and all tissues except the kidney, small intestine, and omentum.

An increase in Ca was general, but most evident in the liver, thyroid, striated muscles, and pancreas. Disturbance in the Na and K metabolism may have occurred, the concn. of these elements in the tissues usually deviating in reverse directions from the normal. The low Mn content of the liver is probably significant. No unusual elements were encountered.

NUTR. ABS. (*m*)

**Alkalosis, a clinical problem.** C. T. WAY and E. MUNTWYLER (*Ann. Intern. Med.*, 1935, 8, 818—824).—In cases of hypertension and renal disease with a slight or no increase in non-protein-N, the acid-base balance of blood may change with a tendency towards a lower Cl content. Administration of alkali should be controlled by blood acid-base analyses.

CH. ABS. (*p*)

**Role of pressor substances in arterial hypertension.** R. B. CAPPS, E. B. FERRIS, jun., F. H. L. TAYLOR, and S. WEISS (*Arch. Int. Med.*, 1935, 56, 864—876).—In hypertension the urinary pressor substance is  $\neq$  the normal, and appears to be a  $H_2O$ -sol. substance, acting centrally.  $COMe_2$  extraction does not completely separate the pressor and depressor substances, but this fraction contains more pressor and less depressor material than the  $EtOH$  fraction.

H. G. R.

**Calcium metabolism in idiopathic hypoparathyroidism.** A. GOERNER and G. SAMUELSEN (*J. Amer. Med. Assoc.*, 1934, 102, 1001—1002).—The positive Ca balance in hypoparathyroidism was reduced by parathyroid extract. The increased excretion was by the urine.

CH. ABS. (*p*)

**Goitre prophylaxis with iodised salt.** R. D. McCURE (*Science*, 1935, 82, 370—371). L. S. T.

**Malaria in Panama with reference to control with atebirin and plasmoquin.** W. H. W. KOMP and H. C. CLARK (*Amer. J. Trop. Med.*, 1935, 15, 131—154; cf. A., 1935, 1149).—Atebrin and plasmoquin administered simultaneously enhance the toxic action of the latter. When given separately the desired effect is obtained with less toxicity.

CH. ABS. (*p*)

**Muscle chemistry in myasthenia gravis, pseudohypertrophic muscular dystrophy, and myotonia.** S. NEVIN (*Brain*, 1934, 57, 239—254).—The  $PO_4^{'''}$  content of pathological muscle under various conditions is examined. A method for determining the partition of acid-sol. P between  $H_3PO_4$ , creatinephosphoric and adenosinetriphosphoric acids is described. Sol. carbohydrate phosphates are determined by difference. CH. ABS. (*p*)

**Calcium and inorganic phosphorus in the blood-serum of emotionally unbalanced children.** C. G. KERLEY, E. J. LORENZE, jun., and E. R. GODFREY (*N.Y. State J. Med.*, 1935, 35, 571—572).—Of 90 children 81 showed normal Ca vals. and 83 normal inorg. P vals. Exaggerated nervous symptoms were not more severe in children with low Ca vals. than in those with normal Ca and P vals.

NUTR. ABS. (*m*)

**Renal damage following ingestion of a diet containing an excess of inorganic phosphate.** E. N. MACKAY and J. OLIVER (*J. Exp. Med.*, 1935, 61, 319—333).—Permanent renal lesions were pro-

duced in rats by feedings an excess of K and Na phosphates or  $H_3PO_4$ . Removal of excess of  $PO_4^{'''}$  does not restore normal structure. CH. ABS. (*p*)

**Comparison of "yeast" milk and irradiated milk in the treatment of infantile rickets.** E. T. WYMAN, R. C. ELEY, J. W. M. BUNKER, and R. HARRIS (*New England J. Med.*, 1935, 212, 257—262).—The two milks are equally effective.

CH. ABS. (*p*)

**Nitrogen balance and oxidation process in experimental scurvy. II. Effect of reduced iron.** L. D. KASHEVNIK, S. A. EIDMANN, and J. B. FRIEDLAND (*Biochem. Z.*, 1935, 282, 56—61; cf. A., 1935, 888).—In guinea-pigs, daily oral administration of 10 mg. of reduced Fe prior to the onset of scurvy caused increase in N metabolism, stimulated subsequent urinary N excretion when scurvy had set in, and tended to decrease the O : N ratio. The Fe caused retention and deposition of fat during the course of the disease, but had no effect on the excretion of protein degradation products, there being retention of these when scurvy was developing and increased excretion when the disease was fully established. Subsequently, while the animals fasted, there was N retention.

W. McC.

**Correlation of mineral metabolism and the vegetative nervous system in thyroid disease.** J. KLEIN (*Ann. Int. Med.*, 1935, 8, 778—804).

CH. ABS. (*p*)

**Interpretation of abnormal glucose-tolerance curves occurring in toxæmia in terms of liver function.** S. SOSKIN, M. D. ALLWEISS, and I. A. MRSKY (*Arch. Int. Med.*, 1935, 56, 927—934).—Toxæmias cause abnormal glucose-tolerance curves through an interference with the homeostatic mechanism of the liver.

H. G. R.

**Amino-acid content of the blood of the rabbit in tuberculous infection of the Yersin type.** E. S. PANAYOTOPOULOU (*Compt. rend. Soc. Biol.*, 1935, 120, 604—605).— $NH_2$ -acids increase steadily until death. The increases are of the same order for avian and bovine infections.

R. N. C.

**Tyrosine index of serum-polypeptides in the rabbit in the course of tuberculous infection of the Yersin type.** E. S. PANAYOTOPOULOU (*Compt. rend. Soc. Biol.*, 1935, 120, 695—696).—The tyrosine index increases steadily from the time of inoculation until death.

R. N. C.

**Whooping-cough: diagnostic significance of blood counts.** N. D. BEGG and M. F. COVENEY (*Lancet*, 1935, 229, 1113—1114).

L. S. T.

**Mathematical physics in metabolising systems with reference to lung cells.** N. RASHEVSKY (*Physics*, 1935, 6, 117—119; cf. A., 1935, 1073).—Previous results are applied to glucose oxidation and glycolysis. The relative rates of the two reactions, when occurring simultaneously, determine whether the system will divide spontaneously or not. Rapidly-dividing cancer cells show abnormally high rates of glycolysis.

CH. ABS. (*p*)

**Metabolism in children doing muscular work. I. Effect of racing on urinary constituents in**

boys. I. NAKAGAWA and K. KAWAMO (Amer. J. Dis. Children, 1935, 49, 594—602).—Following a 1200-m. race some albuminuria and increased acidity occurred.  $\text{NH}_3$ , creatine, and creatinine concns. were practically unchanged. P increased and total N decreased temporarily. The ratios, total N:urine vol., total P:urine vol., creatine:total N, and  $\text{NH}_3$ :total N, were all increased. CH. ABS. (p)

Metabolism of injured tissue. H. DRUCKREY (Naturwiss., 1935, 23, 796—799).—Mechanical trauma, such as that sustained by cells in thin sections of tissue, produces a marked immediate rise in their metabolism followed by a slow fall. The role of tissue damage in producing the observed results of  $\text{O}_2$  deficiency and also its possible significance in tumour metabolism are discussed. W. O. K.

Insect metabolism at temperatures below  $0^\circ$ . I. V. KOSHANTSCHIKOV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 373—376).—The R.Q. of larvae of *Pyrausta nubilalis*, Hb., and of *Loxostege sticticalis*, L., indicate that metabolism at  $0^\circ$  is mainly concerned with carbohydrate, but at  $-6^\circ$  and  $20^\circ$  fats and proteins become important. A. G. P.

Biological cell oxidation. A. BERTHO (Chem.-Ztg., 1935, 59, 953—957).—A review.

Metabolic oxidation and radiation. M. COPESAROW (Protoplasma, 1934, 21, 73—80).—Blood, urine, tissue extracts, and yeast exposed to atm.  $\text{O}_2$  in the dark at  $37^\circ$  emit ultra-violet radiations. The effect is abolished by heat; in the case of yeast it is also destroyed by  $\text{H}_2\text{O}_2$ ,  $\text{KMnO}_4$ , KCN, or CO, but not by  $\text{CO}_2$  or  $\text{N}_2$ . No radiation is given off by pure cholesterol, calciferol, ascorbic acid, alkaloids, or synthetic adrenaline. The radiation is associated with the chemical function of respiratory enzymes; metabolic products radiate only in presence of the enzymes. R. N. C.

Infant feeding and nutrition. S. FRIEDMAN (Amer. J. Dis. Children, 1935, 49, 152—190, 460—473).—A review. CH. ABS. (p)

Effect of low calorific diets and resultant loss in weight on plasma-cholesterol in the obese. C. A. POINDESTER and M. BRUGER (Arch. Int. Med., 1935, 56, 884—890).—Plasma-cholesterol (I) in complicated or uncomplicated obesity is not altered primarily by reduction in wt. on a low-calorific diet; but an increase is noted in some cases due to the "starvation effect." Some high vals. of (I) show a decrease due to secondary changes. H. G. R.

Growth, reproduction, lactation, longevity, and haemoglobin formation in albino rats on meat diets contrasted with their response on the Steenbock stock diet and on the Sherman milk diet. P. M. NELSON and P. P. SWANSON (Iowa Agric. Exp. Sta. Rept. on Agric. Res., 1933, 116; 1934, 144—145).—As a N source dried beef muscle was superior to cereal or milk proteins. Neither pork nor beef muscle at a level of 15% protein was adequate for maintenance of body-wt., reproduction, and lactation. Pork at 15 and 30% protein levels and beef at the 15% level fed to female rats allowed no reproduction beyond the second generation. Beef was

superior to pork. With 30% beef protein rats reproduced freely. CH. ABS. (p)

Supplementary values of animal protein concentrates in chick rations. H. J. ALMQUIST, E. L. R. STOKSTAD, and E. R. HALBROOK (J. Nutrition, 1935, 10, 193—211).—Vals. of various meat products as protein (I) supplements are determined. The cystine, tryptophan, and  $\text{H}_2\text{S}$  contents of (I) feeds do not afford a basis for predicting their nutrient vals. Determinations of intact (I) (Cu ppt.), (I) decomp. products (phosphotungstic acid ppt.), undigestible (I) (pepsin-HCl), and hot  $\text{H}_2\text{O}$ -sol. (I), to which are assigned the relative nutrient vals. 100, 40, 0, and 40, respectively, permit the determination of nutrient vals. of (I) concentrates which agree closely with biological trials. A. G. P.

Is linoleic acid essential in the nutrition of rats? E. BECKER (Z. Vitaminforsch., 1935, 4, 241—249).—Without small amounts of linoleic acid (I) rats fail to maintain normal growth and develop a deficiency disease, which can be cured by daily doses of 5 mg. of walnut oil containing 2—3 mg. of (I). The growth curves of rats run parallel with the amount of (I) in the oil. It is not known which isomeride of (I) is responsible for the action. J. N. A.

"Bukuryo," sclerotia of *Pachyma Hoelen*, Rumph. V. Nutritive value of pachyman. K. TAKEDA (J. Agric. Chem. Soc. Japan, 1934, 10, 685—690).—Pachyman is not easily digested, and its nutritive val. resembles that of cellulose. Neither it nor "Bukuryo" can be used as a substitute for cereals. J. N. A.

Biochemistry of fermented soya-bean paste ("miso"). III. Effect of cystine on the nutritive value of miso-protein given as supplement to rice. I. IWAMURA (Bull. Agric. Chem. Soc. Japan, 1935, 11, 128—134).—The nutritive val. of the miso-protein, when used as a supplement to a rice diet for albino rats, is increased by addition of cystine (I). For young rats the optimum amount of (I) is about 0.1% ( $>0.5\%$  is harmful), but for adult rats 0.5% is favourable. W. McC.

Substitution of dithioethylamine (cystine-amine) for cystine in the diet of the white rat. H. H. MITCHELL (J. Biol. Chem., 1935, 111, 699—705).—Addition of cystine-amine (I) to a cystine-deficient diet depresses the growth of the animal and impairs appetite. There is therefore no evidence that (I) can replace cystine in a diet. E. A. H. R.

Protein requirements of chicks. J. D. MCCONACHIE, W. R. GRAHAM, jun., and H. D. BRANTON (Sci. Agric., 1935, 15, 754—764).—Optimum levels of protein feeding are determined for chicks of various ages. The efficiency of food utilisation declines with age. Mortality decreases as the proportion of protein fed approaches the optimum. High and low protein intakes tend to modify the contour and texture of feathers, although the optimum protein requirement for correct feather development is not necessarily the same as that for growth. Slipped tendons are not directly due to high-protein feeding. The occurrence of "crow heads" is a dietary rather than a genetic factor. A. G. P.

**Effect of protein and amino-acid metabolism on the urea and xylose clearance.** R. F. PITTS (J. Nutrition, 1935, 9, 657—666).—Post-absorptive clearances of urea and xylose on a basal diet are low and not greatly affected by feeding the diet. Introduction of meat into the diet produces a gradual and prolonged post-prandial rise in both clearances. When meat feeding is prolonged, post-absorptive clearances are raised without obliteration of the post-prandial effect. Similar effects are produced by feeding casein, by administration of thyroxine to dogs on a basal diet or of phloridzin to fasting dogs, or by replacement of part of the carbohydrate of the basal ration with glycine. The primary effect of protein on renal function results from the action of  $\text{NH}_2$ -acids or OH-acids produced in the course of their metabolism on glomerular activity. A. G. P.

**Effects of varying amounts of animal protein fed to white Leghorn pullets. I. Influence of low-, medium-, and high-protein diets on the weight and number of eggs.** C. C. RHODES, L. H. BARTEL, and P. E. F. JOOSTE (Empire J. Exp. Agric., 1935, 215—228).—Comparison is made of the food consumption with different rations and varying levels of protein content. Differences in the ratio of carbohydrate to protein consumed were apparent, but there was a definite tendency for birds to balance the ration to a common nutritive ratio. The amount of protein consumed produced little significant effect on the body-wt. of the birds or on egg size, but was directly related to the average no. of eggs per bird. A. G. P.

**Effect of feeding vegetable protein on copulation and fertilisation in the fowl.** T. HATANO (Bull. Agric. Chem. Soc. Japan, 1935, 11, 125—128).—Vegetable (soya-bean) is more effective than animal (fish-meal) protein. W. McC.

**Utilisation of meat by human subjects. II. Nitrogen and phosphorus of round and liver of beef.** Z. LONG and M. S. PITTMAN. **III. Nitrogen and phosphorus of beef heart.** B. L. KUNERTH, I. M. CHITWOOD, and M. S. PITTMAN (J. Nutrition, 1935, 9, 677—683, 685—690).—II. The N of round of beef was as effectively utilised as that of liver. A higher proportional utilisation of liver-P is indicated.

**III. Utilisation of the N and P of beef-heart was not appreciably different from that of round.**

A. G. P.

**"Continuing" metabolism of nitrogen in animals.** H. BORSOOK and G. L. KEIGHLEY (Proc. Roy. Soc., 1935, B, 118, 488—521).—The continuing N metabolism (I) is defined as the N already present in the tissues metabolised on any one day, and is distinct from "wear-and-tear" metabolism. For man in N equilibrium at a level of 10—11 g. of urinary N per day, (I) constitutes > 50% of total urinary N. S excretion is lowered, but only by about 50%, when a normal diet is interrupted either by a day of N starvation or a day on which N is ingested in the form of compounds low in S; the lowering persists for a short period after restoration of the original diet.  $\text{NH}_3$  may serve as precursor of urinary uric acid in man.  $\text{NH}_2$ -acids do not stimulate either (I) or endogenous N metabolism. F. A. A.

**Digestion of foods. V. Synthetic fats.** S. SUZUKI (J. Agric. Chem. Soc. Japan, 1935, 11, 1—10; cf. A., 1934, 920, 1027).—Comparison is made of triacetin (I), tributyrin (II), trioctoin, and tridecain fed at the rates of 2 and 12% with a fat-free polished rice ration. At the lower level differences between the real and apparent digestion coeffs. were considerable, but there was little influence on the digestion of other food constituents. At the 12% level fats retarded protein digestion. Except for (I) and (II), the lower acid compounds were the more digestible and had the higher nutrient vals. CH. ABS. (p)

**Fat metabolism. VII.  $\beta$ -Oxidation of normal saturated dicarboxylic acids administered *per os*.** P. E. VERKADE, J. VAN DER LEE, A. J. S. VAN ALPHEN, and M. ELZAS (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 943—948).—After administration to dogs of the Na salts of sebacic (I) or undecanedicarboxylic (II) acids, the urine was found to contain (I), suberic, and adipic acids or (II), azelaic, and pimelic acids, respectively. The ratios in which these acids are found varies, but (I) or (II) always occurs in a greater amount. H. G. R.

**Carbohydrate metabolism in the guinea-pig.** F. GOTTDENKER (Biochem. Z., 1935, 281, 128—139).—In autumn the blood-sugar is greatly (up to 250%) increased by fasting, but in the same animal, in winter, fasting causes only slight increase or even decrease, the difference not being due to the change in temp. of the surroundings. Oral administration of overdoses of glucose causes hyperglycaemia, which reaches its max. within 0.5—1.0 hr., then decreases in intensity, and finally attains a val. < that first reached. Overdoses of adrenaline cause increases of 250—300% in blood-sugar. Hypoglycaemic convulsions are produced by overdoses of insulin, but the blood-sugar level is only slightly lowered or even raised, there being no accompanying increase in the content of reducing substances other than sugar. W. McC.

**Nutritive value of lactose in man.** A. E. KOEHLER, I. RAPP, and E. HILL (J. Nutrition, 1935, 9, 715—723).—In normal adults ingestion of 1.5 g. of lactose per kg. had no appreciable effect on blood-sugar (I) levels. A similar ingestion of starch (II) produced an increase in (I) which was nearly as great as that produced by glucose (III). The total hyperglycaemia after (II) was > that after (III). In these individuals lactose produced a slight and in diabetics a marked rise in (I). A. G. P.

**Xylan.** H. IWATA (Bull. Imp. Coll. Agric. Morioka, 1935, No. 21, 120 pp.).—Xylanase was not present in the saliva, pancreas, or bile of higher animals, and only in small amounts in the intestines. Decomp. of xylan (I) in the intestines into xylose (II) and small quantities of org. acids by micro-organisms was very active and several new species were isolated; these also hydrolyse starch, dextrin, inulin, and several carbohydrates, but do not affect xylose. The digestion velocity of (I) was < that of starch, but was increased by mild treatment with alkali. On feeding (I) there was little change in the blood constituents and no increase in the urinary excretion of (II), but a protein-sparing action was observed. Both glycogen

and fat accumulation were nearly equiv. to that due to starch. The total calorific val. of (I) was 4167—4184 and the assimilation 61.6%. H. G. R.

**Influence of calcium on carbohydrate metabolism.** T. HARADA (Bull. Chem. Soc. Japan, 1935, 10, 494—503).—Injection of Ca lactate into albino rabbits decreases the hyperglycaemia and glycosuria caused by simultaneous injection of glucose, but does not alter the effect of adrenaline on the blood-sugar. R. S. C.

**Hydrolysis, oxidation, and energy exchanges in the dog. III. Absorption and assimilation of hexoses in the organs during intravenous administration of galactose, maltose, and glucose.** M. WIERZUCHOWSKI and H. FISZEL (Biochem. Z., 1935, 282, 124—145; cf. A., 1935, 522).—The absorption from and delivery to the blood of the carbohydrates by various organs are studied. As regards rate and extent of absorption of glucose (I) and galactose (II), the organs form the series liver > portal vein organs > organs of the head > motor system. The liver plays little part in absorption of maltose (III), the other groups of organs exhibiting absorptions equal to those shown with (I). As regards extent of absorption of (I) from the liver, the order is organs of the head > portal vein organs > motor system, the amounts of lactic acid (IV) simultaneously produced by those absorbing organs corresponding respectively with 14—17, 96—164, and 40—60% of the amount of (I) injected. 5—15% of the injected and absorbed (I) or (II) is given up by these organs as (IV) to the blood. Absorption of injected (I) by these organs is at first slight, whilst urinary (I) excretion increases but later becomes more pronounced. The (I) consumption of the organs during injection of (II) is about the same as it is during fasts. During (II) injection the liver ceases to give out (I), about 40% of the (II) absorbed by the organs being subsequently utilised or excreted in the urine. Amytal narcosis has no effect on the assimilation of carbohydrates. Loss of blood and laparotomy have no effect on assimilation of (II), but they interfere slightly with that of fructose (V) and considerably with that of (I) and (III). Of the intravenously injected carbohydrates tested (V) is the best utilised during the narcosis. W. McC.

**Effect of sulphur administration on carbohydrate metabolism.** T. YOSHIKAWA (Sei-i-kwai Med. J., 1934, 53, No. 6, 74—84).—Administration of S by rubbing S-ointment on rabbit's ears, by mouth, or intravenously produced no appreciable change in blood-sugar. CH. ABS. (p)

**Chief sulphur compounds in nutrition.** H. B. LEWIS (J. Nutrition, 1935, 10, 99—116).—A review. A. G. P.

**Calcium, phosphorus, and nitrogen retention of children. Effects of acid- and base-forming diets.** N. J. DAVIS (Amer. J. Dis. Children, 1935, 49, 611—624).—The total Ca output was similar on acid- and base-forming diets. Acid diet led to decreased faecal P and slightly increased urinary P. Basic diets induced greater N retention and higher  $\text{NH}_3$  excretion. CH. ABS. (p)

**Minerals for dairy cattle.** J. C. KNOTT (Proc. 7th Ann. State Coll. Washington Inst. Dairying, 1934, 120—124).—The occurrence and functions of Na, K, Mg, S, Cu, Fe, F, Zn, Mn, I, Ca, and P in dairy cows are discussed. CH. ABS. (p)

**Mineral requirements of milk production. Annual cycle of mineral and nitrogen metabolism of the milch cow as affected by lucerne hay, timothy hay, bone flour, and ground limestone.** E. B. FORBES [with A. BLACK, W. W. BRAMAN, D. E. H. FREAR, O. J. KAHLENBURG, F. J. McCLURE, R. W. SWIFT, and LE R. VORIS] (Penn. Agric. Exp. Sta. Bull., 1935, No. 319, 152 pp.).—Monthly determinations of balances of N, Ca, Mg, P, Na, K, and Cl resulting from the different rations are recorded and discussed. A. G. P.

**Chemical reactions in muscle. X.** P. OSTERN and T. BARANOWSKI (Biochem. Z., 1935, 281, 157—167; cf. A., 1935, 1150).—In dialysed and non-dialysed extracts of autolysed skeletal muscle [free from adenosinetriphosphoric acid (I) and adenylic acid (II)] phosphoglyceric acid and (II) successively added are converted into (I) [yield 40% calc. on (I)]. In heart extracts (horse) the products are diadenosine-pentaphosphoric acid and a substance (possibly a nucleotidephosphoric acid) yielding a Ba salt insol. in dil HCl. Extracts of rabbit heart contain free (II), very little phosphocreatine, and half as much adenosinepolyposphoric acid and total phosphate as does skeletal muscle. The direct transfer of phosphate [from phosphopyruvic acid to (II) and from (I) to creatine] is accelerated by  $\text{Mg}^{++}$ , which only slightly affects liberation of free phosphate. In heart the transfer of phosphate is the same as in skeletal muscle, but (II) is here more stable and more slowly deaminated by enzymes. W. McC.

**Fission of adenylypyrophosphoric and arginine-phosphoric acid in crab muscle.** K. LOHMANN (Biochem. Z., 1935, 282, 109—119; cf. A., 1934, 1033, 1034).—Only one of the readily eliminated  $\text{H}_3\text{PO}_4$  residues is removed from adenylypyrophosphoric acid (I) by washed crab muscle and dialysed extract of the muscle. On addition of  $\text{Mg}^{++}$  the adenosine-diphosphoric acid (II) produced is converted into adenylic acid (III). Hence dephosphorylation of (I) is a two-stage process (as in vertebrate muscle), different enzymes being involved. In the dialysed extract argininephosphoric acid (IV) is hydrolysed only if (I) or (II) is present because the extract, in presence of (IV), cannot convert (III) into (II) or (I), whilst (II) is easily rephosphorylated. Crab muscle contains no adenylic acid deaminase. W. McC.

**Production of kynurenic acid from tryptophan and indole derivatives.** L. C. BAUGUESS and C. P. BERG (Proc. Iowa Acad. Sci., 1934, 41, 174—175).—When administered to rabbits *l*-tryptophan-amides (free amide, mono- and di-ethyl-amides, amide, and ethylanilide) were as readily converted to kynurenic acid (I) as was *l*-tryptophan (II). Substituted carboxylic acid derivatives were not converted  $\beta$ -3-Indolylpyruvic and *dl*- $\beta$ -3-indolyl-lactic acids, but not  $\beta$ -3-indolylacrylic or  $\alpha$ -oximino- $\beta$ -3-indolylpropionic acids, were also converted into

(I), but in amounts < those from (II) derivatives. Indole derivatives are probably not intermediates in the conversion of (II) into (I). CH. ABS. (p)

**Transformation of urobilinogen in the liver.** K. FELIX and H. MOEBUS (Z. physiol. Chem., 1935, 236, 230—236).—Fresh liver pulp (pig) attacks urobilinogen ( $p_{H}$  optimum at 7.1) in presence of  $O_2$  causing cessation of power to react to the aldehyde test. Boiled liver pulp has no such effect.

W. McC.

**Absorption of salicylic acid after intramuscular injection. Absorption by the bladder.** W. BLUME and F. W. FISCHER (Arch. exp. Path. Pharm., 1935, 179, 646—654).—Following intramuscular injection of 10 c.c. of 2.5% Na salicylate into rabbits, salicylic acid (I) appears in the blood after 1—2 min. and in the urine after approx. 30 min. The rate of excretion is fairly const., 70% of the administered (I) being excreted within 24 hr. The blood-(I) attains a max. within 1 hr. and returns to zero in 6—7 hr. Absorption into the blood after intramuscular injection is > that after rectal or subcutaneous administration. (I) is absorbed by inflamed (EtOH), but not by normal, bladder mucosa.

F. O. H.

**Absorption of intrapleurally and intraperitoneally injected salicylic acid.** W. BLUME and K. PLUM (Arch. exp. Path. Pharm., 1935, 179, 655—661).—Following intrapleural and intraperitoneal injection of Na salicylate into rabbits, salicylic acid (I) appears in the blood after 3—10 and 1—2.5 min. (max. being attained after 1 and 0.5 hr.) and in the urine after 40 and 26 min., the total excretion being 77 and 59%, respectively. With both routes, max. excretion occurs after  $\frac{1}{2}$  hr. and falls to zero in approx. 7 hr. At max. excretion, the blood-(I) indicates a ratio of absorption by buccal mucosa, stomach-intestine, rectal mucosa, pleural cavity, muscle, and abdominal cavity of 3 : 6 : 8 : 10 : 12 : 14. F. O. H.

**Relationship between dielectric polarisation and pharmacological action.** K. W. ROSENEMUND (Angew. Chem., 1935, 48, 701—705; cf. A., 1934, 652).—The anthelmintic properties of different phenolic lactones are not related to surface activity, action on membrane permeability, or action on the swelling of proteins, but to the polarity of the mols., as varied by the relative positions of substituents in the  $C_6H_6$  ring.

F. A. A.

**Relation of cell types in leucæmia to sensitivity to radium.** R. ISAACS (Folia Hematol., 1934, 52, 414—425).—Within 24 hr. of application of X-rays or Ra, metabolic rates rise, showing increased  $O_2$  utilisation, and chemical changes associated with cell growth are accentuated. CH. ABS. (p)

**Action and hæmolytic dose of X-rays.** A. ROGOZINSKI and B. S. LEVIN (Compt. rend., 1935, 201, 798—799).—The dose required for complete hæmolysis is increased if irradiation is carried out in several stages, probably as a result of the formation of antilytic substances.

J. L. D.

**Ionisation in air and the biological effects of  $\gamma$ -rays.** G. FAILLA (Physical Rev., 1934, [ii], 45, 564).—Contrary to the conclusions of Packard,

equal ionisations in air produced by X- and  $\gamma$ -rays are not equally effective in killing fruit-fly eggs. The therapeutic efficacy of high-voltage X- and  $\gamma$ -rays cannot be predicted by the usual biological and physical tests.

L. S. T.

**Action of solar (ultra-violet) rays on the skin and the formation of cholesterol.** A. H. ROFFO (Compt. rend., 1935, 201, 566—568).—The ratio of the cholesterol (I) content of the skin of the cheek to that of the abdomen is in adults 3.42, in infants 1.4, and in the foetus 1.1. Skin exposed to sunlight or ultra-violet light *in vivo* or *in vitro* increases in (I) content.

J. L. D.

**Radio-hæmolysis and cholesterol.** B. S. LEVIN and C. PIFFAULT (Compt. rend. Soc. Biol., 1935, 120, 712—714).—The resistance of guinea-pigs' corpuscles to X-rays is increased by injection or ingestion of cholesterol.

R. N. C.

**Fats and a theory of pharmacodynamic actions of alkali and alkaline-earth ions.** J. WAJZER and L. LAPICQUE (Compt. rend. Soc. Biol., 1935, 120, 707—710).— $K^+$  and  $Na^+$  decrease, and  $Ca^{++}$  increases,  $\sigma$  between  $H_2O$  and oils, by the formation of a unimol. layer of soap at the interface. The effect is unaltered by aliphatic amines.

R. N. C.

**Salt requirements and space orientation of the littoral isopod *Ligia* in Bermuda.** T. C. BARNES (Biol. Bull., 1932, 63, 496—504).—Toxicity of cations in sea- $H_2O$  to *L. baudiniana* decreases in the order  $K$ ,  $Mg$ ,  $Ca$ ,  $Na$ .  $K$  exerts a sp. paralysing action on gill movements.

CH. ABS. (p)

**Difference in action of ter- and quinque-valent arsenic compounds on the explanted spleen from chick embryo.** H. OKADA (Folia Pharmacol. Japon., 1935, 19, 271—282).—The growth of spleen-tissue is increased by low concns. of  $Na_3AsO_3$  (I),  $Na_3AsO_4$  (II), atoxyl (III), and nearsphenamine (IV). Tissue is killed by high concns. Potency decreases in the order (I), (IV), (II), (III).

CH. ABS. (p)

**Influence of bromine on the growth and metamorphosis of the larvæ of *Bufo vulgaris*.** V. FAMIANI (Atti R. Accad. Lincei, 1935, [vi], 21, 821—824).—Toad tadpoles fed on egg-yolk to which a trace of  $Br-H_2O$  had been added grew more rapidly than controls fed on unbrominated yolk. Metamorphosis commenced earlier, but the tadpoles died during metamorphosis; the liver and intestines had developed to the adult state, the legs had appeared early, but were stunted, and the respiratory system had failed to develop.

D. R. D.

**Differential biological reaction of cobaltous compounds and of some cobaltic complexes (cobaltiammines).** J. M. LE GOFF (Compt. rend., 1935, 201, 531—532).—The human organism can differentiate between subcutaneously injected  $Co^{II}$  and  $Co^{III}$ , and between  $Co$  and  $N$  in complexes.

R. N. C.

**New toxicant occurring naturally in certain samples of plant foodstuffs. IX. Toxic effects of orally ingested selenium.** K. W. FRANKE and V. R. POTTER. **X. Effect of feeding toxic foodstuffs in varying amounts and for different time**

periods. K. W. FRANKE (J. Nutrition, 1935, 10, 213—221, 223—231).—IX. Symptoms of poisoning produced by  $\text{Na}_2\text{SeO}_3$  are practically identical with those shown by the natural toxicant.

X. Effects of feeding toxic grain are examined.

A. G. P.

Mechanism of the action of sulphur and mud baths. L. SCHMIDT (Orvosi Hetilap, 1935, 79, 318—319).—Absorption of chemical components of mineral waters is probable. The S of therapeutic muds is in steady circulation, but in dynamic equilibrium, part being oxidised and part reduced.

CH. ABS. (p)

Dietary depigmentation of young black and pied rats, promoted by rapid growth, prevented and cured by ingestion of copper. F. J. GORTER (Z. Vitaminforsch., 1935, 4, 277—293; cf. A., 1935, 1148).—The curative effect of yeast on depigmentation is due to its Cu content and not to its anti-pellagra property. Depigmentation in young growing rats is prevented by adding  $\text{CuSO}_4$  to the diet, the daily preventive dose of Cu being 0.02—0.12 mg., and the curative dose 0.07—0.24 mg. Other metals are ineffective. Cu in cereals appears to be more available than Cu in proteins.

J. N. A.

Feeding and thyroid function. I. Effect of cyanides on the function and histological picture of the rat thyroid. F. BRUMAN and L. BERMAN (Z. ges. exp. Med., 1935, 95, 724—728; Chem. Zentr., 1935, i, 2202—2203).—MeCN given daily does not alter basal metabolism in rats. The diminution of tissue oxidation due to MeCN is compensated by increased thyroxine secretion.

R. N. C.

Effect of iodoacetate on *post-mortem* glycogenolysis in liver. H. R. NOLTIE (Quart. J. Exp. Physiol., 1935, 24, 377—382).—Iodoacetate did not prevent glycogenolysis in rabbit liver incubated in  $\text{N}_2$  at 38°, or the accumulation of sugar (although exerting some inhibitory action), but caused the lactic acid content to remain stationary.

CH. ABS. (p)

Effect of dinitrophenol on calcium and phosphorus metabolism. C. L. ROBBINS (J. Nutrition, 1935, 10, 187—191).—Increased basal metabolism caused by administration of dinitrophenol was not accompanied by any change in the excretion of Ca, P, or N.

A. G. P.

Effects of moderate doses of dinitrophenol on the energy exchange and nitrogen metabolism of patients under conditions of restricted dietary. M. L. TAINTER, W. C. CUTTING, and E. HINES (J. Pharm. Exp. Ther., 1935, 55, 326—353).—0.3—0.4 g. of 2:4-( $\text{NO}_2$ ) $_2\text{C}_6\text{H}_3\cdot\text{OH}$  (I) was given daily for 1—2 weeks to normal human subjects maintained on a low-calorific diet with only sufficient protein to maintain N balance. (I) produced an increased loss in body-wt. associated with increased fat metabolism with the production of no ketones or acidosis. There was no extra metabolism of carbohydrates or proteins; (I) was not conjugated in the body as an org. sulphate and no extra secretion of Cl' in the urine, faeces, or sweat occurred.

H. D.

Antagonism of cryogenin and 2:4-dinitrophenol. A. LEULIER and G. BÉRUARD (Compt.

rend. Soc. Biol., 1935, 120, 650—651).—The temp. rise in pigeons given cryogenin and ( $\text{NO}_2$ ) $_2\text{C}_6\text{H}_3\cdot\text{OH}$  (I) is < in those given (I) only.

R. N. C.

[Pharmacology of] phenanthrene derivatives. V. Homologous acids and aldehydes and some of their derivatives. N. B. EDDY (J. Pharm. Exp. Ther., 1935, 55, 354—364; cf. A., 1933, 858).—The action on cats of phenanthrenecarboxylic and  $\beta$ -(3-phenanthryl)propionic acids, their Me esters, amides, ketone and alcohol derivatives, and some position-isomerides of these compounds are compared. Effectiveness is greater in the higher homologues; that of the alcohols is > that of ketones. The amides and Me esters are less active than the acids. 3-derivatives are more active than the 2- or 9-derivatives. Of the compounds studied, Me phenanthrene-3-, m.p. 95°, and -9-carboxylate, m.p. 116°; phenanthrene-3-carboxydimethylamide, m.p. 120.5—121°, -2-carboxylamide, m.p. 242—243°, -3-, m.p. 79—80°, and -9-aldehyde, m.p. 100.5—101°;  $\beta$ -3-phenanthrylpropionic acid, m.p. 154.5—155° (Me ester, m.p. 61—62°; amide, m.p. 161—162°); 3-, m.p. 100—103.5, and 9-hydroxymethyl-, m.p. 149—149.5°; 3-, m.p. 72°, 2-, m.p. 143°, and 9-acetyl-, m.p. 74.5°, 3-propionyl-phenanthrene, m.p. 53—54°; phenanthryl-3-, m.p. 83—83.5°, and -2-methylcarbinol, m.p. 134.5—135.5°, are new.

Pharmacology of some hydroxyphenoxyethylalkylamines. D. BOVET, A. SIMON, and J. DRUEY (Compt. rend. Soc. Biol., 1935, 120, 690—691).—*sec*-Hydroxyphenoxyethylalkylamines exhibit adrenolytic action, whilst the *tert*-amines exhibit nicotine-like action and resemble hordenine in having a powerful ganglionic nicotine-like action which is abolished by methylation of the OH. Certain of the *tert*-amines exhibit both the above actions.

R. N. C.

Renal activity. VIII. Effect of xanthine and histidine fractions isolated from various organs of cows. IX. Effect of endocrine preparations on renal activity. Y. MIZUNO (Sci-i-Kwai Med. J., 1933, 52, No. 10, 50—70, 71—90; cf. A., 1935, 258).—VIII. Xanthine fractions (especially from adrenals) markedly accelerated renal activity in rabbits. The histidine fraction is less effective. Arginine and lysine fractions have no action.

IX. Injection of thyreoglandol caused marked acceleration. Pituitrin and adrenaline were non-effective.

CH. ABS. (p)

Effect of bile acids on sugar assimilation in depancreatized dogs. T. HASEGAWA (Arb. Med. Fak. Okayama, 1935, 4, 453—460).—Injection of Na cholate, with or without glucose, reduced hyperglycemia and glucosuria in depancreatized dogs.

CH. ABS. (p)

Influence of bile acids on calcium metabolism. VIII. Influence of bile acids and spleen extract on urinary calcium excretion. IX. Blood composition of normal and splenectomized rabbits under the influence of bile acids and spleen extract. M. IWADÔ (Arb. Med. Fak. Okayama, 1935, 4, 346—355, 356—364).—VIII. In normal or splenectomized rabbits subcutaneous injection of cholate (I) augments and spleen extract (II) decreases urinary Ca.

**IX. Splenectomy** is followed by hypercalcaemia, which gradually disappears. Blood-Ca is lowered by (II) in normal rabbits > in splenectomised rabbits. Post-operative hypercalcaemia is increased by (I) and lowered by (II). Spleen and liver are concerned in the regulation of blood-Ca. CH. ABS. (p)

**Influence of fractionated liver extract on blood composition of normal dogs.** M. IWADÔ (Arb. Med. Fak. Okayama, 1935, 4, 438—444).—The factor in aq. liver extracts which causes hypercalcaemia is sol. in EtOH and slightly less sol. in Et<sub>2</sub>O (cf. preceding abstract). CH. ABS. (p)

**Blood composition of normal and splenectomised rabbits under the influence of liver extracts from normal and splenectomised rabbits, spleen extracts, and bile salts.** M. IWADÔ (Arb. Med. Fak. Okayama, 1935, 4, 424—437).—Subcutaneous injection of Na cholate increases blood-Ca (I). Splenectomy removes a factor from the liver which is capable of increasing (I). CH. ABS. (p)

**Barbiturates. XI. Methods of barbital research.** C. R. LINEGAR, J. M. DILLE, and T. KOPANYI (J. Amer. Pharm. Assoc., 1935, 24, 847—852).—Prior to determination of barbiturates (I), highly pigmented urines are cleared by Na<sub>2</sub>MoO<sub>4</sub>-H<sub>2</sub>SO<sub>4</sub> or CuSO<sub>4</sub>-Na<sub>2</sub>WO<sub>4</sub>-H<sub>2</sub>SO<sub>4</sub>. Extraction of urines or cleared filtrates by CHCl<sub>3</sub> indicates that excreted (I) are present as acids even in alkaline urines. Following pptn. of blood with Na<sub>2</sub>WO<sub>4</sub>-H<sub>2</sub>SO<sub>4</sub> (Folin-Wu), the CHCl<sub>3</sub> extract of the filtrate is free from substances interfering with the colorimetric determination. (I) are determined in brain by extraction of the powdered (liquid air) tissue with CHCl<sub>3</sub>, concn. of the extract, and removal of phospholipins by pptn. with COMe<sub>2</sub> (cf. A., 1935, 118). F. O. H.

**Barbiturate-picrotoxin antagonism.** C. R. LINEGAR, J. M. DILLE, and T. KOPANYI (Science, 1935, 82, 376—377). L. S. T.

**Use of coramine for combating poisoning from narcotics and hypnotics.** H. KILLIAN (Anesthesia and Analgesia, 1935, 14, 23—27). CH. ABS. (p)

**Effect of ultra-violet irradiation on the anaesthetising power of methyl and ethyl alcohols.** W. P. ELHART and O. S. ORTH (Anesthesia and Analgesia, 1935, 14, 15—19).—The anaesthetic action of MeOH and EtOH on goldfish was accelerated by irradiation as a result of formation of the aldehydes and acids. CH. ABS. (p)

**Rate of production of anaesthesia in mice by ether containing aldehyde and peroxide.** P. K. KNOEFEL and F. C. MURRELL (J. Pharm. Exp. Ther., 1935, 55, 235—241).—Et<sub>2</sub>O containing > 0.07% MeCHO and 0.02% H<sub>2</sub>O<sub>2</sub> is less effective anaesthetically than pure Et<sub>2</sub>O. EtOH acts merely as a diluent. H. D.

**cycloPropane anaesthesia: post-operative morbidity in 2200 cases.** E. R. SCHMIDT and R. M. WATERS (Anesthesia and Analgesia, 1935, 14, 1—3).—Respiratory, nausea, and emetic after-effects of cyclopropane and Et<sub>2</sub>O were < those of C<sub>2</sub>H<sub>4</sub> and N<sub>2</sub>O (with CO<sub>2</sub> absorption), but circulatory complications were slightly greater. CH. ABS. (p)

**Novocaine oxide.**—See this vol., 70.

**Influence of morphine on local anaesthesia of the cornea through various local anaesthetics in rabbits.** K. ARIMA (Folia Pharmacol. Japon., 1935, 19, 283—286).—Small amounts of morphine which do not affect the sensitivity of the cornea increased and lengthened the action of cocaine, tutocaine, and pantocaine. CH. ABS. (p)

**Morphine and ether hyperglycaemia in hypophysectomised dogs.** E. DI B. DE SABELLI and E. J. DI BENEDETTO (Compt. rend. Soc. Biol., 1935, 120, 738—739).—Hyperglycaemia from morphine in hypophysectomised dogs is > in normal dogs, whilst that from Et<sub>2</sub>O is less. R. N. C.

[Pharmacology of] morphine, codeine, and their derivatives. X. Deoxymorphine-C, deoxycodine-C, and their hydrogenated derivatives. N. B. EDDY and H. A. HOWES (J. Pharm. Exp. Ther., 1935, 55, 257—267; cf. A., 1935, 780).—Reduction of the alcoholic OH in members of the morphine and codeine series increases the analgesic and depressor effects and decreases the emetic effect. Of the compounds formed, tetrahydrodeoxymorphine, m.p. 260°, [α]<sub>D</sub><sup>25</sup> -45.5° in EtOH, is new. H. D.

**Effects of morphine and its derivatives on intestinal movements. IV. Dihydro-ψ-codeine and dihydroallo-ψ-codeine.** H. KRUEGER, H. HOWES, and H. GAY (J. Pharm. Exp. Ther., 1935, 55, 288—318).—The quantities of morphine, ψ- and allo-ψ-codeine, dihydro-ψ-codeine and -allo-ψ-codeine required to reduce the frequency of rhythmic contractions of the dog's intestine were as 1:22:108:35:27, respectively; for producing peristalsis 1:45:65:31:54, and for equivalently maintained effects on tone 1:75:22:30:60. H. D.

**Emetic action of apomorphine in rabbit lymph.** S. TAKAHASHI (Arb. dritt. Abt. Anal. Inst. Univ. Kyoto, D, 1934, No. 4, 138—139).—The emetic effect is lost by incubation with blood-serum or lymph. CH. ABS. (p)

**Combined action of quinine and pituitrin, histamine, and barium on the excised uterus and isolated urine bladder of the rabbit.** K. KUNISHO (Folia Pharmacol. Japon., 1935, 19, 333—345).—Stimulative effects were obtained by use of half the min. active dose of one of the drugs with half the dose of any other. A potentiation was observed in all cases except with histamine and quinine on the pregnant uterus. CH. ABS. (p)

**Comparative toxicity of anabasine and nicotine sulphates to insects.** J. M. GINSBURG, J. B. SCHMITT, and P. GRANETT (J. Agric. Res., 1935, 51, 349—354).—Anabasine sulphate was more toxic to a no. of insects than was nicotine, but when used as a stomach poison for grasshoppers and silk-worm larvae was much inferior. A. G. P.

**Effect of nicotine in the albino rat.** C. S. SMITH, S. ROSENFELD, jun., and L. J. SACKS (J. Pharm. Exp. Ther., 1935, 55, 274—287).—Injection of 0.005—0.0075 mg. of nicotine per g. of body-wt. in rats decreased their voluntary muscular activity

and their fat contents; it had no influence on the growth curves or oestrus cycles. H. D.

**Balance of nicotine in the smoking of tobacco in cigarettes.** A. KOPERINA (Tabacn. Prom., 1934, No. 5, 37—40).—Of the nicotine (I) in tobacco, 60% is burned during smoking, 27% escapes on exhalation, and 12% is absorbed by the smoker. Absorption of (I) is through the lungs and not through the stomach or saliva. CH. ABS. (p)

**Use of rabbits in the assay of digitalis, strophanthus, and squill.** G. N. RAPSON and S. W. F. UNDERHILL (Quart. J. Pharm., 1935, 8, 409—423).—Application of the infusion method of assay (Gaddum, A., 1932, 964) indicates that rabbits are less sensitive than cats to ouabain (I), strophanthus (II), or squill, but more sensitive than dogs or guinea-pigs to (I) and (II); to digitalis, rabbits are the most resistant of the four species. With strict adherence to conditions characteristic for each drug, results from rabbits agree with those from cats. F. O. H.

**[Pharmacology of] samandarine and its derivatives and fission products.** O. GESSNER and W. ESSER (Arch. exp. Path. Pharm., 1935, 179, 639—645).—The pharmacological action and min. lethal dose of samandarine (I) and 9 derivatives (A., 1935, 97) were determined in mice. Samandarone approximates to (I) in its activity. No correlation between constitution and pharmacological (especially convulsive) action is apparent. F. O. H.

**Pharmacological action of dendrobine, the alkaloid of Chin-shih-hu.** K. K. CHEN and A. L. CHEN (J. Pharm. Exp. Ther., 1935, 55, 319—325).—Dendrobine produces moderate hyperglycæmia, diminishes cardiac activity in large doses, lowers blood pressure, suppresses respiration, inhibits isolated rabbit's intestine, and contracts the guinea-pig's uterus. H. D.

**Yolk-sac vessels of the chick embryo.** IV, V. T. NAKANO (Folia Pharmacol Japon., 1935, 19, 293—299, 300—305; cf. A., 1935, 893). CH. ABS. (p)

**Comparative actions of sympathomimetic compounds: bronchodilator actions in experimental bronchial spasm of parasymphathetic origin.** J. R. PEDDEN, M. L. TAINTER, and W. M. CAMERON (J. Pharm. Exp. Ther., 1935, 55, 242—256; cf. A., 1934, 1134).—Of fourteen amines tried, the most effective in producing bronchial dilation in dogs treated with arecoline were adrenaline, arterenol, and epininc; activity appeared to be associated with the pyrocatechol nucleus. H. D.

**Action on the gaseous metabolism of poisons for the vegetative nervous system.** F. PÉTER (Biochem. Z., 1935, 281, 111—120).—Subcutaneous administration of ergotamine increases the basal metabolic rate of fasting male rats at 28° (max. 42%) and its effects last 5—6 hr.; atropine (II) slightly reduces the rate, and Na luminal (III) does not affect it. (I)+(III) cause increase, (II)+(III) slight increase, and (I)+(II) and (I)+(II)+(III) have no effect. W. McC.

**Toxicity of optically active and inactive dihydrodeguelins.** W. A. GERSDORFF (J. Agric. Res., 1935, 51, 355—361).—The order of toxicity to goldfish was rotenone > active dihydrodeguelin (I) > deguelin > inactive (I), although the relative proportional toxicity varied somewhat with the concns. examined. A. G.

**Toxicity of methyl alcohol.** A. BENEDICENTI (Mem. R. Accad. Italia, 1935, 6, 601—633).—Injection of MeOH into rabbits and dogs lowers the alkaline reserve of the blood. The toxic action is not influenced by administration of cholesterol (I) or oils containing (I). Most animals tolerate 0.2—0.4 vol.-% in the inspired air, but considerable variations occur with different species and also with animals of the same species. MeOH in air is determined by conversion into  $\text{Me}_3\text{BO}_3$  and subsequent decomp. in 0.1N-NaOH. Severe poisoning is followed by accumulation of MeOH in blood, brain, etc. Normal combustion produces (non-toxic) traces of CO,  $\text{CH}_2\text{O}$ , and other reducing substances. Industrial hazards are discussed. F. O. H.

**Mechanism of mercury diuresis.** J. J. BERTERVIDE and C. RECHNIEWSKI (Prensa med. Argentina, 1934, 21, No. 50—51).—Novasural causes hydræmia only when  $\text{H}_2\text{O}$  is retained in the tissues. The globulin content of blood is reduced. CH. ABS. (p)

**Influence of mercury on cultivated tissues.** III. How will the action of mercury compounds on cultures of fibroblast *in vitro* be influenced by glucose? K. HIRASHIMA (Folia Pharmacol. Japon., 1935, 19, 323—332).—The toxic action of  $1 \times 10^{-6} M$ - $\text{HgCl}_2$  is decreased by raising the glucose concn. in fibroblast culture media 0.01M > that in normal media. Cultures in such media show normal resistance to  $\text{HgCl}_2$ . CH. ABS. (p)

**Repeated injections of a thio-derivative of gold: tolerance and localisation.** A. LEULIER and G. BERUARD (Compt. rend. Soc. Biol., 1935, 120, 651—654).—Sr aurothiopropansulphonate (I) is less toxic than the corresponding Na and Ca salts to guinea-pigs, and diffuses less readily through the organs on account of its low solubility; it is excreted less rapidly in the urine. The Au storage in the kidneys, spleen, liver, and other organs produced by repeated injections of (I) is not much > that produced by the more sol. salts. R. N. C.

**Has glucose any influence on the arsphenamine action on cultivated tissue?** H. OKADA (Folia Pharmacol. Japon., 1935, 19, 287—292).—Combination of glucose and neo- or myo-arsphenamine causes better growth in spleen-tissue cultures than arsenicals alone. CH. ABS. (p)

**Cyanide antidotes.** P. J. HANZLIK and A. P. RICHARDSON (J. Amer. Med. Assoc., 1934, 102, 1740—1745).—Intravenous injection of methylene blue is recommended. A mixture of  $\text{NaNO}_3$  and  $\text{Na}_2\text{S}_2\text{O}_3$  is also effective. CH. ABS. (p)

**Antidote for acute mercury poisoning.** S. M. ROSENTHAL (J. Amer. Med. Assoc., 1934, 102, 1273—

1276).—Oral or intravenous administration of Na formaldehydesulphoxylate proved satisfactory.

CH. ABS.

**Influence of chronic fluorine toxicosis in laying hens on the fluorine content of the egg and its relation to the lipin content of the egg-yolk.** P. H. PHILLIPS, J. G. HALPIN, and E. B. HART (J. Nutrition, 1935, 10, 93—98).—Addition of F-containing rock phosphate to hen's rations increases the F content of egg-yolks. Within the yolk the additional F occurs mainly in the COMe<sub>2</sub>-insol. fraction of the fatty matter, possibly in combination with complex lipins. Ingestion of F by means of mineral phosphate did not reduce egg size.

A. G. P.

**Oxidation-reduction catalysis in the living cell.** P. JOYET-LAVERGNE (Protoplasma, 1935, 23, 50—69).—Published work is discussed in support of the concept that vitamin-A and glutathione act as complementary constituents of a catalytic system controlling intracellular oxidation-reduction processes located on the surface of the chondriome. A. G. P.

**Catalase in lymphocytes.** K. FUKUCHI (Arch. dritt. Abt. Anat. Inst. Univ. Kyoto, D, 1934, No. 4, 65—67).—The catalase activity of lymphocytes from the popliteal gland of rabbits is determined.

CH. ABS. (*p*)

**Iron. IX. Catalase and "readily eliminated" iron of blood.** G. BARKAN (Z. physiol. Chem., 1935, 236, 197—200).—Since the catalase (I) is not affected by CO under conditions in which elimination of Fe is greatly restricted, it follows that (I) is not identical with the "readily eliminated" blood-Fe.

W. McC.

**Cytochrome-c. IV.** K. ZEILE (Z. physiol. Chem., 1935, 236, 212—215; cf. A., 1934, 109; Theorell, A., 1935, 1277).—The mol. wt. (18,000) and hæmin content (3.5%) of the smallest unit of the cytochrome (I) are determined, taking advantage of the non-adsorption of reduced (I) on kaolin. The isoelectric point of (I) is at *p*<sub>H</sub> 8.2.

W. McC.

**Tyrosinase action on mono- and di-hydric substrates.** M. GRAUBARD and J. M. NELSON (J. Biol. Chem., 1935, 111, 757—770).—*p*<sub>H</sub>-activity curves for *p*-cresol (I) with various preps. of tyrosinase (II) are given. The system (I)–(II) proceeds differently from the system pyrocatechol (III)–(II), for in the former (II) is not inactivated, whilst in the latter it is inactivated very quickly and addition of NH<sub>2</sub>Ph produces very little change. With (I) the rate of reaction  $\propto$  concn. of (II), whilst with (III) the total O uptake depends on the *p*<sub>H</sub> and amount of (II). Neither NH<sub>2</sub>Ph nor NaHSO<sub>3</sub> inhibits the reaction, but there may be prolonged induction periods. It is concluded that (II) consists of only one enzyme and that it acts like a peroxidase.

J. N. A.

**Activation by glutathione of the enzymic dehydrogenation of alcohol.** T. WAGNER-JAUREGG and E. F. MÖLLER (Z. physiol. Chem., 1935, 236, 222—227).—Reduced (but not oxidised) glutathione (I), and also KCN [action > that of (I)], Na<sub>2</sub>S,  $\alpha$ -amino-3-naphthol-4-sulphonic acid, and thioglycollic acid (but not pyrophosphate) in presence of dialysed extract of washed yeast activate the enzymic dehydro-

genation of EtOH. The activation is due to the binding of heavy metals, since, when these are as completely removed as possible, the effects of reduced (I) and KCN are < usual and the inhibition caused by added CuSO<sub>4</sub> is counteracted by addition of reduced (I) or KCN [ $\leq$  about 10 mols. of reduced (I) or KCN per mol. of CuSO<sub>4</sub>]. Cysteine (II) does not accelerate the dehydrogenation and even counteracts the effect of reduced (I), probably because heavy-metal compounds of (II) catalyse oxidation of reduced (I).

W. McC.

**Dehydrogenase of lactic acid.** T. WAGNER-JAUREGG and E. F. MÖLLER (Z. physiol. Chem., 1935, 236, 216—221; cf. Adler *et al.*, A., 1935, 1276).—The yellow (flavin) enzyme of yeast plays no part in the aerobic enzymic conversion of lactic acid into AcCO<sub>2</sub>H.

W. McC.

**Enzymes of liver. III. Aldehydease. IV. Alcohol-dehydroase.** L. REICHEL and H. KOHLE (Z. physiol. Chem., 1935, 236, 145—157, 158—167; cf. A., 1934, 807; Battelli *et al.*, A., 1910, ii, 980).—III. Dry preps. of the aldehydease (I) (from pig liver), which retain their activity almost unchanged for > 1 year, have optimal effect at *p*<sub>H</sub> 7.5—7.8, are destroyed at 69°, and cease to act after 2 hr. The action is greatly (> 50%) diminished by KCN, probably because of cyanohydrin production, and decreases as the concn. of substrate increases. Benzoquinone (II) in high concn. inhibits anaerobic dismutation by (I), methylene-blue (III) in high concn. increases it, and the oxidation product (IV) of adrenaline has no effect. Cytochrome and indophenol-oxidase accompany (I), which acts only if they are present. In fresh liver, in presence or absence of O<sub>2</sub> the action of (I) is slight, most of the EtCHO being consumed in other ways.

IV. Alcohol-dehydroase (from frog-liver) does not act in absence of O<sub>2</sub>, converts PrOH (optimum at *p*<sub>H</sub> 6.7—7.3) into EtCHO, no EtCO<sub>2</sub>H being produced, retains its activity for 6—8 weeks in a vac., but loses it in a few days in air, is destroyed at 47.5° (*p*<sub>H</sub> 7.8), is not affected by KCN, and ceases to act after 80 min. The extent of action decreases as the concn. of substrate increases. (II), (III), and (IV) act as intermediate H acceptors in the process and increase the extent of dehydrogenation, but ascorbic acid diminishes it. The extent of dehydrogenation is also increased by preps. from spleen (calf).

W. McC.

**Cabbage-amylase.** B. A. RUBIN and V. E. TRUPP (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 229—232).—In addition to amylase (I) an enzyme cytase (II) exists, capable of hydrolysing cellulose to reducing sugar. In "Amager," a late variety, the leaves are richest in (II), whilst in "No. 1" the stalks have a higher (II) content. The (I) content is const. during storage for 6 months, whilst (II) gradually decreases.

**Reversible inhibition of  $\beta$ -malt-amylase by ascorbic acid and related compounds.** C. S. HANES (Biochem. J., 1935, 29, 2588—2603). The degree of inactivation of  $\beta$ -malt-amylase (I) by ascorbic acid (II), dihydroxymaleic acid (III), and reductone (IV) increases with the time of treatment. With low

conens. of (II) regeneration of activity occurs after 10 min. treatment; the regeneration is more rapid with (III) and (IV), and is correlated in all cases with decreases in the I vals. of the inhibitor-enzyme mixtures. (I) stabilises (II) against oxidation, whilst it accelerates the oxidation of (III) and (IV), thus explaining the difference in inhibiting powers of these three. Preliminary oxidation of the inhibitors, or the addition of a no. of reducing substances such as HCN, reverses the inhibition.  $\text{CuSO}_4$  causes increased inhibition. It is concluded that the sp. effect of (I) lies in its dienol group as opposed to its reducing powers.

H. D.

$\alpha$ - and  $\beta$ -Amylase in ripening wheat grain. P. S. UGRUMOV (Biochem. Z., 1935, 282, 74—78; cf. Purr, A., 1934, 934; Stenstam *et al.*, *ibid.*, 1258).—During the early stages of the ripening,  $\beta$ -amylase, which is predominantly a saccharifying agent, and  $\alpha$ -amylase (I), which produces dextrin, are present. (I) becomes inactive at the "milky" stage and cannot be detected during subsequent ripening or in resting wheat, but it reappears during germination.

W. McC.

Effect of potassium cyanide on amylase activity. J. O. PAGE and D. T. ENGLIS (Trans. Illinois State Acad. Sci., 1934, 27, 74).—The rate of saccharification by barley amylase is unaffected by KCN at  $p_H$  4.56. At  $p_H$  7.0 KCN increases the rate until it approximates to that at  $p_H$  4.56.

CH. ABS. (p)

Conversion of rutin into a brown pigment by tobacco enzymes. C. NEUBERG and M. KOBEL (Naturwiss., 1935, 23, 800—801).—The enzymes of the tobacco leaf convert rutin (quercetinrhamnogluco-side) into a dark brown  $\text{H}_2\text{O}$ -sol. product which on hydrolysis yields a  $\text{H}_2\text{O}$ -insol. aglucone. The reaction, which apparently consists in the oxidation of the rutin, is accelerated by the presence of 0.03%  $\text{H}_2\text{O}_2$ .

W. O. K.

Enzymes of pectin. III. Complete direct hydrolysis of pectolic acid to  $d$ -galacturonic acid by pectolase. F. EHRLICH, R. GUTTMANN, and R. HAENSEL (Biochem. Z., 1935, 281, 93—102; cf. A., 1933, 491).—Crude material obtained from pectin by heating with HCl and washing with  $\text{H}_2\text{O}$  and EtOH is rapidly (3—4 days) converted by pectolase into pure cryst.  $d$ - $\alpha$ -galacturonic acid in 87% yield. The conversion of purified material is much slower (2 months) and is incomplete except at  $p_H$  6—4.

W. McC.

Cellobiase activity of the bovine rumen. C. ANTONIANI (Biochim. Terap. sper., 1935, 22, 48).—Neither the mucosa of the rumen nor aq. extracts made by prolonged maceration in presence of PhMe at 37° hydrolyse cellobiose, although the presence of cellobiase (I) is readily demonstrated in expressed fluid. Possibly (I) is of alimentary origin.

NUTR. ABS. (m)

Retarding action of formaldehyde, acetaldehyde, and acetone on the enzymic hydrolysis of sucrose. A. CHAUDIN (Bull. Soc. Chim. biol., 1935, 17, 1346—1350).—The effect of  $\text{CH}_2\text{O}$ , MeCHO, and COMe<sub>2</sub> on the hydrolysis of sucrose by invertase, like that of alkalis, MeOH, and EtOH, is to retard the

reaction, and displace the curve of reaction rate against time so that the amount of enzyme present appears to be increased.

A. L.

Purification of choline-esterase. E. STEDMAN and (MRS.) E. STEDMAN (Biochem. J., 1935, 29, 2563—2567; cf. A., 1933, 1081).—Preps. of choline-esterase, 50 to 100 times as active as serum, may be prepared from the latter by fractional pptn. with  $(\text{NH}_4)_2\text{SO}_4$  and AcOH and adsorption on  $\text{Al}_2\text{O}_3$  or  $\text{Fe}(\text{OH})_3$  from acid solution using aq.  $\text{NH}_3$  and  $M/3$ -phosphate buffer at  $p_H$  8 as eluents. These preps. do not attack  $\text{PrCO}_2\text{Me}$ .

H. D.

Action of magnesium on the aspartase system. K. P. JACOBSON and F. B. PEREIRA (Compt. rend. Soc. Biol., 1935, 120, 551—554).—Addition of  $\text{Mg}^{++}$  to the aspartase system displaces the equilibrium in favour of fumaric acid formation,  $K_e^{37}$  showing a considerable decrease.

R. N. C.

Enzymes of snake venom. I. Activation of dipeptidase by the venom of the snake *Trimoresurus mucrosquamatus*. Y. TSUCHIYA (J. Agric. Chem. Soc. Japan, 1935, 11, 720—730).—The dipeptidases of extract of dried tortoise liver and of fresh or dried intestinal mucous membrane of the pig are activated by the venom, the effect being pronounced with respect to hydrolysis of leucylglycine, slight with respect to that of valylglycine, and absent with respect to that of glycyl- and alanyl-glycine when the tortoise liver extract is used. The  $p_H$ -activity curve exhibits max. within a certain  $[\text{H}^+]$  zone. The activating power decreases with time and the amount of venom required for max. activation  $\propto$  the amount of enzyme used.

W. McC.

Enzymic proteolysis. VI. Structure of protamines. II. Clupein. E. WALDSCHMIDT-LEITZ and E. KOFRANYI (Z. physiol. Chem., 1935, 236, 181—191; cf. A., 1931, 984).—Clupein is hydrolysed by activated trypsin, 4 peptide linkings being broken [no arginine (I) produced] and the product yields two fractions separated by pptn. with aq. EtOH. The less sol. (N :  $\text{NH}_2$  ratio 9) forms 73% of the product and is a mixture of tripeptides containing 2 (I) residues and 1  $(\text{NH}_2)_1$ -acid residue. The more sol. (N :  $\text{NH}_2$  5) forms 27% and is a mixture of dipeptides containing 1 (I) and 1  $(\text{NH}_2)_1$ -acid residue. The results of acid and enzymic (aminopolypeptidase, arginase, carboxypolypeptidase, dipeptidase) hydrolysis of these fractions indicate the structure of clupein (mol. wt. 2021), which is a chain of 10 (I), 4  $(\text{NH}_2)_1$ -acid, and 1 proline residues, the position of the latter alone being uncertain, although only 3 positions are possible.

W. McC.

Proteolytic enzymes. VIII. Proteolytic systems of papain. M. BERGMANN and W. F. ROSS (J. Biol. Chem., 1935, 111, 659—666).—The enzymic homogeneity and the activation processes of papain (I) are investigated. Substrates such as hippuryl-amide (II) and carbobenzyloxydiglycylglycine are acted on by (I) only after activation by HCN,  $\text{H}_2\text{S}$ , and thioglucose. (I) inactivated by oxidising agents ( $\text{H}_2\text{O}_2$ , I) has its proteinase but not its polypeptidase (III) action reactivated by the above activators,

so that (I) must contain two different proteolytic enzymes.  $\text{NHPh-NH}_2$  completely inhibits the splitting of (II) by HCN-activated (I), but the hydrolysis of gelatin is only slightly affected. Excess of I added to HCN-activated (I) destroys both enzymes, but small amounts inhibit (III) only. The results are in accord with the presence of a CHO group in (III).  
E. A. H. R.

**Enzymic amylolysis. V. Amylophosphatase of barley.** E. WALDSCHMIDT-LEITZ and K. MAYER (Z. physiol. Chem., 1935, 236, 168—180; cf. A., 1934, 449).—Barley and malt extracts contain an enzyme, amylophosphatase (I), which eliminates all bound  $\text{H}_3\text{PO}_4$  from starch paste, and the accompanying decrease in viscosity  $\propto$  the amount of  $\text{H}_3\text{PO}_4$  eliminated. The degradation (optimal at  $p_{\text{H}}$  5.6) results in the production of reducing substances apparently consisting of chains of about 36 glucose residues. (I), which is not activated by amylokinase from malt, is purified and freed from accompanying enzymes by selective adsorption on  $\text{Al}_2\text{O}_3$  and kaolin. Kidney-phosphatase behaves very similarly towards starch paste, but at  $p_{\text{H}}$  5.6 its action is very much slower.  
W. McC.

**Phosphatase of the prostate gland.** W. KUTSCHER and H. WOLBERGS (Z. physiol. Chem., 1935, 236, 237—240; cf. A., 1935, 1268).—The human prostate gland and seminal fluid contain large amounts of a phosphatase (I) not identical with urinary phosphatase. (I), which is destroyed in 5 min. at  $60^\circ$ , exhibits specificity as regards its action on phosphates,  $\alpha$ - and  $\beta$ -glycerophosphates being readily attacked, hexose diphosphate and pyrophosphate only slightly affected.  
W. McC.

**Glycerophosphatase activity of the tissue of animals in avitaminosis-A.** L. EMERIQUE (Bull. Soc. Chim. biol., 1935, 17, 1372—1377).—The phosphatase (I) content of the kidneys and liver of rats suffering from vitamin-A deficiency is the same as that in normal animals. In the lung, however, (I) is  $>$  normal.  
A. L.

**Combining power of taka-diastase towards glycerophosphates.** J. COURTOIS (Bull. Soc. Chim. biol., 1935, 17, 1340—1345).—The reaction coeffs. for the rates of hydrolysis of  $\alpha$ - and  $\beta$ -glycerophosphates by taka-diastase increase regularly with increasing amounts of enzyme up to a certain point and thereafter both remain const., the amount of diastase at this point being the same in both cases. This behaviour is explained by the affinities of the enzyme for both substrates being the same, but the rates of hydrolysis different.  
A. L.

**Comparative hydrolysis of  $\alpha$ - and  $\beta$ -glycerophosphoric acids by vegetable phosphatases. II. Taka-diastase.** J. COURTOIS (Bull. Soc. Chim. biol., 1935, 17, 1318—1339; cf. A., 1935, 122).—The vals. of the optimum  $p_{\text{H}}$  for the hydrolysis of  $\alpha$ - and  $\beta$ -glycerophosphoric acids increase with the substrate concn., the displacement being greater for the  $\beta$ - than the  $\alpha$ -compound. This behaviour is the result of two simultaneous reactions, one involving the affinity of the enzyme for the substrate which increases with acidity and on which depends the

optimum  $p_{\text{H}}$  val. for the reaction at low substrate concn., and the other the actual hydrolytic activity, which at high concn., when the enzyme surface is saturated, controls the  $p_{\text{H}}$  optimum. This interpretation is applied to corresponding observations made with laccase and urease.  
A. L.

**Inhibitory effect of phloridzin on an enzymic dismutation.** H. KALCKAR (Nature, 1935, 136, 872—873).—The dismutative conversion of triose-phosphoric acid into phosphoglyceric acid and glycero-phosphoric acid is prevented or markedly inhibited by approx. 0.01*N*-phloridzin (I). The velocity of conversion of hexose diphosphate into dihydroxy-acetone phosphate (II), and of (II) into glyceraldehyde phosphate, is not affected by this concn. of (I).  
L. S. T.

**Yeast zymin. I. Effect of some electrolytes on carbon dioxide production. II. Effect of ethanol on the production of carbon dioxide. III. Effect of some electrolytes, and of ethanol, on the phosphate content during fermentation.** H. E. STAVELEY, L. M. CHRISTENSEN, and E. I. FULMER (J. Biol. Chem., 1935, 111, 771—783, 785—790, 791—802).—I. The optimum  $p_{\text{H}}$  for the production of  $\text{CO}_2$  by zymin (I) is 5.8—6.2, and (I) is most active when prepared from yeast which has been kept for several days at refrigerator temp.  $\text{NH}_4\text{Cl}$ ,  $\text{MgSO}_4$ , NaCl, and KCl increase the initial max. rate of  $\text{CO}_2$  formation by (I), whilst  $\text{NH}_4\text{Cl}$  (most active),  $\text{MgSO}_4$ , NaCl, and  $\text{CaCl}_2$  increase the steady const. rate of  $\text{CO}_2$ .  $\text{NH}_4\text{Cl}$  and  $\text{MgSO}_4$  increase the rate of  $\text{CO}_2$  formation in presence of added inorg.  $\text{PO}_4'''$ , but the effect of the two salts is not additive.

II. Production of  $\text{CO}_2$  by dried yeast, yeast juice, living yeast, and (I) is increasingly lowered by EtOH in the order named. 1.86% of EtOH reduces the activity of (I) 50%, whereas 14% is necessary to reduce the activity of dried yeast 50%. Inorg.  $\text{PO}_4'''$  does not decrease the sensitivity of (I) towards EtOH.  $\text{NH}_4\text{Cl}$  in presence of EtOH increases the rate of  $\text{CO}_2$  production to  $>$  that observed in absence of EtOH.

III. The optimum  $p_{\text{H}}$  for disappearance of inorg.  $\text{PO}_4'''$  from a (I) fermentation mixture is 6.2—6.4. Electrolytes markedly decrease the time which elapses before  $\text{PO}_4'''$  attains a min. val., and the effects of the cations are in the order  $\text{NH}_4 > \text{Mg} > \text{Na} > \text{K} > \text{Ca}$ . EtOH in low concn. increases the time required for esterification and the min. steady state val. of  $\text{PO}_4'''$ , but the latter is decreased if  $\text{NH}_4\text{Cl}$ , KCl, or NaCl be present also. For compounds of the type  $\text{R-NH}_3\text{Cl}$ , the influence of R in decreasing the time necessary for inorg.  $\text{PO}_4'''$  to reach a min. val. is  $\text{C}_6\text{H}_{11}\text{O}_5 > \text{H} > \text{Me}$ .  
J. N. A.

**Fermentation of carbohydrates.** G. MALYOTH and E. SOMMERFELD (Biochem. Z., 1935, 281, 49—79).—The effect of changes in amount of enzyme, vol. of  $\text{H}_2\text{O}$ , and amount of sugar and of addition of  $\text{KH}_2\text{PO}_4$  with and without nutrient media on the rate and results of fermentation of glucose by yeast has been measured (error usually  $\pm 4\%$ ) in a modification of the micro-apparatus of Krogh. When cell-free press juice is used, 100% fermentation is recorded, the deficit with living yeast being due to sugar con-

sumption for building up the cells, to undetected gaseous exchanges, and to related causes. With living yeast, alone or in nutrient media, the fermentation is accelerated by  $\text{KH}_2\text{PO}_4$ , especially when the proportion of yeast is small. When the juice is used,  $\text{KH}_2\text{PO}_4$  with nutrient medium causes acceleration  $>$  that found with living yeast. The apparatus may also be used to measure the fermentation of polysaccharides (*e.g.*, hydrolysis of maltose by leucocytes from horse blood). W. McC.

**Chemical reactions during alcoholic fermentation.** I. Production and hydrolysis of adenosinetriphosphoric acid and their connexion with hydrolysis of sugar. C. LUTWAK-MANN and T. MANN. II. Theoretical considerations. J. K. PARNAS, C. LUTWAK-MANN, and T. MANN (Biochem. Z., 1935, 281, 140—156, 168—174).—I. Fresh bottom yeast contains appreciable amounts and Lebedev extract only small amounts of adenylic acid (I) and adenosinetriphosphoric acid (II). The extract contains an enzyme which converts (II) into (I), but no enzyme which produces  $\text{NH}_3$  and inorg. phosphate from (I). During alcoholic fermentation with yeast or extract (I) is converted into (II), phosphate being transferred to (I) from hexosediphosphoric acid (III) when the extract is used and otherwise from phosphoglyceric (IV) and phosphopyruvic acid (V) with accompanying production of  $\text{AcCO}_2\text{H}$ . In the first case the process is not affected by  $\text{NaF}$ , in the second it is completely inhibited. (II) added to the extract in presence of glucose yields (III) and (I), but no dephosphorylation of (II) occurs if (III) is present. It is concluded that when fermentable substances are added to (II) fructosediphosphoric acid is produced, and that the transformation of (IV) and (V) into  $\text{AcCO}_2\text{H}$  provides the occasion for a transformation of (II) additional to that which occurs during the first phase of fermentation by yeast.

II. The above (and other) results indicate that (I) and (II) act as phosphate carriers during alcoholic fermentation much in the same way as they do in muscle. W. McC.

**Effect of cholesterol and insulin on fermentation by yeast.** S. HERMANN [with R. NEIGER] (Biochem. Z., 1935, 281, 121—127).—The fermenting power of living yeast is specifically restricted by cholesterol (I) sols which, however, accelerate fermentation by autolysed yeast. Some samples of insulin (II) accelerate fermentation by living yeast, but this acceleration is checked by (I) sols. Fermentation by autolysed yeast is not accelerated by (II). The sensitivity of yeast to poisoning with  $\text{H}_2\text{SO}_4$  and salicylic acid is increased by washing with light petroleum. The acceleration of fermentation caused by cozymase (III) is checked by (I) sols. Apparently the samples of (II) contain a thermostable (not destroyed in 30 min. at  $100^\circ$ ) substance which is not (III). W. McC.

**Effect of vitamin-C on fermentation by yeast and on lactic acid production in *B. aerogenes* cultures and muscle pulp.** K. ZIFF and M. THURAU (Biochem. Z., 1935, 282, 51—55).—Alcoholic fermentation by yeast is not inhibited by ascorbic acid in concns. of 1 :  $10^6$ —1 : 125. Concns.  $<$  0.004M

inhibit production of lactic acid (I) by *B. aerogenes* and those  $<$  0.02M inhibit production of (I) in rabbit muscle pulp, but addition of glycogen to the pulp prevents the inhibition. W. McC.

**Determination of oxygen consumption of yeast.** G. NEUMANN (Biochem. Z., 1935, 281, 181—185).—Spectroscopic examination of a standard oxyhæmoglobin (I) solution (saturated with  $\text{O}_2$ ) to which a known amount of yeast has been added (with exclusion of  $\text{O}_2$ ) permits determination of the time required for the yeast to reduce (I) and hence of the  $\text{O}_2$  consumption of the yeast. If the time of reaction is suitably chosen, the vol. of  $\text{O}_2$  consumed by 1 mg. of yeast is about 17 c.c. with dil. and 22 c.c. with conc. (I) solutions. W. McC.

**Determination of phosphorus in yeast by the bomb calorimeter.** R. AIROLDI (Annali Chim. Appl., 1935, 25, 523—525).—Application of the method of Garelli and Carli (A., 1933, 621, 1179) to yeast is described. F. O. H.

**Influence of buffer on sugar consumption and acid production by *Aspergillus*.** V. BOLCATO (Annali Chim. Appl., 1935, 25, 515—523).—Production of acid by *Aspergillus* grown in aq. sucrose is increased by the presence of citrate buffer, due to both buffering action and diminished rate of carbohydrate consumption. Utilisation of the citric acid produced is unaffected. F. O. H.

**Chemistry of mould-tissue. VIII. Innate factors influencing growth and sterol production of *Aspergillus fischeri*.** P. R. WENCK, W. H. PETERSON, and H. C. GREENE. IX. Cultural factors influencing growth and sterol production of *A. fischeri*. P. R. WENCK, W. H. PETERSON, and E. B. FRED (Zentr. Bakt. Par., 1935, II, 92, 324—330, 330—338; cf. A., 1935, 535).—VIII. Growth and sterol (I) production varied with the strain used.

IX. With a no. of C sources the amount of mycelium produced and its (I) content were inversely related. Urea was the best N source in  $\text{CaCO}_3$ -free media, whereas  $\text{NH}_4\text{NO}_3$  was superior in the presence of  $\text{CaCO}_3$ . The % of (I) in mycelium increased with the glucose concn. in the medium, with the glucose : urea ratio (optimum 40 : 1), and with temp. (optimum  $37^\circ$ ). With prolonged incubation, production of (I) increased even after autolysis of mycelium set in. Aeration influenced the rate of fermentation, but not of (I) formation. The max. % of (I) was obtained in low-urea media at  $p_{\text{H}}$  2.0. A. G. P.

**Production of dimethylpyruvic and pyruvic acids by *Aspergillus niger*.** T. HIDA (J. Shanghai Sci. Inst., 1935, IV, 1, 201—214).—The mycelium of *A. niger*, when transferred to a medium of  $p_{\text{H}}$  7, containing glucose or sucrose 5%,  $\text{Na}_2\text{SO}_3$  5%,  $\text{NH}_4\text{Cl}$  1%,  $\text{KH}_2\text{PO}_4$  2%, produces  $\text{Pr}^2\text{CO}\cdot\text{CO}_2\text{H}$  (I) and  $\text{AcCO}_2\text{H}$  (II). (I) was synthesised by the interaction of  $\text{Et}_2\text{C}_2\text{O}_4$ ,  $\text{Pr}^2\text{Br}$ , and Mg in  $\text{Et}_2\text{O}$ . The Mg compound on decomp. with  $\text{H}_2\text{O}$  affords the Et ester of (I).  $\text{NH}_4^+$  favours the production of (I) and inhibits that of (II). J. H. B.

**Effect of thymol on progress of rabbit moniliasis.** W. D. STOVALL, S. B. PESSIN, and L. ALMON (J. Lab. Clin. Med., 1935, 20, 572—582).—Thymol

(I) inhibits growth of *Monilia* in cultures, but has no effect on the progress of infection in rabbits. (I) is completely absorbed and can be recovered from urine, blood, or liver, but not in appreciable amounts from faeces. CH. ABS. (p)

Effect of certain nitrogen compounds on growth of *Chlorogonium* and *Chilomonas*. J. B. LOEFER (Arch. Protistenk., 1935, 85, 74—86).—*Chilomonas* cannot utilise  $\text{NH}_2$ -acids, whereas *Chlorogonium* produces markedly increased growth, notably with aspartic acid. Neither species can use amide-N. A. G. P.

Alcohol- and carbohydrate-oxidising bacteria isolated from fruits, and a new classification of oxidising bacteria. II. T. ASAI (J. Agric. Chem. Soc. Japan, 1934, 10, 1124—1136; 1935, 10, 50—60; cf. A., 1934, 1036).—Organisms are grouped according to the optimum temp. for multiplication. The optimum  $p_{\text{H}}$  for production of gluconic acid is < that for multiplication. Peptone and glucose are the best sources of N and C, respectively. CH. ABS. (p)

Deamination of alanine by bacteria. E. AUBEL and F. EGAMI (Compt. rend. Soc. Biol., 1935, 120, 684—685).—"Resting" bacteria in aerobiosis convert alanine into  $\text{AcCO}_2\text{H}$  more readily in presence of  $\text{NO}_3^-$ , which is reduced, or of  $\text{NH}_2\text{OH}$ . The process is therefore probably a dehydrogenation; the action of catalase on the  $\text{H}_2\text{O}$  formed, which would otherwise destroy the  $\text{AcCO}_2\text{H}$ , is partly inhibited. R. N. C.

Mechanism of non-symbiotic fixation of atmospheric nitrogen. T. R. BHASKARAN and V. SUBRAHMANYAN (Current Sci., 1935, 4, 234—235).—In cultures of soil organisms glucose decomp. was rapid during the first 4 days. During this period  $\text{CO}_2$  and org. acids were produced and approx.  $\frac{1}{3}$  of the expected amount of N was fixed. Of this much was in a  $\text{H}_2\text{O}$ -sol. form. Subsequently (4—8 days) org. acids were destroyed, mucilage was formed, and N was fixed. Formation of mucilage and N fixation are related, but not proportional. A. G. P.

Occurrence of *Azotobacter* at high temperatures. J. SINGH and A. HUSSAIN (Current Sci., 1935, 4, 235—236).—*Azotobacter* survive in a vegetative condition at  $45^\circ$ . A. G. P.

Can *Azotobacter chroococcum* synthesise vitamin-D? J. E. GREAVES (J. Bact., 1935, 30, 143—148).—When grown on synthetic media *A. chroococcum* can synthesise ergosterol, which is transformed into vitamin-D by irradiation. A. G. P.

Occurrence of a strain of *Azotobacter chroococcum* which does not ferment mannitol. N. R. SMITH (J. Bact., 1935, 30, 323—328).—The organism is widely distributed in soils. A. G. P.

*Bacterium acidi lactici*, Hueppe, and its systematic classification on the basis of its properties. G. PRANGE (Zentr. Bakt. Par., 1935, II, 92, 305—324).—Comparison is made of the biochemical activities of various organisms of the *coli-aerogenes* group and of *B. acidi lactici*. The latter does not ferment sucrose, raffinose, dextrin, starch, inulin, dulcitol, or inositol, fails to grow in citrate-

$\text{NH}_4\text{Cl}$  media, and produces indole from tryptic-peptone- $\text{H}_2\text{O}$ . A. G.

Toxin formation by bacteria. I. Stimulatory and inhibitory substances in peptones. P. STADLER and I. MEISSNER (Zentr. Bakt. Par., 1935, I, 134, 102—109).—The influence of peptones on toxin production by *B. botulinus* varied with their source and method of prep., and was dependent on the presence of certain chemical substances. Decomp. products of animal proteins have an inhibitory action. A. G. P.

Metabolism of *Bact. coli*. Production of biogenic amines. P. STADLER and E. NEUS (Zentr. Bakt. Par., 1935, I, 134, 110—114).—Some strains of *B. coli* converted tyrosine into tyramine, others produced OH-acids by deamination. A. G. P.

Influence of lithium chloride on *Bact. coli*. II. K. RICHTER (Zentr. Bakt. Par., 1935, II, 92, 249—256).—Addition of  $\text{LiCl}_2$  to agar media lowered the dry-matter production, sugar fermentation, and respiration rates of cultures. A. G. P.

Acid and gas formation by members of the *coli-aerogenes* intermediate groups in the presence of certain sugar alcohols and their anhydrides. K. P. DOZOIS, F. HACHTEL, C. J. CARR, and J. C. KRANTZ, jun. (J. Bact., 1935, 30, 189—192).—Dulcitol and mannitol are fermented by many organisms of the group, but the anhydrides are not utilised. A. G. P.

Amino-acids necessary for growth of *Cl. sporogenes*. P. FILDES and G. M. RICHARDSON (Brit. J. Exp. Path., 1935, 16, 326—335).—Growth occurs in a medium containing  $\text{NH}_2$ -acids as N source, the indispensable  $\text{NH}_2$ -acids being tryptophan, tyrosine, phenylalanine, arginine, and leucine; histidine, cystine, methionine, and valine are also probably indispensable. R. N. C.

Gonococcal polysaccharides. S. MUTERMILCH and A. GRIMBERG (Compt. rend. Soc. Biol., 1935, 120, 587—589).—A polysaccharide with the properties of a hapten is isolated from *Gonococci* by dissolving in Na taurocholate, acidification with  $\text{AcOH}$ , filtration, neutralisation with  $\text{NaOH}$ , and evaporation in vac.; proteins are coagulated by heating to  $100^\circ$  and removed by filtration, and the polysaccharide is repeatedly pptd. with  $\text{EtOH}$  in alternately acid and alkaline solutions. The final product is protein-free, and yields a reducing sugar on hydrolysis. It fixes the antigenococcal antibody. R. N. C.

Interrelationship between the amount of V-factor and the amount of air necessary for growth of *Haemophilus influenza*, type b, in certain media. M. PITTMAN (J. Bact., 1935, 30, 148—161).—Growth of the organism in certain media containing small amounts of V-factor is initiated only if the culture is well aerated. With more V-factor less air is necessary. A. G. P.

Biochemistry of *Bacillus mesentericus hydrolyticus*. S. HERMANN and P. NEUSCHUL (Biochem. Z., 1935, 281, 219—230).—The bacillus, obtained from carrots, grows very poorly or not at all anaerobically, liquefies gelatin, and coagulates milk (clots

later liquefied). It grows best in media (*e.g.*, vegetables or suspensions containing them) containing org. N (no growth if no org. N) and cellulose or hemi-cellulose. Growth on bouillon or peptone solutions is not accompanied by production of  $H_2S$  or indole. Acid production is very small; no gas is evolved and no reducing substances (Fehling) are produced except from starch, which, like sugars (glucose, fructose, sucrose, galactose, maltose, lactose), is hydrolysed. The bacillus and enzymes obtained from it have powerful softening action on vegetables, the connective tissue being destroyed. W. McC.

**Relation of micro-organisms to carotenoids and vitamin-A. II. Production of carotenoids by *Mycobacterium phlei*.** M. A. INGRAHAM and H. STEENBOCK (Biochem. J., 1935, 29, 2553—2562).—On a medium containing asparagine (I), glucose (II),  $K_2HPO_4$ ,  $MgSO_4$ , and Na and  $Fe^{III}$  citrates *M. phlei* produced less pigment than when  $[K^+]$  and  $[HPO_4^{''}]$  were lowered, or when glycols and alcohols replaced (II); at normal  $p_H$  replacing (I) with  $NH_4^+$ ,  $CO(NH_2)_2$ , and peptones was without influence on pigmentation. Increasing the  $[Fe^{III}]$  prevents pigmentation; excess of (I) causes autolysis, and on media containing glycerol or low concn. of (II), (I) is attacked by the bacteria.  $C_2H_4$ ,  $Na^+$ ,  $Li^+$ ,  $Ca^{++}$ ,  $Mg^{++}$ , and Se, the redox potential, the light intensity, and temp. were without effect on pigmentation. By separating the pigments from light petroleum on an adsorption column the presence of  $\alpha$ - and  $\beta$ -carotene, kryptoxanthin, and esters of lutein, zeaxanthin, and azafrin was established. H. D.

**Solubility of *Pneumococcus* in saponin. III. Saponinlysis reaction as a means of differentiating *Pneumococcus* and *Streptococcus*.** S. J. KLEIN (J. Bact., 1935, 30, 43—48; cf. A., 1933, 1207). A. G. P.

**Kinetics of the attack on glucose and lactic acid by small concentrations of bacteria; concept of minimum active concentrations.** P. CHAIK (Compt. rend., 1935, 201, 626—628).—Of three species of propionic bacteria, one exhibited a threshold concn. below which it decomposed neither glucose nor lactic acid, the second a threshold for short but not for long periods of incubation, and the third a threshold for glucose, but for lactic acid only some retardation of decomp. W. O. K.

**Physiology of *Rhizobium*. III. Respiration and growth as influenced by the reaction of the medium.** D. W. THORNE and R. H. WALKER. IV. **Utilisation of carbonaceous materials.** O. R. NEAL and R. H. WALKER (J. Bact., 1935, 30, 33—42, 173—187; cf. A., 1933, 638, 752).—III. Growth of *R. meliloti* and *R. japonicum* reached max. at  $p_H$  7.0, 6.7—6.9, decreasing to zero at 4.6—4.9, 4.2 and 9.6, 9.5, respectively. The optimum  $p_H$  for respiration was  $>$  that for growth in both cases.

IV. No significant differences in the rate and extent of  $O_2$  consumption by *R. meliloti* were apparent in media containing glucose (I), mannitol (II), or sucrose (III). Galactose (IV) and arabinose (V) were more effectively utilised than (I) on  $NO_3^-$  and on  $NH_4^+$  media. Maltose (VI), lactose (VII), inositol, dulcitol,

and sorbitol with both forms of N and raffinose and erythritol (VIII) on  $NH_4^+$  media were inferior to (I). As measured by total  $O_2$  consumption  $NH_4^+$  was more readily utilised than  $NO_3^-$ . For *R. japonicum*, (V) was the best energy source, (I), (IV), and xylose were equally effective, whereas (II), (VI), (VII), (III), and (VIII) were utilised little or not at all.  $NO_3^-$  was more effective than  $NH_4^+$ . A. G. P.

**Factors influencing the respiration of *Rhizobium*.** D. W. THORNE and R. H. WALKER (Proc. Iowa Acad. Sci., 1934, 41, 63—70).—Stimulation of *R. meliloti* by certain substances (yeast and legume extracts) is attributable to their nutrient content. The assumption that there is a co-enzyme of respiration is not substantiated. CH. ABS. (p)

**Oxidation of glucose by *Rhizobium meliloti*.** O. R. NEAL and R. H. WALKER (Proc. Iowa Acad. Sci., 1934, 41, 167—168).—In media containing  $M/540$ — $M/180$  concns. of glucose the  $O_2$  consumption of *R. meliloti* increased rapidly for 4—8 hr. and subsequently declined to a low and fairly const. level, the total consumption being approx.  $\frac{1}{3}$  of that required for complete oxidation. The proportion of glucose-C converted into  $CO_2$  in the presence of  $NH_4^+$ -N was  $<$  that in the presence of  $NO_3^-$ -N. CH. ABS. (p)

**Inhibition of growth of *Bacillus subtilis* on a modified extract agar by X-irradiation of the medium.** I. H. BLANK and H. KERSTEN (J. Bact., 1935, 30, 21—32).—The action of soft X-rays on agar produces a diffusible, non-volatile substance which is toxic to *B. subtilis*. A. G. P.

**Metabolism of spirochaetes *in vitro*.** G. SCHEFF (Zentr. Bakt. Par., 1935, I, 134, 35—43).—In 4 species examined no  $O_2$  consumption was apparent. Production of  $CO_2$  occurs only in carbonate media and results from the action of lactic acid formed from sugars. A. G. P.

**Evolution of dehydrogenases of *Staphylococcus aureus* during growth.** D. BACH (Compt. rend. Soc. Biol., 1935, 120, 673—674).—The dehydrogenase content of the cultures falls as their age increases; the nature of the H donator does not affect the rate of decrease. R. N. C.

**Hydrogen donators for *Staphylococcus aureus*.** D. BACH (Compt. rend. Soc. Biol., 1935, 120, 608—610).—The active H donators include most carbohydrates and related substances and eight org. acids. EtOH and BuOH are the only active alcohols, and cysteine and glutamic acid the only active  $NH_2$ -acids; the activities of these are very feeble. Simple aldehydes, ketones, and natural bases are inactive. R. N. C.

***Staphylococcus* toxins and anti-toxins.** A. T. GLENNY and M. F. STEVENS (J. Path. Bact., 1935, 40, 201—210).—Certain strains produce two toxins for which there are corresponding antibodies. CH. ABS. (p)

**Differentiation of *Streptococcus pyogenes* from man and animals by the sorbitol-trehalose test.** F. C. MINETT (J. Path. Bact., 1935, 40, 357—364).—Trehalose is usually fermented by human, and sorbitol by bovine, strains. CH. ABS. (p)

**Toxic fraction of scarlatinal streptococci.** C. A. GREEN (Quart. J. Med., 1935, 4, 93—115).—All strains produced a heat-labile exotoxin. Broth filtrates also contained an acid-insol. toxic fraction similar to that from an alkaline extract of washed bacterial bodies. It was species-sp. CH. ABS. (*p*)

**Differences in effect of mercuric phenyl chloride on different races of bacteriophage and similarity in effect on a phage and its homologous organism.** N. R. GOLDSMITH (J. Bact., 1935, 30, 237—242).—Lysis by bacteriophages of *Staphylococcus* or of *Escherichia coli* was not affected by HgPhCl (1 : 20,000—80,000) in a contact period of 30 min. After 6 weeks' contact the *Staphylococcus* phage was destroyed, but that of *E. coli* remained unaffected. Toxicity of the antiseptic to the sp. phage is paralleled by that to the homologous organism.

A. G. P.

**Stimulation of bacterial growth rate by germanic methyl oxide.** P. L. CARPENTER, McD. FULTON, and C. A. STUART (J. Bact., 1935, 30, 137—142).—As compared with nutrient broth cultures those in germanic Me oxide broth are inhibited during the lag phase, stimulated during the early logarithmic phase, and show a premature period of decline.

A. G. P.

**Action of sulphurous acid on bactericidal power of blood.** H. CREMER (Z. Unters. Lebensm., 1935, 20, 315—317).—Prolonged administration of small amounts of H<sub>2</sub>SO<sub>3</sub> to rabbits markedly decreases the power of the blood to destroy staphylococci.

E. C. S.

**Bactericidal principle in excretions of surgical maggots, which destroys important etiological agents of pyogenic infections.** S. W. SIMMONS (J. Bact., 1935, 30, 253—267).—The active bactericidal principle (not a bacteriophage) isolated from excreta of surgical maggots is heat-stable and retains its activity longer in a desiccated condition than in solution.

A. G. P.

**Therapeutic application of phenylmercuric salts. Use of basic phenylmercuric nitrate in gynaecology.** L. H. BISKIND (Lancet, 1935, 229, 1049—1052).

L. S. T.

**Antiseptic action of certain metals.** V. JENSEN and A. JENSEN (Zentr. Bakt. Par., 1935, I, 134, 86—96).—The efficiency of Ag-Hg, Ag, Ag<sub>2</sub>O, and AgCl as urinary disinfectants is examined.

A. G. P.

**Microbiological basis of chemotherapeutic action. II. Microscopical detection of therapeutically applied gold in spirochaetes, trypanosomes, and bacteria by ultracrystallisation.** N. VON JANCsó and E. NOVAK (Zentr. Bakt. Par., 1935, I, 134, 76—86).—The method is based on the absorption of injected Au by spirochaetes in rats or mice. Spirochaetes are removed centrifugally from a blood sample. From a smear on a slide org. matter is removed by gentle ignition and the remaining minute Au crystals serve as nuclei for crystal formation from a "developing" solution of AuCl<sub>3</sub>-K<sub>3</sub>Fe(CN)<sub>6</sub>. The Au "picture" is examined microscopically.

A. G. P.

**Influence of various metallic compounds on the growth of bacteria.** W. HAASE (Med. Klin., 1934, 30, 1585—1587; Chem. Zentr., 1935, i, 2199).—The germicidal action of Cu, brass, Sn, Al, and Ag foil was relatively small compared with that of Simanit (Ag<sub>2</sub>O<sub>2</sub>, MnO<sub>2</sub>) or Euthagen (Ag salt of thiocellobiose).

A. G. P.

**Effect of hormones on alcohol metabolism.** E. M. P. WIDMARK (Biochem. Z., 1935, 282, 79—84; cf. A., 1934, 213; 1935, 655).—In dogs, administration of pituitrin, adrenaline, and thyroxine has no effect on the metabolism of EtOH, but that of insulin (I) greatly increases slow rates of EtOH metabolism until the max. attainable under normal conditions is reached; high rates are not affected. The naturally occurring differences in the rates are partly dependent on the (I) content of the organism. The effect of (I) is not counteracted by giving sucrose.

W. McC.

**Adrenaline content of adrenals of splenectomised dogs.** S. TSUJIOKA (Arb. Med. Fak. Okayama, 1935, 4, 445—452).—The abs. content of adrenaline and the amount per g. of gland increase until the 15th day after splenectomy and subsequently decline to normal (30th day).

CH. ABS. (*p*)

**Adrenal cortex. I. Fractionation of hormone concentrates.** J. J. PFIFFNER, O. WINTERSTEINER, and H. M. VARS. II. Isolation of several physiologically inactive crystalline compounds from active extracts. O. WINTERSTEINER and J. J. PFIFFNER (J. Biol. Chem., 1935, 111, 585—597, 599—612).—I. The cortical hormone preps. were assayed by an earlier method (A., 1934, 566). Preps. from ox glands (*ibid.*, 1267) were purified by alternate dissolution in H<sub>2</sub>O and Et<sub>2</sub>O and contained 100—200 dog units per mg.; these preps. gave phenylhydrazones in cold aq. AcOH. More active preps. which did not reduce alkaline AgNO<sub>3</sub> were obtained by using C<sub>6</sub>H<sub>6</sub> in place of Et<sub>2</sub>O in the alternate dissolution procedure. By fractionation of these preps. one containing 400 dog units per mg. was obtained; this absorbed at 236 mμ, was pptd. by NHPh-NH<sub>2</sub>, but no insol. NaHSO<sub>3</sub>, semicarbazide, oxime, or dimedon derivatives were obtained.

II. Four physiologically inactive compounds were separated from the most active preps.: C<sub>20</sub>H<sub>34</sub>O<sub>5</sub> or C<sub>21</sub>H<sub>36</sub>O<sub>5</sub>, m.p. 214°, C<sub>21</sub>H<sub>32</sub>O<sub>5</sub> (I), m.p. 210—214°, C<sub>24</sub>H<sub>40</sub>O<sub>7</sub>, m.p. 126—128°, and one with undetermined empirical formula, m.p. 236—239°. (I) reduces Benedict's solution and alkaline AgNO<sub>3</sub> and is possibly identical with the life maintenance hormone of Kendall, but the absence of physiological activity is stressed. Leucylproline anhydride was also separated.

H. D.

**Physico-chemical state of the adrenal hormone in the blood.** D. BROWN and H. SCHEINER (Compt. rend., 1935, 201, 794—795).—Minced adrenal capsules give up their adrenaline (I) to serum (II), distilled H<sub>2</sub>O (III), or H<sub>2</sub>O at *p*<sub>H</sub> 3.5—4.0 (IV). (III) and (IV) when injected into atropinised dogs under chloralose anaesthesia affect the blood pressure as does (I); (II) produces a much more prolonged, but less abrupt, rise in arterial pressure and there is no apnoea. The (I) in (III) and (IV) is completely

ultrafilterable, but in (II), practically not at all. Extraction of (II) with  $\text{Et}_2\text{O}$  or  $\text{C}_6\text{H}_6$ , or acidification to  $p_{\text{H}}$  3.5—4.0, or dilution with  $\text{H}_2\text{O}$ , or treatment with  $\text{Ca}^{++}$ , renders the (I) completely ultrafilterable. The hormone is probably bound to the protein-lipin complexes of the blood. J. L. D.

**Action of adrenaline on liver suspensions.** E. GEIGER (Biochem. Z., 1935, 281, 86—92; cf. A., 1932, 188).—The sedimentation of the material pptd. from colloidal liver preps. (frog) by  $\text{CCl}_3\text{-CO}_2\text{H}$  is specifically accelerated (thyroxine, insulin, histamine, ergotamine, ephedrine, morphine, and atropine in equiv. concns. have no effect) by added adrenaline (I) (concn.  $10^{-6}$ — $10^{-16}$ ), although degradation of glycogen (II) and sugar production are unaffected. The effect appears after  $\leq 5$  min., reaches its max. after about 20 min., and then becomes less pronounced. In the absence of (II) or at  $p_{\text{H}}$  outside the range 5.5—7.5, or if the diastatic activity of the preps. is destroyed by heating for 1 hr. at 48—50°, there is no effect, but sedimentation is more rapid when (II) is absent. Added (I) has no effect on the extent of degradation or on production of simplexes. Possibly (I) alters the physical state of (II), reducing its power as a protective colloid. W. McC.

**Influence of peripheral lymph on the blood-sugar fluctuation due to adrenaline.** H. ARAKI (Arb. dritt. Abt. Anat. Inst. Univ. Tokyo, D, 1934, No. 4, 145—151).—Blood-sugar fluctuations were greatly suppressed when adrenaline-lymph mixtures were stored (notably at 37° for 24 hr.) prior to injection. Lymph alone caused very little fluctuation.

CH. ABS. (p)

**[Slow] continuous injection of adrenaline: [absence of] effect on blood-urea, -cholesterol, and -calcium.** A. BAUDOUIN, H. BÉNARD, J. LEWIN, and J. SALLET (Compt. rend. Soc. Biol., 1935, 120, 629—631). R. N. C.

**Influence of oxidation-reduction system on adrenaline action.** III. K. TERAI and H. ICHITSUBO (Folia Pharmacol. Japon., 1935, 19, 306—322; cf. A., 1935, 1172).—Injection of  $\text{NaHSO}_4$  instead of quinol into rabbits produced the quinol-effect on adrenaline action.

CH. ABS. (p)

**Inactivation of adrenaline by acetaldehyde verified on several plain-muscle organs.** A. M. BAPTISTA (Compt. rend. Soc. Biol., 1935, 120, 547—550).—The inactivation of adrenaline by  $\text{MeCHO}$  is confirmed on the Löwen-Trendelenburg vascular prep., the isolated rabbit intestine, the enucleated frog's eye, and the bronchial muscle of the cat or dog. R. N. C.

**Inactivation of adrenaline by methylglyoxal, glyceraldehyde, and acetaldehyde.** J. T. RICO and A. M. BAPTISTA (Compt. rend. Soc. Biol., 1935, 120, 545—546).—Adrenaline is inactivated as regards its pressor effect in decerebrate dogs by  $\text{AcCHO}$ , glyceraldehyde, and  $\text{MeCHO}$ , but not by  $\text{AcCO}_2\text{H}$  or phosphoglyceric acid. The inactivation is not opposed by ascorbic acid. R. N. C.

**Hypocalcaemia of depancreatized dogs.** R. GERSCHMAN and A. D. MARENZI (Compt. rend. Soc. Biol., 1935, 120, 737—738).—Total pancreatectomy

in normal and hypophysectomized dogs induces a fall of blood-Ca and an increase of plasma- $\text{PO}_4$ . Ca is restored to normal by parathormone, but depressed still further by anterior pituitary extract. The Ca depression is due to parathyroid lesions following pancreatectomy. R. N. C.

**Use of mice in the standardisation of parathyroid hormone.** Effect of parathyroid on rachitic rats examined by the "line" test. F. J. DYER (Quart. J. Pharm., 1935, 8, 513—524).—The Mg-Ca antagonism method of Simon (A., 1935, 539) is applied by using at least 20 mice in each group, administering 1.7—1.8 mg. of  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$  per g. body-wt., and recording the max. no. of mice affected 20—60 min. after injection of Mg. The % obtained for parathyroid prep. and control are then referred to a standard curve. Parathyroid preps. supplement the calcification produced by vitamin-D as indicated by the "line" test (A., 1928, 1288), but the test when used for parathyroid alone is insensitive and non-sp. F. O. H.

**Influence of temperature on the secretion of thyrotropic hormone.** G. KUSCHINSKY (Arch. exp. Path. Pharm., 1935, 179, 726—737).—Exposure of rats to cold (4°) is accompanied by normal activity of the thyroid gland (indicated histologically) for 10 days, after which the activity markedly increases. At 38—40°, the gland is normal for the first few days, inactive at the 14th, and, in some cases, again active after 26—33 days. These changes are correlated with those in thyrotropic activity of the pituitary gland and the presence of an inhibitory factor.

F. O. H.

**Thyroid standardisation and dosage.** R. F. CORRAN, J. PRITCHARD, and F. E. RYMILL (Quart. J. Pharm., 1935, 8, 331—336).—Variations in total and thyroxine (I-I) contents of fresh and of dried defatted glands invalidate any correlation between "thyroid B.P. 1932" and preps. expressed as fresh or dried gland. The relative activities of U.S.P. X and B.P. 1932 thyroid preps. are approx.  $74 \pm 12 : 100$ . Following hydrolysis, direct determination of I on the acid-insol. [(I)-containing] ppt. affords a check for the B.P. 1932 method for (I) in thyroid preps.

F. O. H.

**Role of the thyroid in the process of plumage development in chicks.** I. N. LEKTORSKY and N. A. KUSMINA (Biol. Zentr., 1935, 55, 16—29).—The thyroid hormone shows no preferential effect on plumage development. R. N. C.

**Influence of thyroxine on the hypoglycaemic action of cholic acid.** H. KOSAKA (Arb. Med. Fak. Okayama, 1935, 4, 370—378).—Thyroxine does not alter the blood-sugar level of normal rabbits, but lowers the capacity of Na cholate to produce a hypoglycaemia when injected simultaneously.

CH. ABS. (p)

**Preparation of prolactin.** R. W. BATES and O. RIDDLE (J. Pharm. Exp. Ther., 1935, 55, 365—371).—Prolactin (I) free from follicle-stimulating (II) and thyrotropic hormone (III) is prepared by extraction of the anterior lobe with 60—70% aq.  $\text{EtOH}$  at  $p_{\text{H}}$  9—10 and pptn. of (I) at higher  $\text{EtOH}$  concns. (I) is separated from (II) and (III) by pptn. from aq.

solution with  $\text{H}_2\text{SO}_4$  and is further purified by dissolution in aq.  $\text{EtOH}$  and repeated pptn. with  $\text{NaCl}$  at  $p_{\text{H}}$  6. Preps. so obtained have a potency of 5–10 units per mg. and may be boiled at  $p_{\text{H}}$  8 for 1 hr. without loss of potency. H. D.

**Diabetogenic anterior pituitary action independent of the adrenals.** B. A. HOUSSAY and L. F. LELOIR (Compt. rend. Soc. Biol., 1935, 120, 670–672).—Adrenaline produces a transitory hyperglycæmia, but neither it nor cortin is diabetogenic. Anterior pituitary extract (I) produces diabetic hyperglycæmia in hypophysectomised, pancreatectomised, and adrenalectomised toads, and in adrenalectomised dogs, together with glycosuria; splanchnic section or sympathectomy does not inhibit the action. The hyperglycæmia produced in partly adrenalectomised dogs persists after complete adrenalectomy only if (I) administration is continued; the diabetogenic action of (I) is therefore independent of the adrenals. R. N. C.

**Effect of hypophysectomy on pregnancy and lacteal secretion in the bitch.** B. A. HOUSSAY (Compt. rend. Soc. Biol., 1935, 120, 496–497).—Hypophysectomy results in abortion in pregnant, and cessation of secretion in lactating, bitches. The anterior pituitary is the necessary part of the gland; the effects are not induced by removal of the posterior lobe only, and are abolished by anterior pituitary extract. R. N. C.

**Lacteal secretion provoked by anterior pituitary extract in the dog.** B. A. HOUSSAY (Compt. rend. Soc. Biol., 1935, 120, 502–503). R. N. C.

**Lacteal secretion through the action of anterior pituitary extract in male guinea-pigs.** J. L. SARDI (Compt. rend. Soc. Biol., 1935, 120, 503–504). R. N. C.

**Glutathione in the tissues of the hypophysectomised dog: evidence for a pituitary-thyroid and pituitary-testicular association.** L. BINET, L. KÉPINOV, and G. WELLER (Compt. rend. Soc. Biol., 1935, 120, 589–590).—Hypophysectomy produces a fall of total glutathione (I) of blood < that of reduced (I). The red cell count is only slightly reduced. (I) is normal in the adrenals, spleen, pancreas, and cardiac muscle, and only reduced (I) falls in skeletal muscle. Both total and reduced (I) fall considerably in the liver, thyroid, and testicle, the falls being similar to those noted by Marenzi in the toad. The results favour a biochemical association between the pituitary and the thyroid and testicle. R. N. C.

**Influence of extract of posterior lobe of pituitary gland on urine- and blood-inorganic phosphate.** G. DOBERO (Arch. Farm. sperim., 1935, 60, 422–429).—Subcutaneous or intravenous injection of posterior pituitary extracts into rabbits increases the serum-inorg.  $\text{PO}_4'''$ ; the urinary level tends to decrease. The phenomena are apparently independent of changes in renal function. F. O. H.

**Influence of luteinising substance on (a) function of the lipin-containing cells of ovaries, (b) testes.** G. KUSCHINSKY and TANG-SU (Arch.

exp. Path. Pharm., 1935, 179, 717–721, 722–725).—(a) Administration to rats of anterior pituitary-like prep. from pregnancy urine (prolan) (I) inhibits formation and ripening of follicles and promotes luteinisation in the ovaries. (b) (I) enlarges the lipin-containing cells of rats' testes. F. O. H.

**Estrogenic activity of cow's urine during pregnancy.** M. M. O. BARRIE, J. B. E. PATTERSON, and S. W. F. UNDERHILL (Quart. J. Pharm., 1935, 8, 424–428).—Only small amounts of œstrin (< 50 international units per litre) are excreted by cows during the first 23 weeks of pregnancy; after this period the level increases to 700 units per litre at the 30th week, 4000 at the 34th, and 17,000 at the 37th. During the final weeks, the content varies probably due to variations in the concn. of urine. F. O. H.

**Action of œstrin on mammary secretion.** J. W. ROBSON (Quart. J. Exp. Physiol., 1935, 24, 337–344).—In lactating mice cryst. ketohydroxy-œstrin temporarily inhibits mammary secretion according to the dosage and method of administration. CH. ABS. (*p*)

**Hormone of the corpus luteum.** E. FELS (Compt. rend. Soc. Biol., 1935, 120, 730–731).—A mixture of luteosterone-*C* and -*D*, or of either with pregnandione, is more potent than either separately. R. N. C.

**Dehydroandrosterone.**—See this vol., 77.

**Androstendione.**—See this vol., 77.

**Testosterone.**—See this vol., 77.

**Sexual hormones, and related substances.** V.—See this vol., 77.

**Sex hormones.** VIII–X. See this vol., 76.

**Recent progress in the study of vitamins.** P. KARRER (Chim. et Ind., 1935, 34, 1027–1035).—A review.

**International vitamin standards.** E. M. NELSON (J. Assoc. Off. Agric. Chem., 1935, 18, 610–611).—The standards adopted by the International Conference on Vitamin Standards (1935) are discussed. E. C. S.

**Aseptic culture of insects in vitamin research.** E. G. VAN'T HOOGE (Z. Vitaminforsch., 1935, 4, 300–324).—Symbiont-free, aseptic cultures of *Drosophila melanogaster* can be obtained from ova sterilised by  $\text{EtOH}$  and chloramine-*T*, provided that the synthetic food complies with certain requirements. *D. melanogaster* requires traces of vitamin- $B_1$  and - $B_2$  and other  $\text{H}_2\text{O}$ -sol. yeast factors together with a very small amount of fat or unsaponifiable fraction, and the absence of - $B_1$  or - $B_2$  can be determined easily with these cultures. The insect does not require vitamin-*A*, -*D*, or -*E*. J. N. A.

**Vitamin-*A*, -*C*, and  $B_2$ . Constitution and constitution specificity of action.** P. KARRER (Monatsh., 1935, 66, 367–392).—The development of the chemistry of these compounds and the connexion between constitution and physiological action are discussed. H. W.

**Sterol content and vitamin value of avocado oil.** R. C. ROBBINS and L. N. BILGER (Hawaii Agric. Exp. Sta. Rept. [1933], 1934, 23–24).—

Sterols are isolated from the expressed oil. The oil also contains vitamin-A and possesses strongly antirachitic properties. CH. ABS. (p)

**Influence of experimental technique during the preliminary period in vitamin-A determinations on the response of the test animal to supplementary feeding of the vitamin.** P. M. NELSON and P. P. SWANSON (Iowa Agric. Exp. Sta. Rept. on Agric. Res., 1933, 116—117; 1934, 145).—Vitamin-A supplements must be fed to the rats separately. The influence of the body-wt. at the end of the depletion period is shown. Females are more responsive to -A than are males. CH. ABS. (p)

**State of combination of vitamin-A in liver oils.** L. RETI (Compt. rend. Soc. Biol., 1935, 120, 577—580).—Extraction with MeOH of unsaponified liver oils dissolved in light petroleum removes none of the vitamin-A; if the unsaponifiable matter is extracted in the same way, the whole of the -A is removed. -A is therefore present in the oil as an ester of a higher fatty acid, and its formation in the liver from carotene is followed by esterification. R. N. C.

**Detection of vitamin-A by the Rosenthal-Erdélyi test.** H. WILLSTAEDT (Z. Vitaminforsch., 1935, 4, 272—276).—The test has no advantages over that of Carr and Price. Carotenoids do not give the rose-red to reddish-violet coloration, but interference can be caused by sterols. J. N. A.

**Vitamin-A and carotene content of human milk.** W. NEUWEILER (Z. Vitaminforsch., 1935, 4, 259—271).—The vitamin-A content of human milk varies from 25 to 300 rat units per 100 c.c. It is independent of the age of the mother, the no. of children, and daily vol. of milk, and is higher after suckling. Colostrum contains more -A than milk. Large doses of -A or of carotene (I) increase the -A content of milk. (I) is present to the extent of 0.005—0.400 mg. per 100 c.c. J. N. A.

**Vitamin-A and carotenoids in the frog.** C. RAND (Biochem. Z., 1935, 281, 200—205).—The liver and fat glands and to a smaller extent the other parts (skin, ovary, eggs, testicles, kidney, lung, fallopian tubes) of the frog (summer and winter) contain carotene accompanied by varying amounts of xanthophyll. The liver also contains vitamin-A. W. McC.

**Increase in length in rats receiving vitamin-A.** M. MALMBERG (Biochem. Z., 1935, 281, 215—218; cf. Orr *et al.*, A., 1934, 1040).—In young rats receiving a diet free from vitamin-A the length of the tail is increased by administration of 0.02 mg. of -A daily. Administration of thyroxine checks the increase. W. McC.

**Physiological action of substances used in treatment of flour.** II. Action on vitamin of flour and on the animal organism fed exclusively on bread. III. Effect of oxidising substances used in treatment of flour on vitamin of flour. S. VON VITÉZ (Z. Unters. Lebensm., 1935, 70, 258—265, 265—269; cf. A., 1935, 529).—I. The harmful effect of the oxidising substance is due to destruction of carotene and vitamin-A. NaBO<sub>3</sub> is more harmful than (NH<sub>4</sub>)<sub>2</sub>S<sub>2</sub>O<sub>8</sub>.

III. The harmful effect of NaBO<sub>3</sub> and Bz<sub>2</sub>O<sub>2</sub> is counteracted by simultaneous administration of -A, but not by -B. E. C. S.

**Vitamin-A and -B of maize.** E. TAKAHASHI and G. MASUDA (J. Agric. Chem. Soc. Japan, 1935, 11, 741—749).—There is a close relationship between vitamin-A content and the yellow pigment of the endosperms, but the colour of the pericarp has no significance. As regards vitamin-B content, neither colour has any significance. One out of 5 kinds of Japanese maize had a high -A content, but the -B content was much the same in all the kinds. Pigeons required  $\leq 60\%$  of whole corn in the diet for normal growth. W. McC.

**Occurrence of vitamin-B in organs.** J. B. BRODIE and F. L. MACLEOD (J. Nutrition, 1935, 10, 179—186).—The -B content of organs decreased in the order liver, heart, brain, muscle. Only traces occur in blood, spleen, and lungs. The feeding of normal tissues to -B-deficient rats did not increase the survival period except in those receiving brain. The amount of -B in the body of the rat may be changed, within limits, by varying the dietary level of the vitamin. A. G. P.

**B-Avitaminosis in rats.** E. KODICEK and J. JOACHIM (Z. Vitaminforsch., 1935, 4, 250—255).—No hyperglycaemia could be observed in rats showing the typical nervous symptoms of B-avitaminosis, and the blood-cholesterol was normal. The hyperglycaemia in vitamin-B<sub>1</sub> deficiency in pigeons may be due to an increase in non-sugar reducing substances. J. N. A.

**Vitamin-B in relation to carbohydrates, proteins, and fats in food.** R. LECOQ (Bull. Soc. sci. Hyg. Aliment., 1934, 278—331; Chem. Zentr., 1935, i, 2205—2206).—The rate of assimilation of carbohydrate, protein, and fat is influenced by the supply of vitamin-B. The -B requirement is greatest with high-carbohydrate rations. Fats and proteins tend to lower the proportion of -B necessary. A. G. P.

**Crystalline vitamin-** IV. Injection method of assay. M. AMMERMAN and R. E. WATERMAN. V, VI. Effect of graduated doses on growing rats and on pigeons. R. E. WATERMAN and M. AMMERMAN (J. Nutrition, 1935, 10, 25—33, 35—44, 161—166).—IV. Appropriate technique is described.

V. The stimulative effect of the vitamin increases up to and probably beyond dosages of  $160 \times 10^{-6}$  g., an amount which is 80—160 times that necessary for maintenance of life.

VI. The min. dose of vitamin-B<sub>1</sub> hydrochloride to cure polyneuritis was  $4 \times 10^{-6}$  g. Larger amounts up to  $160 \times 10^{-6}$  g. increased the wt. of depleted pigeons, but failed to bring birds to normal wt. Results are discussed in relation to -B<sub>3</sub>. A. G. P.

**Physiological action of vitamin-B.** H. G. K. WESTENBRINK (Arch. Neerland. Physiol., 1935, 20, 481—484; cf. A., 1934, 568).—In pigeons on a diet free from carbohydrate and vitamin-B<sub>1</sub> onset of polyneuritis is not delayed by increasing the fat content of the diet. Probably the disease is caused by chronic poisoning with carbohydrate or with

a degradation product or products of carbohydrate resulting from the absence of  $-B_1$ . W. McC.

**Vitamin- $B_1$  in grapes and grape products.** C. VACCA (Quad. Nutrizione, 1934—1935, 1, 424—432). Tests on pigeons show that the berry of the grape, as opposed to the seed, is wholly or almost devoid of vitamin- $B_1$ . NUTR. ABS. (m)

**Vitamin content of beer.** A. SCHEUNERT and M. SCHIEBLICH (Z. Vitaminforsch, 1935, 4, 294—299).—Beer contains very small amounts of vitamins of the B group only. Dark beer contains 3 international units of  $-B_1$  and 7.4 biological units of  $-B_2$  per 100 c.c. If extracts of  $-B_1$  and  $-B_2$  are added to the beer after manufacture, no loss of vitamins occurs during storage. Possibly yeast withdraws the vitamins from beer during manufacture. J. N. A.

**Nutritive value of fungi. II. Vitamin- $B_1$ ,  $-B_2$ , and  $-B_4$  content of mycelium of *Aspergillus sydowi*. III. Growth of rats on supplemented and unsupplemented mould proteins.** H. J. GORCICA, W. H. PETERSON, and H. STEENBOCK (J. Nutrition, 1935, 9, 691—700, 701—714; cf. A., 1934, 220).—II. When fed at a 10% level in a vitamin- $B_1$ -deficient diet the mycelium protected chicks from polyneuritis and produced good growth. Pellagra was prevented by additions of 1% of mycelium to a  $-B_2$ -deficient ration, although 3% was necessary for good growth. At a 30% level in an otherwise  $-B_4$ -deficient ration the mould prevented the onset of paralysis.

III. Proteins of *A. sydowi* produced little growth in rats and failed to sustain life for > 7—9 weeks. Growth was resumed by supplementing mould-protein with casein, egg-white, or yeast-protein. Still better results were obtained with proteins of whole wheat or of maize-gluten feed. No improvement was obtained by use of gelatin, cystine (I), histidine, tyrosine (II), or a (I)–(II) mixture. A. G. P.

**Flavin syntheses. VIII.**—See this vol., 85.

**Preparation and nutritional value of hepatoflavin.** F. J. STARE (J. Biol. Chem., 1935, 111, 567—575).—Hepatoflavin (I) does not prevent dermatitis in vitamin- $B_2$ -deficient rats and chicks, whilst a fraction of the liver extract not adsorbed by fuller's earth does. Proper growth appears to depend on the presence of both these factors in the diet. The prep. of (I) is modified by pptn. from EtOH with hot  $\text{Ba}(\text{OH})_2$ ,  $p_H$  fractionation of the Ag ppt., and extraction of the Ag ppt. with hot  $\text{AcOH} + \text{H}_2\text{S}$ . H. D.

**Modification of the Sherman method of studying the multiple nature of vitamins, with an application to vitamin- $B_2$ .** T. S. HAMILTON and H. H. MITCHELL (J. Nutrition, 1935, 10, 117—128).—The precision of assay methods is much increased by careful control of the intake of the basal diet as well as of the vitamin supplement. The technique described disclosed no evidence of the multiple nature of vitamin- $B_2$ . A. G. P.

**Realisation of the normal ascorbic acid content in the organism responsive to deficiency.** A. GIROUD, C. P. LEBLOND, R. RATSIMAMANGA, and M. RABINOWICZ (Compt. rend. Soc. Biol., 1935,

120, 633—635).—A guinea-pig requires 30 mg. of ascorbic acid (I) daily to maintain an adrenal (I) content > 1 mg. per g.-wt., and considerable quantities to maintain the normal (I) content. R. N. C.

**Ascorbic acid in lens and aqueous humour.** V. DEMOLE and H. K. MULLER (Biochem. Z., 1935, 281, 80—85).—Fresh aq. humour (from the eyes of cattle) exhibits pronounced antiscorbutic action (3 c.c. of humour equiv. to 5 mg. of ascorbic acid) when injected subcutaneously into guinea-pigs receiving a diet free from vitamin-C. A prep. from the lenses behaves similarly. In the humour the activity corresponds with 100%, in the lens with 50%, of the reducing power (dichlorophenol-indophenol). W. McC.

**Ascorbic acid content of blood and cerebrospinal fluid.** F. PLAUT and M. BULOW (Z. physiol. Chem., 1935, 236, 241—256; cf. A., 1935, 1036).—In human and rabbit cerebrospinal fluid the vitamin-C exists entirely in the reduced form, but in the blood most of the -C occurs in the oxidised form. The variations which occur in the amount of -C in blood (caused, e.g., by diet changes) concern the reduced part only and are not parallel to accompanying variations in the -C content of the fluid. Oral administration of moderate amounts of -C increases the -C content of the fluid and slightly increases that of blood. With large doses there are large increases in both. -C introduced into the blood is transported in reduced form, is not oxidised by blood *in vitro* or *in vivo*, and disappears rapidly. Oxidised -C is not reduced by the fluid *in vitro* or *in vivo* but is more rapidly absorbed than is reduced -C. In rabbits, injected -C can pass from blood into fluid and conversely but under physiological conditions the passage from fluid to blood is in some way controlled. In the fluid -C persists much longer than it does in blood. There is no evidence that the -C of the fluid is reduced in the nervous system or that this system produces reduced -C. W. McC.

**Comparison of the vitamin-C (ascorbic acid) content of the cerebrospinal fluid and of the urine in hypervitaminosis-C.** F. PLAUT and M. BULOW (Naturwiss., 1935, 23, 771).—The vitamin-C content of the cerebrospinal fluid can be used for diagnosis of vitamin-C-subnutrition in the same way as the urinary content (cf. A., 1935, 417), the results by the two methods giving close agreement. P. W. C.

**Ascorbic acid in glands. Isolation from the pituitary.** J. R. MENDIVE and V. DEULOFEU (Z. physiol. Chem., 1935, 236, 208—211).—As regards their content of the acid (I) organs of Argentinian cattle form the series: pituitary, corpus luteum, adrenals > thymus, spleen, > testicles, pancreas, thyroid gland > follicular fluid, the val. varying from 1.9 to < 0.2 g. per kg. (I) was isolated from the pituitary, but from the corpus luteum only 4-benzeneazo-3-l-threoglyceryl-1-phenylpyrazolone could be isolated. W. McC.

**Distribution of vitamin-C in lower organisms.** G. BOURNE and R. ALLEN (Austral. J. Exp. Biol., 1935, 13, 165—174).—Unicellular animals and plants, algae, and fungi contain granules which stain with

the  $\text{AcOH-AgNO}_3$  reagent and therefore presumably contain reduced vitamin-C. W. O. K.

**Vitamin-C in fresh apples and in apple powder.** M. POCHINO (La Pediat. med. prat., 1935, 10, 16).—Administration of fresh apples to guinea-pigs receiving Bezssonoff's scorbutic diet prevented appearance of symptoms of scurvy, but did not permit normal development, whilst administration of apple powder only delayed onset of the symptoms.

NUTR. ABS. (m)

(A) Effect of sulphitising on the preservation of vitamin-C. B. I. JANOVSKAJA. (B) Antiscorbutic activity of "marmelad" jelly, enriched, after four months' storage, with vitamin-C by addition of a concentrate of infusion of pine needles. N. JARUSOVA. (C) Antiscorbutic properties of pine needles. V. Effect produced on the vitamin-C content of pine needles when cut pine branches are kept for a short time. N. E. SHEPILEVSKAJA. (D) Antiscorbutic properties of sulphitised dried cabbage. Antiscorbutic turnip preparation. S. N. MATZKO (Problems of Nutrition, Moscow, 1935, 4, No. 2, 51—54, 54—55, 56—58, 59—60, 61—64).—(A) The process of sulphitising black-currant juice for storage seemed to preserve the vitamin-C (I) activity, which was lost in untreated, stored juice.

(B) Four months' storage at room temp. of a jam enriched with (I) concentrate from pine needles caused very little destruction of (I).

(C) Infusions in very dil.  $\text{HCl}$  of fresh pine needles and of needles from a bough that had been kept indoors for 10 days were almost equal in their antiscorbutic activity.

(D) The expressed juice from cooked, dried white cabbage, which had been sulphitised for storage, protected guinea-pigs from scurvy in a min. dose equiv. to 6 g. of original dry cabbage, so that in 1 kg. of dried cabbage there were about 160 "units" of (I). Juice of a damaged white "semi-table" turnip gave fairly good protection from scurvy in guinea-pigs.

NUTR. ABS. (m)

**Ascorbic acid in sprouted oats.** R. BOGART and J. S. HUGHES (J. Nutrition, 1935, 10, 157—160).—The vitamin-C content of sprouting oats increased to a max. at the tenth day. Vals. were similar whether sprouting was in light or in darkness.

A. G. P.

**Vitamin-C (ascorbic acid) content of the paprika product "Vitapric."** E. BECKER (Z. Vitaminforsch., 1935, 4, 255—259).—Vitapric contains about 0.45% of ascorbic acid (cf. B., 1935, 1116), and increases the resistance of animals not only to scurvy, but also to other diseases. J. N. A.

**Reducing power of vitamin-C in urine in health and disease.** (A) T. BAUMANN. (B) W. VON DRIGALSKI (Z. Vitaminforsch., 1935, 4, 354—356, 356—357).—(A) Von Drigalski's method of iodometric titration (A., 1935, 793) for the determination of ascorbic acid (I) in urine is untrustworthy.

(B) The method is upheld.

J. N. A.

**Chemical method for determining vitamin-C.** V. A. DEVIATNIN and V. M. DOROSCHENKO (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 177—180).—The

following modification of the method of Tillmans *et al.* (A., 1932, 310, 658) removes the reducing activity of most foreign substances in extracts of vitamin-C. The material is boiled with 5%  $\text{AcOH}$  ( $\text{CO}_2$  stream), cooled, neutralised ( $p_H$  5.0) with  $\text{CaCO}_3$ , and pptd. with  $\text{Pb(OAc)}_2$ . After filtration the extract is acidified with  $\text{AcOH}$  to  $p_H$  3.0 and titrated with 2 : 6-dichlorophenol-indophenol to a slight pink ( $\text{CO}_2$  stream). Good agreement with biological assays is obtained. J. W. B.

**Determination of ascorbic acid by titration.** B. AHMAD (Nature, 1935, 136, 797).—Boiling before extraction with  $\text{CCl}_3\text{-CO}_2\text{H}$  increases the ascorbic acid val. for Darjeeling cabbage. The results support the views of McHenry *et al.* (A., 1935, 903) as opposed to those of van Eekelen (*ibid.*, 1176). L. S. T.

**Value of the chemical titration method in determining the vitamin-C potency of certain foodstuffs.** N. B. GUERRANT, R. A. RASMUSSEN, and R. A. DUTCHER (J. Nutrition, 1935, 9, 667—675).—Titration of ascorbic acid with 2 : 6-dichlorophenol-indophenol gives approx. results suitable as preliminary data for biological assays of vitamin-C potency. The accuracy of the method varies with the nature of the test material. A. G. P.

**Influence of vitamin-C level on resistance to diphtheria toxin.** I. Changes in body-weight and duration of life. C. G. KING and M. L. MENTEN II. Production of diffuse hyperplastic arteriosclerosis and degeneration in various organs. M. L. MENTEN and C. G. KING (J. Nutrition, 1935, 10, 129—140, 141—153).—I. A wide zone of vitamin-C deficiency exists without the appearance of scurvy, but in which physiological processes are subnormal and sensitivity to bacterial toxins is increased. A. G. P.

**Reactions of animals susceptible to deficiency to increasing doses of ascorbic acid.** A. GIROUD, R. RATSIMAMANGA, A. BARATTE, and F. SYLVA (Compt. rend. Soc. Biol., 1935, 120, 701—703).—Vascular lesions and dental mobility decrease and haemoglobin increases steadily as the quantity of ascorbic acid administered increases. R. N. C.

**Fractionation studies on pro-vitamin-D.** E. M. KOCH and F. C. KOCH (Science, 1935, 82, 394—395).—"Cholesterol W" and heated purified cholesterol (I) are superior to viosterol or purified, unheated (I) in preventing leg weakness in rats and chicks. The pro-vitamin-D of heated (I) separates readily in crystallisation from  $\text{EtOH}$ . L. S. T.

**Antirachitic efficiency of irradiated milk, yeast milk, cod-liver oil, and irradiated cholesterol.** R. W. HAMAN and H. STEENBOCK (Proc. Amer. Inst. Nutrition, J. Nutrition, 1935, 9, No. 6, Suppl. 7).—When fed to chicks on a rat unit basis, cod-liver oil, irradiated milk, and irradiated cholesterol showed 10—15 times the antirachitic potency of milk from cows fed on irradiated yeast.

NUTR. ABS. (m)

**Sensitivity of rachitic rats for vitamin-D.** J. VAN NIEKERK (Arch. Neerland. Physiol., 1935, 20, 477—480).—The sensitivity of the rat stock

fell to about 50% of the initial val. from 1929 to 1932, but no seasonal variations were noted. H. G. R.

**Relationship of the vitamin-D intake of the hen to the antirachitic potency of eggs produced.** N. B. GUERRANT, E. KOHLER, J. E. HUNTER, and R. R. MURPHY (J. Nutrition, 1935, 10, 167—178).—The antirachitic potency of eggs depends on the vitamin-D intake of the hen. The transfer of -D from diet to egg is of low efficiency, and is more complete from cod-liver oil than from viosterol.

A. G. P.

**Constitution of vitamin-D<sub>2</sub>.**—See this vol., 69.

**Sitostanol and stigmastanol.**—See this vol., 69.

**Differences in age of cells of some water plants in relation to their reducing powers.** M. LLIENSTERN (Protoplasma, 1935, 33, 86—92).—Differences in reducing power of laminae and midribs of leaves of varying age and under varying conditions of assimilation are examined by means of methylene-blue and thionine.

A. G. P.

**Permeability studies of *Valonia* osmometers. Behaviour with neutral salt solutions.** P. KORN-MANN (Protoplasma, 1935, 23, 34—49).—With a *Valonia* cell-membrane osmometer, K citrate, tartrate, phosphate, sulphate, and acetate solutions caused a withdrawal of fluid at rates which declined in the order of substances named. KNO<sub>3</sub> and KCl caused an intake of fluid. In isotonic solutions the order of intake of fluid was LiCl > NaCl > KCl. The phenomena are explained by differences in the degree of swelling of the internal and external sides of the membrane induced by the various salts.

A. G. P.

**Dry matter production [by plants] in nitrogen and potassium deficiency.** D. MÜLLER and P. LARSEN (Planta, 1935, 23, 501—517).—In H<sub>2</sub>O-cultures of *Sinapis alba* respiration losses were substantially the same for plants in normal and deficient media. Assimilation intensity was lower in deficient plants, the difference between these and normal plants declining with light intensity. The compensation point was the same in normal and deficient plants. Lowered assimilation is not due to reduced opening of stomata or smaller chlorophyll contents, but to "protoplasmic factors." The wt. of dry matter produced in stems and roots per unit leaf area was the same for completely manured and K-deficient plants, but was approx. doubled in N-deficient plants.

A. G. P.

**Heat-resistance of plants.** I. SAPPER (Planta, 1935, 23, 518—556).—Starved plants have a decreased heat-resistance, although small differences in C nutrition have only a slight effect. Deficiency of nutrient salts causing increased osmotic pressure may increase the resistance. Heavy excess of nutrients lowers resistance. The latter is controlled by sp. structural characteristics of the protoplasm and merely modified by the H<sub>2</sub>O content. A. G. P.

**Absorbing power of roots.** P. MAZE, P. J. MAZE, jun., and R. ANXIONNAZ (Compt. rend. Soc. Biol., 1935, 120, 693—695).—The absorbing power varies with the N compounds in the nutritive solution,

the concn. of the solution, and the nature of the inorg. N salts in solutions of which the roots are placed.

R. N. C.

**Root exudation and root types in sugar cane.** H. EVANS (Mauritius Dept. Agric. Sugar Cane Res. Sta. Bull., 1934, 5, 13).—Mineral analyses of exudates from cut roots of various parts of the rooting system are recorded.

CH. ABS. (p)

**Catadyn process for sterile cultures of higher plants.** F. C. GERRETSEN (Planta, 1935, 23, 593—603).—The root system of the plant is protected from infection by means of a cork layer containing a catadyn (Ag)-infusorial earth prep.

A. G. P.

**Regulation of protein exchange and the condition of proteolytic enzymes in plants.** K. PAECH (Planta, 1935, 24, 78—129).—Anaerobic decomp. of protein in plant cells does not depend on deprivation of O<sub>2</sub>, but is influenced by injury to the cell by prolonged anaerobiosis. In acid leaves death of cells in O<sub>2</sub> deficiency is not caused by increasing proteolysis. In wilting petals the "explosive" decomp. of protein is a post-mortal process resulting from destruction of protoplasts. Synthesis or hydrolysis of protein in intact cells is controlled by the relative amounts of active carbohydrate (monose) and sol. N (NH<sub>3</sub>) present.

A. G. P.

**Nitrogen fixation by germinating legume seeds without co-operation of nodule bacteria.** K. GIRTCHANOV (Zentr. Bakt. Par., 1935, II, 92, 349—363).—In the absence of nodule organisms germinating seeds of yellow lupin were unable to utilise atm. N<sub>2</sub> even under the influence of certain stimulants.

A. G. P.

**Apparent assimilation of nitrogen by germinating peas.** E. M. SMYTH and P. W. WILSON (Biochem. Z., 1935, 282, 1—25; cf. Vita, A., 1932, 436, 1180; Orcutt *et al.* A., 1934, 1273).—Apparent increases in the N content of peas germinating in presence of stimulants (salts, alkaloids) or H<sub>2</sub>O are due to inaccuracies in analytical methods. The Kjeldahl method and its modifications yield untrustworthy results, and the Dumas method is recommended. There is no evidence that direct assimilation of elementary N<sub>2</sub> occurs.

W. McC.

**Role of asparagine and glutamine in the higher plants.** G. SCHWAB (Planta, 1935, 24, 160—162).—Asparagine (I) and glutamine (II) are present simultaneously in plants. Increased "amide" in germinating seedlings or that induced by shading plants or supplying NH<sub>4</sub> salts involves increases in (I) and (II) in normal proportions. The (II) content of roots of *Aspidium filix* declines with the total sol. N during the summer months. Protein exchange in plants is discussed in relation to org. acid and carbohydrate contents. Plant extracts contain enzymes sp. for (I) and (II). Yeast extracts contain only (I) and can only effect the fission of (I).

A. G. P.

**Variation of saponins during germination and development in some species of grasses.** T. SOLACOLU and E. WELLES (Compt. rend. Soc. Biol., 1935, 120, 662—664).—Saponin accumulates in the seeds when they reach maturity; it is then used up partly in germination and partly in growth until the

appearance of the fifth leaf, after which it has disappeared entirely. R. N. C.

**Influence of partial pressure of carbon dioxide on photosynthetic efficiency.** B. N. SINGH and K. KUMAR (Proc. Indian Acad. Sci., 1935, 1, B, 909—927).—The rate of photosynthesis in radish leaves increases with rising  $[\text{CO}_2]$  to a stationary stage followed by a decline as the proportion of  $\text{CO}_2$  is further increased. With increasing light intensity the  $\text{CO}_2$ -photosynthesis curves show a steeper rising phase and earlier evidence of toxic effects. The curves are discussed in relation to those obtained by earlier observers. A. G. P.

**Oxygen intake of oily and starchy seeds.** E. REUHL (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 879—886).—In the early stages of germination *Brassica* seeds absorb  $\text{O}_2$  at a normal rate with decreasing  $\text{O}_2$  tension until it reaches 3%, whereas linseed shows a retarded rate almost immediately and buckwheat shows intermediate vals. During the later stages this behaviour is reversed. H. G. R.

**Energy of growth. XIV. Effect of zinc and manganese salts at toxic concentrations on the energy output during germination.** G. BOY (Bull. Soc. Chim. biol., 1935, 17, 1414—1426).—The energy output of rice seeds (heat of combustion of the cotyledon/difference between the heats of combustion of the original and the germinated seeds) grown in the dark in aq. solutions of Mn and Zn salts is < that of seeds grown in  $\text{H}_2\text{O}$ . With Mn the decrease  $\propto$  the concn.; with Zn the toxic action is not so marked, and is the same at a concn. of 2 as at 4 g. of Zn per litre. A. L.

**Possible association of vitamin-A with nutritional conditions in plants.** E. S. HABER, P. M. NELSON, and P. P. SWANSON (Iowa Agric. Exp. Sta. Rept. Agric. Res., 1933, 134—135; 1934, 163).—Poorly nourished plants were deficient in chlorophyll and in vitamin-A. The ability of plants to translocate -A is indicated. CH. ABS. (p)

**Effect of concentration of neutral salts on seedling growth.** J. PORT (Acta Comment. Univ. Tartu., 1932, A, 23, No. 1, 166 pp.).—Growth was influenced by salt solutions absorbed by paper on which seeds were sprouted. Concns. of  $< 0.1N$  inhibited the swelling of seed colloids and produced seedlings showing < normal growth and  $\text{H}_2\text{O}$  content. In wheat, diastatic activity was less in solutions of higher concn. The effect of salts on growth decreased in the order  $\text{SCN}^-$ ,  $\text{NO}_3^-$ ,  $\text{Cl}^-$ ,  $\text{Br}^-$ ,  $\text{PO}_4^{3-}$ ,  $\text{SO}_4^{2-}$  and  $\text{Li}^+$ ,  $\text{NH}_4^+$ ,  $\text{Ba}^{++}$ ,  $\text{Ca}^{++}$ ,  $\text{K}^+$ ,  $\text{Na}^+$ ,  $\text{Mg}^{++}$ , in  $0.1N$  concn. With concns. of  $0.01$ — $0.001N$  salt effects were sp. for different species. The favourable action of anions on root growth was in the reverse order of the lyotropic series.  $0.0001N$  solutions of  $\text{Li}^+$ ,  $\text{NH}_4^+$ , and  $\text{Ba}^{++}$  were particularly beneficial to growth, probably because of increased imbibition of  $\text{H}_2\text{O}$ . CH. ABS. (p)

**Elements indispensable for plant nutrition.** A. FREY-WYSSLING (Naturwiss., 1935, 23, 767—769).—For the higher plants C, N, P, S, O, H, K, Mg, Ca, and Fe appear to be essential. In addition, the absence of Mn, B, Cu, and Zn often leads to deficient and

diseased growth. Many elements, e.g., Al, Si, Na, Cl, are utilised by particular groups of plants in considerable amounts, but it is difficult to say that they are essential to the life of the plant. Other elements, although not essential to life, stimulate the growth of the plant. The functions of the various elements are discussed and it is pointed out that all the indispensable elements lie on a line drawn in the periodic table from A through C to A. P. W. C.

**Effect of humic acid on assimilation in plants.** A. V. BLAGOVESTSCHENSKI and A. A. PROSOROVSKAJA (Biochem. Z., 1935, 282, 99—103; cf. A., 1935, 265).—Humic acid (I) stimulates plant growth by increasing the permeability of the tissues and so facilitating osmosis.  $\text{NH}_4\text{NO}_3$  enabled to penetrate the cells by (I) has no effect on the synthesis of proteins there. W. McC.

**Vegetable growth-substances.** F. KOGL (Naturwiss., 1935, 23, 839—843).—A lecture.

**Physiological analysis of the growth substance.** A. J. HAAGEN SMIT and F. W. WENT (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 852—857).—The cell-elongation and polar transport properties of a series of org. substances have been examined. Some, which have only growth-stimulating properties, do not exhibit polar transport and do not give the *Avena* bending test nor the bud-inhibition of the auxins. *allo*Cinnamic acid has the greatest cell-elongation power, comparable with that of 3-indolyl-acetic acid, whereas cinnamic acid has none. H. G. R.

**Analysis of the activity of two growth-promoting substances in plant tissues.** K. V. THIMMANN (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 896—912).—Both indene-3-acetic acid and coumaryl-1-acetic acid show biological activity, although the latter does not produce any *Avena* curvature, but they lack the property of being readily transported in the plant. It appears that cell-elongation, root-formation, root-growth inhibition, and bud-inhibition arise from one primary reaction in the cell. H. G. R.

***Lambertella corni-maritima*, von Hohnel, a brown spotted parasitic discomycete.** T. H. HARRISON and A. F. EL-HELALY (Trans. Brit. Mycol. Soc., 1935, 19, 199—213).—Growth characteristics of the fungus are examined in relation to  $p_{\text{H}}$  of the medium. CH. ABS. (p)

**Xyloporosis—the new citrus disease.** I. REICHERT and J. PERLBERGER (Hadar, 1934, 163—167, 172, 193—202).—Fruit from diseased trees contained less total solids, higher total and reducing sugars and total acids than healthy fruit. CH. ABS. (p)

**Biochemical modifications and phytopathology.** Official oil of lavender from plants parasitised with *Septoria lavandulae*, Desm. R. SALGUES (Compt. rend. Soc. Biol., 1935, 120, 703—704). The infection reduces the quantity of oil and its terpene alcohol content, and increases  $d$  and the cineole content of the essence. R. N. C.

**Toxicity of magnesium towards higher plants.** D. RABINOVITZ-SERENI (Bull. Staz. Pat. veget.,

1933, 13, 346—366; Bied. Zentr., 1935, A, 5, 517).—Plants in solutions containing 1% of  $\text{MgSO}_4$  showed loss of chlorophyll, restricted growth, and browning. Enzyme processes are concerned. Low  $[\text{Mg}^{++}]$  stimulated and higher concns. retarded catalase activity. Oxidase activity was favoured at all concns. examined. Respiration was increased by 0.1% and retarded by 1% solution of  $\text{Mg}^{++}$ . A. G. P.

**Toxins of wilting [in plants].** O. K. ELPIDINA (Compt. rend. Acad. Sci. U.S.S.R., 1935, 3, 360—364).—The toxin produced by the *Fusarium* which causes wilting of potatoes is  $\text{NH}_3$ . A. G. P.

**Action of potassium oxalate on the living protoplasts of *Allium cepa*.** R. EICHBERGER (Planta, 1935, 23, 479—485).—Sections of *A. cepa*, after 10—15 min. treatment with aq.  $\text{K}_2\text{C}_2\text{O}_4$  (I), show normal urea-plasmolysis only in the central area. Injury to plasma by (I) is counteracted by treatment with  $\text{CaCl}_2$ , K citrate,  $\text{KNO}_3$ ,  $\text{NaCl}$ , or  $(\text{NH}_4)_2\text{SO}_4$ , or by prolonged washing with  $\text{H}_2\text{O}$ . No sp. action of  $\text{Ca}^{++}$  in this respect was apparent. A. G. P.

**Occurrence of lime in edible *Mormordica*.** H. L. CHAKRAVARTY (Current Sci., 1935, 4, 239—240).—Cystoliths in various Indian species are described. A. G. P.

**Iodine of seaweeds. III.** E. MASUDA and K. NISHIDA (J. Pharm. Soc. Japan, 1934, 54, 243—245; cf. A., 1934, 336).—Of the total I in *Laminaria japonica*, Aresch, an average of 48% occurs in org. forms. *L. ochotensis* contains 65% of sol. I as org. compounds. Warming causes a gradual transition to inorg. forms. In *Ecklonia cava* I is present as iodoammonium salts or I salts of amines and not as KI or NaI. CH. ABS. (p)

**Chemical composition of saltbushes from the Salmon Gums area.** L. J. H. TEAKLE (J. Dept. Agric. W. Austral., 1935, 12, 188—189).—Complete analyses of *Atriplex prostratum* and *A. halimoides* are given. Both specimens are high in  $\text{Na}_2\text{O}$  and Cl, but low in  $\text{P}_2\text{O}_5$ . NUTR. ABS. (m)

**Saltbush. Its mineral composition.** M. S. BENJAMIN (Agric. Gaz. N.S.W., 1935, 46, 309—310).—*Chenopodium triangulare* and *Atriplex semibaccatum* were analysed. < 54.06% of the sol. ash in the latter was NaCl. NUTR. ABS. (m)

**Phytin of seeds of *Eleusine coracana* (besna), *Sorghum verticillatum* (dura), *Eragrostis Teff* (teff), and *Pennisetum spicatum* (bultuc).** R. MONTUORI (Ateneo parmense, 1934, 6, 89).—The ash, P, and phytin contents of the seeds are recorded. NUTR. ABS. (m)

**Formation of acetic acid from ginkgo wood (*Ginkgo biloba*).** Y. C. TANG, Y. W. WANG, and H. L. WANG (Cellulosechem., 1935, 16, 90—92).—The Ac content of 4 samples of the wood (I) of different age and habitat is const. (mean 1.18%). The lignin-free portion (II) (68.74%) (ash content 0.58, 0.64, 0.41, and 0.38%) contains 1.70% Ac, in close agreement with the val. (1.72%) calc. from that of (I) and the loss resulting from isolation of (II). Thus no elimination of AcOH occurs during the process of

isolating (II), which must contain an Ac group and not a formyl group (semi-acetal). J. W. B.

**South American drugs. I. Bixol, a new alcohol from the oil of *Bixa Orellana*. II. Chemical composition of *Canavalia obtusifolia*.** M. BACHSTETZ and G. CAVALLINI (Chimica e l'Ind., 1935, 17, 650—651, 652).—I. The unsaponifiable matter (2.5%) of annatto-seed oil was submitted to chromatographic analysis, using  $\text{Al}_2\text{O}_3$ , which adsorbed ergosterol and vitamin-D (positive reactions in the Rosenheim and Brückner tests). The non-adsorbed portion was distilled in vac., yielding 0.58% (calc. on the seed) of *bixol*,  $\text{C}_{18}\text{H}_{30}\text{O}$ , b.p.  $176^\circ/2\text{ mm.}$ , a pale green oil, probably  $\text{CMe}_2[\text{CH}\cdot\text{CH}_2\cdot\text{CMe}]_3\text{CH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$ , oxidised to the corresponding aldehyde, b.p.  $175\text{—}180^\circ/6\text{ mm.}$  (semicarbazone, m.p.  $96\text{—}97^\circ$ ).

II. Ouari seeds contain 10.42%  $\text{H}_2\text{O}$ , 2.50% ash, 0.65% fatty matter, 4.25% N, 26.5% proteins (93.5% sol. in HCl+pepsin), 53.77% starch, 0.106% lecithin-phosphoric acid (calc. as  $\text{P}_2\text{O}_5$ ). They contain no HCN or alkaloids and are not toxic to rabbits.

D. R. D.

**"Bukuryo," sclerotia of *Pachyma Hoelen*, Rumph. III. Chemical constituents.** K. TAKEDA (Trans. Tottori Soc. Agric. Sci., 1934, 5, 62—73).—"Bukuryo" contains approx. 93% of a carbohydrate, pachyman (I), and also gum, chitin, protein, adenine, histidine, *d*-glucose, sterol, lecithin, and fat, Cl, S, P, Ca, Fe, Mg, Mn, K, Si, Na, enzymes which decompose fat and (I), and traces of pepsin and trypsin. J. N. A.

**Arabogalactan of Siberian larch.** N. I. NIKITIN and I. A. SOLOVIEV (J. Appl. Chem. Russ., 1935, 8, 1016—1022).—The arabogalactan (I) (1 mol.) with 12 mols. of NaOH and 13 of  $\text{Me}_2\text{SO}_4$  yields a product in which all the available OH-groups (20) are methylated. (I),  $\text{CH}_3\text{PhCl}$ , and NaOH ( $80^\circ$ ; 16 hr.) afford the *dibenzyl ether*, and (I),  $\text{BzCl}$ , and NaOH (with cooling) give the *Bz* ester. The mol. wt. of (I) cannot be determined cryoscopically, as the depression of f.p. is not  $\propto$  concn.; the I val. method gives a mol. wt. corresponding with  $[\text{C}_5\text{H}_8\text{O}_4(\text{C}_6\text{H}_{10}\text{O}_5)_6]_2$ . R. T.

**Lignin in straw and deciduous trees.** R. S. HILPERT [with E. LITTMANN, O. PETERS, H. HELLWAGE, and O. LISSNER] (Cellulosechem., 1935, 16, 92—96).—The action of 72%  $\text{H}_2\text{SO}_4$  at room temp. on various sugars produces insol. residues (I) which closely resemble lignin (II). Pentoses and fructose are especially sensitive, but aldohexoses (particularly glucose and galactose) are very stable. The amount of (I) formed decreases rapidly with fall in reaction temp. The amount of (II) similarly formed from straw also decreases from 41.66% at  $60^\circ$  to 2—3% at  $-10^\circ$ , and dilution of the filtrate affords a carbohydrate material of composition  $2\text{C}_6\text{H}_{10}\text{O}_5\text{—H}_2\text{O}$ . Thus the acid-sol. products are not (II) but carbohydrate. Treatment of straw with alkali effects dissolution of 20—30% (mainly hexoses) and dilution then ppt. a substance with the composition of a partly methylated cellulose anhydride (pentosan content increased from 24 to 29%; OMe reduced from 4 to 3.1%), which is acetylated in presence of 8%

H<sub>2</sub>SO<sub>4</sub> to a substance (83% yield) of composition [C, 49.5, H 6.0, OAc 61.6, OMe 1.3 (? 3.1), pentosans 13%] closely resembling that of cellulose triacetate. Since the OMe content is the same as that of the original straw, this group is present not in lignin but in the carbohydrate of which straw is composed. Treatment of the wood (III) of deciduous trees with HCl at -10° affords a residue (12%) of composition intermediate between that of (III) and (II). The H<sub>2</sub>O-pptd. material is also a cellulose anhydride. With HCl (*d* 1.19) at room temp. the C and H content of the residue is the same as that of (III), but the OMe content, and lignin formed, are higher. Hence the higher methylated portions are less readily attacked. The ground-substance is a cellulose anhydride which readily loses H<sub>2</sub>O intramolecularly to give (II).

J. W. B.

**New constituent of beechwood.** E. WEDEKIND and O. MÜLLER (Naturwiss., 1935, 23, 833—834).—MeOH extraction of beech, eucalyptus, alder, cherry, and, to a smaller extent, oak and hornbeam, but not of pine and ash, yields a substance (I) (C 57.1, H 4.3, OMe 4.8%) giving an intense red-violet colour with conc. acids. (I), which is separated admixed with a less sol. substance converted into (I) by hot aq. alkali, readily forms a Ac<sub>1</sub> derivative which does not give the colour reaction. F. O. H.

**Leaf starch: isolation and properties.** H. A. SPOEHR and H. W. MILNER (J. Biol. Chem., 1935, 111, 679—687).—Depletion of starch (I) in leaves does not occur on drying if the leaves have been frozen or treated with CHCl<sub>3</sub>. To prepare (I) the leaves are dried, ground, the pigments extracted with EtOH and light petroleum, polyuronides etc. are extracted with cold H<sub>2</sub>O, and (I) with hot H<sub>2</sub>O, from which, after cooling, it is separated by centrifuging. If a (I) solution is frozen for some time and then allowed to thaw, (I) is pptd. in a fibrous mass (retrogradation). Cooling for 3 days at -80° ppts. (I) completely, but 90—95% pptn. can be obtained if the solution is cooled only to -8°. Retrograded (I) dissolves in H<sub>2</sub>O, but if thoroughly dried, it is more sparingly sol. Determinations of the amounts of (I) were made on the basis of the reducing power of the solution after acid hydrolysis with an accuracy of ±1%. *d*-Glucose is the chief product of hydrolysis. The apparent lower reducing power of retrograded (I) is due to its slower rate of hydrolysis. The leaves of *Nicotiana tabacum* give the highest yield. E. A. H. R.

**Detection of hydroxylamine in autolysed green leaves.** M. LEMOIGNE, P. MONGUILLON, and R. DESVEAUX (Compt. rend., 1935, 201, 1067—1069).—By modification of Blom's reaction NH<sub>2</sub>OH has been detected in the juice of leaves allowed to autolyse for several days (1—3 mg. per kg. of original leaves), but is absent from the juice of fresh leaves. W. O. K.

**Determination of starch in plants with special reference to woody plants.** J. T. SULLIVAN (J. Assoc. Off. Agric. Chem., 1935, 18, 621—636).—The starch is extracted with slightly alkaline aq. CaCl<sub>2</sub>, pptd. with EtOH, redissolved in H<sub>2</sub>O, and pptd. with I in aq. KI in presence of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. The starch is then hydrolysed and glucose determined by Cu reduction. A single extraction is sufficient if

the conditions specified with regard to [CaCl<sub>2</sub>], duration of boiling, and fineness of grinding are adhered to. The method is more trustworthy than that of enzymic hydrolysis. The applications of the method are discussed. E. C. S.

**Aromatic substances in maple sugar.** J. RISI and A. LABRIE (Canad. J. Res., 1935, B, 13, 175—184).—The aromatic substances in the syrup and sugar of the maple contain vanillin (I), vanillic acid (II), and a resinous part, which is hydrolysed to guaiacol (III) by emulsin. The bark contains an enzyme (acerase) which hydrolyses coniferin and amygdalin; the sap also contains an enzyme. The wood contains a little coniferin, which may be the parent substance of (I). The odour is due to presence of hadromal, which, during heating of the sap, is decomposed into (I), (II), and (III). Hadromal may be synthesised from (I), (III), and sucrose. F. R. S.

**Constituents of the sap of sugar maple (*Acer saccharum*, Marsh).** G. H. FINDLAY and J. F. SNELL (Canad. J. Res., 1935, 13, B, 269—275).—The development of the maple flavour from its precursor in sap, during boiling, is not due to oxidative changes. No individual constituent of various maple extracts examined was capable of imparting the flavour to sugar syrups. A. G. P.

**Biochemistry of amygdalin.** A. VIEHOEVER and H. MACK (Amer. J. Pharm., 1935, 107, 397—450).—The physiological properties of amygdalin (the commercial product contains 2H<sub>2</sub>O) and of its hydrolytic products are discussed. J. L. D.

**Manchurian kaoliang (*Andropogon sorghum*, Brot.).** S. HIRAO (J. Agric. Chem. Soc. Japan, 1935, 11, 921—924).—Three cryst. substances have been isolated from the hot aq. extract of kaoliang: (1) yellow, m.p. 249—250°, a quercetin monoglucoside, probably quercimeritrin; (2) long white needles, m.p. 240—242°, probably a new flavanonol; (3) short white crystals, m.p. 98—100°, similar to pyrocatechol. H. G. R.

**Action of *Nuphar luteum* on the heart.** M. BULAJEWSKI (Wiad. Farm., 1935, 62, 15—18, 29—32, 43—47, 57—62).—EtOH extracts of blossoms of *N. luteum* contain a cryst. glucoside, *nymphalin* (I), which exerts a toxic action on the animal heart. (I) has m.p. 40° (approx.) and gives a purple colour with α-C<sub>10</sub>H<sub>7</sub>OH and H<sub>2</sub>SO<sub>4</sub>. Hydrolysis yields Cu-reducing substances. (I) is present in flowers and seeds but not in roots. CH. ABS. (p)

**Ascorbic acid (vitamin-C) content of some Indian plant materials.** M. DANODARAN and M. SRINIVASAN (Proc. Indian Acad. Sci., 1935, 11, B, 377—386).—Data obtained by the Tillmans-Harris method are recorded. A. G. P.

**Constituents of red sandal wood.** Homoptero-carpin.—See this vol., 81.

**Pigments of cotton flowers.** I. Cambodia (*Gossypium hirsutum*). K. NEELAKANTAM, R. H. R. RAO, and T. R. SESHADRI (Proc. Indian Acad. Sci., 1935, 1, 887—890).—The presence is established of quercetin and quercimeritrin in proportions which varied with variety, locality, and season. A. G. P.

**Fluorescence spectra of chlorophyll pigments.** C. DHERE and A. RAFFY (Bull. Soc. Chim. biol., 1935, 17, 1385—1413).—The bands in the fluorescence spectra of  $\alpha$ -chlorophyll in hexane,  $\text{Et}_2\text{O}$ ,  $\text{COMe}_2$ ,  $\text{EtOH}$ ,  $\text{MeOH}$ ,  $\text{C}_6\text{H}_6$ , cyclohexanol,  $\text{CHCl}_3$ , and  $\text{CS}_2$  have axes at 663, 663.5, 666, 666.5, 667, 666.5, 668, 670 and 676.5  $\text{m}\mu$ , respectively, the corresponding val. for  $\beta$ -chlorophyll in  $\text{Et}_2\text{O}$  being 646.2  $\text{m}\mu$ . The bands in the fluorescence spectrum of the leaves of *Pelargonium zonale* (in vivo) occur at 738 and 686, whilst with an  $\text{Et}_2\text{O}$  extract of the leaves the vals. are 732.5 and 672  $\text{m}\mu$ , respectively. The fluorescence bands of  $\alpha$ - and  $\beta$ -phytylphosphoribide in  $\text{CS}_2$  have axes at 679 and 663.5  $\text{m}\mu$ , respectively. A. L.

**Phlobaphen and durasantalin in the colouring matter of Manchurian kaoliang (*Andropogon sorghum*).** K. OKANO and I. OHARA (J. Agric. Chem. Soc. Japan, 1935, 11, 767—772).—The  $\text{Et}_2\text{O}$ -insol. fraction of the colouring matter of the hulls contains phlobaphen (I) (43% of the whole colouring matter) and the  $\text{COMe}_2$ -insol. fraction contains durasantalin (II) (red dura) (35%). The colouring matter (2%) of the seed coats also contains (I) (82%) and (II) (15%). The coats contain 3% of  $\text{H}_2\text{O}$ -sol. tannin but no apigenin (cf. Perkin, J.C.S., 1910, 97, 220). W. McC.

**Carotenoids and some lipins of *Ipomaea reptans* (L.).** Pair. M. ISHII (J. Soc. Trop. Agric. [Nettai Nogoku Kwaishi], 1933, 5, No. 2, 192—197).—Analyses of the vegetable are given.  $\beta$ -Carotene, xanthophyll, and a trace of taraxanthin were separated. Lipins detected included *n*-hentriacontane, sitosterol and its glucoside, and a higher alcohol, m.p. 267°. CH. ABS. (p)

**Daturic acid.** R. W. CLARK (J. Amer. Pharm. Assoc., 1935, 24, 843—847).—Solid fatty acids were prepared from the oil of *Datura stramonium* seeds. Attempts to separate them by fractional crystallisation from  $\text{EtOH}$ , pptn. of Mg salts, and vac. distillation of the Me esters failed. The occurrence and identity of heptadecic acid are discussed. F. O. H.

**Apple- and pear-seed oils.** J. PRITZKER and R. JUNGKUNZ (Z. Unters. Lebensm., 1935, 70, 255—257).—Air-dried apple- and pear-seeds contained 19.23 and 21.44%, respectively, of their dry wt. of oil, which had refractometer val. (40°) 62.9 and 62.0, acidity 4.1° and 9.7°, acid val. 2.3 and 5.4, ester val. 185.4 and 184.1, sap. val. 187.7 and 189.5, I val. (Hanus) 122.4 and 124.1, Reichert-Meissl val. 0.22 and 0.33, Polenske val. 0.4 and 0.33, unsaponifiable matter 1.10 and 1.03%, phytosterol (min.) 0.36 and 0.28%, m.p. of phytosteryl acetate 122° and 119°, respectively. The fatty acids (95.8 and 95.7%) had refractometer val. 48.4 and 47.7, neutralisation val. 196.5 and 196.8, mean mol. wt. 285.5 and 285.1, solid fatty acids (Bertram) 7.2 and 10.3%, (Grossfeld) 4.9 and 6.0%, and isooleic acid 0.62 and 0.45%, respectively. Each oil gave positive Bellier, Bellier-Kreis, and  $\text{HNO}_3$  tests, and the apple-seed oil a positive Kreis test. The latter oil was clear yellow, and had a bitter almond flavour, the pear-seed oil egg-yellow, and had a slightly acid taste. E. C. S.

**Odorous substances of green tea. VI. Constituents of tea oil.** S. TAKEI, Y. SAKATO, and M. ONO (Bull. Inst. Phys. Chem. Res. Japan, 1935, 14, 1262—1274).—From tea-leaf oil were isolated  $\text{CHMeEt-CHO}$ , *n*-hexyl, benzyl, and benzyl- and phenyl-ethyl alcohols,  $\text{PhOH}$ , cresol,  $\text{AcOH}$ , and hexoic acid. No ester with an odour characteristic of that of the oil was isolated (cf. A., 1934, 571).

F. O. H.

**Agar-agar of Black Sea phyllophora.** V. F. OPOTZKI and L. A. BORTNIK (Ukrain. Chem. J., 1935, 10, 331—335).—The washed dried agar-agar contains  $\text{H}_2\text{O}$  19, protein 5.5, Ac 9.8, org. and total S (as  $\text{SO}_3$ ) 10.7 and 14.6, galactosans 42.5, pentosans 0.64, methylpentosans 0.16, ash 11.73% ( $\text{SO}_3$  3.93,  $\text{SiO}_2$  1.81,  $\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3$  2.01,  $\text{CaO}$  2.52,  $\text{MgO} + \text{Na}_2\text{O} + \text{K}_2\text{O}$  1.46%). Japanese agar differs chiefly in its lower protein (1.32%), org. S (4.35%), and ash content (3.98%). The hardness of the gels of Black Sea agar is considerably < that of Japanese agar, and the m.p. and setting points are lower. R. T.

**Bitter principles of the Colombo root. III.**—See this vol., 89.

**Alkaloid of Chin-shih-hu.**—See this vol., 88.

**Chemistry and pharmacology of the alkaloids of *Duboisia Hopwoodii*.** C. S. HICKS and H. L. MESSURIER (Austral. J. Exp. Biol., 1935, 13, 175—188).—The leaves contain an alkaloid,  $\text{C}_9\text{H}_{12}\text{N}_2$ , b.p. 266—268°,  $[\alpha]_D^{20} +38.6^\circ$  (picrate, m.p. 186—188°; picrolonate, m.p. 252—253°), which yields nicotinic acid on oxidation with  $\text{KMnO}_4$  and is probably *d*-nornicotine (cf. A., 1932, 177). W. O. K.

**Alkaloids of European *Lycopodium* species.** J. MUSZYŃSKI (Arch. Pharm., 1935, 273, 452—457).—*L. Selago*, *annotinum*, *inundatum*, *complanatum*, and *clavatum*, L., contain solid, non-volatile (amorphous salts) and volatile,  $\text{H}_2\text{O}$ -sol. alkaloids (cryst., hygroscopic salts). The latter, named *selagine*, *annotine*, *inundatine*, *complanatine*, and *clavatine*, respectively, confer poisonous properties on the plants. R. S. C.

**Distribution of alkaloids in *Ephedra sinica* (Ma-Huang).** M. TARLÉ (J. Chinese Chem. Soc., 1935, 3, 377—380).—In the young herb the total amount of ephedrine alkaloids (I) is almost evenly distributed between the pith and the rest of the stem, but in the ripe plant the former contains much > the latter. The percentage of *l*-ephedrine in (I) is nearly the same in early summer (56.45%) as in the autumn (57.7%). H. G. M.

**Histochemical detection of sodium in plants.** M. STEINER (Ber. deut. Bot. Ges., 1935, 53, 720—732).—An adaptation of the uranyl Zn acetate method is described. Other plant substances do not interfere. A. G. P.

**Spectrographic micro-determination of zinc [in plant material].**—See this vol., 43.

**Method of making latent finger-prints visible.** M. WAGENAAR (Pharm. Weekblad, 1935, 72, 1265—1271).—The latent finger-print is developed by treatment with I vapour and permanent impressions are taken from the developed stain on paper coated with a prep. consisting of 1 g. of rice starch, 2 g. of KI, and 0.3 g. of thymol in 20 c.c. of  $\text{H}_2\text{O}$ . S. C.

**Impregnation of the nervous system with silver.** J. SZEPESENWOL (Compt. rend. Soc. Biol., 1935, 120, 689—690).—Larvæ of batrachians are impregnated with Ag by means of a 10% solution of  $\text{CH}_2\text{O}$  in 4%  $\text{HCl}$  or  $\text{HCO}_2\text{H}$  as fixer, followed by  $\text{AgNO}_3$  solutions of gradually increasing concn.

R. N. C.

**Deproteinisation of blood and urine by copper ferrocyanide.** R. VLADESCO (Compt. rend. Soc. Biol., 1935, 120, 664—665; cf. A., 1935, 1044).—Deproteinisation of blood and urine by  $\text{Cu}_2\text{Fe}(\text{CN})_6$  removes uric acid and  $\text{NH}_2$ -acids in the ppt. Urea, creatine, and creatinine may be determined in the filtrate if excess of Cu is first removed with  $\text{H}_2\text{S}$ , as it interferes with the determination of the latter two substances with Na picrate. Deproteinisation by this method is preferable to the older methods in diabetic urines.

R. N. C.

**Determination of benzene by the Pulfrich step-photometer.** L. VON SZECSENYI-NAGY (Biochem. Z., 1935, 281, 178—180; cf. Janovsky, A., 1891, 685).—The  $\text{C}_6\text{H}_6$  is separated from the acidified material (biological) by distillation into a cooled nitration mixture. The  $\text{C}_6\text{H}_4(\text{NO}_2)_2$  obtained is dissolved in  $\text{COMe}_2$ , made alkaline with 33% aq.  $\text{NaOH}$ , and shaken. The intensity of the violet colour in the  $\text{COMe}_2$  is measured. About 70% of the  $\text{C}_6\text{H}_6$  is thus determined.

W. McC.

**Spectrographic determination of phenol in different media.** G. BARAC (Compt. rend. Soc. Biol., 1935, 120, 520—522).— $\text{PhOH}$  is determined in aq. solution, and in plasma and whole blood after deproteinisation with  $\text{H}_2\text{WO}_4$ , by extracting with  $\text{Et}_2\text{O}$  and spectroscopic examination of the extract in the Jobin-Yvon quartz spectrograph;  $\text{PhOH}$  shows three narrow bands at 267, 274, and 280.7  $\text{m}\mu$ , the mol. extinction coeff. in  $\text{Et}_2\text{O}$  for the third of these being 2400.

R. N. C.

**Sugar determination by the ferricyanide electrode.** P. A. SCHAEFFER and R. D. WILLIAMS (J. Biol. Chem., 1935, 111, 707—723).—Reducing sugars may be determined by the ferri-ferro-cyanide electrode. Vals. are unaffected by  $p_{\text{H}}$  change, by the products of the sugar oxidation, or by changes in the vol. of the solution about the electrode. The method can be adapted for determinations with 20 cu. mm. of blood. As no supplementary reagents are used, side reactions are avoided.

E. A. H. R.

**Rapid method for the determination of reducing sugars.** G. I. SOLOMOS (Bull. Soc. Chim. biol., 1935, 17, 1465—1469).—The solution containing the reducing sugar is added from a burette to a known amount of 0.4%  $\text{K}_3\text{Fe}(\text{CN})_6$  in  $N$ - $\text{NaOH}$  until the red colour disappears. The method is applied to blood, urine, and milk.

A. L.

**Determination of glutamine in presence of asparagine.**—See this vol., 60.

**Determination of carotenoids in blood, tissue, and fluids in clinical practice.** P. RATCHEVSKY (Bull. Soc. Chim. biol., 1935, 17, 1187—1193).—The method is based on the observation that  $0.03 \times 10^{-6}$

g. of carotene is the smallest amount detectable by the yellow residue obtained on evaporation of light petroleum solutions.

A. L.

**Infra-red absorption spectra of plant and animal tissue etc.**—See this vol., 9.

**Iodine value as a biological constant. Rapid micro-determination by means of bromine vapour.** H. WOLLSCHITT (Arch. exp. Path. Pharm., 1935, 179, 260—265).—The material (0.1—5.0 mg.) is exposed to  $\text{Br}$  vapour for 15—180 min. and then heated at  $100^\circ$  to const. wt. The increase in wt.  $\times 160/\text{wt. taken}$  is the I val. Vals. for common fats and fatty acids agree with theoretical vals., but the indicated nos. of double linkings of some carotenoids (crocin, methylbixin) and unsaturated esters are < the known vals. The method differentiates various body fats.

F. O. H.

**Determination of carbon in biological fluids.** F. LAVERSON and K. VOIT (Biochem. Z., 1935, 280, 276—285).—The fluid is burned in air or  $\text{O}_2$  in an electrically heated combustion furnace and the  $\text{CO}_2$  produced is passed into aq.  $\text{Ba}(\text{OH})_2$ . Excess of 0.01*N*- $\text{HCl}$  is added and the solution is titrated with 0.01*N*- $\text{NaOH}$  using Tashiro's mixed indicator (Amer. J. Physiol., 1920, 60, 519). 0.002 mg. of C can be determined.

W. McC.

**Calcium determination in biological material.** C. C. WANG (J. Biol. Chem., 1935, 111, 443—453).—Use of a washing solution, for  $\text{CaC}_2\text{O}_4$  ppts., consisting of 2% aq.  $\text{NH}_3$  in equal parts of  $\text{H}_2\text{O}$ ,  $\text{EtOH}$ , and  $\text{Et}_2\text{O}$  prevents loss by flotation and dissolution. Treatment with  $\text{CCl}_3\text{CO}_2\text{H}$  and C allows direct Ca determinations to be made on urines.

F. A. A.

**Determination of mercury in viscera.** C. NEWCOMB, S. R. NAIDU, and K. S. VARADACHAR (Analyst, 1935, 60, 732—735).—The org. matter is destroyed by heating with  $\text{HNO}_3 + \text{H}_2\text{SO}_4$ , and the solution is distilled in a current of air until  $\text{H}_2\text{SO}_4$  fumes appear. Distillation is continued in a stream of air charged with  $\text{HCl}$ ,  $\text{HgCl}_2$  distilling over.  $\text{Hg}$  in both distillates is pptd. as  $\text{HgS}$ , which is dissolved in  $\text{Br-H}_2\text{O}$  and repptd. Separation is quant. from other heavy metals, including  $\text{As}^{\text{III}}$ , which is oxidised to  $\text{As}^{\text{V}}$ .

J. S. A.

**Micro-determination of phosphoric acid in tissue.** L. THIVOLLE (Bull. Soc. Chim. biol., 1935, 17, 1427—1450).—Conc.  $\text{HNO}_3$  containing  $\text{Cu}(\text{NO}_3)_2$  is used for the mineralisation of the material. The aq. solution of the phosphomolybdate ppt. is reduced with Zn, added to aq. Na phosphomolybdate, and titrated with  $\text{KMnO}_4$  using benzidine as indicator.

A. L.

**Micro-determination of sulphur in biological material.** L. REVOL and M. FERRAND (Bull. Soc. Chim. biol., 1935, 17, 1451—1454).—Losses in the determination of S in org. compounds due to the escape of traces of  $\text{SO}_2$  are avoided by passing the vapour from the  $\text{HNO}_3\text{-H}_2\text{O}_2$  treatment of the material through aq.  $\text{Br}$  which is finally added to the main solution. The  $\text{SO}_4^{--}$  is pptd. with benzidine.

A. L.

# BRITISH CHEMICAL ABSTRACTS

## A—PURE CHEMISTRY

FEBRUARY, 1936.

### General, Physical, and Inorganic Chemistry.

**Spectral intensities for hydrogen.** P. RUDNICK (Physical Rev., 1935, [iii], 48, 807—811).—Mathematical. N. M. B.

**Extension of the Paschen series.** B. JOHANSEN (Naturwiss., 1935, 23, 866).—The infra-red spectrum of  $H_2$  has been photographed and the  $\lambda\lambda$  of the 6th—13th members of the Paschen series are determined. A. J. M.

**Fine structure of  $D_a$  with increased resolution.** R. C. WILLIAMS and R. C. GIBBS (Physical Rev., 1935, [ii], 48, 971; cf. A., 1934, 575).—The chief minor component resulting from the coincident transitions  $2p^2P_{1/2} - 3s^2S_{1/2}$  and  $2s^2S_{1/2} - 3p^2P_{1/2}$  has been resolved. The measured half-intensity breadth of the high-frequency main component is  $0.120\text{ cm}^{-1}$ , and the average interval between centres of components  $0.134\text{ cm}^{-1}$ . The deviation from theory may be due to a Stark effect. The val. of  $e/m$  calc. from the measured interval between components of the two isotopes is  $1.7577 \pm 0.0004 \times 10^7$  e.m.u. per g. N. M. B.

**Continuous spectrum of deuterium.** (MILLE.) A. TOURNAIRE and E. VASSY (Compt. rend., 1935, 201, 957—958).—The continuous spectrum of  $D_2$  is slightly more intense than that of  $H_2$  at  $\lambda\lambda < 4000\text{ \AA}$ . H. J. E.

**New investigations of helium and hydrogen lines with crossed electric and magnetic fields.** W. STEUBING (Physikal. Z., 1935, 36, 822—825).—The changes suffered by the Stark effect components of the first secondary series of He which have been magnetically split into duplets, when the strength of the electric field is varied, have been investigated. For  $H_2$  it was shown that the method could be applied in spite of the electrodynamic decomp. of the Balmer lines observed by Wien. Results for  $H_2$  are analogous to those for He. A. J. M.

**Doubly excited states of helium.** T. Y. WU and S. T. MA (Physical Rev., 1935, [ii], 48, 917; cf. *ibid.*, 1934, [ii], 46, 239).—A correction. N. M. B.

**Perturbations in the second positive nitrogen bands.** D. COSTER and F. BRONS (Z. Physik, 1935, 97, 570—572).—Perturbation of the 2nd and 3rd vibration states of the  $^3\pi C$  level of  $N_2$  is characterised by a weakening without displacement of only a few lines, and is not explained by Gero's analysis (A., 1935, 1437). A. B. D. C.

**New afterglow spectrum in nitrogen.** J. KAPLAN (Physical Rev., 1935, [ii], 48, 800—801).—A detailed account of results previously reported (cf. A., 1935, 907). N. M. B.

**Rotational structure of the Schumann-Runge bands of oxygen in the vacuum region.** H. P. KNAUSS and S. S. BALLARD (Physical Rev., 1935, [ii], 48, 796—799).—Data for the absorption bands photographed in the range  $1760\text{--}1925\text{ \AA}$ . and rotational analyses are tabulated. An expression for, and table of, band origins are given. The energy of dissociation is  $5.05$  volts. N. M. B.

**Absorption spectra of oxygen at high concentration.** B. J. EISEMAN, jun. (J. Math. Phys. Mass. Inst. Tech., 1935, 14, 260—261).—New data for the ultra-violet triple bands,  $2847\text{--}2434\text{ \AA}$ ., using highly purified  $O_2$  at  $440\text{--}55\text{ atm.}$ , are given. The bands at  $6280$ ,  $5765$ , and  $4775\text{ \AA}$ . at room temp. and  $>440\text{ atm.}$  degrade towards the short  $\lambda$ . The  $4470\text{ \AA}$ . band appeared only at low temp. at const. concn. N. M. B.

**Influence of foreign gases on the higher principal series lines of sodium.** C. FUCHTBAUER and P. SCHULZ (Z. Physik, 1935, 97, 699—707).—Ne, A, and  $N_2$  produced dissymmetry towards the red at the end of the series. A. B. D. C.

**Arc spectrum of alkali metals with high vapour density.** A. CARRELLI and M. BATTISTA (Nuovo Cim., 1934, [ii], 11, 685—689; Chem. Zentr., 1935, i, 2776).—The intensity of forbidden lines and of the continuum is explained by the formation of quasi-mols., the effect increasing with the polarisability of the atoms from Na to Cs. J. S. A.

**Absorption spectra of sulphur vapour.** L. D'OR (Compt. rend., 1935, 201, 1026—1028).—Changes in the absorption spectrum of S vapour with concn. and temp. indicate four species as well as S atoms. The band system between  $3600$  and  $4200\text{ \AA}$ . is due to  $S_4$  or  $S_3$ , and not  $S_8$  or  $S_2$ . The validity of Preuner's conclusions is questioned (A., 1912, ii, 1145). T. G. P.

**Predissociation in the sulphur bands.** B. ROSEN, M. DESIRANT, and J. DUCHESNE (Physical Rev., 1935, [ii], 48, 916).—The feature of predissociation is that the emission band system stops abruptly at  $v'=8$  and the last observed band (8,0) is shorter than the others. Spectroscopic examination showed abrupt termination of the rotational structure in the  $v'-8$  and  $v'=7$  progressions and in the (8,0) band. It is concluded that there is a predissociation in the  $v'-7$  level, and the derived heat of dissociation is  $4.41 \pm 0.02\text{ e.v.}$  N. M. B.

**Spectrum of Se II.** D. C. MARTIN (Physical Rev., 1935, [ii], 48, 938—944).— $\lambda$  measurements were made in the region  $500\text{--}2600\text{ \AA}$ . of the spectrum

excited by a hollow-cathode discharge in He. Identifications and  $J$  vals. of new terms are given, and data and classifications of all known Se II lines are tabulated.

N. M. B.

**Anomalous dispersion of silver vapour.** L. ALEGRETTI (Nuovo Cim., 1934, [ii], 11, 717—722; Chem. Zentr., 1935, i, 2776).—The intensity ratio of the first doublet of the Ag principal series was measured by means of anomalous dispersion. J. S. A.

**Spark spectrum of cadmium.** R. RICARD and A. SAUNIER (Compt. rend., 1935, 201, 1115—1116).—Lines of Cd III and Cd IV at  $\lambda\lambda$  3400—5000 Å. were measured.

H. J. E.

**Absorption spectrum of the iodine molecule in the vacuum ultra-violet.** H. CORDES (Z. Physik, 1935, 97, 603—624).

A. B. D. C.

**Arc spectrum of cerium.** K. HASPAS (Z. Physik, 1935, 96, 410—430).—430 lines are arranged in terms, the lowest being a  $^2D$  term. The first and second ionisation potentials are 6.9 and 14.8 volts, respectively.

A. B. D. C.

**Spectrum of polonium.** B. KARLIK and H. PETERSSON (Sitzungsber. Akad. Wiss. Wien, IIA, 1934, 143, 379—383; Chem. Zentr., 1935, i, 2496).—2 (or 3 ?) strong Po lines are recorded from a Po deposit on Pt, enclosed in a heated SiO<sub>2</sub> tube and excited with radiation of short  $\lambda$ .

J. S. A.

**Ultra-violet spectrum of radium emanation.** H. PETERSSON (Sitzungsber. Akad. Wiss. Wien, IIA, 1934, 143, 303—311; Chem. Zentr., 1935, i, 2647).— $\lambda\lambda$  and intensities are recorded for 169 lines, not due to other elements, between 3700 and 2280 Å. The lines found do not correspond with those reported by previous workers.

J. S. A.

**Energy transfer in collisions of excited thallium atoms with gas molecules.** N. PRILESHAEVA (Acta Physicochim. U.R.S.S., 1935, 2, 647—664).—Results on the quenching of the Tl fluorescence line 5351 Å. by various gases, previously published (A., 1934, 340), are discussed theoretically. F. L. U.

**Anomalous diffraction gratings.** R. W. WOOD (Physical Rev., 1935, [ii], 48, 928—936).—A Cr-plated echelette grating of 7200 lines per in. on Cu, and one of 15,000 lines on Al film on glass, showed narrow bright and dark bands in the continuous spectrum of a white source. The variation of the bands with incidence angle is studied, and the bands, unexplained by classical theory, are attributed to a type of destructive interference along the plane of the grating.

N. M. B.

**Initiation of electrical discharges by field emission.** J. W. FLOWERS (Physical Rev., 1935, [ii], 48, 954—959).—The initiation of highly over-voltage discharges in effectively ion-free gases by short-duration voltage impulses is independent of the gas between the electrodes, and of the pressure over the range 1 atm.—vac. spark stage. Oscillograms for discharges in asymmetrical fields are given and discussed.

N. M. B.

**Interpretation of the fine structure coefficient,  $\alpha$ .** S. A. DE MAYOLO (Compt. rend., 1935, 201, 1097—1099).

H. J. E.

**Behaviour of certain diatomic molecules in stellar atmospheres.** E. BODSON and F. E. NISOLI (Bull. Acad. roy. Belg., 1935, [v], 21, 922—926).—Russell's theory is applied to the stellar spectra of the oxides and hydrides of B, Al, Ca, and Mg in the dwarf and giant stars, and temp.—abundance curves are given and discussed in relation to influence of dissociation and ionisation.

N. M. B.

**Red-shift from nebulae.** F. ZWICKY (Physical Rev., 1935, [ii], 48, 802—806).—Mathematical. The expansion of the universe, the red-shift of light through intergalactic space, and the width of spectral lines from distant nebulae are examined.

N. M. B.

**Artificial crystal lattice for interference with optical light.** W. KRAMER (Physikal. Z., 1935, 36, 841—843).—A method for obtaining interference diagrams of a similar nature to X-ray interference patterns, with ordinary light, is described. The process depends on the use of stationary waves produced by a method similar to that employed in the Lippmann process for colour photography.

A. J. M.

**X-Ray determinations with the diamond.** M. RENNINGER (Physikal. Z., 1935, 36, 834—837).—Intensity determinations of the reflexions from the (222) plane have been made using Cu  $K\alpha$  rays. The structure factor,  $F_{222}$ , lies between 2.1 and 2.6.

A. J. M.

**K X-ray absorption of light elements.** E. DERSHEM (Physical Rev., 1934, [ii], 45, 768).—Absorption of the  $L\alpha_{12}$  lines of Cu, Ni, and Fe in CO<sub>2</sub>, N<sub>2</sub>, O<sub>2</sub>, and Ne have been measured.

L. S. T.

**K-Absorption of X-rays at the K-edges.** H. NITKA (Naturwiss., 1935, 23, 866).—The determination of the absorption of X-rays by intensity measurements gives uncertain results for the heavier elements, but if the change of intensity coeff. on crossing an edge is considered, the effect of scattering is considerably reduced. There is a linear dependence of at. K-absorption at the K-edge on the  $\lambda$  of the edge.

A. J. M.

**Change in relative intensity of the satellites of  $L\alpha$  in the atomic number range 47—52.** F. R. HIRSH, jun., and F. K. RICHTMYER (Physical Rev., 1934, [ii], 45, 754).

L. S. T.

**Measurements of small light intensities with counter tubes. II.** K. H. KREUCHEN (Z. Physik, 1935, 97, 625—632; cf. A., 1935, 800).—Photo-electric sensitivity is given for Zn, Cd, and Cu in the region 400—185 m $\mu$ , both as solid and as deposited cathodes.

A. B. D. C.

**Neon lamps in counter circuits. I. Limits of region of photo-electric sensitivity.** G. VALLE and B. ROSSI (Nuovo Cim., 1934, [ii], 11, 708—716; Chem. Zentr., 1935, i, 2778).—The dependence of photo-electric sensitivity on  $\lambda$  has been investigated. The upper limit gives a max. rate of potential increase between two impulses.

J. S. A.

**Foreign ionisation and decrease of discharge potential in gases.** W. ROGOWSKI and A. WALL-RAEF (Z. Physik, 1935, 97, 758—764).

A. B. D. C.

**Role of space charge in the study of the Townsend ionisation coefficients and the mechanism**

of static spark breakdown. R. N. VARNEY, H. J. WHITE, L. B. LOEB, and D. Q. POSIN (Physical Rev., 1935, [ii], 48, 818—822).—The mechanism of spark breakdown is investigated by a study of the deviations of the pre-spark current from the simple electron ionisation law, on the basis of distortion of the field of the spark gap by space charge. N. M. B.

Electron affinity of iodine from space-charge effects. G. GLOCKLER and M. CALVIN (J. Chem. Physics, 1935, 3, 771—777; cf. A., 1934, 1054).—The electron affinity  $\Delta E_0$  of I atoms, determined directly by measuring the equilibrium of reaction  $I^- \rightarrow I + E^- - \Delta E_0$  at the surface of a hot W filament, was 74.6 kg.-cal., in good agreement with available data. The concn. of the several ions of different masses ( $I^-$  and  $E^-$ ) was calc. from their effect on space charge. I has no effect on the thermionic emission of W. N. M. B.

Charging potential and secondary emission of bodies irradiated with electrons. M. KNOLL (Physikal. Z., 1935, 36, 861—869).—The charging potential of a homogeneous metallic plate in a high vac. is discontinuous with respect to the velocity of the primary electrons over the range 0—5000 volts. For C, however, the charging potential  $\propto$  velocity of primary electrons. This behaviour is connected with the variation of emission of secondary electrons. A. J. M.

Energy distribution of electrons in the photo-electric effect. E. RUDBERG (Physical Rev., 1935, [ii], 48, 811—817).—Available expressions for the distribution of electron levels and the transition probabilities from these levels, characterising the photo-electric emission from a metal, are examined, and equations for the energy distribution are derived in each case. Results are compared with data for Mo (cf. Roehr, A., 1934, 130), and Mitchell's theory is supported (cf. *ibid.*, 1290). N. M. B.

Photo-ionisation in gases. R. N. VARNEY and L. B. LOEB (Physical Rev., 1935, [ii], 48, 822—824).—When the radiation emitted from a H discharge tube passed through a fluorite window into a balanced space-charge positive ion detector containing gas at 0.02 mm., it was proved that the ionisation, for discharge tube pressures  $> 5$  mm., was of electrostatic origin, and not caused by radiation. This may explain Lenard's observations on the ionisation of gases. For a given gas at each end of a tube, photo-ionisation of A and of Xe by its own radiation was found, but this disappeared when a fluorite window was inserted; no ionisation of  $N_2$  or air by its own radiation was observed with or without the window. Results indicate that in pure, clean, dry gases photo-ionisation by radiation of energy appreciably  $<$  the ionisation potential of the gas is improbable. N. M. B.

Surface ionisation of potassium on tungsten. A. L. REIMANN (Physical Rev., 1934, [ii], 45, 898).—The results of Copley and Phipps (cf. A., 1935, 1303) are discussed. L. S. T.

Surface ionisation of potassium on tungsten. M. J. COPLEY and T. E. PHIPPS (Physical Rev., 1935, [ii], 48, 960—968).—Work previously reported (cf.

A., 1935, 1303) is continued under improved conditions, and observations of degree of ionisation are made up to 2800° abs. The calc. work function for W is  $4.51 \pm 0.01$  volts. Difference between experiment and theory in the log ion-atom ratio- $1/T$  graph indicates a temp. coeff.  $\alpha$  of the work function; the calc. val. of  $\alpha$  is  $5.6 \times 10^{-5}$  volt per degree. N. M. B.

Monatomic films of alkali metals on platinum. H. MAYER (Physikal. Z., 1935, 36, 845—848).—The prep. of monat. films of alkali metals on Pt by means of at. rays is described. The thickness of the film can be calc. by assuming that to each four Pt atoms there is one K atom, since the lattice const. of Pt is approx. half that of K. The variation of the photo-electric sensitivity for both gas-containing and outgassed Pt on which were deposited at. films of K (gas-containing and outgassed, respectively) with thickness of K film was investigated. A. J. M.

Radiation characteristics of oxide cathodes. W. T. MILLIS and E. F. LOWRY (Physical Rev., 1934, [ii], 45, 764). L. S. T.

Thermionic emission and electronic conductivity of solids. A. GEHRTS (Physikal. Z., 1935, 36, 764—767).—The thermionic emission of cathodes consisting of a metal covered with a monat. adsorption layer is a pure surface phenomenon just as in the case of homogeneous cathodes. The electron emission work is smaller for a Th-covered W cathode (monat. layer) than for a homogeneous Th cathode. The thicker is the Th film the more nearly do the consts.  $A$  and  $b$  of the thermionic emission equation,  $I = AT^2 e^{-b/T}$  ( $I$ =saturation current), approach those for a homogeneous Th cathode. A. J. M.

Effect of temperature on electron field currents from thoriated tungsten. A. J. AHEARN (Physical Rev., 1934, [ii], 45, 764—765; cf. A., 1933, 993).—The measurements made agree with the view that the field currents are const. and independent of temp., and that thermionic emission accounts for the observed variations with temp. L. S. T.

Electron emission from thoriated tungsten. W. B. NOTTINGHAM (Physical Rev., 1934, [ii], 45, 765).—Variation with temp. and electric field of electron emission from C-free thoriated W has been measured for surface coverings from zero to approx. a single layer. L. S. T.

Potential of an insulated screening grid in an electron stream. H. STRUBIG (Z. Physik, 1935, 97, 538).—Preliminary. A. B. D. C.

Born theory of the electron. A. BRAMLEY (Science, 1935, 82, 438—439).—A discussion. L. S. T.

After-effect of aluminium bombarded by electrons. M. TANAKA (Physical Rev., 1935, [ii], 48, 916).—Livingood's experiments (cf. this vol., 131) were performed using 250—300 kv. tube voltage and bombarding Al foil in high vac. with high-speed electrons. The Al afterwards emitted an electron radiation decaying with half-val. periods of about 7 sec., 40 sec., and 10 min. A similar effect was observed for other elements, including Ni, Cu, and Ag. N. M. B.

**Inelastic scattering of electrons from metals.** E. RUDBERG (Physical Rev., 1934, [ii], 45, 764).

L. S. T.

**Saturation ionisation current from high-speed electrons in air.** L. S. TAYLOR (Physical Rev., 1935, [ii], 48, 970).—A method previously reported (cf. *ibid.*, 1934, [ii], 45, 762) of plotting results of ionisation produced in liquids is extended to determine the ionisation produced in air at normal pressure by a heterogeneous beam of electrons of max. energy 150 electron kv.

N. M. B.

**Acceleration of electrons to high energies.** J. W. BEAMS and H. TROTTER, jun. (Physical Rev., 1934, [ii], 45, 849—850).—A method of accelerating electrons by means of effectively moving electrical fields is described.

L. S. T.

**Energy losses of electrons in helium, neon, and argon.** R. WHIDDINGTON and E. G. WOODROOFE (Phil. Mag., 1935, [vii], 20, 1109—1120).—An extension of work previously reported (cf. A., 1934, 825). Energy losses, relative probabilities, and interpretations of the excitations are tabulated.

N. M. B.

**Limitations of the theory of the positron.** W. H. FURRY and J. R. OPPENHEIMER (Physical Rev., 1934, [ii], 45, 903—904; cf. A., 1934, 468; 1935, 278).

L. S. T.

**Proton-proton forces in anomalous scattering and in nuclear binding.** R. D. PRESENT (Physical Rev., 1935, [ii], 48, 919—920).—In view of anomalies reported by White (cf. *ibid.*, 47, 573) on the scattering of protons in  $H_2$ , the scattering cross-section is calc. for  $45^\circ$  scattering, using the Feenberg-Knipp nuclear model (cf. this vol., 134) and assuming an additional attractive proton interaction.

N. M. B.

**Scattering of molecular rays in gases.** R. G. J. FRASER, H. S. W. MASSEY, and C. B. O. MOHR (Z. Physik, 1935, 97, 740—744).—The geometry of the crossed mol.-ray method is worked out for a primary beam of rectangular cross-section, and used to obtain collision cross-sections for Na-H $\sigma$  and K-Hg.

A. B. D. C.

**High-current ion sources for nuclear investigations.** E. S. LAMAR, E. W. SAMSON, and K. T. COMPTON (Physical Rev., 1935, [ii], 48, 886—892).—Experiments are described with a capillary ion source designed by Tuve (cf. A., 1935, 1296), which has been modified by eliminating the auxiliary electrode for drawing ions out of the arc. The ion current for a 1.92 amp. arc was 4.2 milliamp.; currents up to 5 amp. have been used. The mass spectrograph, when the arc is operated in  $H_2$ , shows a preponderance of diat. and triat. ions with proton fractions 5—20% of the total ion current. There is evidence of the breaking up of the heavy ions into protons and neutral particles on collision at high speed with gas mols.

N. M. B.

**Positive rays. Application to the study of the Stark effect.** A. POIROT (Ann. Physique, 1935, [xi], 4, 533—645; cf. A., 1930, 657).—Morand's method (cf. A., 1927, 492) is extended to the emission of positive rays from Na, K, Ca, Ba, and Cr. The rays form a well-defined faintly luminous beam; the spectrum of the light emitted shows chiefly the lines of the

arc spectrum of the metal of the salt deposited on the anode. The phenomena observed can be explained by the electrolysis and partial volatilisation of the salt. The rays can be used for the study of the Stark effect, particularly in the case of metals which do not form stable volatile compounds for study by the discharge tube. The Stark effect for Li, the diffuse doublets of Na, and the singlets and triplets of Ba were observed.

N. M. B.

**At. wt. of neon.** A. VON ANTROPOFF [with R. JUNGBLUTH-FICHT and M. HOEPPENER] (Ber., 1935, 68, [B], 2389—2391).—Ne and He can be separated from one another by active C cooled in liquid air. The at. wt. of Ne, determined from its density, is 20.183.

H. W.

**Isotopic constitution of iron.** J. DE GIER and P. ZEEMAN (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 959—961).—The isotope 58 of Fe has been detected in  $Fe(CO)_5$  by the mass spectrograph, its abundance being about 0.5%.

J. W. S.

**Isotopic structure of iridium.** A. J. DEMPSTER (Nature, 1935, 136, 909).—A mass analysis of the Ir ions formed by a high-frequency spark between Pt-Ir electrodes confirms the existence (cf. A., 1935, 1295) of  $Ir^{191}$  and  $Ir^{193}$ , the latter more abundant.

L. S. T.

**Production of  $H^3$  by a canal-ray discharge in deuterium.** G. P. HARNWELL, H. D. SMYTH, S. N. VAN VOORHIS, and J. B. H. KUPER (Physical Rev., 1934, [ii], 45, 655—656, 769).— $H^3$  has been accumulated by running a high-voltage discharge in  $D_2$  at low pressure and passing the resulting canal rays into  $D_2$  at a higher pressure. Circulation of the gas for 3 hr. increased the  $H^3$  content from 1 in  $2 \times 10^5$  to 1 in 5000 parts of  $D_2$ .

L. S. T.

**Prediction of isotopes.** J. H. BARTLETT, jun. (Physical Rev., 1934, [ii], 45, 847).—A list is given.

L. S. T.

**Inhomogeneous fields for mass spectrography.** S. H. BAUER (Physical Rev., 1935, [ii], 48, 917).—Mathematical.

N. M. B.

**Radioactivity of samarium and "columnar ionisation."** D. LYFORD and J. A. BEARDEN (Physical Rev., 1934, [ii], 45, 743—744).—3.9  $\alpha$ -particles, range 1.28 cm., are emitted per sq. cm. per min. from a  $Sm_2O_3$  surface.

L. S. T.

**Radioactivity of the rare-earths. I. Distribution of radioactivity in the fractionation of cerium earths.** L. MAZZA (Gazzetta, 1935, 65, 993—1008; cf. A., 1934, 578).—By means of an automatic Geiger counter the distribution of radioactivity in the various fractions resulting from the fractionation of rare-earth mixtures has been measured. La-Ce-Pr, Pr-Nd, and Nd-Sm mixtures, respectively, were used. Both La and Ce retain traces of radioactive elements very tenaciously and are themselves inactive. The Pr-Nd fractions are all feebly active, probably due to the radioactivity of Nd. In the Nd-Sm mixtures the radioactivity is due chiefly to Sm, although here also impurities of radioactive elements tend to become conc. in the more sol. fractions.

O. J. W.

**Interaction between  $\alpha$ -particles.** J. A. WHEELER (Physical Rev., 1934, [ii], 45, 746). L. S. T.

**Ionisation curves of single  $\alpha$ -particles.** H. ALFVEN (Z. Physik, 1935, 97, 718—724).—The current due to the ionic sheath surrounding an  $\alpha$ -particle track in a homogeneous electric field has the form of the Bragg curve (cf. A., 1935, 1048). A. B. D. C.

**Range of  $\alpha$ -rays from polonium and its dependence on intensity of the radiation, age of the preparation, and nature of the substrate.** B. KARLIK and E. RONA (Sitzungsber. Akad. Wiss. Wien, IIA, 1934, 143, 217—221; Chem. Zentr., 1935, i, 2773).—Strong preps. show inhomogeneity, which increases on ageing, and is  $>$  corresponds with self-absorption. The range decreases steadily on keeping in  $\text{CO}_2$ . Penetration of Ni or Pd substrates does not occur with weak sources. J. S. A.

**Excitation of  $K$ -radiation of nitrogen, oxygen, and neon by alpha-particles.** W. RIEZLER (Ann. Physik, 1935, [v], 24, 714—718).—The excitation function for  $K$ -radiation of  $\text{N}_2$ ,  $\text{O}_2$ , and Ne by  $\alpha$ -particles was investigated for  $\alpha$ -particles of range 13—35 mm. in air. The curve between range of  $\alpha$ -particle and excitation function is analogous to the Bragg curve for total ionisation by  $\alpha$ -particles, although the max. is much flatter. The Ne curve does not reach a max. in the range considered. A. J. M.

**Recoil by  $\beta$ -decay.** F. BLOCH and C. MÖLLER (Nature, 1935, 136, 911—912).—Theoretical. L. S. T.

**X-Ray levels of radioactive elements with applications to  $\beta$ - and  $\gamma$ -ray spectra.** F. A. MAXFIELD and A. E. RUARK (Physical Rev., 1934, [ii], 45, 744). L. S. T.

**Magnitude and composition of the absorption coefficients of hard  $\gamma$ -rays.** W. GENTNER (Physikal. Z., 1935, 36, 810—812).—The variation with  $\lambda$  of the absorption coeff. for  $\gamma$ -rays in Pb, and for  $\gamma$ -rays from Th-C'' ( $h\nu = 2.65 \times 10^6$  e.v.) the variation with at. no., have been determined. A. J. M.

**Magnetic moment of the neutron.** D. R. INGLIS and A. LANDE (Physical Rev., 1934, [ii], 45, 842; cf. A., 1935, 278).—Theoretical. L. S. T.

**Production of neutrons by annihilation of protons and electrons according to Fermi's theory.** F. BLOCH and C. MÖLLER (Nature, 1935, 136, 987).—Theoretical. L. S. T.

**Experiments with slow neutrons.** P. I. LUKIRSKI and T. V. ZAREVA (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 393—396).—A detailed account of work already noted (A., 1935, 1441).

**Production of secondary  $\gamma$ -rays by neutrons.** R. FLEISCHMANN (Physikal. Z., 1935, 36, 806—808).— $\gamma$ -Rays were produced by the action of slow neutrons on paraffin, Fe, Cu, Cd, and Pb. In the case of the metals the slow neutrons were produced by the preliminary passage of neutrons through paraffin. The efficiency is in all cases one quant per neutron. A. J. M.

**Absorption of residual neutrons.** L. SZILARD (Nature, 1935, 136, 950—951).—Slow neutrons

(paraffin) from a Rn-Be source filtered by thick Cd sheets are strongly absorbed by In and some other elements. Cd absorbs the bulk of the unfiltered beam more strongly than does In. The residual neutrons from the Cd filter are scarcely absorbed by Cd itself. They show marked selective absorption effects, and in some elements are more absorbable than the unfiltered beam. The results are contrary to the current theory of radiative capture. L. S. T.

**Scattering of neutrons by  $\text{H}_2\text{O}$ ,  $\text{D}_2\text{O}$ , paraffin, lithium, boron, and carbon, and the production of radioactive nuclei by neutrons found by Fermi.** J. R. DUNNING and G. B. PEGRAM (Physical Rev., 1934, [ii], 45, 768—769).—The scattering of Rn-Be neutrons by these substances shows that for light in contrast to heavy nuclei the cross-section for neutron-nucleus collision does not vary greatly with the nuclear charge or nuclear mass. Mg gives an induced radioactivity with a period of approx. 3 hr. L. S. T.

**Slowing down of neutrons by collisions with protons.** H. VON HALBAN, jun., and P. PREISWERK (Nature, 1935, 136, 951—952).—The degree of activation produced in a Ag plate by neutrons from a Rn-Be source slowed down by passage through various thicknesses of  $\text{H}_2\text{O}$ , EtOH,  $\text{C}_6\text{H}_6$ , and a liquid paraffin has been observed. The differences in the effect of these liquids on the intensity of slow neutrons cannot be ascribed to differences in the amounts of H, C, or O which the liquids contain. Mol. structure appears to be a factor. L. S. T.

**Energy distribution of neutrons from fluorine.** T. Y. WU (Physical Rev., 1934, [ii], 45, 846—847).—Theoretical. L. S. T.

**Geiger-counter characteristics with applied potentials reversed.** D. B. COWIE (Physical Rev., 1935, [ii], 48, 883—885).—Counters in which the cylinder potential is positive with respect to the wire operate with a reduced efficiency for which an explanation is discussed. N. M. B.

**Search for radioactivity induced by 800-kilovolt electrons.** J. J. LIVINGOOD and A. H. SNELL (Physical Rev., 1935, [ii], 48, 851—854).—About 50 elements were bombarded with 850-kv. electrons and examined with a Geiger counter for induced radioactivity. No positive results were obtained, indicating that the yield is  $< 1$  activation per  $10^{12}$  electrons. N. M. B.

**Radioactivity produced by artificially-accelerated particles.** H. R. CRANE and C. C. LAURITSEN (Physical Rev., 1934, [ii], 45, 746). L. S. T.

**Disintegration of beryllium with fast protons.** B. ZIPPRICH (Z. Physik, 1935, 96, 337—341).—This disintegration produces  $\alpha$ -particles. A. B. D. C.

**Artificial radioactivity using carbon targets.** L. R. HAFSTAD and M. A. TUVE (Physical Rev., 1934, [ii], 45, 902—903).—The production from C bombarded with protons of a radio-element which has a decay period the same as that of C bombarded with deuterons (cf. A., 1935, 1442) is due to deuterons contaminating the proton beam. L. S. T.

**Induced radioactivity which follows bombardment of targets by deuterium ions.** L. R. HAFSTAD and M. A. TUVE (Physical Rev., 1934, [ii], 45, 767—768).—Delayed emission effects produced in a series of targets by deuteron bombardment are described. L. S. T.

**Protons from the disintegration of lithium by deuterons.** L. A. DELSASSO, W. A. FOWLER, and C. C. LAURITSEN (Physical Rev., 1935, [ii], 48, 848; cf. *ibid.* 47, 971).—The range distribution of the  $\alpha$ -particles and protons emitted in the disintegration of Li by 700-kv. deuterons was determined. The calc. energy released in the disintegration is 4.3 m.e.v.; the calc. masses are  $\text{Li}^8$  8.0185, and  $\text{Be}^8$  8.0072 =  $2\text{He}^4 + 0.5 \pm 1.0$  m.e.v. N. M. B.

**Radioactivity induced in oxygen by deuteron bombardment.** H. W. NEWSON (Physical Rev., 1935, [ii], 48, 790—796).—An induced radioactivity of half-life 1.16 min. was observed after the bombardment of  $\text{O}_2$  or its compounds by 3-mv. deuterons. The disintegration particles were positrons, and the active substance an isotope of F. The probable reactions are:  $\text{O}^{16} + \text{D}^2 = \text{F}^{17} + n^1$ ;  $\text{F}^{17} = \text{O}^{17} + e^+$ . The activation function of O was measured, and the drop in the excitation curve at low deuteron energies is explained by assuming that the energy of reaction is the negative of the threshold energy; the estimated val. is -1.8 mv. This is approx. verified by measuring the max. angle between the direction of the deuteron beam and the paths of the radioactive recoil atoms when  $\text{SiO}_2$  and graphite were separately bombarded. N. M. B.

**Two radioactive substances from magnesium after deuteron bombardment.** M. C. HENDERSON (Physical Rev., 1935, [ii], 48, 855—861).—Mg bombarded by 3.3 m.e.v. deuterons became radioactive with emission of negative electrons and  $\gamma$ -rays, and with two decay periods,  $10.25 \pm 0.24$  min., and  $15.8 \pm 0.5$  hr., characteristic of  $\text{Mg}^{27}$  and  $\text{Na}^{24}$ . The reactions are:  ${}_{12}\text{Mg}^{26} + {}_1\text{H}^2 = {}_{12}\text{Mg}^{27} + {}_0\text{H}^1$ ;  ${}_{12}\text{Mg}^{26} + {}_1\text{H}^2 = {}_{11}\text{Na}^{24} + {}_2\text{He}^4$ ;  ${}_{12}\text{Mg}^{27} = {}_{13}\text{Al}^{27} + \beta + \gamma$ ;  ${}_{11}\text{Na}^{24} = {}_{12}\text{Mg}^{24} + \beta + \gamma$ . The measured voltage excitation functions of the two activities follow different laws. At 3 m.e.v. one atom becomes  $\text{Na}^{24}$  for each 9.6 atoms becoming  $\text{Mg}^{27}$ . The thick target yield of  $\text{Mg}^{27}$  atoms is about 5 per  $10^7$  deuterons. The nuclear cross-section ( $\text{Mg}^{26}$ ) at 3 m.e.v. is approx.  $2.4 \times 10^{-26}$  sq. cm. N. M. B.

**Collisions of  $\alpha$ -particles with neon nuclei.** W. W. EATON (Physical Rev., 1935, [ii], 48, 921—928).—Using a special projection method, collisions with nuclei were investigated from photographs of 700,000  $\alpha$ -particle tracks due to a source of Th active deposit. The Wilson chamber contained Ne 85%, air 10%, and  $\text{H}_2$  5%. Range-velocity curves for recoil atoms give no evidence of disintegrations of nuclei with emission of protons or neutrons. The probability of disintegrating  $\text{Ne}^{20}$  with  $\alpha$ -particles of  $< 6$  cm. range in air is small; from this the calc. lower limit for the mass of  $\text{Na}^{23}$  is 22.99945. N. M. B.

**Proton spectra of magnesium, silicon, and sulphur on bombardment with fast  $\alpha$ -particles.** O. HAXEL (Physikal. Z., 1935, 36, 804—806).—The

proton spectra of Mg, Si, and S when bombarded with  $\alpha$ -particles of 8.6 cm. range are very similar. This result is discussed on the basis of the nuclear structure of the three atoms. The spectra are those of the most abundant isotopes,  $\text{Mg}^{24}$ ,  $\text{Si}^{28}$ , and  $\text{S}^{32}$ . From the energies of the emitted proton groups, the energies of the excited nuclei of Al, P, and Cl can be obtained. These energies are identical for the three nuclei, and the excitation probabilities for all three elements are approx. equal. This can be explained if the nuclei differ from each other by only one  $\alpha$ -particle. A. J. M.

**Evidence for a resonance level in the nucleus of  $\text{B}^{10}$ .** E. POLLARD (Physical Rev., 1934, [ii], 45, 746).—The protons emitted by B under  $\alpha$ -particle bombardment consist of a group of 18 cm. range superposed on the 14-cm. group observed by Heidenreich. The new group is due to a broad resonance level through which  $\alpha$ -particles of 1.2—1.7 cm. range can enter the nucleus. L. S. T.

**Methods and types of artificial transformation of atoms.** W. BORNÉ (Physikal. Z., 1935, 36, 776—779).—A review of the types and products of nuclear reactions. The highest known stable isotope of any given at. no. must contain an even no. of neutrons. A. J. M.

**Artificial disintegration. III.** D. VAN DER VEEN (Chem. Weekblad, 1936, 33, 16—21).—A further review (see A., 1934, 826).

**Chemical detection of artificial transmutation of elements.** F. A. PANETH and H. LOEIT (Nature, 1935, 136, 950).—He produced by bombardment of Me borate with neutrons from a Rn-Be source has been observed spectroscopically and the vol. measured. One millicurie of Rn, mixed with Be, produces  $< 3 \times 10^3$  neutrons per sec. L. S. T.

**Excitation of nuclei by neutrons.** W. EHRENBURG (Nature, 1935, 136, 870; cf. A., 1935, 141).—Neutrons, apparently of medium velocity, from a Rn-Be source produce an increased activity in Ag and I and a decreased activity in Si and Al when the source is surrounded by a Ag shield. Collisions of neutrons with Ag nuclei lead either to excitation of the nucleus without capture or to capture with formation of a radioactive element. L. S. T.

**Radioactivity induced by neutron bombardment.** A. BRAMLEY (Physical Rev., 1934, [ii], 45, 901—902).—Nuclear reactions are discussed. L. S. T.

**Effect of substances containing hydrogen on artificial radioactivity excited by neutrons. II.** E. FERMI, B. PONTECORVO, and F. RASETTI (Ric. sci. Prog. tec., 1934, 5, II, 380—381; Chem. Zentr., 1935, i, 2492).—The collision area of the atoms of various elements is derived from the relative activity of Rh, embedded in paraffin wax, activated through a screen of the element in question. Elements of large collision area, except Li and B, show high activation by slow neutrons. Li and B probably form stable isotopes or emit very soft  $\beta$ -rays. J. S. A.

**Artificial radioactivity excited by neutron bombardment. VI.** E. AMALDI, O. D'AGOSTINO, and E. SEGRÉ (Ric. sci. Prog. tec., 5, 381—382;

Chem. Zentr., 1935, i, 2492—2493; cf. A., 1934, 1284).—In all cases (F, Na, Al, Cl, Ga, Ag, In, Cs, Pr, Pt, Re) where the radioactive species could be separated chemically from material activated with slowed-down neutrons, the active atom was isotopic with the starting material. New half-life periods are reported for F, Al, Cl, Pr, and Pt. J. S. A.

Problems of ultra-radiation. P. M. S. BLACKETT (Physikal. Z., 1935, 36, 773—776).—A review. A. J. M.

Transmission of ultra-radiation through matter. H. KULENKAMPF (Physikal. Z., 1935, 36, 785—787).—Coincidence determinations have been carried out using counter tubes placed horizontally above each other with absorbing layers above and between the tubes. A secondary corpuscular radiation with a range of about 35 cm. of Fe is found to be produced by  $\gamma$ -radiation of which the absorption coeff. in Fe is 0.009 cm.<sup>-1</sup> A. J. M.

Showers of rays which produce bursts of cosmic-ray ionisation. C. G. MONTGOMERY and D. D. MONTGOMERY (Physical Rev., 1935, [ii], 48, 786—789).—An expression for the probability that a shower of a given no. of rays will discharge a no. of Geiger-Müller counters is derived and verified experimentally. Results indicate that there is no marked discontinuity between small and large showers. N. M. B.

Compensation method for simultaneous measurement of ionisation collisions and intensity of cosmic rays. A. GASTELL (Z. Physik, 1935, 97, 403—413). A. B. D. C.

Ionisation collisions of cosmic rays. A. GASTELL (Z. Physik, 1935, 97, 414—435).—The gas in the ionisation chamber has little effect on collision measurements. The no. of collisions is sensitive to barometric pressure. A. B. D. C.

Investigation of ionisation by ultra-radiation with a double chamber. W. MESSERSCHMIDT (Physikal. Z., 1935, 36, 788—789).—A double ionisation chamber was used for the investigation of the absorption of Hoffmann "stösse" (A., 1934, 235). A half-val. thickness of 3.5 cm. Pb was obtained. The connexion between the shower groups observed by the cloud-chamber method and the "stösse" is discussed. A. J. M.

Solar components of ultra-radiation. J. BARNÓTHY and M. FORRÓ (Physikal. Z., 1935, 36, 789—791). A. J. M.

Analysis of corpuscular cosmic radiation under a screen of 28 m. of soil. P. AUGER and A. ROSENBERG (Compt. rend., 1935, 201, 1116—1118; cf. A., 1935, 560).—Soft cosmic radiation was almost completely eliminated at this depth. H. J. E.

Sign and nature of the ultra-penetrating particles of cosmic radiation. L. LEFRINCE-RINGUET (Compt. rend., 1935, 201, 1184—1187).—The most penetrating cosmic particles have been investigated in a large Wilson chamber working in a magnetic field. The majority have the paths of fast electrons. One third of the particles have such high energies that the sense of the deflexion of their paths

could not be ascertained. From the measurable paths, the ratio of positive to negative particles is 2:1, and their energies are >700 m.e.v. T. G. P.

What fraction of the primary cosmic radiation is positive? T. H. JOHNSON (Physical Rev., 1934, [ii], 45, 758). L. S. T.

Ionisation spurts resulting from cosmic-ray entities. W. F. G. SWANN and W. E. RAMSEY (Physical Rev., 1934, [ii], 45, 758). L. S. T.

Azimuthal effect of cosmic rays. R. GUNN (Physical Rev., 1934, [ii], 45, 900—901).—Theoretical. L. S. T.

Orbit of electric particles in field of a magnetic dipole, with application to the theory of cosmic radiation. C. STØRMER (Avh. Norske Vid. Akad. Oslo, 1933, No. 11; Chem. Zentr., 1935, i, 2774).—The author's auroral theory is applied to cosmic radiation. J. S. A.

Stellar theory. W. NERNST (Z. Physik, 1935, 97, 511—534).—A physical interpretation for the formation of stars is given. A. B. D. C.

Neutrino theory of light. O. SCHERZER (Z. Physik, 1935, 97, 725—739). A. B. D. C.

Decisive forces in the structure of the atomic nucleus. C. V. VON WEIZSACKER (Physikal. Z., 1935, 36, 779—785).—Theoretical discussion. A. J. M.

The Geiger counter and gas discharges as space-charge problems. A. VON HIPPEL (Z. Physik, 1935, 97, 455—481).—The conception of space charge is developed and applied to the region between initiation and continuous discharge; this gives an accurate definition of initiation potential. Extension to inhomogeneous fields gives a description of the properties of the Geiger counter. A. B. D. C.

Possibility of a metallic modification of hydrogen. E. WIGNER and H. B. HUNTINGTON (J. Chem. Physics, 1935, 3, 764—770).—The energy of a body-centred lattice of H<sub>2</sub>, calc. as a function of the lattice const., assumes its min. val. for a lattice const. which corresponds with a density many times > that of the ordinary mol. lattice of solid H<sub>2</sub>, and with a pressure of approx. 250,000 atm., beyond the range of present technique. N. M. B.

$\infty s$  orbits of the elements. E. FERMI and E. AMALDI (Mem. R. Accad. Italia, 1934, 6, 119—149).—Mathematical. The calculation of the proper functions of elements, using the Thomas-Fermi statistics, is described, and applied to the  $\infty s$  functions of 14 elements. O. J. W.

Tables for determining atomic wave functions and energies. P. M. MORSE, L. A. YOUNG, and (Miss) E. S. HAURWITZ (Physical Rev., 1935, [ii], 48, 948—954). N. M. B.

Value of the electronic charge. R. T. BIRGE (Physical Rev., 1935, [ii], 48, 918).—Kellstrom's result (cf. A., 1935, 1455) for the viscosity of air leads to the val.  $4.816 \pm 0.013 \times 10^{-10}$  for  $e$ , compared with  $4.8036 \pm 0.0005 \times 10^{-10}$  e.s.u. by abs. X-ray  $\lambda$  measurements. These results, however, still leave in doubt

any set of vals. of the interrelated consts.  $e$ ,  $e/m$ , and  $h$  that would satisfy all the experimental results.

N. M. B.

Quantised field theory and the mass of the proton. M. BORN (Nature, 1935, **136**, 952—953).

L. S. T.

Statistic perturbation theory. I. Perturbation calculations with the Thomas-Fermi theory excluding exchange. P. GOMBAS (Z. Physik, 1935, **97**, 633—654).

A. B. D. C.

Majorana's exchange energy. G. BREIT and E. WIGNER (Physical Rev., 1935, [ii], **48**, 918—919).—Mathematical. Anomalies arising from the differences in mass of the neutron and proton are corr.

N. M. B.

Absorption of high-energy particles by matter. J. SOLOMON (Compt. rend., 1935, **201**, 1110—1112).—Theoretical.

H. J. E.

Characteristic constants of the atomic sphere. L. LABOCETTA (Ric. sci. Prog. tec., 1934, **5**, II, 376—377; Chem. Zentr., 1935, i, 2491).—Theoretical.

J. S. A.

Intra-nuclear forces. E. FEENBERG and J. K. KNIPP (Physical Rev., 1935, [ii], **48**, 906—912).—Mathematical. The H and He isotopes are considered.

N. M. B.

Interaction of nuclear particles. L. A. YOUNG (Physical Rev., 1935, [ii], **48**, 913—915; cf. *ibid.*, **47**, 972).—Mathematical. Calculations of the ranges and strengths indicate that the interactions are of an exchange nature with approx. range  $2.8 \times 10^{-13}$  cm.; the neutron-neutron and proton-proton interactions are approx. equal, the former depending probably on spin orientation. A di-neutron or di-proton may be dynamically stable, but unstable with respect to  $\beta$ -decay.

N. M. B.

Application of the Dirac matrix method to the theory of metals. S. SCHUBIN (Compt. rend. Acad. Sci. U.R.S.S., 1935, **3**, 15—18).—Theoretical. The Dirac matrix method is applied to the problem of the motion of electron gas under the influence of an alternating electric field.

A. J. M.

Elements of the quantum theory. VI. Hydrogen atom. S. DUSHMAN (J. Chem. Educ., 1935, **12**, 529—539; cf. this vol., 7).

Electrostatic field and energy conditions in neighbourhood of a lattice edge. W. KLEBER (Zentr. Min., 1935, **A**, 45—52; Chem. Zentr., 1935, i, 2644—2645).—Theoretical.

J. S. A.

Quadratic Zeeman effect. G. RACAH (Nuovo Cim., 1934, [ii], **11**, 723—724; Chem. Zentr., 1935, i, 2775).—Relativistic treatment of the problem gives the same results as the use of Schrodinger's equation.

J. S. A.

Mass of the neutron from the nuclear reaction  $H^2 + H^2 \rightarrow He^3 + n^1$ . H. H. GOLDSMITH and V. W. COHEN (Physical Rev., 1934, [ii], **45**, 850).—A discussion.

L. S. T.

Extensive results of the classical simplest elastic hydrogen atom. L. ZEHNDER (Physikal. Z., 1935, **36**, 820—822).—The structure of the atom is

considered from the viewpoint of the "principle of greatest simplicity."

A. J. M.

Deviation of electrical charge distribution from spherical symmetry for some atomic nuclei. H. SCHÜLER (Physikal. Z., 1935, **36**, 812—814).—There is an asymmetry of the charge distribution in the nuclei of  $^{63}_{29}\text{Cu}$ ,  $^{65}_{29}\text{Cu}$ ,  $^{201}_{80}\text{Hg}$ ,  $^{209}_{83}\text{Bi}$ , the vals. of which are calc. The results are discussed with reference to nuclear structure (cf. A., 1935, 1051).

A. J. M.

Emission spectrum of the oxide of tellurium  $\text{TeO}$ . C. S. PLAW (Compt. rend., 1935, **201**, 1181—1183).— $\text{TeO}$  has a system of about 30 bands, degraded towards the red, between 3190 and 3820 Å., analogous to those of  $\text{SO}$  and  $\text{SeO}$ . The energy of dissociation of the normal mol. is 5.70 volts.

T. G. P.

Rotational structure of the  $D$  and  $E$  band systems of  $\text{CuCl}$ . J. TERRIEN (Compt. rend., 1935, **201**, 1029—1030).—The bands, produced in a discharge tube containing  $\text{CuCl}$ , are complex, since the frequencies of vibration and anharmonic factors of the two states are similar, and each atom has two isotopes. The  $E$  band,  $v'=0$ ,  $v''=0$ ,  $\lambda=4333.19$ , and the  $D$  band,  $v'=0$ ,  $v''=0$ ,  $\lambda=4353.86$ , have been investigated.

T. G. P.

Absorption spectrum of  $\text{SnI}_4$  vapour. A. V. BANOVA (Acta Physicochim. U.R.S.S., 1935, **2**, 733—736; cf. A., 1935, 807).—The continuous absorption of  $\text{SnI}_4$  between  $130^\circ$  and  $280^\circ$  shows max. at 3570, 2800, and 2450 Å. The first two are associated with the dissociation into  $\text{SnI}_3 + \text{I}$ , and  $\text{SnI}_3 + \text{I}^*$ , respectively. The dissociation energy of  $\text{SnI}_4$  into  $\text{SnI}_3 + \text{I}$  is 2.6 volts. The 2450 Å. max. is probably associated with  $\text{SnI}_4 \rightarrow \text{SnI}_2 + 2\text{I}$ .

T. G. P.

Absorption spectrum of tellurium dibromide vapour. J. LARIONOV (Acta Physicochim. U.R.S.S., 1935, **2**, 67—80).—The spectrum consists of diffuse bands without heads, grouped in triplets, of which the 8 most characteristic lie between 6255 and 5684 Å. Heats of dissociation of  $\text{TeBr}_2$  have been calc. from thermochemical data, and the possible dissociation processes are discussed in relation to the band spectrum.

R. S.

Absorption spectra of the vapours, and determination of the heats of sublimation of (I) the monoxides, (II) the monosulphides, of copper, iron, nickel, and cobalt. H. TRIVEDI (Proc. Acad. Sci. Agra and Oudh, 1935, **5**, 27—33, 34—40).—I. The spectrum of the vapours of  $\text{CuO}$  and  $\text{FeO}$  showed only one region, and of  $\text{NiO}$  and  $\text{CoO}$  two regions, of continuous absorption. The long- $\lambda$  limits are:  $\text{FeO}$  2500;  $\text{NiO}$  3270, 2380;  $\text{CoO}$  2750, 2100;  $\text{CuO}$  2410 Å. The difference between the limits of the two regions was approx. 32 kg.-cal. in each case; this may be due to dissociation into the metal atom and  $\text{O} (^3P)$  and  $\text{O} (^1D)$ . The calc. heats of vaporisation of  $\text{FeO}$ ,  $\text{CoO}$ , and  $\text{NiO}$  are 97.5, 101.5, and 111.5 kg.-cal., respectively.

II. The vapours of the sulphides showed continuous absorption from a long-wave limit, resulting in photo-dissociation into two normal atoms; after the first absorption there is a retransmitted patch and

a second absorption. The energy difference 1.31 volts is attributed to the difference  $^3P \rightarrow ^1D$  of S. The heats of vaporisation, determined indirectly, were FeS 93, NiS 101.6, CoS 89, and CuS 84 kg.-cal.

N. M. B.

**Continuous absorption spectrum of hydrogen bromide.** C. F. GOODEVE and A. W. C. TAYLOR (Proc. Roy. Soc., 1935, A, 152, 221—230).—The extinction coeffs. of HBr have been measured over a wide range of conditions, and the approx. upper potential energy curve has been calc. from the eigenfunction of the ground state and the observed extinctions. The results favour the dissociation into normal atoms.

L. L. B.

**Absorption spectrum of water in the ultra-violet.** E. HAAS (Biochem. Z., 1935, 282, 224—229).—A method for determination of the absorption of  $H_2O$  is described and tables summarise the results. The dissociation const. of  $H_2O$  is  $0.6 \times 10^{-14}$  at  $17^\circ$  and  $2.5 \times 10^{-14}$  at  $37^\circ$ . By raising the temp. to  $20^\circ$ , the  $[OH^-]$  increases from  $0.77 \times 10^{-7}$  to  $1.58 \times 10^{-7} N$ . Since  $10^{-7}$ — $10^{-6} N$ -NaOH absorbs as does  $H_2O$ , and since saturation with  $CO_2$  has little effect on the absorption, the effect of temp. on absorption cannot be explained in terms of dissociation.

P. W. C.

**Ultra-violet absorption of mixtures of  $NO$ ,  $NO_2$ , and  $H_2O$ .** E. H. MELVIN and O. R. WULF (J. Chem. Physics, 1935, 3, 755—759).—In the presence of a trace of  $O_2$  or  $NO_2$  in  $NO$ , a continuous absorption in the ultra-violet obscures the absorption of  $NO$  and part of that of  $NO_2$ ; the behaviour of this absorption relative to temp. and partial pressure of the constituents points to  $N_2O_3$ . When, in addition, traces of  $H_2O$  vapour are present, a group of bands appears in the region 4000—3000 Å., decreasing in intensity with rise of temp.; there is evidence of a predissociation process in the carrier, probably HONO.

N. M. B.

**Effect of heavy water of crystallisation on the line absorption spectrum of chrome alum.** G. JOOS and H. BOHM (Physikal. Z., 1935, 36, 826—827).—Replacement of  $H_2O$  in K Cr Se alum by  $D_2O$  causes considerable displacement of the absorption lines.

A. J. M.

**Influence of pressure and foreign gases on the optical absorption of chromyl chloride.** M. KANTZER (Compt. rend., 1935, 201, 1030—1031; cf. A., 1934, 472).—Absorption by the A series increases with pressure, whilst that of the B and C series diminishes. Addition of  $H_2$  up to 1 mol. proportion increases the general absorption, especially at longer  $\lambda$ . Similar effects observed with A,  $N_2$ ,  $CO_2$ ,  $SCl_2$ , and  $SF_6$  decrease regularly with increasing mol. wt.

T. G. P.

**Absorption, optical activity, and configuration of metal complexes.** J. P. MATHIEU (Compt. rend., 1935, 201, 1183—1184; cf. A., 1934, 944).—Examination of the visible absorption bands of 20 Co, Cr, and Ir complexes of the type  $[Co en_2 A A']$  shows that the  $\lambda$  of the max. increases with the mobility of the groups A or A' in the order I, Br, Cl, CNS,  $NO_2$ . Absorption shows a principal and a feeble subsidiary band, confirmed by measuring the circular dichroism,

which is also a means of comparing the configurations of active ions.

T. G. P.

**Paramagnetism. III. Light absorption in paramagnetic crystals and solutions.** S. DATTA and M. DEB (Phil. Mag., 1935, [vii], 20, 1121—1136; cf. A., 1934, 832).—Absorption spectra data are given for anhyd. and hydrated crystals of paramagnetic halides of the Fe group and their solutions at different temp. in  $H_2O$ , EtOH, or conc. HCl. The absorption max. for solutions of  $CrCl_3$ ,  $CoCl_2$ , and  $NiCl_2$  are shifted, relative to the max. in aq. solutions, to the longer- $\lambda$  side when the solvent has dielectric const.  $<$  that of  $H_2O$ , or when it contains excess of HCl; for the latter type of solutions, at low temp. the bands recede towards the shorter- $\lambda$  side and agree with those of the hydrated complexes, as in the aq. solutions. For powdered anhyd. chlorides the absorption max. lie in the longer- $\lambda$  side relative to those of the corresponding hydrated complexes, and agree fairly well with the positions for EtOH and HCl solutions at higher temp. Results are discussed relative to a theory of absorption by a transition group ion forming part of a complex ion or of an undissociated mol.

N. M. B.

**Absorption spectra of nitrophenylhydrazines.** A. K. MACBETH and J. R. PRICE (J.C.S., 1935, 1563—1567).—The absorption spectra of o-, m-, and p- $NO_2 \cdot C_6H_4 \cdot NH \cdot NH_2$  in EtOH and aq. EtOH (20%) have been compared with those of o-, m-, and p- $NO_2 \cdot C_6H_4 \cdot NH_2$  and  $-NO_2 \cdot C_6H_4 \cdot NMe_2$  (cf. A., 1934, 997). It is shown that the long-wave absorption is probably due to electronic excitation of the  $\cdot NO_2$  influenced by the nuclear  $\cdot NH_2$  or  $\cdot NH \cdot NH_2$ . This is supported by the fact that bands due to each influenced  $\cdot NO_2$  still persist in 4:6-dinitrotolyl- and 2:4-dinitrophenyl-hydrazine, although displaced by 2200  $cm^{-1}$ . The band max. for 1:2:4- $C_6H_3(NO_2)_3 \cdot NH_2$  can be calc. from the o- and p- $NO_2 \cdot C_6H_4 \cdot NH_2$  vals. using this figure. The band displacements due to the change from EtOH to 20% EtOH solution are similar to those for the nitroamines.

R. S.

**Spectroscopy of amino-acids and their derivatives. I. Ultra-violet absorption of l-tyrosine, dl-phenylalanine, and l-tryptophan.** (Miss) K. FERAUD, M. S. DUNN, and J. KAPLAN (J. Biol. Chem., 1935, 112, 323—328).—dl-Alanine, dl-leucine, l-hystidine dihydrochloride, l-proline, and l-hydroxyproline show general, but  $C_6H_6$ , PhOH, indole, l-tyrosine, dl-phenylalanine, and l-tryptophan show selective, absorption (band max. given) in the ultra-violet region.

R. S. C.

**Flame spectra of some aromatic compounds.** W. M. VAIDYA (Proc. Indian Acad. Sci., 1935, 2, A, 352—357; cf. A., 1935, 279).—Investigations with a Smithells flame separator are extended to  $C_6H_6$ , PhMe, PhOH, resorcinol, pyrogallol, PhCHO, BzOH,  $Ph_2O$ ,  $NH_2Ph$ ,  $PhNO_2$ , and  $C_5H_5N$ . The bands attributed to HCO were found in the spectra of the flames of  $C_6H_6$  and other aromatic compounds, and are attributed to the double linking of the  $C_6H_6$  ring and the breaking up of oxygenated mols. formed by direct incorporation of the  $O_2$  mol. There is a gradual variation in the spectra of the flames of aliphatic series, and more uniformity in the spectra of aromatics.

Light is thrown on the mechanism of combustion of  $C_6H_6$  by the spectra of  $C_5H_5N$ ,  $NH_2Ph$ , and  $PhNO_2$  flames in which the CN bands and the  $\gamma$ -bands of NO appear; the rupture of the ring seems to take place at the N atom. A tentative scheme for the combustion of  $C_6H_6$  is given. N. M. B.

**Barium hydride spectra in the infra-red.** P. G. KOONTZ and W. W. WATSON (Physical Rev., 1935, [ii], 48, 937—938; cf. A., 1935, 427).—Analyses and frequency assignments of the (1,0), (1,1), and (2,1) bands of the  $^2\Sigma \rightarrow ^2\Sigma$  system of BaH, and some details of the  $^2II \rightarrow ^2\Sigma$  band at 10,300 Å., are given. The spin doubling const. of the upper  $^2\Sigma$  state is  $-4.88$ , decreasing with increasing mol. rotation. N. M. B.

**Overtone absorption bands of gaseous HF.** D. E. KIRKPATRICK and E. O. SALANT (Physical Rev., 1935, [ii], 48, 945—948).—Measurements of the 3  $\leftarrow$  0 and 4  $\leftarrow$  0 vibration-rotation absorption bands are described and discussed, and mol. consts. are tabulated. N. M. B.

**Photography of the third harmonic of hydrogen chloride.** A. P. CLEAVES and C. W. EDWARDS (Physical Rev., 1935, [ii], 48, 850).—The wave-no. of the band origin of the third harmonic at 9153 Å. is 10,922.7  $cm^{-1}$ . Vals. and consts. calc. from previous available data are given. N. M. B.

**Infra-red absorption bands of methane.** A. H. NIELSEN and H. H. NIELSEN (Physical Rev., 1935, [ii], 48, 864—867; cf. following abstract).—The fundamental vibration-rotation bands at 3.3 and 7.7  $\mu$  have been remeasured, and, for the latter, additional complex rotational structure data are reported. The two combination bands at 4218 and 4315  $cm^{-1}$  have been partly resolved. N. M. B.

**Infra-red absorption spectrum of germane.** W. B. STEWARD and H. H. NIELSEN (Physical Rev., 1935, [ii], 48, 861—864; cf. A., 1935, 914).—Data and identifications in the range 1—13  $\mu$  of  $GeH_4$  are given for intense absorption regions, in order of intensity, at 4.74, 10.7, 3.4, and 2.3  $\mu$ ; there is a much weaker peak near 5.7  $\mu$ . Calc. vals. are: moment of inertia of the mol.  $7.0 \times 10^{-40}$  g.- $cm^2$ ; distances Ge—H  $1.37 \times 10^{-8}$ , H—H  $2.06 \times 10^{-8}$  cm. N. M. B.

**Symmetry considerations concerning the splitting of vibration-rotation levels in polyatomic molecules.** E. B. WILSON, jun. (J. Chem. Physics, 1935, 3, 818—821).—The max. no. of fine-structure components, their quantum wts. when nuclear spin is taken into account, and the selection rule for transitions are discussed in relation to the permutation symmetry of mols. containing several identical atoms. N. M. B.

**Raman spectra of the isotopic molecules  $H_2$ , HD, and  $D_2$ .** G. K. TEAL and G. E. MACWOOD (J. Chem. Physics, 1935, 3, 760—764).—Analyses are given for 42 lines excited at 3 atm. pressure by Hg  $\lambda$  2537. New vibrational consts. calc. from the Raman and emission spectrum data of  $H_2$  and HD give calc. vals. of the positions of the rotational-vibration Raman lines in good agreement with observation. Contrary to theory, the 0,0 line of the Q vibrational band of HD was observed. N. M. B.

**Raman effect and molecular structure.** B. SUSZ (Ann. Guebbard-Séverine, 1935, 11, 12—25).—A summary of the theory and technique.  $N_2O_5$  in  $HNO_3$  affords the Raman frequencies 1050 and 1399  $cm^{-1}$ , in addition to those due to  $HNO_3$ . J. G. A. G.

**Raman spectra. I. Raman spectra of sulphuric, nitric, and nitrosylsulphuric acids.** W. R. ANGUS and A. H. LECKIE (Proc. Roy. Soc., 1935, A, 149, 327—340).—Raman spectra are recorded for conc.  $H_2SO_4$  and  $HNO_3$ , for solutions of nitrosylsulphuric acid ( $HNSO_5$ ) in  $H_2SO_4$ , and for solid  $HNSO_5$ . From the spectra of  $HNSO_5$  in various concns. of  $H_2SO_4$  it is concluded that in solutions of  $HNSO_5$  in  $H_2SO_4$  containing  $> 60\%$   $H_2SO_4$  the hydrolysis of  $HNSO_5$  is incomplete. The spectra of  $HNSO_5$ , both in solution and in the solid state, are characterised by a prominent frequency of 1045  $cm^{-1}$  assignable to  $HSO_4'$ . Another prominent frequency of 2340  $cm^{-1}$  in solutions and 2311  $cm^{-1}$  in the solid is shown, by analogy with band spectral data for iso-electronic groups, to arise from  $NO^+$ . Of the different mol. structures reviewed, only  $[HOSO_3]'[NO]'$ , nitrosyl sulphate, is in agreement with observed data. W. R. A.

**Raman spectrum of crystalline selenious acid.** C. S. VENKATESWARAN (Current Sci., 1935, 4, 309—310).—Transparent crystals give an intense Raman spectrum consisting of a large no. of sharp lines, in some cases the anti-Stokes being present. As in the case of  $HIO_3$  (cf. A., 1935, 1301), the spectrum of the solid differs markedly from that of the aq. solution. N. M. B.

**Raman effect of fluosilicic acid.** J. K. SIRKIN and M. V. VOLKENSTEIN (Acta Physicochim. U.R.S.S., 1935, 2, 308—312).— $H_2SiF_6$  shows a strong Raman line at 649  $cm^{-1}$  (cf. 314 and 337 for  $SnCl_6''$  and  $SbCl_6'$ , respectively; A., 1933, 113), but no other. This indicates the symmetrical vibration of six F atoms at the corners of a regular octahedron, in accord with X-ray data. J. W. S.

**Raman effect. XLIX. Mixture of phosphorus trichloride and tribromide.** O. BURKARD. L. Vibrational spectrum of benzene. K. W. F. KOHLRAUSCH (Z. physikal. Chem., 1935, B, 30, 298—304, 305—315).—XLIX. In the Raman spectra of mixtures of  $PCl_3$  and  $PBr_3$  the valency frequencies of  $PCl_3$  rise and those of  $PBr_3$  fall with falling  $[PCl_3]$ , whereas judged from the dipole moments the reverse would be expected. The intensity of the lines due to  $PCl_3Br$  is a max. in the mixture  $2PCl_3 + PBr_3$  (cf. A., 1931, 785).

L. Regarding  $C_6H_6$  and  $C_6D_6$  as valency force systems with the symmetry  $D_{6h}$  and applying Wilson's theory (A., 1934, 829), five of the six force consts. necessary for stability have been calc. and have nearly the same vals. for each compound. From these have been deduced 16 of the 20 possible fundamental frequencies, and these and the selection rules are in almost quant. agreement with the observed vibrational spectrum (cf. A., 1935, 1301). For  $C_5H_5N$  the selection rules point to a ring system with "equalised" linkings and the symmetry  $C_{2v}$ . R. C.

**Raman spectra of solutions. II. Solutions of arsenic trichloride in methyl and ethyl alcohols.**

A. M. SACK and A. E. BRODSKI (*Acta Physicochim. U.R.S.S.*, 1935, 2, 215—220).—In the Raman spectra of  $\text{AsCl}_3$  in EtOH and MeOH, respectively, the frequencies of the alcohols are unchanged; those of  $\text{AsCl}_3$  at 372 and 410  $\text{cm}^{-1}$  are lowered. Denoting the four mol. frequencies of  $\text{AsCl}_3$  (which is a regular pyramid) by  $\omega_1, \omega_2, \omega_3$ , and  $\omega_4$ , the ratio  $\omega_1\omega_2/\omega_3\omega_4$  remains almost const. The  $\text{AsCl}_3$  mol. is thus only slightly deformed by the alcohol dipoles, but the elastic binding force between  $\text{As}^{+++}$  and  $\text{Cl}^-$  changes by about 10% in alcoholic solutions. A. J. M.

**Raman spectrum of tetraethylammonium iodide.** J. K. SIRKIN and M. V. VOLKENSTEIN (*Acta Physicochim. U.R.S.S.*, 1935, 2, 303—307).—The Raman spectrum of  $\text{NEt}_4\text{I}$  is compared with those of  $\text{NEt}_3$  and of EtI. None of the C-I or N-I frequencies are observed, indicating that the I of  $\text{NEt}_4\text{I}$  is ionically bound, and occurs outside the co-ordination sphere, in accord with the behaviour of  $\text{NEt}_4\text{I}$  as a binary electrolyte. The Raman spectrum observed is therefore that of  $\text{NEt}_4^+$ , and the strong lines of  $\text{NEt}_3$  occur, in some cases with modified frequency, with the exception of the 739  $\text{cm}^{-1}$  line. New strong frequencies are observed at 667 and 1231  $\text{cm}^{-1}$ . It is concluded that  $\text{NEt}_3$  is a pyramidal mol. with the N at the apex, whilst  $\text{NEt}_4^+$  is a regular tetrahedron with the N in the centre. J. W. S.

**Vibrations of benzene and Raman spectra of benzene- $d_1$  and benzene- $d_2$ .** O. REDLICH and W. STRICKS (*J. Chem. Physics*, 1935, 3, 834).—Raman data are reported. Experimental error cannot account for the increase from 2270 (PhD) to 2279 ( $\text{C}_6\text{H}_4\text{D}_2$ ). A test relation applied to these and the results of Wood for  $\text{C}_6\text{D}_6$  (cf. A., 1935, 1189) shows that Wilson's correlations of frequencies to vibrations (cf. *Physical Rev.*, 1934, [ii], 46, 146) cannot all be correct. N. M. B.

**Rotational Raman scattering in benzene.** S. BHAGAVANTAM (*Proc. Indian Acad. Sci.*, 1935, 2, A, 342—344).—Contrary to the results of Sirkar (cf. A., 1935, 914), the intensity distribution in the rotation wing accompanying the Rayleigh lines is in exact agreement, using a high-dispersion spectrograph, with results by instruments of lower dispersion. N. M. B.

**Raman effect. LI. Benzene derivatives. IX.** K. W. F. KOHLRAUSCH, W. STOCKMAIR, and (GROSS-PRINZ) YPSILANTI. **LII. Benzene derivatives. X.** A. W. REITZ and W. STOCKMAIR. **LIII. Nucleus-substituted benzoyl chlorides.** K. W. F. KOHLRAUSCH, A. PONGRATZ, and W. STOCKMAIR (*Monatsh.*, 1935, 67, 80—91, 92—103, 104—110; cf. A., 1935, 1190).—LI. Raman spectra of 1:3-dichloro-4-X-benzene ( $X=\text{NH}_2, \text{OH}, \text{Me}, \text{CN}, \text{Br}, \text{I}$ ), 1:4-dichloro-2-X-benzene ( $X=\text{NH}_2, \text{OH}, \text{Me}, \text{Br}, \text{I}$ ), and 4-chloro-2-X-toluene ( $X=\text{NH}_2, \text{OH}, \text{Br}, \text{I}$ ) have been measured.

LII. Raman spectra of the following are given:  $\text{CH}_2\text{PhX}$  ( $X=\text{NH}_2, \text{OH}, \text{Me}, \text{CN}, \text{SH}, \text{Cl}, \text{Br}$ ); *o*-, *m*-, and *p*- $\text{XC}_6\text{H}_4\text{NO}_2$  [ $X=\text{Cl}, \text{Br}, \text{OH}, \text{CN}$  (*m*-, *n*-), *F* (*p*-)];  $\text{PhNO}_2$ ;  $\text{PhSO}_2\text{Cl}$ .

LIII. Raman spectra of *o*-, *m*-, and *p*- $\text{XC}_6\text{H}_4\text{COCl}$  ( $X=\text{Me}, \text{Cl}, \text{Br}, \text{COCl}, p\text{-OMe}$ ) are given. The results are discussed theoretically. F. L. U.

**Raman spectra of hydroxy-acids and their esters and salts.** I. PEYCHES (*Bull. Soc. chim.*, 1935, [v], 2, 2195—2209; cf. A., 1935, 146).—Data are recorded for  $\text{AcOH}$ ,  $\text{KOAc}$ ,  $\text{CH}_3\text{Cl}\cdot\text{CO}_2\text{H}$ ,  $\text{CCl}_3\cdot\text{CO}_2\text{H}$ ,  $\text{OH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ ,  $\text{OH}\cdot\text{CH}_2\cdot\text{CO}_2\text{Na}$ , and lactic acid,  $(\cdot\text{CH}_2\cdot\text{CO}_2\text{H})_2$ ,  $[\cdot\text{CH}(\text{OH})\cdot\text{CO}_2\text{H}]_2$ , their Et esters and Na salts. The results are discussed from the point of view of the structure of the  $\cdot\text{CO}_2\text{H}$  group and of the tartaric acid mol. and anion. F. L. U.

**Raman spectra of glasses.** T. G. KUJUMZELIS (*Z. Physik*, 1935, 97, 561—569).—Raman spectra of different Jena glasses show different characteristic features; a displacement of approx. 800  $\text{cm}^{-1}$  is present in all glasses examined independent of the presence or absence of the  $\text{SiO}_2$  group. A. B. D. C.

**Polarisation of scattered Raman light.** W. HANLE and F. HEIDENREICH (*Physikal. Z.*, 1935, 36, 851—853).—The edges of the Rayleigh lines are polarised in quite a different manner from the centres. The inversion factor (ratio of left to right circularly polarised light) is 6 if there is only rotational widening of the lines, whereas the experimental val. for PhMe is 1.7. There are, therefore, causes of widening of the lines other than rotation. The circular polarisation of the Raman lines of some substances has been determined, and from the inversion factor,  $U$ , the degree of depolarisation  $\rho_n$  has been calc. from Placzek's formula. The same vals. for  $\rho_n$  were found for right circularly polarised lines as for linearly polarised rays, but there were differences for left circularly polarised light. The rotational widenings of the Raman lines are always left circularly polarised, whilst the centres are right circularly polarised. The dispersion of polarisation of the scattered Raman light was investigated, the results disagreeing with those of Sirkar. The degree of polarisation is independent of  $\lambda$  outside the regions of absorption. Assuming that, in general, the polarisation of the line due to the same vibration in different substances is the same, the Raman lines of a no. of org. Cl-derivatives are assigned to their different mol. vibrations. A. J. M.

**$U$  Centres in alkali halide crystals.** P. TARTAKOVSKI and V. PODDUBNI (*Z. Physik*, 1935, 97, 765—773).—NaCl heated to 550—600° absorbs intensely near 1.2  $\mu$ , corresponding with electron transition from the ground to the  $U$  level. Electrons in this level can combine with  $\text{Cu}^+$  ions to colour the crystal red. A. B. D. C.

**Thermal formation of colour centres and their life-period.** R. HILSCH (*Physikal. Z.*, 1935, 36, 735—737).—The equilibrium between the  $U$  and  $F$  centres in KBr crystals with a stoichiometric excess of K is examined. The variation of the "degree of dissociation" of the  $U$  centres with temp. and concn. is determined by means of absorption experiments. The life-period of the  $F$  centres is also found. (Cf. this vol., 139.) A. J. M.

**Thermal diffusion of colour centres.** O. STASIW (*Physikal. Z.*, 1935, 36, 737—740).—The diffusion const. of  $F$  centres in KCl crystals in which the stoichiometric excess of K existed only in the form of these centres has been determined. From the

diffusion const. and the known mobility of the colour centres in an electric field, the mobility of the positive charges in the crystal is determined. The positive charges move more rapidly than electrons at temp.  $>700^\circ$ . Below this temp. retardation of electrons occurs owing to the positive charges. A. J. M.

**Photodissociation of stannous chloride vapour in the Schumann region.** H. NEUJMIN (Acta Physicochim. U.R.S.S., 1935, 2, 595—602; cf. A., 1934, 1286).—Fluorescence is excited in  $\text{SnCl}_2$  vapour in the visible region by  $\lambda$  1700—1800, and in the ultra-violet by  $\lambda$  1500—1700 Å. Analysis of the observed spectrum indicates photodissociation into Cl and excited  $\text{SnCl}$ . The energy required is calc. to be 90 kg.-cal. per mol. F. L. U.

**Correspondence between absorption and luminescence spectra of dilute solutions of dyes.** IV. Effect of temperature and solvents. V. L. LEVSHIN (Acta Physicochim. U.R.S.S., 1935, 2, 221—238; cf. A., 1935, 808).—Absorption and luminescence spectra of eosin B in  $\text{H}_2\text{O}$ , isoamyl alcohol, and  $\text{COMe}_2$ , and of erythrosin and rhodamine 6G in  $\text{H}_2\text{O}$  and  $\text{COMe}_2$ , have been investigated with respect to temp. and solvent. The symmetry of form of the two spectra is maintained in all cases. Change of solvent causes displacement of both absorption and luminescence spectra, the max. undergoing equal displacements. The direction of the displacement is not determined by the dielectric const. of the solvent. The area of the absorption spectrum is approx. the same for all solvents, although the luminescence efficiency,  $\eta$ , varies greatly. The variation of  $\eta$  with temp. is independent of dye concn. and of the properties of the solvent. A. J. M.

**Fluorescence spectra of chlorophyll pigments.**—See this vol., 125.

**Spectrographic investigation of the thermoluminescence of feldspar.** S. IMORI and E. IWASE (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1935, 28, 147—151).—The position of the thermoluminescence bands is unaffected by treatment with X-rays, but their intensity is increased. Data are given for 12 Japanese feldspars. The bands generally lie in the yellow and blue. R. S.

**Induced chemiluminescence of mercury in the carbon monoxide-oxygen flame.** V. KONDRATEEV (Acta Physicochim. U.R.S.S., 1935, 2, 126—128).—Hg becomes chemiluminescent in  $\text{CO} + \text{O}_2$  at 650—700°. Since the line 2537 Å. is below the shortest  $\lambda$  of the CO flame spectrum, it is concluded that the activation must be due to collision with excited  $\text{CO}_2$ . A similar mechanism is proposed for the activation of  $\text{N}_2$  in the explosion of  $\text{CO} + \text{O}_2 + \text{N}_2$  at high pressures. R. S.

**Quantum equivalence of photo-electric conductivity in rock-salt crystals.** Z. GYULAI and P. TOMKA (Z. Physik, 1935, 96, 350—354).—Arsenjeva's results (A., 1926, 782) showing non-equivalence of absorbed light and conductivity are due to colloidal particles in the test-piece. A. B. D. C.

**Electronic conduction in silver and thallium halide crystals.** I. Electron yield on light

absorption in spectral regions of high absorption. II. Photo-electric secondary current. W. LEHFELDT (Nachr. Ges. Wiss. Göttingen, 1935, [ii], 1, 171—186; Chem. Zentr., 1935, i, 2322).—I. In electric fields giving saturation of the primary current in  $\text{TlBr}$  at  $-70^\circ$ , and in  $\text{AgCl}$  at  $-170^\circ$ , all photo-electrons move to the anode, the positive charge remaining stationary. In the ultra-violet absorption region the quantum yield is 0.1—0.5.

II. Crystals with long displacement paths for primary photo-electrons tend to give rise to secondary current, due to electrons drawn from the cathode. J. S. A.

**Electronic conduction of cuprous oxide.** W. SCHOTTKY and F. WAIBEL (Physikal. Z., 1935, 36, 912—914).—The sign of the Hall effect and the mechanism of conduction of specimens of  $\text{Cu}_2\text{O}$  with and without excess of  $\text{O}_2$  are discussed. A. J. M.

**Conductance of salt crystals.** W. H. RODEBUSH and T. G. COOKE (J. Chem. Physics, 1935, 3, 834).—Jost's expression (cf. A., 1934, 11) is inadequate to account for the conductance behaviour of various salts throughout the whole temp. range; it can be obtained by merely general considerations. N. M. B.

**Rate of migration of cations in alkali halide crystals.** O. STASIW (Nachr. Ges. Wiss. Göttingen, 1935, [ii], 1, 147—152; Chem. Zentr., 1935, i, 2318—2319).—The cation mobility increases exponentially with rise of temp., and equals that of electrons at 600—700°. H. J. E.

**Problems of ionic and electronic conduction in non-metallic solids.** B. GUDDEN and W. SCHOTTKY (Physikal. Z., 1935, 36, 717—721).—The different types of ionic conduction are discussed. The mechanism of electronic conduction on the basis of permitted and forbidden energy states is considered and applied to semi-conductors. The energy states may be determined by means of the photo-electric effect and the fine structure of X-ray absorption edges. A. J. M.

**Disorder phenomena in ionic lattices as a basis for ionic and electronic conduction.** C. WAGNER (Physikal. Z., 1935, 36, 721—725).—The types of disarrangement in the crystal lattice giving rise to the possibility of conduction are discussed. The conductivity ( $\kappa$ ) of oxides varies with the pressure ( $p$ ) of  $\text{O}_2$  above them. In this connexion, three classes of oxides may be considered: (1) those for which  $\kappa \propto p^{-1/4}$ , e.g.,  $\text{ZnO}$ ,  $\text{CdO}$ ; (2) those for which  $\kappa \propto p^{1/7}$ , e.g.,  $\text{Cu}_2\text{O}$ ,  $\text{FeO}$ ; (3) those for which  $\kappa$  is independent of  $p$ , e.g.,  $\text{CuO}$ ,  $\text{Fe}_3\text{O}_4$ . The behaviour of oxides of class (1) is governed by dissociation of the oxide giving an excess of metal in solid solution in the oxide phase. With class (2), places with electron defect are formed in the lattice. Electron-defect conductivity is to be expected in those cases where the ions are in an intermediate valency state, whereas electron-excess conductivity is found where the ion is exerting its max. valency. The behaviour of  $\text{Co}_3\text{O}_4$  is explained on the basis of its lattice structure. A. J. M.

**Theory of electron motion in non-metallic crystal lattices.** F. HUND (Physikal. Z., 1935, 36, 725—729).—The description of the states of electrons

in solids is discussed from the viewpoint of quantum mechanics. The arrangement of energy bands in non-metallic ideal and distorted lattices is considered.

A. J. M.

**Electronic conduction in alkali halide crystals.** R. W. POHL (Physikal. Z., 1935, 36, 732—735).—The electronic conduction of a KBr crystal with a stoichiometric excess of K (part of the Br replaced by electrons) is considered. The excess of metal may exist as  $U$  (ultra-violet absorption) centres, or as  $F$  (visible absorption) centres. The production of, and thermal equilibrium between, these centres are discussed. The movements of electrons to the anode can be followed with the eye by means of the  $F$  centres. Crystals with  $U$  centres are semi-conductors. It is possible with the KBr crystal under consideration to determine the variation of both the no. and mobility of the electrons with temp. Crystals with  $U$  centres behave as photo-electric conductors for which the law of the quantum equiv. holds accurately.

A. J. M.

**Electrical conduction in melts of alkali salts with a stoichiometric excess of alkali metal.** E. MOLLWO (Physikal. Z., 1935, 36, 740—742).—The optical properties of alkali salts with a stoichiometric excess of metal indicate that the excess metal is dissolved in the form of neutral atoms. Electron conductivity was not found.

A. J. M.

**Formation of opposing potentials in solid ionic conductors.** A. SMEKAL (Physikal. Z., 1935, 36, 742—749).—Results previously obtained on the decrease with time of the d.c. conductivity of purely ionic conductors are summarised. The Maxwell-Wagner theory of dielectric anomalies, and the Jaffe theory of ions with retarding atm. (A., 1933, 338) fail to account for the facts. The most satisfactory explanation is based on the distortion conduction theory, according to which the formation of the opposing potential is due to retardation of the conducting ions in the structurally inhomogeneous crystal.

A. J. M.

**Electrical conduction in semi-conductors.** W. MEYER (Physikal. Z., 1935, 36, 749—755).—The nature of the consts.  $a$  and  $B$  in the equation  $\kappa = ae^{-B/T}$  connecting conductivity,  $\kappa$ , with abs. temp.,  $T$ , is discussed. No numerical val. can be assigned to  $a$  which will hold for all semi-conductors.  $\log \kappa = -kB$ , where  $k$  is const., is true as a first approximation. The connexion between  $a$  and  $\kappa$  was investigated for  $\text{TiO}_2$ .

A. J. M.

**Calculation of the magnitude and pressure dependence of ionic-disorder energy and mobilities in crystals.** W. JOST (Physikal. Z., 1935, 36, 757—760).—A rough calculation of the disorder energy of ions in crystals is possible from a consideration of the polarisation effect. The effect of pressure on the conductivity and degree of disorder is discussed. If the degree of disorder is affected by temp. it should be possible to arrive at disorder energies from consideration of sp. heats.

A. J. M.

**Electrical conductivity of cuprous oxide in equilibrium with its adjacent phase.** F. WAIBEL (Physikal. Z., 1935, 36, 760—764).—The cold con-

ductivity of  $\text{Cu}_2\text{O}$  plates in equilibrium with Cu after having been heated to temp. between  $10^\circ$  and  $1000^\circ$  was determined and plotted against temp. A max. occurs at a tempering temp. of  $400$ – $500^\circ$ , corresponding with a similar max. in the same curve for  $\text{Cu}_2\text{O}$  in equilibrium with  $\text{CuO}$ . The formation of the rectifying layer of  $\text{Cu}_2\text{O}$  rectifiers is discussed on the basis of this investigation. The amount of  $\text{O}_2$  dissolved in the  $\text{Cu}_2\text{O}$  was determined.

A. J. M.

**Specific resistance of cuprous oxide.** W. H. BRATTAIN (Physical Rev., 1934, [ii], 45, 745).—The sp. resistance of  $\text{Cu}_2\text{O}$  grown on Cu at  $1030^\circ$  in air is not uniform, but varies exponentially in the direction of growth of the oxide.

L. S. T.

**Determination of the metal-cuprous oxide contact resistance.** J. ROULLEAU (Compt. rend., 1935, 201, 947—948).—The factors controlling the Cu- $\text{Cu}_2\text{O}$  contact resistance were studied. High resistances occur only for cryst. surfaces.

H. J. E.

**Effect of cooling on the electrical properties of resistances which vary with temperature.** H. LUEDER and E. SPENKE (Physikal. Z., 1935, 36, 767—773).—The effects of cooling in various ways (e.g., at the edges, at the front of a plate, etc.) have been examined.

A. J. M.

**Conductivity of glasses.** R. L. MULLER (Acta Physicochim. U.R.S.S., 1935, 2, 103—125; cf. A., 1935, 567).—The Frenkel theory of electrical conductivity has been applied to glasses. Alkali-rich glasses approach the ion-lattice type, whilst alkali-poor glasses approx. to liquid salt solutions. The influence of the association of polar mols. on the conductivity has been studied in various glasses.

R. S.

**Dielectric coefficients of volatile compounds of fluorine and boron.**  $\text{CF}_4$ ,  $\text{NF}_3$ ,  $\text{CHF}_3$ ,  $(\text{CF}_3\text{N})_2$ ,  $\text{B}_2\text{H}_6$ , and  $\text{B}_3\text{N}_3\text{H}_6$ . K. L. RAMASWAMY (Proc. Indian Acad. Sci., 1935, 2, A, 364—377).—Data for dielectric coeffs. measured at different temp. are quoted, and give vals. of the electric moments 0, 0.21, 1.59, 0.46, 0, and  $0.67 \times 10^{-18}$ , respectively. Accurate vals. of compressibilities at room temp. by refractometric studies, and approx. vals. at low temp. by studying variations of dielectric coeffs. are given.

N. M. B.

**Discontinuity in the dielectric constant of liquids and their saturated vapours at the critical temperature.** J. MARSDEN and O. MAASS (Canad. J. Res., 1935, 13, B, 296—307).—A dielectric cell of small dimension for simultaneous liquid and gas measurements in the crit. temp. region is described. The electrodes were sealed in by frozen Hg capillary seals. Data are given for  $\text{Me}_2\text{O}$  and  $\text{C}_3\text{H}_8$  from room temp. to  $8^\circ$  above the crit. temp. The dielectric consts.,  $\epsilon$ , of liquid and gas were not identical at the crit. temp. Above the crit. temp. (for up to  $8^\circ$ ) a difference in  $\epsilon$  persisted between the medium above and below the position where the liquid meniscus was last seen, in spite of stirring of the medium.

H. J. E.

**Dependence of dielectric constants of anisotropic liquids on field strength and frequency.** W. KAST (Physikal. Z., 1935, 36, 869—873).—The

decrease of dielectric const.,  $\epsilon$ , of anisotropic liquids, e.g., *p*-azoxyanisole, with increase of field strength reaches a saturation val. at approx. 1000 volts per cm., and is regarded as a dipole saturation effect. Calculation shows that the saturation val. of  $\epsilon$  should be equal to the val. for the solid substance, but actually it is considerably greater, since not only does the mean moment of the mol. groups contribute to the orientation polarisation, but the single polar mols. within the groups are sufficiently movable to take part.

A. J. M.

**Electrical moments of *p*-benzoquinone and related compounds.** D. L. HAMMICK, G. C. HAMPSON, and G. I. JENKINS (Nature, 1935, 136, 990—991).—The following vals. of  $P_{A+O}$  (c.c.) have been obtained: *p*-benzoquinone 8.9 in  $C_6H_6$ , 9.6 in  $CCl_4$ , and 8.6 in  $n-C_6H_{14}$ ; and in  $C_6H_6$  2:5-dimethyl- 9.4, and 2:5-dichloro-1:4-benzoquinone 8.8, and tetramethylcyclobutane-1:3-dione 11.0. These vals. are apparently due either to a general effect of the solvent or to an abnormally large atom polarisation. L. S. T.

**Dipole moments of cyclohexa-1:4-dione, cyclopentadienebenzoquinone, benzoquinone, carbon suboxide, and carbonyl chloride.** C. G. LE FÈVRE and R. J. W. LE FÈVRE (J.C.S., 1935, 1696—1701).—The dielectric consts.,  $d$ , and  $n$ , of solutions of the above substances in  $C_6H_6$  and  $CCl_4$  have been determined, and the total polarisations, mol. refractivities, orientation polarisations, and dipole moments of the solutes have been calc. The dipole moment of cyclohexa-1:4-dione is 1.3 *D*, indicating a comparatively low *cis*-content. The mol. refractivity (27.8) shows that it is entirely ketonic. The dipole moment of cyclopentadienebenzoquinone is 1.39 *D*, and of *p*-benzoquinone 0.69 *D*. The orientation polarisation of the latter is approx. the same in  $C_6H_6$  and  $CCl_4$ , and does not vary with temp., results which may be due to the solute mols. not being completely rigid when bombarded by solvent mols. The orientation polarisation of  $C_3O_2$  is approx. 10 c.c., showing that in  $C_6H_6$  solution very little of the cyclic form can exist. The possible structures are reviewed. The dipole moment of  $COCl_2$  in  $CCl_4$  is 1.099 *D*. The size of the Cl—C—Cl angle is discussed.

A. J. M.

**Relation between molecular orientation polarisation of substances in the liquid, dissolved, and gaseous states.** C. G. LE FÈVRE and R. J. W. LE FÈVRE (J.C.S., 1935, 1747—1751).—The relationship  ${}_oP_1/{}_oP_2 = K(\epsilon_2 + 2)/(\epsilon_1 + 2)$ , where  ${}_oP_1$  and  ${}_oP_2$  are the orientation polarisations developed by a mol. when surrounded by media of dielectric const.  $\epsilon_1$  and  $\epsilon_2$ , respectively, has been tested with a no. of pairs of solutions, solutions and solutes in the vapour state, solutions and liquid solutes in bulk, and substances in the pure liquid and gaseous state. It has no general applicability, since probably the mutual influences of mols. in conjunction with their shapes should be taken into account.  ${}_oP_{liq.}/{}_oP_{gas}$  should be given by  $1 - (\epsilon - 1)/(\epsilon + 2)f$ , where  $f$  depends on the shape and polarisability of the mols.

A. J. M.

**Optical dispersion of HCl in the infra-red.** R. ROLLEFSON and A. H. ROLLEFSON (Physical Rev.,

1935, [ii], 48, 779—785).—In view of the large discrepancy between the temp. invariant part of the dielectric const. of HCl and  $n_\infty^2$ , attributed to the contribution of infra-red vibration bands to  $n$ , the optical dispersion of HCl was measured over 1—10  $\mu$ . The val.  $1.00 \pm 0.05 \times 10^{-10}$  e.s.u. obtained for the effective charge of the rotator-vibrator shows that the contribution of the latter to  $n_\infty$  is too small to explain the discrepancy, which appears to be due to uncertainty in the dielectric const. measurements.

N. M. B.

**Refractivity of cellulose as function of the degree of swelling.** M. MEYER and A. FREY-WYSSLING (Helv. Chim. Acta, 1935, 18, 1428—1435).—Measurements of  $n_a$  by the immersion method show  $n$  to decrease regularly, although very slightly, with the H<sub>2</sub>O content of the fibre. Kanamaru's results (A., 1934, 1292) are attributed to displacement of H<sub>2</sub>O by the immersion medium. Reasons for the negligible influence of the adsorbed H<sub>2</sub>O on  $n$  are discussed.

J. S. A.

**Magnetic birefringence of nitric oxide.** H. BIZETTE and T. BELLING (Compt. rend., 1935, 201, 955—956).—Measurements are recorded at 16.5°/80—180 atm.

H. J. E.

**Quantum-mechanical calculation of polarisability and dispersive powers.** H. HELLMANN (Acta Physicochim. U.R.S.S., 1935, 2, 273—290).—Mathematical.

J. W. S.

**Constitution of diborane.** E. WIBURG (Z. anorg. Chem., 1935, 225, 262—269).—A crit. discussion of published work.

E. S. H.

**Constitution of complex metallic salts. III. Parachors of palladium and mercury in simple and complex compounds.** F. G. MANN and D. PURDIE (J.C.S., 1935, 1549—1563; cf. A., 1934, 640).—The parachor of Pd in homologous series of the type  $[(R_2S)_2PdCl_2]$ ,  $[(R_3P)_2PdCl_2]$ ,  $[(R_3As)_2PdCl_2]$  decreases and becomes negative with increasing length of alkyl chain.  $HgEt_2$  and  $Hg(n-C_5H_{11})_2$  do not exhibit this behaviour, whilst in the Hg mercaptides the parachor of Hg decreases to a const. at  $R=n$ -heptyl. Since the parachors of compounds of the type  $CRR'(SEt)_2$  show no abnormality, the above decrease cannot be due to the formation of a group  $\cdot S \cdot X \cdot S \cdot$ . It is shown that the parachors of the metal in ketonic derivatives of Tl, Be, and Al (cf. Sugden, "The Parachor and Valency," 1930) also decrease as the homologous series is ascended, and it is suggested that the effect is due to a diminution in the vol. of the mol. as a whole owing to increased compression resulting from the operation of "strain factors" (cf. A., 1929, 1219). Dipole moments of  $[(Et_3S)_2PdCl_2]$ ,  $[(Et_3P)_2PdCl_2]$ , and  $[(Et_3As)_2PdCl_2]$  have been determined, and it is concluded that these are stable *trans*-compounds, although  $[(Me_3As)_2PdCl_2]$  may have the *cis*-configuration. Densities, surface tensions, and parachors of the following compounds are given:  $Pr^a$ ,  $Bu^a$ , and *n*-amyl sulphides, *di-n*-amyl sulphoxide, m.p. 60°, *n*-hexyl, heptyl, and octyl sulphide, *Ph Bu^a*, b.p. 137—139°/12 mm., and *Bu^b* sulphide, b.p. 126—127°/12 mm.,  $\alpha$ -*bis*(phenylthiol)propane, b.p. 264°/12 mm. [from PhSH and

$\text{CH}_2(\text{CH}_2\text{Br})_2$ ];  $\alpha$ -bis(phenylthiol)acetone, m.p.  $43^\circ$ , similarly prepared from  $\text{CO}(\text{CH}_2\text{Cl})_2$ ; acetone bisethyl mercaptol, b.p.  $84.5\text{--}85^\circ/20$  mm.; *Me Et ketone bisethyl mercaptol*, b.p.  $99\text{--}100^\circ/18.5$  mm.;  $\text{Pr}^a$ ,  $\text{Bu}^a$ , *n*-amyl, hexyl, and heptyl thiols; *Et*,  $\text{Pr}^a$ ,  $\text{Bu}^a$ , and *n*-amyl phosphines, *tri-n-amylphosphine oxide*, m.p.  $59^\circ$ ;  $\text{Et}_3$  phosphite, b.p.  $55^\circ/19$  mm.;  $\text{AsMe}_3$ ,  $\text{AsEt}_3$ ,  $\text{AsPr}^a_3$ , and  $\text{AsBu}^a_3$ . *Bis(dialkylsulphide)palladium compounds* were prepared by addition of a sulphide to aq.  $(\text{NH}_4)_2\text{PdCl}_4$ . The *Me*, *Et*,  $\text{Bu}^a$ , and *isoamyl* dichlorides are described, also the *Me Et dichloride*, m.p.  $67^\circ$ , decomp. on heating,  $\text{Pr}^a_2$  dichloride, m.p.  $59^\circ$ ,  $\text{Pr}^a_2$  dichloride, m.p.  $163^\circ$ ,  $\text{Bu}^a_2$  dichloride, m.p.  $32^\circ$ , *diisoamyl dichloride*, m.p.  $41^\circ$ ; the *n*-heptyl and *octyl* derivatives obtained were impure; the *divinyl dichloride*, orange, decomposes at room temp., the *Ph Bu^a dichloride* has m.p.  $118^\circ$ , and the  $\text{Bu}^a_2$  compound melts at  $96^\circ$ ;  $\text{Ph}_2$  dichloride, orange, m.p.  $170^\circ$ , *dibenzyl dichloride*, orange, m.p.  $154^\circ$ , *bis(diethyl sulphide)palladium dibromide*, deep red, m.p.  $103^\circ$ , *di-iodide*, m.p.  $107\text{--}108^\circ$  (decomp.). Grinding the corresponding dichloride with aq.  $\text{NaNO}_2$  gave pale yellow dinitrites: *Me*, m.p.  $137\text{--}138^\circ$ , *Et*, m.p.  $161\text{--}163^\circ$  (slight decomp.),  $\text{Pr}^a_2$ , m.p.  $163\text{--}164^\circ$ ,  $\text{Bu}^a_2$ , m.p.  $165\text{--}166^\circ$ , *di-n-amyl*, m.p.  $163^\circ$ . The following *bis(trialkylphosphine)palladium compounds* were similarly prepared:  $\text{Et}_3$  dichloride, m.p.  $139^\circ$ , sublimes  $140^\circ$  in vac.,  $\text{Pr}^a_3$  dichloride, m.p.  $96^\circ$  (crystallographic data given);  $\text{Bu}^a_3$  dichloride, m.p.  $66^\circ$ , *dibromide*, m.p.  $73^\circ$ , and *di-iodide*, dark orange, m.p.  $64\text{--}65^\circ$ , *tri-n-amyl dichloride*, m.p.  $47^\circ$ . Alcoholic solutions of the dichlorides gave dinitrites with  $\text{NaNO}_2$ ;  $\text{Pr}^a_3$  dinitrite, m.p.  $167\text{--}168^\circ$  (decomp.). The following *bis(trialkylarsine)palladium salts* are described: *Me*, golden-yellow crystals, m.p.  $235^\circ$  (crystallographic data given),  $\text{Et}_3$ , m.p.  $116^\circ$ ,  $\text{Pr}^a_3$ , m.p.  $55^\circ$ ,  $\text{Bu}^a_3$ , m.p.  $54^\circ$ , and *tri-n-amyl dichloride*, m.p.  $10\text{--}11^\circ$ ;  $\text{Pr}^a_3$  *dibromide*, orange prisms, m.p.  $49^\circ$ ,  $\text{Et}_3$  *dinitrite*, m.p.  $176\text{--}177^\circ$ . Addition of a thiol in  $\text{CHCl}_3$  to  $(\text{NH}_4)_2\text{PdCl}_4$  gave deep reddish-orange *Pd mercaptides*; *Et* derivative, decomp.  $250^\circ$ ,  $\text{Pr}^a$ , m.p.  $209\text{--}210^\circ$  (crystallographic data given),  $\text{Bu}^a$ , m.p.  $142^\circ$ , *n-amyl*, m.p.  $83^\circ$ , whilst the amorphous vermilion  $\text{Ph}_2$  derivative is formed when  $\text{PhSH}$  is added to  $\text{EtOH}$  or  $\text{COMe}_2$  solutions containing  $[(\text{R}_2\text{S})_2\text{PdX}_2]$ , and gives *Pd* on heating. *Pd* can be determined in this way. Addition of a thiol to  $\text{HgO}$  gave the *Hg alkyl mercaptides*: *Et*, m.p.  $77^\circ$ ,  $\text{Pr}^a$ , m.p.  $67^\circ$ ,  $\text{Bu}^a$ , m.p.  $85^\circ$ , *n-amyl*, m.p.  $66^\circ$ , *n-hexyl*, m.p.  $58^\circ$ , *n-heptyl*, m.p.  $75^\circ$ , and *n-octyl*, m.p.  $71^\circ$ .  $[\text{Et}_2\text{S}, \text{HgCl}_2]$  has m.p.  $77.5\text{--}78.5^\circ$ .

R. S.

**Physical identity of enantiomerides. I. Rotatory dispersion of *l*-borneol, enantiomeric camphors, camphoric acids, sodium camphorates, camphoric anhydrides, and camphorimides.** B. K. SINGH and I. MAHANTI (Proc. Indian Acad. Sci., 1935, 2, A, 378—396).—In view of reported slight deviations in rotatory powers of *d*- and *l*-forms, suggested by wave mechanics, high-precision data for a no. of carefully purified compounds over a range of concns. in various solvents are tabulated. Results indicate that, within the limits of experimental error, Pasteur's principle is quantitatively strictly obeyed.

N. M. B.

**Maximum valency of elements and atomic structure. III, IV.** B. ORMONT (Acta Physicochim. U.R.S.S., 1935, 2, 533—546, 547—556; cf. A., 1935, 1058).—III. The dependence of the stability of the homopolar hydrides on the structure and valency of the central atoms (quantum states of the extranuclear electrons) is discussed.

IV. The stability of organo-metallic compounds containing homopolar linkings is discussed.

O. J. W.

**Maximum valency of elements and atomic structure. V. Maximum valency in the formation of hydrides, organometallic compounds, oxides, and halogen compounds.** B. ORMONT (Acta Physicochim. U.R.S.S., 1935, 2, 689—694; cf. preceding abstract).—Discussion. T. G. P.

**Natural classification of chemical compounds.**

II. F. M. SCHEMJAKIN (Acta Physicochim. U.R.S.S., 1935, 2, 421—426; cf. A., 1931, 287).—Analogies are observed between the physical properties of compounds of similar structural arrangement and between compounds in which the sums of the at. nos. of the constituent atoms are equal. J. W. S.

**Valency strength and the magnetism of complex salts.** J. H. VAN VLECK (J. Chem. Physics, 1935, 3, 807—813).—The anomalously low susceptibilities of ferro- and ferri-cyanides and certain other complex salts, compared with the predictions of the Bose-Stoner "spin only" formula, can be interpreted by Pauling's directed wave functions, or by the cryst. potential method (cf. Schlapp, A., 1933, 212), or by Mulliken's method of mol. orbitals (cf. A., 1932, 562).

N. M. B.

**Group relation between the Mulliken and Slater-Pauling theories of valency.** J. H. VAN VLECK (J. Chem. Physics, 1935, 3, 803—806).—By means of the group theory of characters, an intimate relation and transformation between Mulliken's mol. orbitals and the Slater-Pauling directed wave functions is shown.

N. M. B.

**Molecular structure of dielectrics.** (Sir) W. H. BRAGG (J. Inst. Electr. Eng., 1935, 77, 737—748).—Kelvin Lecture.

**New formulation of the Pauli principle for bond problems.** A. A. SCHUCHOVITSKI (Acta Physicochim. U.R.S.S., 1935, 2, 81—90).—Mathematical. R. S.

**Interaction between vibration and rotation for symmetrical molecules.** M. JOHNSTON and D. M. DENNISON (Physical Rev., 1935, [ii], 48, 868—883).—Mathematical. Teller's explanation of the anomalous fine structure of the infra-red bands of symmetrical mols. is developed. Expressions for the spacing const. of axially symmetrical and of tetrahedral mols. are derived, the internal angular momenta associated with the  $\perp$  frequencies of the axial mol.  $\text{YX}_3$  are calc., and results are applied to  $\text{NH}_3$  and  $\text{ND}_3$ . The axial mol.  $\text{ZXYX}_3$  is treated, and the moments of inertia of  $\text{MeF}$ ,  $\text{MeCl}$ ,  $\text{MeBr}$ , and  $\text{MeI}$  are calc. as  $5.61$ ,  $5.35$ ,  $5.44$ , and  $5.44 \times 10^{-40}$ , respectively. Results for overtones and combinations of two  $\perp$  frequencies are applied to  $\text{NH}_3$  and  $\text{MeCl}$ .

The calc. moment of inertia of  $\text{CH}_4$  is  $5.47 \times 10^{-40}$ . The overtones of  $\text{YX}_4$  are investigated. N. M. B.

Partial calculation of the potential energy function of the benzene molecule on the hypothesis of plane hexagonal symmetry. C. MANNEBACK (Ann. Soc. Sci. Bruxelles, 1935, **55**, B, 237—252; cf. A., 1935, 1057).—Coeffs. of the potential function of  $\text{C}_6\text{H}_6$  have been calc. with the aid of the Raman and infra-red spectra of  $\text{C}_6\text{H}_6$  and  $\text{C}_6\text{D}_6$ . It is shown that interaction occurs between non-adjacent C, giving a trellis-like elastic system. R. S.

Heat of dissociation of nitrogen. W. W. LOZIER (Physical Rev., 1934, [ii], **45**, 840).—A discussion. L. S. T.

Dissociation energy of carbon monoxide. P. GOLDFINGER, V. LASAREV, and B. ROSEN (Compt. rend., 1935, **201**, 958—960).—The dissociation energy of CO of 9.10 e.v. is consistent with related spectroscopic and thermochemical data. H. J. E.

Dissociation energy of CO. D. COSTER and F. BRONS (Proc. K. Akad. Wetensch. Amsterdam, 1935, **38**, 961—964; cf. A., 1934, 237).—The energy of predissociation in the fourth positive group of CO indicates that the energy of dissociation of the CO mol. is 8.41 volts (193.9 kg.-cal. per g.-mol.). From this the heat of sublimation of solid C is 107.6 kg.-cal. per mol. J. W. S.

Surface tension near the critical point. A. W. PORTER (Phil. Mag., 1935, [vii], **20**, 1163—1166).—A quant. discussion of surface flattening in a small tube near the crit. temp. N. M. B.

Surface tension of liquid metals. D. V. GOGATE and D. S. KOTHARI (Phil. Mag., 1935, [vii], **20**, 1136—1144).—Mathematical. An electron theory of surface tension is developed. Results agree with observed vals. N. M. B.

Surface tension of mercury and its alloys. M. LEMARCHANDS and L. CONVERS (J. Chim. phys., 1935, **32**, 657—669).—The drop-wt. method of determining the surface tension ( $\sigma$ ) of Hg in air leads to variable results owing to the adsorption of gases by the surface. The val. of  $\sigma$  determined by the same method in a vac. is 434 dynes per cm. This method applied to Ca amalgam was unsuccessful owing either to superficial oxidation or to the formation of a surface film of solid amalgam. J. W. S.

Contribution of X-ray analysis to the question of electron terms in ionic lattices. R. DE L. KRONIG (Physikal. Z., 1935, **36**, 729—732).—Two chief factors determine the fine structure of the X-ray absorption bands for ionic crystals: (1) the inability of electrons moving in a definite direction to take up certain quanta of energy on account of the zonal structure of the energy spectrum; this is a factor depending on the type of lattice, and (2) the effect of the modulation of the wave function on the probability of transition, depending on the variation of potential within the lattice cell. The various types of fine structure of the  $K$ -absorption edges encountered experimentally are discussed. A. J. M.

X-Ray interference for contact of the source of rays and the crystal. H. SEEMANN (Physikal. Z., 1935, **36**, 837—841).—Results obtained by the single-crystal anticathode method (cf. A., 1935, 1306) in which the crystal and X-ray source are one and the same are improved by separating the crystal from the source by a short distance. A. J. M.

Conditions determining the intensity of X-ray reflexions from microcrystalline layers. J. BRENTANO (Nature, 1935, **136**, 988).—A discussion (cf. A., 1935, 1306; this vol., 45). L. S. T.

Relation between the mechanical strain and the intensity of X-rays reflected by a quartz plate. II. E. FUKUSHIMA (Bull. Inst. Phys. Chem. Res. Japan, 1935, **14**, 1199—1204; cf. this vol., 15).—The intensity of the reflected X-rays approaches a max. as the applied force is increased. R. S.

Face-centred lattices with incompletely arranged cations. E. J. W. VERWEY (Chem. Weekblad, 1935, **32**, 721—726).—A discussion of crystals, the lattice structure of which is determined by the face-centred arrangement of the large anions, the cations being relatively very small. D. R. D.

State of electrons in crystal lattices. F. HUND (Physikal. Z., 1935, **36**, 888—890).—Theoretical. The position of the energy bands in some simple types of crystal lattice is calc. A. J. M.

Recrystallisation processes. I. Single particle recrystallisation of deformed single crystals. II. Recrystallisation of single crystals. III. Compressed powdered rock-salt. H. G. MÜLLER (Z. Physik, 1935, **96**, 279—306, 307—320, 321—327).—I. The speed of growth of visible particles and their rate of formation both follow a van 't Hoff law from 270° to 790°, and for pure NaCl are independent of time; as these both follow the one law there can be no special nuclei formation.

II. Recrystallisation of powdered NaCl to a single crystal gives this microscopic and amicroscopic defects.

III. The tensile strength of tempered compressed NaCl varies with temp. and time of tempering in the same manner as compressed metals. A. B. D. C.

Crystal growth and dissolution under local stress. G. A. RUSSELL (Amer. Min., 1935, **20**, 733—737).—Experiments with halite and alum show that stresses may be localised in crystals as well as in amorphous material, and that the solubility of a part of the crystal is related to local stress. Material dissolved from one part on account of local stress may be redeposited on a less strained part of the same crystal. L. S. T.

Lattice constants of beryllium. E. A. OWEN and L. PICKUP (Phil. Mag., 1935, [vii], **20**, 1155—1158).—In view of discrepancies between results previously obtained with a focussing camera (cf. A., 1934, 136) and those of other authors, determinations were made with a special type of spectrum camera, and data were analysed by a new method. Results for Be annealed in vac. were  $a$  2.2810,  $c$  1.5682 Å., in close agreement with the previous vals. N. M. B.

**Tetragonal martensite in carbon steels.** Z. NISHIYAMA (Sci. Rep. Tohoku, 1935, 24, 517—522).—The lattice const. of tetragonal or  $\alpha$ -martensite, calc. from the effective radii of Fe and C atoms, is in accord with vals. observed in quenched steel. This is interpreted as confirming that martensite is a solid solution of C in Fe. J. W. S.

**Metals and alloys. XVIII. Lattice structure of LiAl.** E. ZINTL and G. WOLTERS DORF (Z. Elektrochem., 1935, 41, 876—879; cf. A., 1934, 356).—LiAl has space-centred cubic lattice of the NaTl type with a 6.360 Å. The radius of both atoms is 1.38 Å. The lattice dimensions are determined solely by the Al atoms, the size of which remains unchanged, whilst the Li atoms undergo a large contraction. F. L. U.

**Structural type of aluminium boride (AlB<sub>2</sub>).** W. HOFMANN and W. JANICKE (Naturwiss., 1935, 23, 851).—The structure of AlB<sub>2</sub> (hexagonal leaflets) has been determined by the Laue, powder, and rotating-crystal methods. The unit cell has  $a$  3.00,  $c$  3.24 Å., and contains 1 mol. of AlB<sub>2</sub>. The Al atoms lie at the corners of the cell, and thus form planes parallel to the leaflet plane. The B form a lattice analogous to the C in graphite. A. J. M.

**Stabilised cubic iron sesquioxide.** A. MICHEL and G. CHAUDRON (Compt. rend., 1935, 201, 1191—1193).—Cubic Fe<sub>2</sub>O<sub>3</sub> is stable in presence of the ferrites of Na, Be, Ag, and K. Its virtual Curie point obtained by extrapolation of the system Na<sub>2</sub>O—Fe<sub>2</sub>O<sub>3</sub> is 675° ± 10°. T. G. P.

**Crystal structure of hydrogen peroxide.** F. FEHER and F. KLOTZER (Z. Elektrochem., 1935, 41, 850—851; cf. A., 1935, 806).—H<sub>2</sub>O<sub>2</sub> has tetragonal structure with  $a=b=4.02$ ,  $c$  8.02 Å. The unit cell contains 4 mols. F. L. U.

**Structure of ferric phosphate.** V. CAGLIOTI (Atti R. Accad. Lincei, 1935, [vi], 22, 146—149).—FePO<sub>4</sub>, prepared by the action of Na<sub>2</sub>HPO<sub>4</sub> on FeCl<sub>3</sub> in presence of NaOAc, crystallises in one phase isomorphous with quartz:  $a_0$  5.035,  $c_0$  5.588 Å.,  $d_{010}$  3.1. O. J. W.

**Crystal parameters of copper ammonium bromide.** A. SILBERSTEIN (Compt. rend., 1935, 201, 970—971).—CuBr<sub>2</sub>·2NH<sub>3</sub>·Br·2H<sub>2</sub>O is quadratic,  $a$  7.98,  $c$  8.41 Å.; 2 mols. in unit cell; space-group  $P4/mnm$  ( $D_{2h}^{14}$ ). H. J. E.

**Crystal structure of cerium tungstate.** J. BEINTEMA (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 1011—1015).—Ce<sub>2</sub>(WO<sub>4</sub>)<sub>3</sub> is tetragonal-bipyramidal, possessing a scheelite-like structure with  $a_0$  5.336,  $c_0$  11.620 Å., and contains 4/3 Ce<sub>2</sub>(WO<sub>4</sub>)<sub>3</sub> in the unit cell. It is isomorphous with PbWO<sub>4</sub>, with which it forms a complete range of mixed crystals, but only 2/3 of the positions occupied by Pb in PbWO<sub>4</sub> are occupied by Ce, the remainder being void. J. W. S.

**Crystal structure and composition of sodium dihydropyrostibiate.** J. BEINTEMA (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 1015—1020).—Na<sub>2</sub>H<sub>2</sub>Sb<sub>2</sub>O<sub>7</sub>·5H<sub>2</sub>O crystallises in the tetragonal-bipyramidal form, the unit cell having  $a_0$  8.005,  $c_0$  7.868 Å. and containing 4 Na atoms. Cations and anions form a NaCl-like lattice, and in each anion Sb is surrounded by 6 O in almost octahedral configuration. The structure is in accord with the view that the composition is NaSb(OH)<sub>6</sub>. J. W. S.

$c_0$  7.868 Å. and containing 4 Na atoms. Cations and anions form a NaCl-like lattice, and in each anion Sb is surrounded by 6 O in almost octahedral configuration. The structure is in accord with the view that the composition is NaSb(OH)<sub>6</sub>. J. W. S.

**Structure and configuration of certain diamminopalladium compounds.** F. G. MANN, (MISS) D. CROWFOOT, D. C. GATTIKER, and (MRS.) N. WOOSTER (J.C.S., 1935, 1642—1652).—The deep red cryst. [(NH<sub>3</sub>)<sub>2</sub>PdCl<sub>2</sub>] (I) which is produced when the rate of formation is slow is chemically identical with the usual yellow form, which is a *trans*-compound. (I) is twinned,  $a$  8.0,  $c$  7.8 Å., and has 4 mols. per unit cell. Both forms give the pale greenish-white *oxalate* (darkens 175—185°) on shaking with aq. K<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, and X-ray measurements indicate that this is a *cis*-compound having a planar configuration. The *trans*-dinitrite, pale yellow, m.p. 231—232° (decomp.), is formed in a similar manner and shows a planar coordination about the central Pd. Addition of [(NH<sub>3</sub>)<sub>4</sub>Pd]Cl<sub>2</sub> to aq. NaNO<sub>2</sub> gives *cis*-diamminopalladium dinitrite, blackens at 234°, which is converted into the *trans*-dinitrite by slow recrystallisation. Since treatment of K palladonitrite with aq. NH<sub>3</sub> gives the *trans*-dinitrite, the production of the *cis*-form must be ascribed to the presence of NaCl or NaNO<sub>2</sub>. The *cis*-dinitrite gives an immediate brown ppt. with CS(NH<sub>2</sub>)<sub>2</sub>, whilst the *trans*-form does not. [(NH<sub>3</sub>)<sub>4</sub>Pd]Cl<sub>2</sub> ppts. canary-yellow *tetramminopalladium palladonitrite* from aq. K palladonitrite, m.p. 224—225° (decomp.). Recrystallisation converts this into the *trans*-dinitrite, which gives yellow *diamminopalladium diiodide* with aq. KI. Treatment with COMe<sub>2</sub> yields a reddish-blue octahedral form which shows a new type of repeated polysynthetic twinning. X-Ray photographs indicate that it is internally highly heterogeneous and that the I are arranged irregularly along the  $c$ -axis. When the diiodide is dissolved in aq. NH<sub>3</sub>, [(NH<sub>3</sub>)<sub>4</sub>Pd]I<sub>2</sub> is formed, which dissociates on keeping and deposits red crystals identical with the yellow pptd. diiodide. The diiodide may also be formed by the action of aq. KI on the dichloride. Diamminopalladium oxalate, when treated with KI, does not give the expected *cis*-diiodide, but chocolate-brown *tetramminopalladium palladoiodide*, which may also be obtained from the palladochloride or from NH<sub>3</sub>, palladoiodide and [(NH<sub>3</sub>)<sub>4</sub>Pd]Cl<sub>2</sub>. Further crystallographic properties of the compounds are given in detail. R. S.

**X-Ray diagrams of sugar carbon submitted to various thermal treatments.** P. CORRIEZ (Compt. rend., 1935, 201, 1189—1191; cf. A., 1934, 1088).—X-Ray diagrams of sugar C heated for 2 hr. at 1200°, 1400°, 1600°, 1800°, and 2000° indicate that the structure approaches nearest to that of graphite in the specimen heated at the highest temp. T. G. P.

**Structure of cellulose.** F. WORSCHITZ (Magyar Chem. Fol., 1934, 40, 60—64; Chem. Zentr., 1935, i, 2825).—A series of fibre diagrams obtained from Canadian Pappel and Pe-mou (*Fokiana hodgensii*, A. Henry), and differing from the normal, are given. In one case the diagram points to orientation of the cellulose crystals along the  $a$ -axis. H. N. R.

**X-Ray analysis of the structure of iridescent shells. II. *Haliotide*.** S. RAMASWAMY (Proc. Indian Acad. Sci., 1935, 2, A, 345—351; cf. A., 1935, 1194).—X-Ray diffraction patterns were investigated, and orientations of the aragonite crystals obtained. Results are compared with those for *Turbo* and *Trochus* shells. N. M. B.

**Orientation of the CO<sub>3</sub> groups in the ammonium [and potassium] hydrogen carbonate crystal.** A. MOOKHERJEE (Physical Rev., 1934, [ii], 45, 844).—Magnetic anisotropy measurements confirm Mooney's conclusions (A., 1933, 1234) concerning NH<sub>4</sub>HCO<sub>3</sub>. KHCO<sub>3</sub> exhibits a much feebleness anisotropy, showing that the planes of the different CO<sub>3</sub> groups in the unit cell must be considerably inclined to each other. L. S. T.

**Anomalies in the diffraction of fast-moving electrons.** H. MARK and H. MOTZ (Monatsh., 1935, 67, 13—23).—Further experiments confirm the conclusion previously reached (A., 1935, 813, 820), that anomalous interference lines obtained with electrons of 20—30 kv. are due to the presence of traces of fatty material of high mol. wt. on the surface of the specimen. F. L. U.

**Deflexion of slow electrons by sublimed tungsten.** V. I. KASSATOTSHKIN (Acta Physicochim. U.R.S.S., 1935, 2, 317—336).—The deflexion of 40—400-volt electrons by a film of micro-cryst. sublimed W indicates that the inner potential of W is  $10.5 \pm 2$  e.v. A second group of deflexion max. correspond with electron diffraction at the surface of the W crystals. The results are in accord with measurements with single W crystals (cf. A., 1933, 549). J. W. S.

**Variation in the lattice constant of zinc oxide.** V. E. COSSLETT (Nature, 1935, 136, 988—989).—A ZnO film prepared from a granulated Zn melt had  $a\ 3.234 \pm 0.005$ ,  $c\ 1.615 \pm 0.005$  Å. when freshly prepared and  $a\ 3.279$ ,  $c\ 1.637$  Å. 18 and also 20 months later. Au films remained const. over this period. ZnO films prepared as described should not be used for high-voltage calibration or measurement. L. S. T.

**Diffraction of electrons by metal crystals and by mica.** J. A. DARBYSHIRE and E. R. COOPER (Proc. Roy. Soc., 1935, A, 152, 104—123).—An examination has been made of spot patterns produced when an electron beam of velocity  $\sim 30$  kv. is transmitted through thin cryst. films of Cd, Zn, and Bi, and through thin curved sheets of mica. The reciprocal lattice picture of electron diffraction is presented in a form suitable for discussing the results. The crystals of the metals were prepared by withdrawing the surface oxide film from the molten metals in air and in N<sub>2</sub>; these films produced Debye-Scherrer patterns due to the oxide and spot patterns due to occluded metal crystals. The spot patterns are caused chiefly by distortion of the metal crystals. This view is supported by the results obtained with mica. Forbidden spectra, probably due to successive reflexions by different crystallites in an aggregate, were observed. L. L. B.

**Molecular structures of sulphur dioxide, carbon disulphide, and carbonyl sulphide.** P. C. CROSS and L. O. BROCKWAY (J. Chem. Physics, 1935, 3, 821—824).—Mol. structure data obtained by the electron diffraction method are: SO<sub>2</sub>, S—O,  $1.46 \pm 0.02$ ; CS<sub>2</sub>, C—S,  $1.54 \pm 0.03$ ; COS, C—O,  $1.16 \pm 0.02$ , C—S,  $1.56 \pm 0.03$  Å. In SO<sub>2</sub> the mol. resonates between structures having single-double and double-single linkings between S and the two O, with a linking angle  $122^\circ \pm 5^\circ$ . CS<sub>2</sub> is a linear mol. having the two double linkings predominating over the single and triple linking structure. In COS the double-double linking arrangement and the structure having the triple C—O linking predominate. N. M. B.

**Molecular structure of nickel carbonyl.** L. O. BROCKWAY and P. C. CROSS (J. Chem. Physics, 1935, 3, 828—833).—Electron diffraction by Ni(CO)<sub>4</sub> vapour leads to a mol. model in which the four CO have a tetrahedral arrangement about the Ni with Ni—C,  $1.82 \pm 0.03$ , and C—O,  $1.15$  Å., corresponding with resonance between two electronic structures in which the C—O linking resonates between triple and double electron pair linkings, and the N—C linking between single and double electron pair linkings. N. M. B.

**Diffraction of electrons by chloroform and its molecular structure: the Urbain and tetrahedral models.** C. DEGARD (Compt. rend., 1935, 201, 951—952).—The Cl—Cl and C—Cl interat. distances in CHCl<sub>3</sub> were  $2.95 \pm 0.03$  and  $1.76$  Å., respectively. This is consistent with either the tetrahedral formulation or Urbain's co-ordinate formula CCl<sub>2</sub>HCl. H. J. E.

**Formation of molecular swarms in liquids.** R. GANS (Physikal. Z., 1936, 37, 19—22).—Theoretical. The calculation of the size and shape of mol. swarms in liquids by the determination of the degree of depolarisation of light scattered by the liquid is considered, the method of Krishnan (A., 1935, 11) being extended. A. J. M.

**Theory of influence of pressure on electrical resistance of metals.** M. H. LENSSEN and A. MICHELS (Physica, 1935, 11, 1091—1107). H. J. E.

**Resistance of very thin films of foreign substances in metallic contacts.** R. HOLM and B. KIRCHSTEIN (Physikal. Z., 1935, 36, 882—888).—Metallic surfaces become covered, in air, with a film of foreign matter of definite resistance. The resistance of very thin films may be calc. using the tunnel effect. Such calculation shows that the resistance is independent of temp. and obeys Ohm's law up to 0.5 volt, in agreement with experiment. A. J. M.

**Variation of electrical resistance and reflecting power of metallic mirrors condensed at low temperatures.** R. SUHRMANN and G. BARTH (Physikal. Z., 1935, 36, 843—845).—The resistance of mirrors of Cu, Ag, Au, Cd, Tl, and Pb deposited at 20—80° abs. decreases on warming to room temp. and there is a simultaneous increase in the reflecting power. The resistance of Bi mirrors deposited at 80° abs. increases with rise of temp. The results are analogous to the resistance changes which occur when the liquid metal solidifies, and therefore indicate that

rise of temp. from 80° abs. to room temp. involves an increase in the orderly arrangement of atoms in the lattice.

A. J. M.

**Longitudinal resistance changes in a magnetic field according to elementary theory.** A. SOMMERFELD and B. W. BARTLETT (Physikal. Z., 1935, 36, 894—899).—Mathematical. Previous calculations of the longitudinal resistance change in a magnetic field (current and magnetic field parallel) led to a zero val. If the electron orbits are quantised a finite result is obtained.

A. J. M.

**Dielectric investigations on crystals of Seignette's salt.** R. DAVID (Helv. phys. Acta, 1934, 7, 647—649; Chem. Zentr., 1935, i, 2779).—The dependence of the dielectric const. on elastic deformation of the crystal has been investigated. The charge-field strength curves exhibit hysteresis and saturation. Non-homogeneous deformation produces highly asymmetric hysteresis curves, which are attributed to internal stresses in the crystal.

J. S. A.

**Magnetisation of single crystals of nickel at various temperatures.** K. HONDA, H. MASUMOTO, and Y. SHIRAKAWA (Sci. Rep. Tohoku, 1935, 24, 391—410).—The magnetisation of single Ni crystals has been measured by the ballistic method between -252° and 370°. The magnetisation along the (111) axis at 20° increases rapidly at first and slowly later with increasing field strength to a saturation val. of about 503 gauss. At higher temp. magnetisation occurs more readily in weak fields, but the saturation val. is lower. The magnetisation along the (100) and (110) axes behaves similarly at higher temp., but at low temp. saturation is not reached with fields up to 1000 oersteds. The estimated val. of the magnetisation of Ni at 0° abs. is 533 gauss.

J. W. S.

**Cessation of spin in ferromagnetic crystals under the influence of mechanical strains.** R. GANS (Ann. Physik, 1935, [v], 24, 680—696).—Theoretical.

A. J. M.

**Directions of discontinuous changes of magnetisation in a rotating monocrystal of silicon-iron.** L. W. McKEEHAN and R. F. CLASH, jun. (Physical Rev., 1934, [ii], 45, 839—840; cf. A., 1935, 287).

L. S. T.

**Action of X- and  $\gamma$ -rays on piezo-electric crystals.** F. SEIDL and E. HUBER (Z. Physik, 1935, 97, 671—680).—Quartz and Rochelle salt show an increase in electrical conductivity when irradiated with X- or  $\gamma$ -rays, but the piezo-const. does not always change in one direction.  $\gamma$ -Rays colour Rochelle salt yellow.

A. B. D. C.

**Magnetostriction volume effect for nickel and magnetite.** M. KORNETZKI (Z. Physik, 1935, 97, 662—666).

A. B. D. C.

**Inversion of quartz to tridymite.** I. Natural tridymite. II. X-Ray distinction between tridymite and cristobalite. S. KONDO and T. YAMAUCHI (J. Soc. Chem. Inst. Japan, 1935, 38, 651—652B).—I. For natural tridymite (I)  $n_D$  varies from 1.477 to 1.479. Interplanar spacings and intensities have been calc. for 29 lines in the diffraction pattern.

II. Artificial (I), and natural and artificial cristobalite (II), have  $n_D$ , respectively, 1.469—1.474, 1.482, 1.484. (I) and (II) can be distinguished by the X-ray pattern.

T. W. P.

**Dynamic theory of crystal optics.** G. MOLIERE (Ann. Physik, 1935, [v], 24, 591—608).—Mathematical. Laue's method for X-rays is extended to longer  $\lambda$  and expressions for double refraction and optical activity are derived; the vals. calc. are in agreement with those obtained from the Born-Ewald lattice theory.

W. R. A.

**Negative cohesion pressure.** V. JACYNA, S. DEREJANKIN, and A. OBNORSKI (Z. Physik, 1935, 97, 774—776).—Weiss and Bridgman's revision of van der Waals' equation of state (cf. A., 1935, 1064) gives results that accord well with Jacyna's theory (A., 1934, 1070).

A. B. D. C.

**Lattice distortion and coercive force in single crystals of nickel-iron-aluminium.** W. G. BURGERS and J. L. SNOEK (Physica, 1935, 11, 1064—1074).—In the state of max. coercive force, the segregation of the supercooled metastable  $\alpha$ -phase into a stable  $\alpha$ - and a  $\gamma$ -phase has reached only a preliminary stage. The  $\gamma$ -phase is not in evidence in the X-ray diagrams. A highly stressed state occurs in the lattice.

H. J. E.

**Crystal plasticity.** IV. Dynamic plasticity law. E. OROWAN (Z. Physik, 1935, 97, 573—595).—Plastic flow of Zn crystals shows that the stress varies with the rate of slip and not with the actual displacement (cf. A., 1934, 949).

A. B. D. C.

**Plasticity of bismuth.** W. F. BERG and L. SANDLER (Nature, 1935, 136, 915).—Crystals of Bi grown in a vac. or under atm. pressure in  $N_2$ ,  $H_2$ , or  $CO_2$  by the Andrade-Rosecoe method are all soft, i.e., they slip in tensile tests at room temp. The hypothesis that the gas is responsible for the softness (A., 1934, 722) is untenable.

L. S. T.

**Strength of crystals towards pressure.** M. SCHULER and A. DIMPKER (Z. Instrument., 1935, 55, 63—70; Chem. Zentr., 1935, i, 2490).—Spheres and cones of materials (sapphire, ruby, diamond, quartz) used for construction of knife edges, pressed against the same material, crack readily, but require much higher loads for breakage. Steel spheres behave as required by the Hertz theory.

J. S. A.

**Elastic behaviour of tin single- and polycrystals.** W. BOAS (Helv. phys. Acta, 1934, 7, 878—883; Chem. Zentr., 1935, i, 2312).—Elastic moduli calc. from the Voigt formula for polycryst. Sn agree fairly well with published data. For single crystals, Bridgman's results are much > those calc.

J. S. A.

**Electrical evaluation of recovery in compressed rock-salt crystals.** J. BOROS and Z. GYULAI (Z. Physik, 1935, 96, 355—358).—Sudden changes in electric conductivity of NaCl under pressure are associated with recovery.

A. B. D. C.

**Explosive antimony.** II. Structure, electrical conductivity, and rate of crystallisation. C. C. COFFIN (Proc. Roy. Soc., 1935, A, 152, 47—63; cf. A., 1934, 1297).—A microscopical examination of

polished and etched surfaces shows that the explosive electrolytic deposit of Sb possesses a heterogeneous gel-like structure definitely oriented with respect to the cathode receiving surface. This oriented phase is probably an  $\text{SbCl}_3\text{-Sb}$  complex resulting from the deposition of a complex ion; the other phase is probably amorphous Sb. The electrical properties of the deposits are non-metallic in that the conductivity is very small and has a positive exponential temp. coeff. Ohm's law is obeyed, but Faraday's law is not involved, although a small polarisation is built up at the higher temp. At temp. too low to initiate explosion the deposits crystallise at a rate which is independent of the extent to which they have already crystallised. The rate of crystallisation increases exponentially with rise of temp. L. L. B.

**Two new phenomena [transitions produced in bismuth and phosphorus] at very high pressure.** P. W. BRIDGMAN (Physical Rev., 1934, [ii], 45, 844—845).—At approx. 25,000 kg. per sq. cm. and room temp., a new modification is produced reversibly from ordinary solid Bi with a vol. decrease of approx. 9%. At 35,000 kg. per sq. cm., black P is formed at room temp. from the modification of white P stable at atm. pressure only below  $-80^\circ$ . The transformation is not complete;  $d$  is 2.59, as compared with 2.69 for the usual form of black P.

L. S. T.

**Effects of high shearing stress combined with high hydrostatic pressure.** P. W. BRIDGMAN (Physical Rev., 1935, [ii], 48, 825—847).—With mean pressures up to 50,000 kg. per sq. cm., the effect of shearing stresses up to the plastic flow point was investigated for a no. of substances in the form of thin discs. Normally stable substances which detonated were: celluloid,  $\text{CHI}_3$ ,  $\text{PbO}_2$ ,  $\text{KMnO}_4$ ,  $\text{Ag}_2\text{O}$ ,  $\text{MnO}_2$ ,  $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ ,  $\text{AgNO}_3$ ,  $\text{Sr}(\text{NO}_3)_2$ ,  $\text{Cr}_2(\text{SO}_4)_3$ ,  $\text{K}_2\text{SO}_4$  cryst. and anhyd.,  $\text{Al}_2(\text{SO}_4)_3$ ,  $\text{CuCl}_2 \cdot 2\text{NH}_4\text{Cl} \cdot 2\text{H}_2\text{O}$ . Rubber changed to a hard horn-like mass, paper, wood, and linen cloth changed to translucent horn-like substances, thymol-blue became insol., amorphous Se partly became metallic, cryst. S appeared to become amorphous,  $\text{PbO}$  decomposed to Pb without detonation, red  $\text{HgO}$  changed to black, and red P changed to the black form. Combinations of substances normally inert to each other which reacted explosively were  $\text{Cu}+\text{S}$ ,  $\text{Fe}_2\text{O}_3+\text{Al}$ ,  $\text{SiO}_2+\text{Mg}$ ,  $\text{K}_2\text{C}_2\text{O}_4+\text{Al}$ , and  $\text{Si}+\text{MgO}$ . Single substances giving negative results were: graphite, mica,  $\text{NH}_4\text{NO}_3$ , sugar, rosaniline,  $\text{CuS}$ ,  $\text{SiO}_2$ , tremolite,  $\text{NH}_4\text{F}$ ,  $\text{CuO}$ ,  $\text{MgO}$ ,  $\text{Ag}_2\text{S}$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{LiF}$ ,  $\text{AgCl}$ ,  $\text{K}_2\text{C}_2\text{O}_4$ ,  $\text{NaBrO}_3$ ,  $\text{Si}$ ,  $\text{Na K tartrate}$ ,  $\text{HgNO}_3$ , and  $\text{K}_2\text{Cr}_2\text{O}_7$ . Polymorphic transitions under these stresses could be detected by a break in the shearing stress-pressure curve; out of 57 elements examined, breaks were found for Li, Sr, Ca, Ba, Cd, Zn, V, Mn, Sb, Te, I, La, Ce, Cr, Tl, Bi, Th, Sn, Yt, and Pr.

N. M. B.

**Polymorphism, principally of the elements, up to 50,000 kg.** P. W. BRIDGMAN (Physical Rev., 1935, [ii], 48, 893—906).—A new technique is described for applying to solids pressures up to 50,000 kg. per sq. cm. and measuring the parameters of transitions. Results of examination for polymorphism of a no. of elements are given; new modifications

were found for Bi, Hg, Tl, Te, Ga, and I, and transition parameters were measured. KCl, KBr, and KI at about 20,000 kg. per sq. cm. appear to assume the CsCl type of structure.

N. M. B.

**Coalescence in stages between two drops of a liquid.** M. KATALINIĆ (Nature, 1935, 136, 915—916; cf. A., 1935, 1062).

L. S. T.

**Recrystallisation accompanying an allotropic change.** C. F. ELAM (Nature, 1935, 136, 917; cf. A., 1935, 1452).—Such changes in  $\text{NH}_4\text{NO}_3$ ,  $\text{KNO}_3$ , and  $\text{AgNO}_3$  can be followed under the microscope using crossed Nicols.

L. S. T.

**Softening of vitreous substances.** E. RENCKER (Ann. Chim., 1935, [xi], 4, 523—566; cf. A., 1934, 17, 480).—Determinations of the softening temp. and the transformation point of vitreous substances are discussed. A kinetic interpretation of the phenomena is advanced, and it is shown that the properties of "tempered" glasses cannot be ascribed to a persistence in the interior of the conditions which exist above the transformation temp.

R. S.

**Highly polymerised compounds. CXXV. Mol. wt. determinations with highly complex polyethylene oxides.** H. STAUDINGER and H. LOHMANN. CXXVI. Comparison of the osmotic and viscosimetric methods of determining mol. wt. in polymeric-homologous series. CXXVII. Osmotic determinations in solutions of rod-like and spherical particles. H. STAUDINGER and G. V. SCHULZ. CXXVIII. Abnormal mol. wts. of highly complex compounds. H. STAUDINGER, W. KERN, and J. J. HERRERA. CXXIX. Polymerisation as chain reaction. H. STAUDINGER and W. FROST. CXXX. Conception of mol. wt. of simple and complex compounds. H. STAUDINGER (Ber., 1935, 68, [B], 2313—2319, 2320 2335, 2336—2346, 2346—2350, 2351—2356, 2357 2362).—CXXV. Determination of the mol. wt. of hemicolloidal polyethylene oxides (concordant data for which are obtained by the cryoscopic, terminal group, and viscosimetric methods) shows that Brintzinger's process gives abnormal values; marked divergences are noted with relatively simple products the diffusion of which is not impeded by the too small diameter of the membrane pores. Diffusion of thread-like particles differs therefore from that of spherical particles, to which alone the expression  $K=\lambda\sqrt{M}$  can be applied. The osmotic and viscosimetric methods give approx. concordant results, proving that extrapolation of the viscosity equation is permissible and that the mol. wt. of complex materials with thread-like mols. can be determined viscosimetrically.

CXXVI. The relationship between mol. wt. and osmotic pressure is expressed by the equation  $M = RTc/p_c[1 - c(K/p_c)^{1/\nu}]$ , in which  $K$  and  $\nu$  are constants for all members of a given polymeric-homologous series and, if determined for mesocolloidal members, can be applied to eucolloids in solutions in which the van 't Hoff relationship does not hold good. The mol. wts. of cellulose acetates (I) and nitrates (II) and methylcelluloses (III) are thus determined and the results applied in the calculation of viscosimetric data.  $K_m$  has the same val. for (II) in COME

(III) in  $H_2O$ , and (I) in  $COMe_3$  or *m*-cresol, proving that  $\eta_{sp.}$  of solutions of thread mols. depends only on the length of the mol. and the concn. and is independent of particular structure. With balata and hydro-caoutchouc the differences between the mol. wt. determined osmotically and viscosimetrically are considerable. With approx. eucolloidal polyethylene oxides the agreement between the determinations by the two methods is scarcely so close as with the cellulose derivatives. Observations with polystyrenes are greatly influenced by the manner in which polymerisation has been effected; it is assumed that unknown complications, particularly at higher temp., cause branching of the thread mols. Similar results are obtained with other synthetic polymerides formed by chain reactions; these, therefore, differ from the natural products which are polymeric-uniform and permit the determination of mol. length and hence mol. wt. by measurement of viscosity.

CXXXVII. The cryoscopic and ebullioscopic methods are trustworthy for the determination of mol. wt. of relatively simple substances with thread-like mols., but their applicability to similarly constructed hemi-, meso-, and eu-colloids is difficult to assess, although the behaviour of cellulose derivatives suggests that they are trustworthy in very dil. solution. Determinations of osmotic pressure of polymeric-homologous caoutchoucs, polyethylene oxides, and cellulose nitrates show that in each series the additional pressure increases with increasing concn. more rapidly as the mol. wt. is greater. Additional pressure is not observed with spherical-colloidal ovalbumin and serum-albumin, whereas gelatin appears to have thread-like particles. In osmotic behaviour, spherocolloids conform approx. to van 't Hoff's law and  $p_c/c$  is const., whereas with linear colloids the  $p_c/c$  vals. increase with increasing concn.

CXXXVIII. The depression of the f.p. of  $C_{10}H_8$  by five fractions of complex polyanetholes, the mol. wt. of which is determined concordantly by the viscosimetric and ultra-centrifugal methods, increases more slowly than expected with increasing concn., and the mol. wts. calc. on the assumption that Raoult's laws are followed are much smaller in dil. than in conc. solution, in some cases being < that of the fundamental mol. The observations are similar to those of Hess with cellulose esters and ethers in  $AcOH$ .

CXXXIX. The view that polymerisation is a chain reaction and not a poly-condensation process is strengthened by the observation that intermediate products are not observed during the polymerisation of acrylic acid or styrene. The rate of polymerisation depends on the rates of activation, growth, and of "final" reaction leading to the formation of non-reactive positions at the end of the thread mols. The second process takes place very rapidly in comparison with the first and third. Catalysts accelerate the initial, but generally also the final, action, so that in general the products are less complex than those formed by slow polymerisation in absence of catalyst. Acceleration of the first change without affecting the third is achieved by polymerisation in soap emulsion, and the addition of a catalyst is here permissible, since it does not penetrate into the interior of the mol.

CXXX. The importance of discriminating between the physical mol. wt. (which does not involve the internal structure of the particles) and the chemical mol. wt. (sum of the wts. of all the atoms united by main valencies in a particle) in the case of highly polymerised compounds is stressed. H. W.

Conductivity of the Bunsen flame measured with direct and alternating current. H. ULLMANN (Z. Physik, 1935, 97, 496—510).—D.-c. and a.-c. conductivity has been determined for the pure Bunsen flame, and for one containing  $Na_2CO_3$ . Probe measurements show that the effect of electrodes is small for the pure flame, but high for the salt flame. The conductivities are 1 and  $14 \times 10^4$  for d.c. and a.c. in the pure flame, and 36 and  $173 \times 10^4$  sec.<sup>-1</sup> in the salt flame. A. B. D. C.

Electrical conductivity of compressed metal vapours. W. BRAUNBEK (Z. Physik, 1935, 97, 482—495).—Bloch's theory predicts a large pressure variation for the conductivity of metal vapours, but measurements on Hg and K vapours at 730° and 1200° and up to 35 and 10 atm., respectively, gave negative results. A. B. D. C.

Effect of ultra-violet light on the electrical conductivity of quartz. R. RADMANCHE (Compt. rend., 1935, 201, 1021—1022).—The conductivity of quartz increases with time of irradiation to a max., and falls gradually to the original val. after removing the light source. T. G. P.

Superconductivity and other low-temperature phenomena. A discussion (Proc. Roy. Soc., 1935, A, 152, 1—46).—J. C. MCLENNAN discussed new methods of liquefying He: (1) in which the cooling is produced by the adiabatic expansion of compressed He gas, (2) in which the gas is pre-cooled with liquid  $N_2$  and in expanding is made to do external work on an expansion engine which is included in the gas cycle. Discontinuities in certain physical properties of liquid He, the lowest temp. which has been reached with liquid He alone (0.71° abs.), and the temp. reached by the method of adiabatic demagnetisation (0.0044° abs.) were mentioned. Up to the present, the following elements have been shown to become superconducting: Nb, Pb, Ta, Hg, Sn, In, Tl, Ti, Th, Al, Ga, Zn, Mg, Zr, Cd, Hf. The magnetic fields around superconductors, superconductivity in thin films, the Hall effect in superconductors, thermal conductivity at low temp., the anomalous behaviour of certain alloys, low-temp. calorimetry applied to radioactive measurements, sp. heats, and the electric magnetic theory of superconductors were also considered.

J. D. COCKCROFT discussed Kapitza's method for the liquefaction of He.

D. SHOENBERG reviewed the magnetic properties of superconductors.

W. H. KEESOM discussed the lambda-phenomena in liquid He, the thermodynamic temp. scale below 0.9° abs., the heat capacity of electrons in metals, and the calorimetry of superconductors.

W. MEISSNER. The magnetic effects occurring on transition to the superconducting state.

R. DE L. KRONIG. The propagation of electro-

magnetic waves in metallic conductors, and its bearing on the problem of superconductivity.

L. BRILLOUIN. Superconductivity and the difficulties of its interpretation.

N. KURTI and F. SIMON. The sp. heat of  $\text{Fe NH}_4$  alum below  $1^\circ$  abs. and a preliminary determination of the thermodynamic temp. scale.

R. PEIERLS. The residual resistance of superconducting metals.

F. LONDON. The macroscopical interpretation of superconductivity.

K. MENDELSSOHN. The induction and energy content in various superconducting substances.

N. F. MOTT. The heat capacity of certain elements at low temp. L. L. B.

**Superconductivity.** M. VON LAUE, F. LONDON, and H. LONDON (Z. Physik, 1935, 96, 359—364).—Theoretical. A. B. D. C.

**Superconductivity of the elements. III. Origin and range of validity of a proposed criterion for superconductivity.** Z. A. ERSTEIN (Z. Physik, 1935, 96, 386—409).—Theoretical (cf. A., 1930, 1242). A. B. D. C.

**Electronic configuration of superconducting metals.** U. DEHLINGER (Physikal. Z., 1935, 36, 892—894).—The composition of the outermost electron shells in the lattices of superconducting metals is considered. Only those elements are superconducting which possess a lattice with high co-ordination no., not too small at. radius, and, in their outermost shells,  $>$  one electron per atom. This holds for all elements, including the transition metals, with the exception of Ti and its congeners, which are weakly superconducting. The superconductivity of alloys is probably governed by a similar law. Thus, although Bi has a lattice too distorted to be superconducting,  $\text{Au}_2\text{Bi}$  has a highly co-ordinated lattice and is superconducting. The superconductivity of the carbides and nitrides of the transition elements may be explained in a similar way. A. M.

**Effect of light on diamagnetic susceptibilities.** H. C. BHUYAN (Nature, 1935, 136, 872).—Exposure to visible light temporarily increases the susceptibilities of  $\text{Cl}_2$ , Br, and I. L. S. T.

**Magnetochemical investigations. XVIII. and  $\text{K}_2(\text{B}_2\text{H}_4[\text{OH}]_2)$ .** L. KLEMM and W. KLEMM. XIX. Magnetic behaviour of potassium polyoxides and polysulphides. W. KLEMM and H. SODOMANN (Z. anorg. Chem., 1935, 225, 258—261, 273—280; cf. A., 1935, 1312).—XVIII. Magnetochemical measurements support the above formulæ in preference to  $\text{KBH}_3$  and  $\text{KBH}_2\cdot\text{OH}$ .

XIX. Magnetochemical data do not suffice to differentiate between the formulæ  $\text{K}_2\text{O}_4$  and  $\text{KO}_2$ . The diamagnetic susceptibilities of  $\text{K}_2\text{S}$ ,  $\text{K}_2\text{S}_2$ ,  $\text{K}_2\text{S}_3$ ,  $\text{K}_2\text{S}_4$ , and  $\text{K}_2\text{S}_6$  have been determined at room temp. and  $-183^\circ$ .  $\text{K}_2\text{S}_3$  becomes ferromagnetic at  $-50^\circ$ . E. S. H.

**Principal magnetic susceptibilities of  $\text{K}_3\text{Fe}(\text{CN})_6$ .** J. B. HOWARD (J. Chem. Physics, 1935, 3, 813—817).—The calc. magnitudes, anisotropy, and temp. dependence of the principal magnetic susceptibilities are in good agreement with experiment.

The relation of susceptibility to electron spin is discussed. N. M. B.

**Magnetic susceptibilities of alkali and alkaline-earth halides.** U. VEIEL (Ann. Physik, 1935, [v], 24, 697—713).—The susceptibilities of alkali and alkaline-earth halides and the halogen acids in aq. solution have been determined as a function of concn. The relationship is linear, in agreement with the Wiedemann additive law. The susceptibilities of the individual halides are considered in relation to their total nuclear charges. The results do not agree with Pascal's rule (extension of the Wiedemann law to mol. constituents). The mol. susceptibilities are used to calculate ionic susceptibilities. The effect of temp. on the susceptibilities of NaCl and KI solutions was determined. The temp.-susceptibility curves show only a small deviation from the curve for  $\text{H}_2\text{O}$ . This may be explained by assuming that the susceptibility of the salt does not vary with temp., although it causes an increase in the susceptibility of  $\text{H}_2\text{O}$  owing to a displacement of the equilibrium between the mol. complexes in  $\text{H}_2\text{O}$ . A. J. M.

**Determination of paramagnetic susceptibilities of crystals of rare earths by measurement of the paramagnetic rotatory power.** J. BECQUEREL (Compt. rend., 1935, 201, 1112—1115).—Measurements with the Et sulphates of Pr, Nd, Dy, and Er verify Van Vleck's prediction that the relation between the magnetisation and the paramagnetic rotation should be independent of temp. H. J. E.

**Thermo-electric effect according to the new electron theory.** M. SATO (Sci. Rep. Tohoku, 1935, 24, 523—536).—Mathematical. J. W. S.

**Thermo-electric power, Peltier heat, and photo-potential of the element copper-cuprous oxide-copper.** G. MONCH (Physikal. Z., 1935, 36, 755—757).—The deductions which can be made from the thermo-electric power, Peltier effect, and photo-potential of an element including a semi-conductor concerning the mechanism of conduction are discussed. A. J. M.

**Diffraction of light by high-frequency sound waves. I, II.** C. V. RAMAN and N. S. N. NATH (Proc. Indian Acad. Sci., 1935, 2, A, 406—412, 413—420).—Mathematical. N. M. B.

**Propagation of ultrasonic waves in liquid media.** R. LUCAS (Compt. rend., 1935, 201, 1172—1174).—Diffusion may account for the rapid diminution in amplitude of ultrasonic waves in liquid media. T. G. P.

**Critical phenomena.** V. JACZYNA (Z. Physik, 1935, 97, 669—670).—The indistinct crit. state of He is not due to impurities, but to the crit. point being a fiction applicable only to an unattainable ideal physical substance. A. B. D. C.

**Entropy of deuterium.** K. CLUSIUS and E. BARTHOLOME (Z. physikal. Chem., 1935, B, 30, 258—264).—At  $298.1^\circ$  abs. the entropy calc. from thermal data is  $33.91_5$ , whilst the statistically calc. abs. val. is  $38.98_4$  g.-cal. per mol. per degree. The difference between these vals. may be accounted for by supposing that on cooling at  $10^\circ$  abs. the equilibrium between

*o*- and *p*-forms is "frozen in," but that down to 10° *p*-D<sub>2</sub> mols. rotate freely in the lattice with — the nuclear spin multiplicity of the *o*- and *p*-mols. being maintained. For practical thermodynamic calculations the abs. val. 34.62<sub>0</sub> should be used. At low temp. the chemical consts. of *o*-D<sub>2</sub> and normal D<sub>2</sub> and the v.-p. const. of normal D<sub>2</sub> are -0.68<sub>1</sub>, -0.522, and -0.67<sub>0</sub>, whilst above 200° abs. the chemical const. of *o*-D<sub>2</sub> and the v.-p. const. of normal D<sub>2</sub> are -2.61<sub>5</sub> and -2.76<sub>3</sub>, respectively. R. C.

**F.p. of organic compounds. XV. Esters of the fatty acids.** R. BILTERYS and J. GISSELEIRE (Bull. Soc. chim. Belg., 1935, 44, 567—586).—B.p., m.p., *d*, coeff. of expansion, viscosity, fluidity, surface tension, *n*, and mol. refractivity data are tabulated for *n*-heptioic acid, *n*-hexyl and *n*-heptyl alcohol, the Me, Pr<sup>a</sup>, Bu<sup>a</sup>, and *n*-C<sub>5</sub>H<sub>11</sub> esters of *n*-hexoic, *n*-heptioic, and *n*-octoic acids, and *n*-hexyl, *n*-heptyl, and *n*-octyl formate, acetate, propionate, *n*-butyrate, *n*-valerate, *n*-hexoate, *n*-heptate, and *n*-octoate. The variation of the m.p. with the no. of C in the alcohol and acid radicals respectively is discussed. R. S.

**Relation between b.p., m.p., and mol. wt.** V. K. NIKIFOROV, N. V. ISMAILOV, and S. S. SANDO-MIRSKI (J. Chim. phys., 1935, 32, 670—677).—Statistical formulæ are deduced relating the b.p. and m.p. of org. compounds of mol. wt. 100—300 with the mol. wt. The formula  $T^2/M = \text{const.}$  holds for the alcohol and paraffin series. J. W. S.

**Normal reduced b.p.** R. LAUTHÉ (Bull. Soc. chim., 1935, [v], 2, 2234—2235).—The formula  $4T_c/T_c + 10T_c/T_c = 12.69$  ( $T_c = \text{crit. temp. and } T_c = \text{b.p. abs.}$ ) has been verified for a large no. of compounds of different types, within 0.3%. Hg and He are exceptions. F. L. U.

**International Bureau of Physico-chemical Standards. VII. Physical constants of twenty organic compounds.** J. TIMMERMANS and (MME.) HENNAUT-ROLAND (J. Chim. phys., 1935, 32, 589—617; cf. A., 1934, 480).—The following data for b.p./760 mm., m.p., and *d*<sub>15</sub> have been determined: MeOBz 199.50°, -12.4°, 1.09334; EtOBz 212.45°, -34.7°, 1.05112; PhCN 191.10°, -13.8°, 1.00948; NH<sub>2</sub>Ph 184.40°, -6.1°, 1.02613; NHPHMe 196.25°, —, 0.99018; NPhMe<sub>2</sub> 194.15°, 2.45°, 0.96012; *o*-200.40°, -16.4°, 1.00279, and *m*-toluidine 203.40°, -31.25°, 0.99302; PhNO<sub>2</sub> 210.80°, 5.70°, 1.20824. Other data recorded include the variation of b.p. with pressure, coeffs. of dilatation, *r*<sup>15</sup>, viscosity coeffs., surface tensions, and crit. solution temp. in suitable solvents. Previous data are tabulated. J. W. S.

**B.p. of normal paraffin series.** E. R. COX (Ind. Eng. Chem., 1935, 27, 1423—1425).—From C<sub>3</sub>H<sub>8</sub> to C<sub>8</sub>H<sub>18</sub> (except C<sub>4</sub>H<sub>10</sub>) results calc. from  $\log_{10} B = 1.07575 + 0.949128 \log_{10} m - 0.101 \log_{10}^2 m$  ( $B = \text{b.p. abs.}$ ;  $m = \text{mol. wt.}$ ) agree with observation. Disagreement in the cases of CH<sub>4</sub> and C<sub>2</sub>H<sub>6</sub> is attributed to their not being true aliphatic compounds (cf. Rossini, A., 1934, 1071). J. W.

**Specific heat of iron carbide, Fe<sub>3</sub>C.** G. NAESER (Mitt. Kaiser-Willh. Inst. Eisenforsch., 1934, 16,

207—210; Chem. Zentr., 1935, i, 2325).—The mean sp. heat (*h*) of cementite, obtained electrolytically from Fe with 0.9% C, has been measured between -188° and 765°. *h* reaches a max., nearly const. val. at 250°. The heat of formation and of the magnetic transformation are calc. J. S. A.

**Heat capacity of gadolinium sulphate from 1.0° to 20.5° abs.** C. W. CLARK and W. H. KEESOM (Physica, 1935, 11, 1075—1079).—The anomalous thermal behaviour of Gd<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·8H<sub>2</sub>O observed by Kurti (A., 1933, 449) was verified down to 1° abs. H. J. E.

**Phase equilibria in hydrocarbon systems. IX. Specific heats of *n*-butane and -propane.** B. H. SAGE and W. N. LACEY (Ind. Eng. Chem., 1935, 27, 1484—1488).—*c* was determined for both compounds in the gaseous and the condensed state; both *c<sub>g</sub>* and *c<sub>r</sub>* were determined. Apparatus is described. J. W.

**Calorimetric and thermal properties of condensed deuterium.** K. CLUSIUS and E. BARTHOLOME (Z. physikal. Chem., 1935, B, 30, 237—257).—The following data are recorded: latent heat of vaporisation at 194.5 mm., 302.3; heat of sublimation at 0° abs., 274.0; latent heat of fusion 47.0 g.-cal.; characteristic temp. of Debye function for *c<sub>p</sub>*, 89°; m.p., 18.65° abs.; slope of fusion curve at triple point, 40.5 kg. per sq. cm.; mol. vol. of liquid at triple point, 23.14; mol. vol. of solid at triple point, 20.48 c.c.; zero-point energy of lattice, ~215 g.-cal. The considerable differences between these vals. and the corresponding figures for H<sub>2</sub> are qualitatively accounted for if it is assumed that H<sub>2</sub> and D<sub>2</sub> have the same intermol. forces but different zero-point energies and anharmonicities of lattice vibration. R. C.

**Absolute zero, and the sub-zero region of temperatures and reactions.** P. N. PAVLOV (Ukrain. Chem. J., 1935, 10, 285—294).—Theoretical. The possibility of temp. < 0° abs. is envisaged, and the properties of matter in this region are discussed. R. T.

**Theory of the equation of state.** S. RAY (Kolloid-Z., 1935, 73, 269—272).—Ray's theory (A., 1931, 1117) is extended to saturated vapours and the liquid phase. E. S. H.

**Vapour pressures of some alkyl sulphides.** H. W. THOMPSON and J. W. LINNETT (Trans. Faraday Soc., 1935, 31, 1743—1747).—The v.p. of EtSH, Me<sub>2</sub>S, MeEtS, and Et<sub>2</sub>S have been determined at several temp. up to the b.p. The vals. of Trouton's const. deduced are normal, indicating non-association. J. W. S.

**Vapour pressure of drops.** S. V. GORBATSCHEV (Kolloid-Z., 1935, 73, 263—267).—Mathematical. E. S. H.

**Influence of degree of dispersion on physico-chemical constants.** V. E. COHEN and J. J. A. BLEKKINGH, jun. (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 978—982; cf. this vol., 20).—*d*<sub>15</sub> for *o*-OH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H is 1.4340, independently of crystal size between 0.01 and 1 mm. J. W. S.

**Fluctuations in density at the critical point.** J. YVON (Compt. rend., 1935, 201, 1099—1102).—Theoretical. H. J. E.

**Röntgenographic thermal expansion of very pure sodium chloride.** W. RECK and A. SMEKAL (Helv. phys. Acta, 1934, 7, 876; Chem. Zentr., 1935, i, 2783).—Measurements between  $-175^{\circ}$  and  $725^{\circ}$  show uniform expansion. Saini's anomaly (A., 1935, 436) is illusory. J. S. A.

**Thermal expansion of rock-salt and of pure sodium chloride.** H. SAINI (Helv. phys. Acta, 1934, 7, 877; Chem. Zentr., 1935, i, 2783).—The conclusion of Reck and Smekal (cf. preceding abstract) is acknowledged. J. S. A.

**Joule-Thomson effect of methane, nitrogen, and their mixtures.** J. H. PERRY and C. V. HERRMANN (J. Physical Chem., 1935, 39, 1189—1195).—Joule-Thomson coeffs. of  $\text{CH}_4$ ,  $\text{N}_2$ , and of 25, 50, and 75% mixtures at five temp. are calc. from the Beattie-Bridgeman equation. F. L. U.

**Viscosity and constitution of organic liquids.** S. PAPKOV (Z. physikal. Chem., 1935, 174, 445—448).—For an org. compound the val. of  $S=M^{2/3}\eta/d$ , where  $M$  is the mol. wt. and  $d$  the viscosity,  $\eta$ , are for  $20^{\circ}$ , is additively made up of characteristic vals. for the constituent atoms. Degrees of association of various liquids have been calc.  $S$  varies with temp. R. C.

**Square root law of fluidity. I. Hydrocarbons.** R. LAUTIF (Bull. Soc. chim., 1935, [v], 2, 2187—2192; cf. A., 1935, 1064).—The law proposed is where  $\phi$  is the fluidity at  $t^{\circ}$ , and  $I_i$  denotes increments appropriate to the atoms, types of linking, etc. in the compound considered. Examples are given for saturated and unsaturated cyclic hydrocarbons, and for paraffins. For mixtures of normal liquids of not too low or too high viscosity ( $\eta$ ), which show little vol. change on mixing, the law  $100\sqrt{\eta}=\sum m_x\sqrt{\eta_x}$  (where  $m_x$ ,  $\eta_x$  indicate the mol.-% and viscosity coeff. of the several constituents) applies closely. F. L. U.

**Viscosity in the system chlorine-sulphur.** V. A. MAZEL (J. Gen. Chem. Russ., 1935, 5, 1066—1072).—The  $\eta$ -composition curves of the system  $\text{Cl}_2$ - $\text{SCl}_2$  have been studied at  $-15^{\circ}$ ,  $0^{\circ}$ , and  $25^{\circ}$ . R. T.

**Viscosity of the system  $\text{KAlSi}_3\text{O}_8$ - $\text{NaAlSi}_3\text{O}_8$  and of perthite at high temperatures.** K. KANI (Proc. Imp. Acad. Tokyo, 1935, 11, 324—336).—The data refer to  $1300$ — $1450^{\circ}$  and the entire range of conens. of the system  $\text{KAlSi}_3\text{O}_8$  (I)- $\text{NaAlSi}_3\text{O}_8$ . Log  $\eta$  increases with concn. of (I), and the slope of the line connecting log  $\eta$  and temp. is the same for all mixtures. J. G. A. G.

**Thermal expansion of the binary system  $\text{Na}_2\text{B}_4\text{O}_7$ - $\text{B}_2\text{O}_3$  in the molten state.** M. P. VOLAROVITSCH (Acta Physicochim. U.R.S.S., 1935, 2, 695—710; cf. A., 1935, 24).—The sp. vols. of  $\text{Na}_2\text{B}_4\text{O}_7$ - $\text{B}_2\text{O}_3$  melts have been determined between  $500^{\circ}$  and  $1200^{\circ}$  in a Pt-Ir dilatometer. Fluidity varies linearly with temp. above  $820^{\circ}$ ; the large divergence at lower temp. is attributable to association. T. G. P.

**Dipole induction and the solvent effect in dipole moment measurements.** F. C. FRANK (Proc. Roy. Soc., 1935, A, 152, 171—196).—On the

basis of Weigle's formula (A., 1934, 12), a theory is developed to account for the effect of the solvent on the measured val. of the dipole moment of a solute. Examples of solvent effect are classified according to mol. geometry. The empirical laws advanced by Müller (A., 1932, 1077) and others apply only to a single class. The theory leads to important conclusions regarding dipole induction in radicals forming part of the polar mol.; in general, the more positive is the radical effect, the more negative is the solvent effect, and vice versa. The attraction of solvent mols. by dipole forces, the effect of anisotropic polar solvents, the bearing of the dielectric constants of aq. solutions on the structure of zwitterions, and the form of the dispersion curve in polar liquids are discussed in the light of the above theory. L. L. B.

**Dielectric polarisation and molecular-compound formation in solution. I. Structures of the compounds of ethers with halogeno-methanes and -ethanes. II. Structures of the compounds of acetone, quinoline, and dioxan with halogenomethanes.** D. P. EARP and S. GLASSTONE (J.C.S., 1935, 1709—1719, 1720—1723).—I. The dielectric polarisations of binary mixtures of  $\text{Et}_2\text{O}$ ,  $\text{Pr}^n_2\text{O}$ , and  $(\text{CH}_2\text{Cl}-\text{CH}_2)_2\text{O}$  with halogen derivatives of  $\text{CH}_4$  and  $\text{C}_2\text{H}_6$  have been determined. The molecular polarisations of the constituents suggest that compound formation in such mixtures involves the introduction of a new co-ordinate linking, which contributes to the dipole moment. A method for calculating the proportion of compound present has been developed. In compounds of the type  $\text{R}_2\text{O}\cdot\text{CHX}_3$ , co-ordination occurs between O and H attached to X. When chemical interaction does not occur, polarisations are additive, even in mixtures of two polar substances, when allowance is made for variation of dielectric const.

II. Compound formation occurs which is analogous to that observed with ethers. The nature of the linking, which generally involves co-ordination with H, is discussed. E. S. H.

**Dipole theory of solutions.** N. BARBULES (J. Chim. phys., 1935, 32, 639—656).—The theory described leads to a formula for the osmotic pressure which corresponds with van der Waals' equation. Deviations of real from ideal solutions at high concentrations are explained by mol. polarisation, the existence of permanent electric moment causing deactivation of the solute in some cases and of the solvent in others. The formulæ are verified by experiment for mixtures of  $(\text{CH}_2\text{Cl})_n$  and  $\text{C}_6\text{H}_6$ ,  $\text{CCl}_4$  and  $\text{C}_6\text{H}_6$ ,  $\text{O}_2$  and  $\text{N}_2$ ,  $\text{EtOAc}$  and  $\text{EtI}$ ,  $o\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{Me}$  and  $\text{Et}_2\text{O}$ , and for  $\text{CHCl}_3$  and  $\text{COMe}_3$ . J. W. S.

**Surface tensions of binary liquid mixtures containing benzene.** J. W. BELTON (Trans. Faraday Soc., 1935, 31, 1642—1648).—The surface tensions of  $\text{C}_6\text{H}_6$ - $\text{AcOH}$  and  $\text{C}_6\text{H}_6$ - $\text{CS}_2$  mixtures have been measured at  $20^{\circ}$  and  $35^{\circ}$  and those of  $\text{C}_6\text{H}_6$ - $\text{CCl}_4$  mixtures at  $50^{\circ}$ , the surface adsorption being calc. from Gibbs' equation. The adsorbed layer is always < unimol. and varies with concn. Only with  $\text{C}_6\text{H}_6$ - $\text{AcOH}$  mixtures of low  $[\text{C}_6\text{H}_6]$  is  $\text{C}_6\text{H}_6$  adsorbed. J. W. S.

**Surface tensions of ternary solutions. III.** J. W. BELTON (Trans. Faraday Soc., 1935, **31**, 1648—1652; cf. A., 1935, 1316).—The surface tensions of solutions containing sucrose and NaCl, HCl and NaCl, and HCl and KCl have been measured and the surface adsorption of  $H_2O$  is calc. The adsorption for sucrose and NaCl is  $\ll$  the sum of the adsorptions which each solute produces separately, but a [HCl] which has inappreciable effect on the surface tension of  $H_2O$  greatly decreases the adsorption of  $H_2O$  on a salt solution. J. W. S.

**Calculation of various physical constants of heterogeneous substances. I. Dielectric constants and conductivities of mixtures of isotropic substances.** D. A. G. BRUGGEMAN (Ann. Physik, 1935, [v], **24**, 636—664).—Theoretical. Dielectric consts. and thermal and electrical conductivities are calc. by a unitary method from the consts. of the homogeneous constituents of the mixture. The accuracy of older formulæ is discussed and previously undetermined consts. in these formulæ are evaluated. W. R. A.

**Calculation of various physical constants of heterogeneous substances. I (cont.). Dielectric constants and conductivities of mixtures of isotropic substances.** D. A. G. BRUGGEMAN (Ann. Physik, 1935, [v], **24**, 665—679).—The above theory is applied to the conductivity of binary heterogeneous alloys. For Pt-Ag alloys the experimental results are in qual. agreement with theory. The dielectric consts. of compressed powdered KCl (KCl-air mixture) and of emulsions are considered in the light of the new theory. For salt-air mixtures experiment agrees with theory, but Piekara's results on emulsions of small concn. are best explained by the Rayleigh formula, although more conc. emulsions would probably be covered by the new theory. A. J. M.

**Vapour pressure of solutions of acids and salts in liquid ammonia at 15°.** A. I. SCHATTENSTEIN and L. S. USKOVA (Acta Physicochim. U.R.S.S., 1935, **2**, 337—344; cf. A., 1934, 838).—The v.p. and  $d$  of solutions of  $NH_4Cl$ ,  $NH_4Br$ ,  $NH_4I$ ,  $NH_4NO_3$ ,  $NH_4OAc$ , NaCl, and  $NaNO_3$  in liquid  $NH_3$  have been determined for wide ranges of concn. at 15°, and for the NaCl solutions also at 10°. The osmotic coeffs. of these solutes follow the order  $NH_4I > NH_4NO_3 > NaNO_3 > NH_4Br > NaCl > NH_4Cl > NH_4OAc$ . J. W. S.

**Numerical relationships in binary metallic systems.** D. STOOKDALE (Proc. Roy. Soc., 1935, **A**, **152**, 81—104).—The work of Hume-Rothery and others on the depression of the f.p. and m.p. of Cu and Ag by the addition of elements of the  $B$  subgroups, and the solubility limits in these alloys (A., 1934, 725), are discussed. It is shown that there are probably other simple integral relationships between the no. of atoms in a binary alloy, and the following empirical rules are adduced: (a) the solute and solvent atoms are present in a simple integral ratio in a saturated solid solution at the temp. of the eutectic or peritectic horizontal; (b) in a eutectic mixture the elements are present in a simple integral at. ratio; (c) in a eutectic mixture the ratio of the no. of atoms, irrespective of their kind, in the phases is

simple. It is improbable that rules (b) and (c) are both exact, but if either is true, then, in seven systems investigated, the other is true to within 1 part in 200. L. L. B.

**Effect of thermal agitation on atomic arrangement in alloys. III.** E. J. WILLIAMS (Proc. Roy. Soc., 1935, **A**, **152**, 231—252; cf. this vol, 24).—Mathematical. The equilibrium equations for a general case are derived from the Boltzmann distribution formula and from the principle of min. free energy. By comparing the dependence of the entropy of the at. arrangement on the order of nearest neighbours with its dependence on the superlattice order, the quant. relation of Bethe's treatment (A., 1935, 1193) to that of Bragg and Williams (*loc. cit.*) becomes evident. L. L. B.

**Methods of investigating the constitution [of alloys].** G. GRUBE (Z. Metallk., 1935, **27**, 194—195).—Dilatometric and magnetometric methods are briefly described and a detailed description is given of a delicate apparatus for measuring the magnetic susceptibility of metals at temp. up to 1400°; it consists of a micro-electric furnace in the middle of two inclined poles of a powerful electro-magnet, the specimen being suspended in the furnace by means of a lever system the movement of which is compensated for by a small coil, the current through which, measured by a milliammeter, is  $\propto$  the susceptibility. A. R. P.

**Relation between diffusion and structure in solid alloys.** W. SEITH and A. KEIL (Z. Metallk., 1935, **27**, 213—215).—In alloys which form homogeneous solid solutions  $\log D = A - Q/RT$ , where  $D$  is the rate of diffusion and  $A$  and  $Q$  are material consts.,  $Q$  being the equiv. of the heat of activation in chemical reactions. The diffusion of small amounts of one metal into another takes place the more readily the greater is the amount of distortion produced and less readily the greater the tendency to form solid solutions; the addition of metals which reduce the m.p. of the base metal increases the rate of diffusion in this metal. Transformation and recrystallisation, as well as the passage of a d.c. through the alloy, increase the rate of diffusion, the effect of the current being due to electrolytic transport. A. R. P.

**Electrical conductivity and equilibrium diagram for binary alloys. XVII. System lithium-aluminium.** G. GRUBE, L. MOHR, and W. BREUNING (Z. Elektrochem., 1935, **41**, 880—883; cf. A., 1935, 23).—The solid phases in the successive ranges are: 0—30 at.-% Li,  $\alpha$ -mixed crystals; 30—60%, LiAl; 60—78%,  $\beta$ -mixed crystals of LiAl with excess of Li; 78—100%, compound  $Li_2Al$ . Between 44.5 and 60.0 at.-% of Li at 698° there are two liquid phases. F. L. U.

**Constitution and properties of iron-carbon-beryllium alloys.** M. BALLAY (Compt. rend., 1935, **201**, 1124—1126).—The effect of Be (0—4%) on an alloy with C 3—4.45, Mn 0.25, Si 0.25, S 0.02, and P 0.05% is reviewed.  $Be_2C$  is almost insol. in austenite. The temp. of the  $\gamma$  transformation is only slightly affected by Be. Data for the hardness of a series of these alloys are given. H. J. E.

**X-Ray analysis of the homogeneous phase in the system Mg-Ni.** E. F. BACHMETEV (*Acta Physicochim. U.R.S.S.*, 1935, 2, 567—570).—Preliminary. Two hexagonal homogeneous phases have been observed, one of which (I), probably  $\text{Mg}_3\text{Ni}$ , has  $a$  5.26,  $c$  about 13.3 Å., whilst the other (II) has  $a$  4.87,  $c$  about 16 Å. The unit cell of (I) contains 16, and of (II) 48, atoms. F. L. U.

**Is an intermetallic homogeneous phase formed in the system Mg-Mn?** E. F. BACHMETEV and J. M. GOLOVTSCHINER (*Acta Physicochim. U.R.S.S.*, 1935, 2, 571—574).—Preliminary. Crystals separating from a Mg-Mn alloy containing 36—51 at.-% Mn have cubic symmetry, and X-ray examination indicates that they consist of  $\beta$ -Mn. F. L. U.

**Modified aluminium-silicon alloys.** II. J. A. KLJATSCHKO (*J. Gen. Chem. Russ.*, 1935, 5, 1299—1301).—The silicide content of Si-Al alloys is reduced from 0.4 to 0.2% by treatment with Na. R. T.

**Physico-chemical investigation of the gold-manganese alloys.** V. A. NEMILOV and A. A. RUDNICKI (*Compt. rend. Acad. Sci. U.R.S.S.*, 1935, 3, 351—354).—The thermal properties, hardness, and electrical resistance of Au-Mn alloys have been investigated. AuMn exists in the molten alloy, whilst  $\text{AuMn}_3$  and  $\text{Au}_2\text{Mn}$  separate from the solid solutions formed on cooling. R. S.

**Nickel-manganese system.** II. S. VALENTINER (*Z. Physik*, 1935, 97, 745—757).—The electrical resistance in magnetic fields shows that alloys with 25—30% of Mn are abnormal (cf. A., 1935, 576). A. B. D. C.

**Mechanism of precipitation [in silver-copper alloys].** U. DEHLINGER (*Z. Metallk.*, 1935, 27, 209—212).—The particles of Ag which first separate during the decomp. of a quenched supersaturated solid solution of Ag in Cu do not act as nuclei for further pptn. The process of pptn. must therefore be propagated by lattice distortion probably at the boundaries of mosaic blocks. At these points thin films of Ag first separate and gradually coalesce into grains which are visible under the microscope. After deformation and recrystallisation decomp. of the solid solution is accelerated, probably owing to the concn. of an "active factor" at the boundaries of regions in which pptn. has already commenced. A. R. P.

**System copper-nickel-iron.** W. KOSTER and W. DANNOHL (*Z. Metallk.*, 1935, 27, 220—226).—The system has been investigated by thermal, magnetometric, and electrical resistance methods. The  $\alpha$ - $\gamma$  transformation occurs in all alloys the composition of which lies on the Fe side of a straight line joining the Cu corner of the ternary diagram to the 28% Ni point on the Fe-Ni side. The miscibility gap in the Fe-Cu system is gradually closed by addition of Ni and disappears entirely with 27% Ni at 1220° and with 82% Ni at 20°; alloys within this range are therefore amenable to pptn.-hardening, and such treatment gives rise to interesting magnetic properties. The equilibria in the system are showed in ternary diagrams and in numerous sectional diagrams for const. Ni contents and const. Fe : Cu ratio. A. R. P.

**X-Ray analysis of crystal formation in the ternary system Cu-Al-Ti.** E. F. BACHMETEV, N. G. SEVASTIANOV, and N. I. KOTOV (*Acta Physicochim. U.R.S.S.*, 1935, 2, 561—566).—In an alloy of composition Cu 40, Al 40, Ti 20 wt.-%, a preliminary examination has established the existence of two homogeneous phases, viz., cubic, with  $a$  3.94 (or 7.88) Å., and hexagonal, with  $a$  5.05,  $c$  8.06 Å. F. L. U.

**Magnetic investigations of precipitation-hardening.** H. AUER (*Physikal. Z.*, 1935, 36, 880—882).—The mechanism of the improvement of the mechanical properties of an alloy by suitable heat-treatment whereby a new phase is produced is discussed. The variation of susceptibility,  $\chi$ , of Cu-Al alloys during such a process is determined. There is a considerable decrease in  $\chi$  during the transition, and this fact can be used to follow the velocity of transition under different conditions of temp., concn., supersaturation, and previous heat-treatment. The mean transition velocity,  $u$ , is connected with abs. temp.,  $T$ , by  $\log u = A/T + B$  ( $A$  and  $B$  const.). The final val. of  $\chi$  depends in a discontinuous manner on the tempering temp. The points at which the discontinuities occur give points on the diagram of state. The val. of  $\chi$  shows that the separating phase is  $\text{CuAl}$ . An extended Curie law holds for the alloys when equilibrium is attained, but the considerable deviations found at the transition point are to be connected with supersaturation in the mixed crystal phase. A. J. M.

**Rate of diffusion in metallic crystals and atomic structure.** W. SEITH (*Z. Elektrochem.*, 1935, 41, 872—876; cf. A., 1935, 158, 1205).—The rates of diffusion of metals in solid Pb show the same dependence on their at. radius and no. of valency electrons as do their solubilities. F. L. U.

**Shape of critical temperature curves of binary systems.** R. V. MERZLIN (*J. Gen. Chem. Russ.*, 1935, 5, 1073—1076).—Stachorski's formula (A., 1928, 472) corresponds more closely with experimental surface tension data than do those of Pawlewski (A., 1882, 915; 1883, 176) or Strauss (Ber., 1881, 14, 510). R. T.

**Desaturation experiments on aqueous carbonic acid.** Y. KAUKO and H. KOMMUSAR (*Ann. Acad. Sci. fenn.*, 1934, A, 39, No. 8; *Chem. Zentr.*, 1935, i, 2767).—With good mixing of gas and liquid, the rates of saturation and desaturation of  $\text{CO}_2$  in  $\text{H}_2\text{O}$  are reproducible. J. S. A.

**Solubility of lime in water.** G. L. LAROCQUE and O. MAASS (*Canad. J. Res.*, 1935, 13, B, 276—279; cf. A., 1933, 897).—Conductivity data at 0—30° are given for a series of  $\text{Ca}(\text{OH})_2$  solutions. Vals. for the solubility and degree of dissociation of  $\text{Ca}(\text{OH})_2$  are calc. Equilibrium between aq. solutions and solid  $\text{Ca}(\text{OH})_2$  is established very slowly. H. J. E.

**Solubilities of *l*-proline and *l*-hydroxyproline in water, the calculated heats of dissolution, and the partial molal volume of *l*-hydroxyproline.** T. TOMIYAMA and C. L. A. SCHMIDT (*J. Gen. Physiol.*, 1935, 19, 379—382). F. A. A.

**Solubilities of certain salts in liquefied ammonia.** III. Solubility of ammonium chloride,

and vapour pressure of the solution. S. ABE, K. WATANABE, and R. HARA (J. Soc. Chem. Ind. Japan, 1935, 38, 642—646B).—Solid phases in the  $\text{NH}_4\text{Cl}$ — $\text{NH}_3$  system are  $\text{NH}_4\text{Cl}$  and  $\text{NH}_4\text{Cl}\cdot 3\text{NH}_3$ , which coexist at  $5.9^\circ$ . Solubilities between  $-20^\circ$  and  $25^\circ$  are recorded, and also v.p. of the saturated and unsaturated solutions. Heats of dissolution are calc.

J. S. A.

Absorption of hydrogen sulphide and sulphur dioxide from a current of air. V. A. PIANKOV (J. Gen. Chem. Russ., 1935, 5, 1112—1118).—The velocity of adsorption of  $\text{H}_2\text{S}$  by wood C is doubled at  $20^\circ$ , and quadrupled at  $40^\circ$ , by treatment with I, whilst for  $\text{SO}_2$  it is increased 1.8 times at  $20^\circ$  and  $40^\circ$ .

R. T.

Distribution of hydrogen sulphide between benzene and water. S. A. SCHTSCHUKAREV and I. B. CHACHAM (J. Gen. Chem. Russ., 1935, 5, 1056—1058).—The high vals. of the partition coeff. of  $\text{H}_2\text{S}$  between  $\text{C}_6\text{H}_6$  and  $\text{H}_2\text{O}$  are ascribed to anomalously low solubility in  $\text{H}_2\text{O}$ .

R. T.

Distribution of (A) saturated monocarboxylic fatty acids between glycerol and other organic solvents, (B) hexoic acid between two contiguous liquid phases. N. A. DE KOLOSOVSKI (J. Gen. Chem. Russ., 1935, 5, 1041—1044, 1048—1055).—(A) [with F. S. KULIKOV]. Data are recorded for  $\text{EtCO}_2\text{H}$  with  $\text{CHCl}_3$  and for  $\text{Bu}^n\text{CO}_2\text{H}$  with  $\text{CHCl}_3$ ,  $\text{PhMe}$ , and  $\text{PhNO}_2$ , at  $25^\circ$ .

(B) [with M. O. LEVITAS]. Data are recorded for the systems  $\text{H}_2\text{O}$ — $\text{C}_6\text{H}_6$ , — $\text{PhMe}$ , —decahydronaphthalene, — $\text{CCl}_4$ , — $\text{MeI}$ , — $\text{PhBr}$ , — $\text{PhOMe}$ , and — $\text{PhNO}_2$ , at  $25^\circ$ . The val. of 1/partition coeff. approaches the same figure when the concn. of hexoic acid in the entire system approaches 7.8 g.-equiv. per litre.

R. T.

Points of intersection of curves representing distribution of solutes between two liquid phases. N. A. DE KOLOSOVSKI (J. Gen. Chem. Russ., 1935, 5, 1045—1047).—The curves connecting the total concn. of  $\text{Bu}^n\text{CO}_2\text{H}$  with the partition coeff. between a no. of org. solvents and  $\text{H}_2\text{O}$  intersect at the origin and at another point. The phenomenon is shown to be general when the solubility of the solute is unlimited in one, and limited in the other, solvent.

R. T.

A partition paradox. N. A. DE KOLOSOVSKI and F. S. KULIKOV (J. Gen. Chem. Russ., 1935, 5, 1037—1040).—It is shown mathematically that the concn. of a solute in each layer of a binary liquid mixture may increase as the result of the addition of a small amount of one of the solvents, owing to changes in the mutual solubility of the solvents themselves.

R. T.

Sorption of sulphur dioxide by active charcoal. VI. Rate of sorption. K. ARII (Bull. Inst. Phys. Chem. Res. Japan, 1935, 14, 1210—1232; cf. A., 1935, 577).—Rates of sorption and desorption determined between  $-20^\circ$  and  $-40^\circ$  are in agreement with Bangham's equation.

R. S.

Heterogeneous catalysis. II. Adsorption on graphite and diamond. E. STORFER (Z. Elektrochem., 1935, 41, 868—872; cf. A., 1935, 696).—Adsorption isotherms have been determined for  $\text{N}_2$ ,

$\text{CH}_4$ ,  $n\text{-C}_6\text{H}_{14}$ , cyclohexane, and  $\text{C}_6\text{H}_6$  on graphite and diamond at  $155^\circ$  and  $205^\circ$ . The first two exhibit stepped adsorption at low pressures, and are adsorbed in quantities approx.  $\propto$  the sp. surface. The three last are adsorbed by graphite more strongly than can be accounted for by its higher sp. surface. Heats of adsorption are calc.

F. L. U.

Van der Waals, activated, and atomic adsorption of hydrogen on copper and nickel, and their influence on the photo-effect. O. I. LEIPUNSKI (Acta Physicochim. U.R.S.S., 1935, 2, 737—760).—The adsorption of  $\text{H}_2$  on Cu and Ni has been investigated. The presence of a steric factor (Leipunski, A., 1935, 578) is generally characteristic of activated adsorption, which therefore involves a diffusion process, contrary to other views (cf. Taylor *et al.*, A., 1934, 1181). There is no activated adsorption on Cu which has been distilled in vac. or has been once oxidised and then reduced. Ni adsorbs  $\text{H}_2$  by two different processes according to the temp. The heats of adsorption are 4, 13, and 16—17 kg.-cal. per mol. at  $-183^\circ$ ,  $0^\circ$ , and  $100^\circ$ , respectively. At the higher temp. the activation energy is 3 kg.-cal. per mol. The surface of Ni is not homogeneous and only 10% of it is active. The activated adsorption at low temp. is a localised phenomenon, and each active area is heterogeneous. Neither adsorption process influences the photo-effect. At. H is adsorbed by Cu and Ni at  $-183^\circ$  to an extent corresponding with a layer 3 mols. thick. The kinetics of desorption of at. H from Ni at  $-106^\circ$  suggest that the process may be due to recombination of atoms in the surface followed by desorption of the mols. The energy of activation of the surface diffusion process is 23.8 kg.-cal. per mol.

T. G. P.

Adsorption of indium and thallium atoms on tungsten oxide. C. F. POWELL and R. L. MERCER (Phil. Trans., 1935, A, 235, 101—124).—The adsorption and desorption of In and Tl atoms have been studied thermionically on a film of  $\text{WO}_3$  on W,  $10^{-4}$  cm. thick, at  $656$ — $765^\circ$ . The condensation coeff. is independent of the fraction of surface covered ( $\theta$ ) and of the temp., and is probably 1. In contrast with the behaviour of Cs on W, the adsorbed phase is always uniform. From the ratio ( $r$ ) of positive ion to neutral atom emission the electronic work function ( $V$ ) of a bare surface is calc. to be 6.13 and 6.25 volts, using In and Tl, respectively. Surface migration and diffusion into the interior of the oxide film have been studied at approx.  $200^\circ$  below emission temp. The ratio  $r$  increases with  $\theta$ , and  $V$  for the partly covered surface decreases linearly with increasing  $\theta$ . The ratio of the dipole moments associated with adsorbed Tl and In is 0.80. Similar experiments with Ga are not possible, since this is too strongly adsorbed, and appreciable emission occurs only at temp. at which  $\text{WO}_3$  decomposes; Ga acts as a poison towards the adsorption of In and Tl. The oxides of Ni, U, Fe, and Mo have been studied as sources of positive ions,  $\text{Fe}_2\text{O}_3$  being most similar to  $\text{WO}_3$ .

R. S. B.

Sorption and diffusion of ammonia in analcime. A. TISELIUS (Z. physikal. Chem., 1935, 174, 401—423; cf. A., 1934, 726).—Langmuir's isotherm is

valid if the amount sorbed is not too great, and this equation yields a val. for the amount of  $\text{NH}_3$  sorbed at saturation which approximates to the val. calc. from the equiv. max.  $\text{H}_2\text{O}$  content; in the temp. range studied ( $302$ — $385^\circ$ ) this does not vary with temp. The const.  $b$  of the isotherm is  $\propto e^{Q/RT}$ , where  $Q$  is the heat of sorption. Each sorbing centre corresponds with a vol. which is of the order of magnitude of a mol. vibrating in the lattice rather than of a mol. able to move freely in the whole sorption space. The heat of sorption is  $16,640$  g.-cal. At  $302^\circ$  the diffusion coeff. in a single crystal is  $1.3 \times 10^{-8}$  (sq. cm., sec.). Diffusion apparently takes place by jumps along the canals in which the  $\text{H}_2\text{O}$  mols. are present (cf. *ibid.*, 947) and its rate determines that of the sorption as a whole; the energy of activation is  $14,480$  g.-cal., irrespective of the direction. R. C.

**Selective adsorption of heavy water.** A. KING, F. W. JAMES, C. G. LAWSON, and H. V. A. BRISCOE (J.C.S., 1935, 1545—1549; cf. A., 1934, 1062).—Steam from London tap- $\text{H}_2\text{O}$  was passed over  $\text{SiO}_2$  gel and various charcoals until equilibrium was attained, and the  $\text{H}_2\text{O}$  fractionally desorbed. The isotopic enrichment ratio, determined by measurement of  $d$ , is greatest (about 1.4) in the last fraction and is independent of the activity of the charcoal. An experiment with pure charcoal and  $\text{H}_2\text{O}$  containing 4% of  $\text{D}_2\text{O}$  gave a similar result, the % of  $\text{D}_2\text{O}$  being determined in this case from the f.p. It is suggested that the difference in the adsorption of  $\text{D}_2\text{O}$  and  $\text{H}_2\text{O}$  is due to a difference in polarisability. R. S.

**Adsorption of anions by precipitated barium sulphate.** T. P. CHAO, K. H. HSIUNG, and Y. L. CHU (J. Chinese Chem. Soc., 1935, 3, 325—342).—The order of adsorption of anions by  $\text{BaSO}_4$  is  $\text{NO}_3' > \text{ClO}_3' > [\text{Fe}(\text{CN})_6]''' > [\text{Fe}(\text{CN})_6]''' > \text{NO}_2' > \text{CNS}' > \text{Cl}' > \text{Br}'$ . The Schulze-Hardy law is only qualitatively valid. The amount of adsorption is governed by the nature of the ion, its valency, and the solubility of its Ba compound. The less sol. are more strongly adsorbed.  $\text{NO}_3'$  and  $\text{ClO}_3'$  are particularly strongly adsorbed, and their presence in the quant. pptn. of  $\text{SO}_4'$  is to be avoided. A. J. M.

**Absorption of sodium hydroxide by cellulose.** S. M. NEALE (J. Physical Chem., 1935, 39, 1245; cf. A., 1930, 417, 1249).—The concn. of adsorbed aq.  $\text{NaOH}$  removed from cellulose by powerful centrifuging decreases as centrifuging proceeds. This effect is compatible with the assumption that  $[\text{OH}']$  in the adsorbed solution is determined by membrane equilibrium. F. L. U.

**Absorption of dyes by cellulose. VI. Effect of modification of the cellulose and a theory of the electrolyte effect.** J. HANSON, S. M. NEALE, and W. A. STRINGFELLOW (Trans. Faraday Soc., 1935, 31, 1718—1730; cf. A., 1934, 1169).—Increased motion of the absorbent relative to the dye-bath increases the rate of absorption of sky-blue FF considerably in the case of yarns and fabrics and slightly for Cellophane. Swollen cellulose takes up more dye than natural cellulose in a ratio which is independent of the concn. of added  $\text{NaCl}$ . Oxidation of cellulose reduces the absorption of dye, especially

at low  $[\text{NaCl}]$ . These effects are attributed to Donnan equilibria, and a theoretical equation is deduced which is in accord with the observed variation of the absorption with  $[\text{NaCl}]$  and dye concn. An extension of the theory embracing the ionisation of the  $\text{CO}_2\text{H}$  groups of oxycellulose is in qual. agreement with experiment. J. W. S.

**Adsorption of cyclopentanone by cellulose nitrate.** J. DESMAROUX, R. VANDONI, and (MLE.) T. PETITPAS (Compt. rend., 1935, 201, 1392—1393).—The adsorption of cyclopentanone by nitro-cotton (12.13 and 13.52% N) has been examined. It is independent of the N content. R. S. C.

**Adsorption problems. I.** TRAUBE (Trans. Faraday Soc., 1935, 31, 1730—1739).—Anthracene,  $\text{C}_{10}\text{H}_8$ ,  $\text{NHPh}$ , phthalic acid, and charcoal, added to aq. solutions of  $\text{C}_8\text{H}_{17}\cdot\text{OH}$  or  $\text{C}_7\text{H}_{15}\cdot\text{CO}_2\text{H}$  adsorb such small quantities of the solute that the Langmuir theory may be applicable, but if such adsorbents are added to  $\text{H}_2\text{O}$ -sol. or  $\text{H}_2\text{O}$ -insol. substances in an emulsified state, the emulsified substances are adsorbed to a very high degree and very firmly. This is attributed to the lower diminution of surface tension produced by colloid particles than by dissolved mols. The adsorption is generally accompanied by flocculation owing to linking of the adsorbent particles through the adsorbed substances, and this flocculation is compared with electrolytic flocculation of colloids by ions, coagulation by gelatinous colloids, and flocculation of ores by surface-active org. substances. J. W. S.

**Formation and constitution of crystals of lead salts containing water-soluble colloid.** F. D. MILES (Phil. Trans., 1935, A, 235, 125—164).—The adsorption of neutral dextrin, gum-arabic, and gelatin, and their influence on the crystal habit, have been studied with  $\text{PbCl}_2$ ,  $\text{PbBr}_2$ ,  $\text{PbI}_2$ ,  $\text{PbN}_6$ , and  $\text{PbSO}_4$  during slow and rapid crystallisation from aq. solution. At low concn. of colloid the crystal edges are curved, but the internal structure, as revealed by optical measurements, is almost unaffected up to 5% of adsorbed colloid. The max. adsorption is 10%. Colloids retard the formation of  $\beta$  crystals of  $\text{PbN}_6$  from the  $\alpha$  form, whereas dyes have the opposite effect. Adsorption occurs in the order  $\text{PbSO}_4$  and  $\text{PbN}_6 > \text{PbCl}_2 > \text{PbI}_2$  at  $20^\circ$ , i.e., in the order of increasing polarisability of the anion. Maltose is not adsorbed. From conductivity measurements on solutions of Pb salts in presence of dialysed dextrin it is inferred that no association occurs in solution. X-Ray studies on  $\text{PbSO}_4$  and  $\text{PbN}_6$  show that the lattice dimensions are unaffected, but that the particle size decreases with increasing content of colloid. With  $\text{PbN}_6$  the introduction of colloid causes the deposition of a colloidal Pb compound. It is inferred that at  $< 5\%$  adsorption the crystallites are approx. in the same crystallographic orientation and are separated by a layer of dextrin, the mols. being attached to the crystallites by some of their OH groups. At  $> 5\%$  adsorption the same orientation is not maintained throughout the crystal. R. S. B.

**Exchange adsorption on colloidal vanadium pentoxide.** V. A. KARGIN and H. B. KLEMOVITZKAJA

(Acta Physicochim. U.R.S.S., 1935, 2, 33—50; cf. A., 1935, 1069).—The pptn. of  $V_2O_5$  sol by  $BaCl_2$ ,  $CaCl_2$ , and  $MgCl_2$  has been studied and the changes in ionic concn. in the filtrate determined by gravimetric and potentiometric methods. The amounts of  $Ba^{++}$ ,  $Ca^{++}$ , and  $Mg^{++}$  adsorbed are not themselves equiv. nor are they equiv. to the total cations ( $H^+$  and  $NH_4^+$ ) released, whilst the amount of acid in the filtrate is approx. const. The intermicellar ionic concns. have been determined by analysis of the ultrafiltrate and the true adsorption calc., but the cation exchanges are again not equiv. Vanadic acids derived from the dissolution of the sol are present in the intermicellar liquid in approx. const. concn. The non-equivalence of the cation exchange and the fact that cation adsorption is also independent of sol concn. over a limited range are attributed to the formation of insol. Ba, Ca, or Mg salts of the intermicellar vanadic acids. R. S.

**Adsorption of grass and butter carotenes on alumina.** A. E. GILLAM and M. S. EL RIDI (Nature, 1935, 136, 914—915).—A double adsorption of pure  $\beta$ -carotene (I) from grass changes it partly into a substance resembling  $\alpha$ -carotene (II). This process is reversible, since re-adsorption changes this substance in part to (I).  $Ca(OH)_2$ , but not  $MgO$ , effects a similar change in (I), but less readily than does  $Al_2O_3$ . Pure (II) from palm oil is also changed by repeated adsorption on  $Al_2O_3$ . The possibility of changes brought about by chromatographic adsorption itself must thus be considered in work on the carotenes. L. S. T.

**Electrokinetics. XVII. Surface charge and ion antagonism.** L. S. MOYER and H. B. BULL (J. Gen. Physiol., 1935, 19, 239—247).—The surface charges of cellulose in contact with various salts are calc. from previously published data. The surface charge in contact with  $NaCl$  plotted as a function of temp. is discontinuous at  $39^\circ$ . Mixtures of Na, K, Mg, and Ca chlorides give lower surface charges at a given anion concn. than the single chlorides, thus showing ion antagonism. F. A. A.

**Affinities between proteins and fatty acids, fats, and lipins.** S. J. VON PRZYLECKI, E. HOFER, and S. FRAJBERGER-GRYNBERG (Biochem. Z., 1935, 282, 362—373).—Paraffins adsorb ovalbumin, serum-albumin, and edestin very readily, but caseinogen, gelatin, and peptone only slightly. Suspensions of cholesterol (I) behave similarly. Possibly the non-polar  $NH_2$ -acid residues (especially leucyl) are responsible for the adsorption, but the adsorption which occurs on acids and esters seems to be due to the polar groups of the proteins. The union with (I) may be partly strengthened by its  $CH:CH$  and  $OH$  groups. W. McC.

**Theory of adsorption.** H. BRADLEY (Trans. Faraday Soc., 1935, 31, 1652—1655).—The author's formula (A., 1927, 821), identical with that of Miyamoto (A., 1935, 578), is in accord with the observed adsorption of CO or A by coconut charcoal, of  $N_2$  by charcoal, of  $H_2O$  vapour by cotton, and of  $COMe.$  in  $H_2O$ , Br in  $H_2O$ ,  $iso-C_5H_{11}OH$  in  $H_2O$ , or  $BzOH$  in  $C_6H_6$  by blood charcoal. J. W. S.

**Formula for the rate of evaporation of adsorbed atoms and mols.** J. K. ROBERTS (Trans. Faraday Soc., 1935, 31, 1710—1713).—A formula derived from kinetic considerations is consistent with the behaviour of adsorbed films of O and H atoms on W, and with that of  $O_2$  mols. adsorbed on isolated W atoms left bare during formation of the at. O film. The theory is also applied to the case where the adsorbed atoms are the same as those in the surface, and an equation for v.p. is derived which is in good accord with experiment. J. W. S.

**Application of force-fields to the derivation of special thermodynamic relations, especially a general sorption equation and a new electrocapillary equation.** B. DERJAGUIN (Acta Physicochim. U.R.S.S., 1935, 2, 377—384).—Mathematical. J. W. S.

**Surface forces at the gas-liquid interface. VI. Method for determining the potential difference at still surfaces.** M. GEROVITSCH and A. FRUMKIN (Acta Physicochim. U.R.S.S., 1935, 2, 1—8).—The potential developed when a rapid stream of 0.01N-KCl is passed over a still surface of the same in air has been determined and compared with the result given by a radioactive probe. Good agreement is obtained, and it is shown that ionisation of the air does not affect the results for very dil. solutions. The potential and the sensitivity given by the stream method vary linearly with the height of the stream above the surface. R. S.

**Solid-liquid interface.** W. CLAYTON (J. Oil Col. Chem. Assoc., 1935, 18, 412—429).—A lecture on dielectric properties, polar groups, the electric double layer, adsorption, crystal growth, and surface films. E. S. H.

**Determinations of surface tension of solutions of potassium and lithium salts of higher fatty acids by the ring method with exclusion of atmospheric carbon dioxide and with special regard to other disturbing influences. II.** A. LOTTER-MOSER and E. GIESE (Kolloid-Z., 1935, 73, 276—288; cf. this vol., 26).—The surface tensions,  $\sigma$ , of several aq. K and Li soap solutions have been determined, using the precautions previously described. With rising temp.,  $\sigma$  decreases linearly as a rule; the causes of deviations have been traced. In certain soaps  $\sigma \propto \log$  concn. The cation has no influence on surface activity. At low concns. ( $10^{-5}$ — $10^{-4}$  g. per c.c.) Traube's rule holds qualitatively. E. S. H.

**Surface tension between aqueous and isopropyl ether solutions of acetic acid.** F. M. BROWNING and J. C. ELGIN (Ind. Eng. Chem. [Anal.], 1935, 7, 399—400).—Data for surface tension and  $d$  for dil. solutions at  $20^\circ$  are recorded. E. S. H.

**Graphical representation of the angle of wetting relations by the maximum bubble pressure method.** E. LANGE and K. NAGEL (Kolloid-Z., 1935, 73, 268—269).—Mathematical. E. S. H.

**Heat of wetting and the physical significance of the constants in Rodewald's equation.** P. J. ANDRIANOV (Kolloid-Z., 1935, 73, 328—334).—Theoretical. E. S. H.

**Constitution of the capillary layer in solutions of malachite-green.** (MLLE.) M. T. SALAZAR (Compt. rend., 1935, 201, 1120—1123).—The difference between the surface tension of  $H_2O$  ( $\sigma_w$ ) and that of the malachite-green solution ( $\sigma_s$ ) is const. for concns.  $> 6.5$  g. in 100 c.c. At lower concns. (c) the relation  $\sigma_w - \sigma_s = ac^b$  holds ( $a=15.14$ ,  $b=0.26$ ). The Gibbs equation is applied to these solutions. Above a certain concn. corresponding with the completion of a unimol. surface layer of solute, the quantity of solute absorbed in the surface is const. H. J. E.

**Investigation of unimolecular films.** I. LANGMUIR and K. B. BLODGETT (Kolloid-Z., 1935, 73, 257—263).—A discussion of technique. E. S. H.

**Semipermeability and neutral salts.** T. Y. CHANG and S. T. CH'IAO (J. Chinese Chem. Soc., 1935, 3, 308—320).—Experiments have been made to discover a possible relationship between semipermeability and the lyotropic series, due to the dehydration effect of the ions. Such an effect, leading to change of adsorption, provides an alternative theory to that of Zsigmondy on the variation of permeability with the nature of the solution. When increasing amounts of a neutral salt were added to an acid dye hydrosol, a collodion membrane became permeable at first, but later became impermeable. The effect of different salts was not in the order of the lyotropic series, and it appears that the effect is not simply a dehydration, but that discharge of the  $H_2O$  layer in the pore-wall and coagulation by the salts also intervene. Basic dye hydrosols were similarly examined. The membrane did not become permeable to the sol when neutral salt was added. The effect of tannin and EtOH was also studied.

A. J. M.

**Influence of a solid phase on the f.p. of water and of dilute aqueous solutions. I. Quartz sand-water.** A. V. RAKOVSKI, D. N. TARASENKOV, and A. V. KOMANDIN (J. Gen. Chem. Russ., 1935, 5, 1273—1278).—The f.p. of  $H_2O$  is depressed by  $SiO_2$  to an extent varying exponentially with the  $H_2O$  content of the mixture, and directly with the  $SiO_2$  surface. The phenomenon is not affected by the presence of  $0.1N-Na_2CO_3$  or  $-Ca(NO_3)_2$ . The results indicate that surface forces act at a distance of  $< 10,000$  mol. diameters.

R. T.

**Electrical investigation of solutions of stearanilide in paraffin wax.** W. JACKSON and F. C. FRANK (Trans. Faraday Soc., 1935, 31, 1700—1706).—The dielectric loss and d.c. conductivity of dil. solutions of stearanilide in molten and solid paraffin wax indicate the presence of polar groups containing  $< 10$  stearanilide mols. It is suggested that the mols. in the groups may approach a liquid crystalline formation, and that they adsorb ionic impurities.

J. W. S.

**Kinetic treatment of formation of nuclei in supersaturated vapours.** R. BECKER and W. DÖRING (Ann. Physik, 1935, [v], 24, 719—752).—Theoretical.

A. J. M.

**Theory of physico-chemical periodic processes.** F. M. SCHEMJAKIN and A. A. VITT (Acta Physicochim. U.R.S.S., 1935, 2, 171—176).—For certain periodic

reactions, the law of mass action and Fick's law of diffusion are together sufficient to explain the periodicity.

A. J. M.

**Formation of microscopic Liesegang rings.** E. C. BOTTI, O. W. LINK, and B. P. CALDWELL (J. Chem. Educ., 1935, 12, 540—541).—Details for the production of periodic ppts. of  $Ag_3AsO_4$  and  $Ag_2CrO_4$  in gelatin on a microscope slide are recorded; the advantages of the method are pointed out. L. S. T.

**Investigation of periodic reactions by application of physico-chemical analysis.** F. M. SCHEMJAKIN and P. F. MICHALEV (Acta Physicochim. U.R.S.S., 1935, 2, 427—432; cf. A., 1934, 363).—The product of the distance between successive bands and the velocity of diffusion for Liesegang ring type periodic structures produced with  $K_2Cr_2O_7$  and  $AgNO_3$  diffusing in gelatin varies with the concn. of the gel and of the electrolytes. Periodic ppts. have also been observed with  $K_2Cr_2O_7$  and neutral-red,  $K_4Fe(CN)_6$  and methylene-blue, and with  $K_2Cr_2O_7$  and Me-violet, all in gelatin. J. W. S.

**Physico-chemical analysis of periodic reactions. VI.** F. M. SCHEMJAKIN, E. A. FOKINA, and P. F. MICHALEV (J. Gen. Chem. Russ., 1935, 5, 1145—1157).—The val. of the periodicity const.  $K-\lambda v$  ( $\lambda$ =distance between rings,  $v$ =velocity of propagation) rises with increasing dilution of the internal electrolyte when aq.  $Pb(NO_3)_2$  diffuses into aq.  $KI$ ,  $Na_2CO_3$  into  $HgCl_2$  or  $BaCl_2$ ,  $AgNO_3$  into  $K_2CrO_4$ , and  $K_2CrO_4$  into  $CuSO_4$ . At the same time  $\lambda$  rises,  $v$  falls, whilst the no. of crystallites present in the ring falls, and the radius of the diffusion field increases. Periodic pptn. occurs in the reaction  $Na_2HPO_4 + CaCl_2 \rightarrow CaHPO_4 + 2NaCl$  at  $p_H$  0.5—12.9. In general,  $\lambda$  and  $K$  fall with increasing dilution of the  $Na_2HPO_4$  and with increasing deviation from  $p_H$  7.

R. T.

**Liesegang phenomenon in the precipitation of iodine in the absence of a gel.** B. N. SEN (Monatsh., 1935, 67, 10—12).—The rhythmic pptn. of I by the reduction of aq.  $KIO_3$  by  $As_2O_3$  in presence of  $CaCl_2$  is described.

F. L. U.

**Viscosity and plasticity of disperse systems. VIII. Application of Batschinski's formula to the viscosity of hydrogenated fats.** M. P. VOLAROVITSCH and G. B. RAVITSCH (Kolloid-Z., 1935, 73, 339—342; cf. A., 1935, 1318).—The viscosity of sunflower-seed oil and of two hydrogenated fats has been determined at 50—140°. The results are in accordance with Poiseuille's law. At high temp. there is a linear relation between fluidity and sp. vol.

E. S. H.

**Dispersion of multi-disperse solutions by Nistler's apparatus.** J. FAUTREZ (Bull. Acad. roy. Belg., 1935, [v], 21, 927—936).—Measurements of the variations of  $\lambda\lambda$  of the scattered light in colloidal suspensions of various colouring matters support the theory of multi-dispersion.

N. M. B.

**Light scattering in gold sols in relation to particle size and shape.** D. S. SUBBARAMAIYA (Proc. Indian Acad. Sci., 1935, 2, A, 358—363; cf. A., 1935, 821).—Measurements of the depolarisation obtained with unpolarised light and with per-

pendicular and parallel polarisation are reported. Results show that the particles in Faraday's sols are much  $<$  those in the other red sols prepared by using nuclear sols and  $\text{H}_2\text{O}_2$  as the reducing agent; those in the blue sols are relatively the largest. The size and anisotropy of the particles increase with increase in rate of growth caused by raising the temp. during prep. Addition of  $\text{K}_2\text{CO}_3$  to the mixture before reduction has the reverse effect. N. M. B.

**Cryolysis, diffusion, and particle size. III. Investigations with gum-arabic and polyacrylic acid.** C. ENDOH, F. E. M. LANGE, and F. F. NORD (Ber, 1935, 68, [B], 2004—2011; cf. A., 1935, 932).—Determinations of the conductivity of solutions of polyacrylic acid (I) show no difference between the frozen and unfrozen solutions. Proof that the purely chemical properties of (I) are not influenced by freezing is still more firmly established by conductometric titration of the acid with NaOH. The irreversible nature of the action of freezing lyophilic colloids is established, since a 2% solution of (I) diffuses more slowly after freezing than when unfrozen and the difference persists when the dilution is increased to 0.1%. A 0.1% solution after being frozen at  $-17^\circ$ , however, diffuses more rapidly than an unfrozen solution. Similar results are obtained with gum-arabic. H. W.

**Viscometric investigations of structure formation in  $\text{V}_2\text{O}_5$  sols. III. Action of anions.** G. SCHUMANN (Acta Physicochim. U.R.S.S., 1935, 2, 792—808; cf. A., 1935, 1073).—The viscosity-pressure curves of three  $\text{V}_2\text{O}_5$  sols in presence of Na salts have been determined. Structure formation is influenced in the order  $\text{Cl}^- > \text{NO}_3^- > \text{Br}^- > \text{SO}_4^{2-} > \text{CrO}_4^{2-}$ . All the salts depress the viscosity during the first day after addition. The results are discussed. T. G. P.

**Structure in hydrosols of aluminium oxide and the lyotropic effect of ions.** A. RABINERSON and Z. ARISTOVA (Acta Physicochim. U.R.S.S., 1935, 2, 585—594; cf. A., 1935, 700).—Undialysed hydrosols of  $\text{Al}(\text{OH})_3$  (from the acetate) show normal viscosity ( $\eta$ ), whilst dialysis causes to vary with the rate of shear owing to formation of structural elements. Comparison of the effects of various neutral salts in promoting structure-viscosity shows that the effect increases with hydration not only of the cation but also of the anion. It is inferred that sols of  $\text{Al}(\text{OH})_3$  and  $\text{Fe}(\text{OH})_3$  owe their stability in part to hydration, and that the action of electrolytes is not exclusively electrical. F. L. U.

**Mechanism of coagulation of sols by electrolytes. V. Sulphur sol.** H. B. WEISER and G. R. Y. Physical Chem., 1935, 39, 1163—1175; cf. A., 1933, 23).—Pptn. vals., adsorption, and capacity for displacing  $\text{H}^+$ , of  $\text{Th}^{4+}$ ,  $\text{Nd}^{3+}$ ,  $\text{Al}^{3+}$ ,  $\text{Ba}^{2+}$ ,  $\text{Sr}^{2+}$ , and  $\text{Ca}^{2+}$ , have been measured for Raffa and Selmi S sols. Contrary to the results of Bassett and Durrant (A., 1932, 19) and of Bolam and Muir (A., 1933, 1011), neither the adsorption vals. of the several cations nor the quantities of  $\text{H}^+$  displaced by them are equiv. at the respective pptn. concns. Cationic adsorption and coagulating power vary in opposite senses at the pptn. concn., but in the same sense at higher concns.

The results are interpreted, and a mechanism is suggested, in terms of the theory of the diffuse double layer. F. L. U.

**Structure of colloid particles of artificial atacamite.** A. A. MOROZOV (Kolloid-Z., 1935, 73, 288—299).—Investigations of the kinetics of formation of the sol from  $\text{Cu}(\text{OAc})_2$  and NaCl, the behaviour on dilution, the conductivity, the charge on the particles, and the coagulation by electrolytes suggest the structure  $n\{[\text{Cu}(\text{OH})_2\text{Cu}]_3\text{Cl}_2\}_x\text{CuCl}_m, m\text{Cu}^{2+}, 2m\text{Cl}^-$ . E. S. H.

**Coagulation of ferrocyanide sols containing varying amounts of potassium ferrocyanide.** N. CHATTERJEE (J. Indian Chem. Soc., 1935, 12, 671—685).—The coagulating concn. (a) of various electrolytes on ferrocyanide sols freed as far as possible from intermicellar ions, and (b) of KCl on ferrocyanide sols in presence of (adsorbed)  $\text{K}_4\text{Fe}(\text{CN})_6$ , has been determined. With (b) if the concn. of added  $\text{K}_4\text{Fe}(\text{CN})_6$  ( $c_1$ ) is small the coagulating concn. of total K ions ( $c_2$ ) increases with  $c_1$ , and stability increases with dilution of sol. For greater vals. of  $c_1$ , max. and min. appear in the curves of  $c_1$  against  $c_2$  [Prussian-blue and  $\text{Cd}_2\text{Fe}(\text{CN})_6$ ] or the coagulating val. increases continuously (U, Cu, Al, and Zn ferrocyanides). These complicated results explain the disagreements between published observations. The sp. conductivity ( $\kappa$ ) of  $\text{Cu}_2\text{Fe}(\text{CN})_6$  sols and their ultrafiltrates and the  $p_H$  of the latter have been determined;  $\kappa$  increases with the dilution of the sol. The cataphoretic velocity for these Cu sols passes through a max. with increasing  $c_1$  and decreases with increasing dilution for low  $c_1$ . These results are correlated with the phenomena of coagulation. R. S. B.

**Effect of light on the flocculation of colloidal solutions in fluorescent media.** A. BOUTARIC (Ann. Guébbard-Séverine, 1935, 11, 25—34).—In general, fluorescent substances accelerate the flocculation of colloids only in the presence of visible or ultra-violet light and added electrolytes. The fall ( $\Delta t$ ) in the time of flocculation of colloidal  $\text{As}_2\text{S}_3$  which is associated with the addition of eosin, uranine, or erythrosin, diminishes as the fluorescing power of the dye is decreased by the added electrolyte. Oxidation inhibitors and dyes which diminish the fluorescing power have a similar influence on  $\Delta t$ . J. G. A. G.

**Electrolyte coagulation of weakly solvated sols and electrolyte activity.** W. OSTWALD (Kolloid-Z., 1935, 73, 301—328).—A new theory of electrolyte coagulation of sols is put forward, in which attention is directed to the rôle of the dispersion medium. Coagulation is supposed to occur, not when the particles reach a certain state of charge, but when the intermicellar electrolyte reaches a certain physico-chemical state. The importance of the activity coeff. of the coagulating ions is emphasised and the interpretation of the valency rule and other regularities in coagulation is discussed. A large amount of published data is re-examined in the light of the theory. E. S. H.

**Variation of viscosity during the coagulation of colloid aluminium hydroxide by potassium chloride solutions.** S. S. JOSHI and K. P. N.

PANNIKAR (Proc. Acad. Sci. Agra and Oudh, 1935, 5, 41—45; cf. A., 1935, 164).—The  $\eta$ -time curves for 0.5*N*—0.025*N*-KCl solutions show initial discontinuity in the progress of coagulation at low concns. The time corresponding with the viscosity at the first min. on the curve is independent of the concn., indicating that the min. may not denote a definite stage of coagulation. N. M. B.

**Gelatinised emulsions. I. Emulsifying power of different soaps. Thickness of [protective] layer. Role of water.** L. KREMNEV (Acta Physicochim. U.R.S.S., 1935, 2, 779—792).—Gelatinised emulsions are best prepared by manual shaking. The emulsification of  $C_6H_6$  by alkali oleates has been investigated. The emulsifying power decreases in the order  $Li > Na > K$ , and depends on the dispersion of the soap, being highest with 0.016*N* solutions, when an unsaturated monolayer covers the  $C_6H_6$  drops in the gelatinised emulsion. The influence of  $H_2O$  has been investigated, and the relationship between gelatinised and liquid emulsions is discussed. T. G. P.

**Thixotropy and allied phenomena, and their biological significance.** H. FREUNDLICH (Chem. Weekblad, 1935, 32, 739—745).—A lecture. E. S. H.

**Imbibition of hydrosols and of dye solutions through porous bodies.** A. BOUTARIC (J. Chim. phys., 1935, 32, 618—638, and Bull. Soc. Chim. biol., 1935, 17, 1522—1533).—The motion of the medium and of colloidal particles through filter-paper is in accord with the view that the particles are carried through the porous material mechanically by the medium unless adsorbed by the paper. The motion of the particles does not vary appreciably with the surface tension of the medium and has no direct relation with electric forces; the usual term "electro-capillary rise" is therefore a misnomer. J. W. S.

**X-Ray method for the study of "bound water" in hydrophilic colloids at low temperatures.** W. H. BARNES and W. F. HAMPTON (Canad. J. Res., 1935, 13, 218—227; cf. A., 1934, 597).—The X-ray camera (cf. this vol., 45) has been applied to the study of bound  $H_2O$  in gelatin between 0° and -50°. The presence of ice crystals due to free  $H_2O$  gives rise to randomly distributed diffraction spots on the photograph and causes a shift in the halo at 20°—19—24°. The amount of bound  $H_2O$  decreases with fall of temp. to 0.44 g. per g. of dry gelatin at some temp. between -11.5° and -25.4°, below which it remains const. R. S.

**Time of setting of gels.** M. PRASAD and M. U. PARMAR (Current Sci., 1935, 4, 310—311).—Divergent times obtained by optical and various mechanical methods, in the case of  $H_2SiO_3$  gel, suggest that a precise definition is required for the term "time of setting," the process involving at least three stages. N. M. B.

**Dielectric constant and conductivity of gelatin sols and gels.** A. PIEKARA and B. PIEKARA (Kolloid-Z., 1935, 73, 273—276).—The dielectric const. of gelatin sols is  $>$  that of  $H_2O$ , increases with concn., and decreases with rising temp. The conductivity of the sol is  $>$  that of the gel. E. S. H.

**Hydroxide and oxide hydrate gels, and their amphoteric properties.** R. FRICKE (Kolloid-Z., 1935, 73, 300).—A criticism (cf. A., 1935, 1075). E. S. H.

**Anomalous dispersion of metallised gelatin.** L. CAVALLARO (Boll. Soc. ital. Biol. speriment., 1935, 10, 198—200).—The metastability of gelatin (I) and ovalbumin increases progressively with their purity during electrodialysis, but reaches a max. before max. purity is attained, and falls considerably during the final stages of purification. The behaviour of  $\epsilon_{H_2O}^{20}$  with increase of  $\lambda$  in metallised (I) is qualitatively similar to that of non-metallised (I), but  $\epsilon$  is increased in all cases. R. N. C.

**Colloid chemistry of edestin. II.** K. HOLWERDA (Biochem. Z., 1935, 282, 317—344; cf. A., 1935, 1203; Hollemann *et al.*, A., 1934, 842).—The composition of the coacervates produced by adding  $H_2O$  to edestin sols indicates that the peptisation is not chiefly dependent on the amount of  $H_2O$  introduced with the salts, although the degree of adsorption of univalent ions accords with viscosimetric results. In the zone of peptisation the adsorption is positive, whilst in the zone of salting out it is negative. When the concn. of salt is insufficient to cause peptisation the adsorption is positive. The controlling factor in the peptisation is the lowering of the surface tension caused by the addition of the salts, but intermolecular cohesive forces are involved, and such forces probably play a part in the salting-out process also. W. McC.

**Physico-chemical researches on the proteins.** A. BOUTARIC and M. ROY (Acta Physicochim. U.R.S.S., 1935, 2, 51—66).—Proteins as ordinarily prepared contain salt impurities which modify their colloidal properties. Pure preps. obtained by  $COMe_2$  pptn. have now been investigated. The optical density and  $n$  of coagulating mixtures of resorcinol (I) with serum-albumin and myxoprotein have been determined. (I) is fixed by the pptd. protein, and the solubility decreases to zero as the amount fixed approaches a limiting val. Absorption data for a no. of proteins on charcoal standardised against Na oleate are given and the influence of different protein concns. on the time of pptn. of  $Fe(OH)_3$  sol has been determined. It has been shown by both methods that the degree of polymerisation of albumin and myxoprotein obtained from various physiological secretions is the same. R. S.

**Colloidal model for illustration of biological processes.** I.—See this vol., 232.

**M.-p. curve of mixtures of heavy water and water.** A. EUCKEN and K. SCHAFER (Z. anorg. Chem., 1935, 225, 319—320).—Contrary to Dezelic's results (this vol., 30), but in agreement with those of other investigators, the authors have shown that the solidus-liquidus curves do not coincide, the max. distance apart being 0.02° for mixtures containing 42%  $D_2O$ . The m.-p. curve is not a straight line, but concave towards the concn. axis. Measurements have been made in a special apparatus recording variations of temp. of 0.00001°. M. S. B.

**Exchange equilibria between deuterium and ammonia.** K. WIRTZ (Z. physikal. Chem., 1935, B, 30, 289—297; cf. A., 1935, 1460).—A method which may in principle be used to calculate the equilibrium consts. of all the exchange reactions possible in a mixture of  $\text{NH}_3$  and  $\text{D}_2$  is described. As yet, however, the experimental accuracy is not great enough for it to be possible fully to follow this procedure. From spectroscopic data the equilibrium consts. of  $\text{NH}_3 + \text{NHD}_2 = 2\text{NH}_2\text{D}$  and  $\text{ND}_3 + \text{NDH}_2 = 2\text{NHD}_2$  at  $573^\circ$  abs. have been calc. to be 2.30 and 2.89, respectively. The distribution ratio of D between  $\text{H}_2$  and  $\text{NH}_3$  has also been determined. R. C.

**Maximum concentration of endothermic compounds at high temperatures; application to ozone and nitric oxide.** E. BRINER and B. SUSZ [with E. ROD] (Helv. Chim. Acta, 1935, 18, 1468—1478).—The equilibrium concns. of  $\text{O}_3$  and of NO in gas mixtures at high temp. have been recalcd. using more exact thermochemical data and equilibrium consts. Vals. so calc. are < those found previously. J. S. A.

**Equilibrium constants of the reaction of formation of ethyl chloride from ethylene and hydrogen chloride.** D. M. RUDKOVSKI, A. G. TRIFEL, and A. V. FROST (Ukrain. Chem. J., 1935, 10, 277—282).—The equilibrium const. for  $\text{C}_2\text{H}_4 + \text{HCl} \rightleftharpoons \text{EtCl}$  over the range  $170\text{--}230^\circ$  is given by  $\log K = 4.96 - 2925/T$ , and the heat of the reaction is 13.4 kg.-cal. R. T.

**Law of displacement of equilibrium.** P. RENAUD and E. BAUMGARDT (Compt. rend., 1935, 201, 1129—1131).—Polemical against Planck (A., 1934, 837). H. J. E.

**Thermodynamic potentials and affinity.** P. VAN RYSSELBERGHE (Compt. rend., 1935, 201, 1126—1128).—Theoretical. H. J. E.

**Thermodynamic problem.** A. SKRABAL (Z. Elektrochem., 1935, 41, 883—884; cf. A., 1935, 301, 446, 1204).—Further discussion. F. L. U.

**Thermodynamic problem.** R. LUTHER (Z. Elektrochem., 1935, 41, 884—885; cf. preceding abstract).—Discussion concluded. F. L. U.

**First dissociation constant of carbonic acid equilibrium.** Y. KAUKO (Ann. Acad. Sci. fenn., 1934, A, 39, No. 3; Chem. Zentr., 1935, i, 2767).— $K = [\text{H}^+][\text{HCO}_3^-]/[\text{CO}_2]$  is calc. at different temp. from published conductivity data, the uncertainty of  $K$  being principally dependent on the accuracy of the val. of the ionic conductivity of  $\text{H}^+$ . The heat of dissociation of  $\text{H}_2\text{CO}_3$  is calc. as 2500 g.-cal.  $K$  is determined independently by potentiometric measurements on aq.  $\text{CO}_2$  solutions. J. S. A.

**Dissociation constants of organic acids. XIII. Primary and secondary constants of some cyclic 1:1-dicarboxylic acids.** W. L. GERMAN, G. H. JEFFERY, and A. I. VOGEL (J.C.S., 1935, 1624—1630; cf. A., 1935, 1076).—Conductivity data are given for *cyclo*-propane-, -butane-, -pentane-, and -hexane-1:1-dicarboxylic acids and their Na salts, and the primary dissociation consts. calc. These have been confirmed by potentiometric titration of the acids using the quinhydrone electrode and the secondary dissociation consts. also obtained. The

distances between the  $\text{CO}_2\text{H}$  groups calc. from Bjerrum's expression are < those obtained by Gane and Ingold's method (A., 1931, 1126). R. S.

**Dissociation constants of monohalogenated anilines and phenols.** G. M. BENNETT, G. L. BROOKES, and S. GLASSSTONE (J.C.S., 1935, 1821—1826).—The dissociation consts. of *o*-, *m*-, and *p*-fluoro-, chloro-, bromo-, and iodo-aniline and -phenol at  $25.0^\circ$  in 30 vol.-% EtOH have been determined by observations of  $p_{\text{H}}$ , using the glass electrode. The results are discussed. E. S. H.

**Mathematical and graphical treatment of the equilibrium base-carbon dioxide-water in dilute solutions.** Y. KAUKO (Ann. Acad. Sci. fenn., 1934, A, 39, No. 1; Chem. Zentr., 1935, i, 2766—2767).— $\text{CO}_2$ - $\text{H}_2\text{O}$ -base equilibria are treated according to the classical and modern theories of solution, and a graphical method is described for the calculation of quantities involved in water-softening. The method is applicable also to quant. analysis of  $\text{H}_2\text{O}$ . J. S. A.

**Hydration of chromic chloride in heavy water.** G. CHAMPETIER (Compt. rend., 1935, 201, 1118—1120).—Measurements are recorded of the change in electrical conductivity with time of  $\text{CrCl}_3$  dissolved in  $\text{H}_2\text{O}$  and  $\text{D}_2\text{O}$ . The rate of change is slower and the final val. is lower in  $\text{D}_2\text{O}$ . The absorption spectra for the  $\text{D}_2\text{O}$  and  $\text{H}_2\text{O}$  solutions appear to be the same. H. J. E.

**Ion hydration and aquo-complexes.** H. BRINTZINGER (Z. anorg. Chem., 1935, 225, 221—224).—The results of published work are discussed (cf. A., 1935, 1091, 1335). E. S. H.

**Complex ions [of ferro- and ferri-cyanides] and prussi- and prusso-compounds.** H. BRINTZINGER and H. OSSWALD (Z. anorg. Chem., 1935, 225, 217—220).—The ion wts. of  $[\text{Fe}^{\text{III}}\text{NO}_3(\text{CN})_5]^{4-}$ ,  $[\text{Fe}^{\text{III}}\text{NH}_3(\text{CN})_5]^{3-}$ ,  $[\text{Fe}^{\text{III}}\text{NO}_2(\text{CN})_5]^{3-}$ ,  $[\text{Fe}^{\text{II}}\text{NH}_3(\text{CN})_5]^{2+}$ ,  $[\text{Fe}^{\text{II}}\text{NO}_2(\text{CN})_5]^{2+}$ ,  $[\text{Fe}^{\text{II}}\text{H}_2\text{O}(\text{CN})_5]^{2+}$ , and  $[\text{Fe}^{\text{II}}\text{AsO}_2(\text{CN})_5]^{2+}$  have been determined by the dialysis method. E. S. H.

**Effect of temperature on borax solutions in the presence of polyhydric substances and organic acids.** S. M. MEHTA (Proc. Acad. Sci. Agra and Oudh, 1935, 5, 46—49).—Preliminary results are given of an extension of Meldrum's investigations (Proc. Ind. Sci. Cong., 1923, 108) to the hydrolysis of borax in presence of mannitol and of salicylic acid, and the system  $\text{H}_3\text{BO}_3$ -NaOH, over a wide temp. range. N. M. B.

**Stability of sodium aluminate solutions.** V. D. DJATSCHKOV and O. S. KOSHUCHOVA (J. Gen. Chem. Russ., 1935, 5, 1139—1143).—The stability of Na aluminate (I) is unaffected by presence of < 1.4 mols. of  $\text{Na}_2\text{O}$  per mol. of  $\text{Al}_2\text{O}_3$ ; in higher concns. of NaOH it rises linearly, but is always least in solutions which contain 120—180 g. of (I) per litre. Agar-agar and Na silicate stabilise the solutions. R. T.

**Isotope exchange between water and some organic compounds.** M. HARADA and T. TITANI (Bull. Chem. Soc. Japan, 1935, 10, 554—557).—Neglecting mols. of relatively low concn. the exchange of D between org. compounds and dil.  $\text{D}_2\text{O}$  proceeds

according to  $\text{RH}_n + \text{H}_2\text{O} \rightleftharpoons \text{RH}_{n-1}\text{D} + \text{H}_2\text{O}$ . The equilibrium consts.  $K = [\text{RH}_{n-1}\text{D}][\text{H}_2\text{O}]/[\text{RH}_n][\text{HDO}]$ , and the distribution coeffs.  $k = (\text{at. concn. of D in exchangeable H in compound})/(\text{at. concn. of D in H}_2\text{O})$  are:  $\text{CHCl}_3$ ,  $\text{Et}_2\text{O}$ ,  $\text{PhCHO}$ , no exchange;  $\text{NH}_2\text{Ph}$   $k=K=1.11$ ;  $\text{PhOH}$   $k=1.07$ ,  $K=0.54$ ;  $\text{C}_6\text{H}_5\text{NH}_2$   $k=0.88$ ,  $K=0.44$ ;  $\text{BzOH}$   $k=1.04$ ,  $K=0.52$ ;  $(\text{CH}_2\text{Ph})_2\text{OH}$   $k=1.10$ ,  $K=0.55$ . R. S. B.

**Exchange reactions of hydrogen with deuterium. I. Exchange in carboxyl groups of succinic acid and in hydroxyl groups of quinol.** A. E. BRODSKI and O. C. SCARRE. **II. Exchange in sulphuric acid and in sodium hydroxide.** J. M. SCHERSCHEVER, A. E. BRODSKI, and M. M. SLUCKAJA (*Acta Physicochim. U.R.S.S.*, 1935, 2, 603—610, 611—614; cf. A., 1935, 44).—I. When  $(\text{CH}_2\text{CO}_2\text{H})_2$  or  $p\text{-C}_6\text{H}_4(\text{OH})_2$  is heated with  $\text{H}_2\text{O} + \text{D}_2\text{O}$  for 2—4 hr. in the absence of a catalyst, equilibrium is reached in which the coeff. of exchange between D and the H of the  $\text{CO}_2\text{H}$  or OH groups is approx. 1. The reverse change has been observed qualitatively.

II. The exchange coeff. of D between heavy water and dissolved  $\text{H}_2\text{SO}_4$  or  $\text{NaOH}$  has been found to be 1.0, thus affording direct evidence that in the production of  $\text{D}_2\text{O}$  by electrolysis acid or alkaline solutions the D content of the dissolved electrolyte changes *pari passu* with that of the water. F. L. U.

**Physicochemical studies of complex formation involving weak acids. XIV. Complex formation between malonates of the heavy metals and of sodium.** H. T. S. BRITTON and M. E. D. JARRETT (*J.C.S.*, 1935, 1728—1735; cf. A., 1935, 305, 449).—When Na malonate (I) is added to solutions of heavy-metal salts, the heavy metals remain in solution as feebly ionised basic hydromalonates; with excess of (I) complex anions are formed. Malonic acid solutions of heavy-metal bases do not contain definite complex acids. The prep. of  $\text{K}_2\text{CH}(\text{CO}_2\text{H})_2 \cdot 3\text{H}_2\text{O}$ ,  $\text{Na}_2\text{Al}(\text{CH}(\text{CO}_2\text{H})_2)_3$ , and  $\text{Na}_2\text{Fe}(\text{CH}(\text{CO}_2\text{H})_2)_3$  is described. The solubility product of Ag malonate at  $18^\circ$  is  $1.41 \times 10^{-4}$ . E. S. H.

**Determination of weight of organic dye ions by the dialysis method.** H. BRINTZINGER and A. SCHALL (*Z. anorg. Chem.*, 1935, 225, 213—216).—Apparatus for use with small amounts of liquid is described. Results are given for 6 dyes. E. S. H.

**System lithium nitrite-water: the hydrate  $\text{LiNO}_2 \cdot 1.5\text{H}_2\text{O}$ .** J. BUREAU (*Compt. rend.* 1935, 201, 1193—1195).—Thermal analysis reveals the peritectic transformation of  $\text{LiNO}_2 \cdot 1.5\text{H}_2\text{O}$  into  $\text{LiNO}_2 \cdot \text{H}_2\text{O}$  at  $-7.95^\circ$ , of  $\text{LiNO}_2 \cdot \text{H}_2\text{O}$  into  $2\text{LiNO}_2 \cdot \text{H}_2\text{O}$  at  $30.9^\circ$ , and of  $2\text{LiNO}_2 \cdot \text{H}_2\text{O}$  into  $\text{LiNO}_2$  at  $94^\circ$ . T. G. P.

**Existence of two hydrates of potassium thiocyanate.** A. CHRISTEN and O. HOFFER (*Compt. rend.* 1935, 201, 1131—1133).—The  $\text{KCN} \cdot 0.5\text{H}_2\text{O}$  and  $\text{KCN} \cdot 0.5\text{H}_2\text{O}$  are formed. The former is the stable solid phase at  $-29.5^\circ$  to  $6.8^\circ$ , the latter is always metastable. It is formed at  $-30^\circ$  to  $-17.75^\circ$ . H. J. E.

**Vapour pressure of saturated solutions and hydrates of magnesium chloride.** N. V. KON-

DIREV and G. V. BEREZOVSKI (*J. Gen. Chem. Russ.*, 1935, 5, 1246—1251).—V.-p. data are recorded for  $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$  and  $\text{MgCl}_2 \cdot 4\text{H}_2\text{O}$  over a wide temp. range. R. T.

**Dissociation pressures of nitrates and sulphates. IV. Sodium vanadates.** B. NEUMANN and A. SONNTAG (*Z. Elektrochem.*, 1935, 41, 860—868; cf. A., 1933, 1246).—O<sub>2</sub> pressures of Na vanadates with varying ratios of  $\text{Na}_2\text{O} : \text{V}_2\text{O}_5$ , with and without admixture of  $\text{SiO}_2$ , have been measured.  $\text{SO}_2$  is oxidised with appreciable rapidity only at temp. at which the vanadate is partly decomposed. The influence of  $\text{SiO}_2$  is purely physical, in preventing sintering and compaction of the products. The pressure measurements show that the catalytic activity of Na vanadates in promoting oxidation of  $\text{SO}_2$  depends on the formation of a definite, at present unidentified, sulphate which is more labile than  $\text{VOSO}_4$ . F. L. U.

**Thermodynamics of the liberation of oxygen from ferric oxide-ferrous oxide melts.** J. KIEHLAND (*Z. Elektrochem.*, 1935, 41, 834—838; cf. A., 1935, 1075).—An expression for the activity coeff. of the components is given. The calc. free energy change of the reaction  $\text{Fe}_2\text{O}_3 = 2\text{FeO} + 0.5\text{O}_2$  agrees with the observed val. (A., 1935, 1204). The standard entropy of  $\text{FeO}$  is calc. Mol. and partial mol. heats of mixing and free energies of liquid  $\text{Fe}_2\text{O}_3$  and  $\text{FeO}$  are given. F. L. U.

**System calcium oxide-sulphur dioxide-water. I. Determination of vapour pressures and conductivities.** G. W. GURD, P. E. GISHLER, and O. MAASS (*Canad. J. Res.*, 1935, 13, B, 209—217; cf. A., 1933, 897).—An apparatus is described in which pure  $\text{CaO}$ ,  $\text{H}_2\text{O}$ , and  $\text{SO}_2$  in accurately known amounts can be mixed at a const. temp. and the v.-p. and conductivity determined. V.-p. between  $25^\circ$  and  $130^\circ$  and conductivities between  $25^\circ$  and  $90^\circ$  are tabulated for  $[\text{SO}_2]$  up to 6% and  $[\text{CaO}]$  up to 2.5%. R. S.

**System calcium oxide-sulphur dioxide-water. II. Calculation of ionic concentrations.** P. E. GISHLER and O. MAASS (*Canad. J. Res.*, 1935, 13, B, 308—322; cf. preceding abstract).—Ionic concns. in the system  $\text{CaO}-\text{SO}_2-\text{H}_2\text{O}$  are calc. from earlier v.-p. and conductivity data. The existence of the compound  $\text{CaSO}_3 \cdot \text{Ca}(\text{HSO}_3)_2$  is deduced. Vals. of  $p_H$  up to  $90^\circ$  are extrapolated to  $140^\circ$ . H. J. E.

**Reciprocal solubility of aluminium, sodium, potassium, and ferric nitrate in water in presence of nitric acid. II.** A. J. SASLAVSKI, J. L. ETTINGER, and E. A. ESEROVA (*Z. anorg. Chem.*, 1935, 225, 305—311; cf. A., 1935, 928).—Data are given for the quaternary system  $\text{Al}(\text{NO}_3)_3-\text{NaNO}_3-\text{HNO}_3-\text{H}_2\text{O}$  at  $0^\circ$  and  $20^\circ$ . The only solid phases are  $\text{NaNO}_3$  and the hydrates  $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ ,  $8\text{H}_2\text{O}$ , and  $6\text{H}_2\text{O}$ . The composition of the solution at the transition points has been determined. M. S. B.

**System  $\text{CaO}-\text{SiO}_2-\text{H}_2\text{O}$ . II.** R. NACKEN and R. MOSEBACH (*Z. anorg. Chem.*, 1935, 225, 285—288; A., 1933, 935).—Equilibrium data at  $23-1^\circ$  are given. E. S. H.

**System  $\text{CaO}-\text{Al}_2\text{O}_3-\text{H}_2\text{O}$ .** R. NAOKEN and R. MOSEBACH (Z. anorg. Chem., 1935, 225, 289-301).—Equilibrium data at  $23\pm 1^\circ$  are given. E. S. H.

**Binary additive compounds in tannary systems. IX. Phenacetin-sulphonal-resorcinol.** F. ADAMANIS (Rocz. Chem., 1935, 15, 383-390).—Equilibrium data are recorded for the system, which shows a 2:3 compound of phenacetin and resorcinol. R. T.

**Thermodynamic studies of silver and mercurous sulphate.** F. ISHIKAWA and H. HACHISAWA (Bull. Inst. Phys. Chem. Res. Japan, 1935, 14, 1205-1209).—The e.m.f. of the cell  $\text{Ag}|\text{Ag}_2\text{SO}_4(s), \text{aq. Ag}_2\text{SO}_4|0.0269M\text{-K}_2\text{SO}_4, \text{HgSO}_4(s)|\text{Hg}$  has been determined at  $20^\circ, 25^\circ$ , and  $30^\circ$  and various thermodynamic quantities are calc. R. S.

**Heats of dissolution and specific heats of rhombic sulphur in carbon disulphide. Surface energy of solid rhombic sulphur.** A. R. WILLIAMS, F. M. G. JOHNSON, and O. MAASS (Canad. J. Res., 1935, 13, B, 280-288).—The thermal data are recorded for  $20^\circ$  and  $25^\circ$  and for concns. of 6-17%. Modifications of the adiabatic rotating calorimeter are described (cf. A., 1928, 609). The surface energy of solid rhombic S, calc. from the heats of dissolution of coarse and finely-divided substance, is 1024 ergs per sq. cm. (accuracy approx. 30%). H. J. E.

**Thermodynamic properties of sulphur compounds. II. Sulphur dioxide, carbon disulphide, and carbonyl sulphide.** P. C. CROSS (J. Chem. Physics, 1935, 3, 825-827; cf. A., 1935, 569).—Vals. of free energy, entropy, and heat capacity are derived from the consts. obtained from electron diffraction and from Raman and infra-red spectra, and these are applied to several reactions involving the three compounds. The free energies of formation at  $298.1^\circ$  abs. are:  $\text{CS}_2$ , 15.24,  $\text{COS}$ , -40.48 kg.-cal. N. M. B.

**Thermal decomposition of iron carbide  $\text{Fe}_3\text{C}$ .** G. NAESER (Mitt. Kaiser-Wilh. Inst. Eisenforsch., 1934, 16, 211-212; Chem. Zentr., 1935, i, 2336). The decomp. of  $\text{Fe}_3\text{C}$ , studied by measurement of magnetic susceptibility, takes place at  $1050-1060^\circ$  with out-gassed material. Equilibrium in the system cementite-pearlite-ferrite-graphite are recorded. J. S. A.

**Heat of formation and free energy of formation of boron nitride.** S. SATOH (Bull. Inst. Phys. Chem. Res. Japan, 1935, 14, 1233-1240). The heat of formation and free energy of formation of BN calc. from the dissociation pressure and the sp. heats are 56,940 and 54,760 g.-cal., respectively. R. S.

**Heat of reaction between kaolin burnt at different temperatures and  $\text{Ca}(\text{OH})_2$ .** P. P. BUDNIKOV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 355-359).—The heat evolved when burnt kaolin is added to aq.  $\text{Ca}(\text{OH})_2$  is a max. when the burning temp. is  $800^\circ$  and becomes zero when this is  $>1000^\circ$ . It is suggested that meta-kaolinite formed below  $1000^\circ$  reacts with  $\text{Ca}(\text{OH})_2$  giving a Ca aluminosilicate.

**Nature of conductivity of non-aqueous solutions.** M. USSANOVITSCH (Acta Physicochim. U.R.S.S., 1935,

2, 239-271).—The conductivity and temp. coeff. of conductivity of solutions of  $\text{AsCl}_3$ ,  $\text{AsBr}_3$ ,  $\text{SbCl}_3$ , and  $\text{SbBr}_3$  in  $\text{Et}_2\text{O}$  have been determined. The conductivity is attributed to the formation of  $\text{Et}_2\text{O}\cdot\text{AsCl}_3$ ,  $\text{Et}_2\text{O}\cdot\text{AsBr}_3$ ,  $\text{Et}_2\text{O}\cdot 2\text{SbCl}_3$ , and  $\text{Et}_2\text{O}\cdot 2\text{SbBr}_3$ .  $\text{PCl}_3$  does not form a compound with  $\text{Et}_2\text{O}$ , and the solution is non-conducting. The conductivity of solutions of  $\text{AsCl}_3$  in  $\text{PhNO}_2$  and  $\text{C}_6\text{H}_5\text{N}$  also due to compound formation. Data for  $\text{AcOH}$ ,  $\text{H}_2\text{SO}_4$ , and  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$  confirm the existence of  $2\text{H}_2\text{SO}_4\cdot\text{HNO}_3$  and  $\text{H}_2\text{SO}_4\cdot\text{HNO}_3$ . In the system  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$ , the  $\text{HNO}_3$  acts as a base. In the systems  $\text{H}_2\text{SO}_4$ ,  $\text{Me}_2\text{SO}_4$  and  $\text{H}_2\text{SO}_4$ ,  $\text{CO}_2\cdot\text{CO}_2\text{H}$ , in which there is no compound formation, a new type of dependence of conductivity on concn. is found. When corr. for viscosity, the conductivities of both systems are identical, although the dielectric consts. are widely different. A. J. M.

**Mobility of the hydrogen and hydroxyl ions in aqueous solution.** H. G. WANNIER (Ann. Physik, 1935, [v], 24, 509-590; cf. this vol., 31). An expression for the mean life of  $\text{H}^\cdot$  and  $\text{OH}^\cdot$  is obtained by a combination of the theory of Debye and Hückel and quantum mechanics. An equation is derived for the effect of temp. on the mobility of the ions which is in agreement with experiment. Calculation of the electric moment of the ions, however, does not agree with the experimental val. The mobility of  $\text{D}_2\text{O}^\cdot$  is calc. A. J. M.

**Electrode potentials of sodium and potassium in liquid ammonia.** V. A. PLESKOV and A. M. MONOSSOV (Acta Physicochim. U.R.S.S., 1935, 2, 616-620; cf. A., 1935, 1077). Measurement of the e.m.f. of the cell  $\text{Hg}-\text{Na}|0.1N\text{-NaNO}_3(\text{sat. KNO}_3)|0.1N\text{-Ph}(\text{NO}_2)_3|\text{Ph}$  at  $35^\circ$ , the salts being dissolved in liquid  $\text{NH}_3$ , has been used to calculate the normal potential of Na. Results for K have been obtained in a similar manner. The potentials, referred to  $\text{H}^+ = 0$ , are: Na, -1.83 volt, K, -1.98 volt. These vals., which are nearly 1 volt  $\pm$  the corresponding potentials in  $\text{H}_2\text{O}$ , are considered partly responsible for the slowness of the reaction of the metals with liquid  $\text{NH}_3$ . P. L. U.

**Electrode potentials in water and in liquid ammonia.** V. A. PLESKOV and A. M. MONOSSOV (Acta Physicochim. U.R.S.S., 1935, 2, 621-632 cf. preceding abstract). A method of comparing electrode potentials in  $\text{H}_2\text{O}$  and liquid  $\text{NH}_3$  by means of a dropping electrode is described, and results of measurements for K, Na, Zn, Cd, Pb, H, Cu, Ag, and Hg, from which normal potentials in the two solvents are calc., are given. The ionic solvation energies calc. on purely electrostatic grounds are, with the exception of K and Na, greatly at variance with the energies of transfer given by the experiments. The discrepancies show that an important part is played by homopolar chemical forces. P. L. U.

**Electrode potentials of halides in liquid ammonia.** V. A. PLESKOV (Acta Physicochim. U.R.S.S., 1935, 2, 679-688). In calculating the normal potentials of halides in liquid  $\text{NH}_3$  the energy of formation of the crystal solvate must be considered. Homopolar forces play a part in the solvation. Calculations from previous data show that the normal potentials of

different halides differ less in liquid  $\text{NH}_3$  than in  $\text{H}_2\text{O}$  (cf. Fredenhagen, A., 1927, 936). T. G. P.

**Measurement of capacity of polarised mercury electrodes.** P. P. PORITROV (J. Gen. Chem. Russ., 1935, 5, 1077—1084).—The polarisation capacity  $P$  falls with increasing potential to a min. at about 1 volt, and then rises; with increasing c.d. the val. of  $P$  rises uninterruptedly, and the above min. becomes more abrupt. Using a.c. the val. of  $P$  is independent of the frequency, but  $\propto$  only to the p.d. R. T.

**Cathodic polarisation in the deposition of copper from solutions of its simple salts.** O. ESSIN and A. LEVIN (J. Gen. Chem. Russ., 1935, 5, 1302—1315).—Gordon's empirical equation (A., 1925, ii, 549),  $E = E_0 + b \log(1 - kD)$ , where  $E$  is the polarisation potential, and  $b$  and  $k$  are consts., is confirmed by the data for the electrolysis of 0.3—1.0N- $\text{CuSO}_4$  in 0.1—0.2N- $\text{H}_2\text{SO}_4$  at 25°, with a c.d.  $D$  of 1—110 m.amp. per sq. cm.;  $E_0$  cannot be considered to be the initial polarisation. The difference between the actual  $E$  and that calc. for the concn. potential is best represented by Erley-Gruz and Volmer's equation (A., 1930, 1376),  $E_x - 1/(a + k \log D)$ , indicating that  $E_x$  is ascribable to the retarded formation of crystal nuclei at the cathode. When the c.d. is increased gradually from 1 m.amp. per sq. cm., the potential becomes most negative at about 10 amp., but the potentials cannot be reproduced when the process is repeated or reversed. R. T.

**Hydrogen peroxide theory of electrolytic oxidation and the influence of the electrode surface on anodic polarisation.** S. GLASSTONE and A. HICKLING (Trans. Faraday Soc., 1935, 31, 1656—1660).—The anodic overpotentials at smooth Pt, platinised and otherwise prepared Pt, Au,  $\text{PbO}_2$ ,  $\text{MnO}_2$ , arc-gas C, and Ni electrodes cannot be simply correlated with their efficiencies in oxidation of  $\text{OAc}$ ,  $\text{S}_2\text{O}_3^{2-}$ , and  $\text{SO}_3^{2-}$ . Difficulties in the discharged ion theory of anodic processes are pointed out, and it is shown that formation of  $\text{H}_2\text{O}_2$  from OH radicals is not improbable, since not only do catalysts for  $\text{H}_2\text{O}_2$  decomp. inhibit anodic oxidation, but the action of  $\text{H}_2\text{O}_2$  is in many cases qualitatively similar to that of electrolytic oxidation. Probably no one mechanism accounts for all types of anodic oxidation reactions. J. W. S.

**Significance of negative difference effect.** W. O. KROENIG and V. N. USPENSKAJA (Korros. u. Metallschutz, 1935, 11, 10—16; Chem. Zentr., 1935, i, 2781).—The negative difference effect is the increased H evolution from an Al electrode in acid (or a Mg electrode in salt solutions) on short-circuiting with a Pt cathode, and is associated with the oxide skin. Removal of the latter inhibits the negative and gives rise to a positive difference effect. The effect is due to destruction of the oxide skin by the augmented passage of ions into solution, the rate of dissolution of Al being thereby increased. J. S. A.

**Electrochemical behaviour of non-metallic inclusions in iron and its relation to corrosion.** E. CHYZEWSKI and A. SKAPSKI (Z. Elektrochem., 1935, 41, 843—849).—The e.m.f., current strength, and internal resistance of cells of the type: non-metal electrode|0.005N- $\text{FeSO}_4$ +0.005N- $\text{MnSO}_4$ |Fe

have been measured at room temp. The non-metal electrodes were of FeO,  $\text{Fe}_2\text{O}_3$ , magnetite, fayalite, haematite, FeS, MnS, and MnO, and the solutions were saturated with air or  $\text{O}_2$ . The results show that only MnS, and to some extent its solid solutions, can give rise to electrochemical corrosion. FeS can under certain conditions exert a protective action.

F. L. U.

**Application of the barium amalgam electrode to the determination of the activity of barium ions in aqueous solutions.** Z. J. BERESTNEVA and V. A. KARGIN (Acta Physicochim. U.R.S.S., 1935, 2, 163—170).—The potential of a Ba-Hg electrode in  $N$ - to 0.001N- $\text{BaCl}$ , has been determined. Addition of  $\text{Na}^+$  up to 0.1N has no effect on the potential of the electrode. The Ba-Hg electrode may be used to determine the activity of  $\text{Ba}^{2+}$ , if its potential is first determined against a standard Ba solution.

A. J. M.

**Alkali amalgam electrodes and their application to the study of colloidal solutions.** Z. J. BERESTNEVA and V. A. KARGIN (Acta Physicochim. U.R.S.S., 1935, 2, 151—162).—An attempt has been made to use alkali-metal amalgam electrodes to investigate the adsorption of ions in the coagulation of  $\text{As}_2\text{S}_3$  sols by NaCl and KCl. The electrodes are, however, poisoned by products of hydrolysis of  $\text{As}_2\text{S}_3$ , and trustworthy results cannot be obtained.

A. J. M.

**Activity of hydrogen in complexes of alcohols with unsaturated organic compounds.** B. V. TRONOV and L. P. KULEV (J. Gen. Chem. Russ., 1935, 5, 1233—1239).—The e.m.f. developed when Pt and Na electrodes are immersed in primary alcohols is unaffected by addition of  $\text{C}_5\text{H}_5\text{N}$  or  $\text{PhNO}_2$ ; the same applies to *sec.*-alcohols, with the exception of  $\text{Pr}^n\text{OH}$ , which appears to form a highly dissociated compound with  $\text{C}_5\text{H}_5\text{N}$ . *tert.*-Alcohols and the homologues of cyclohexyl alcohol give considerably higher e.m.f. in presence of  $\text{C}_5\text{H}_5\text{N}$  and  $\text{PhNO}_2$ .  $\text{NH}_4\text{Ph}$  and  $\text{NPhMe}$  do not affect the e.m.f. given by aliphatic alcohols, but slightly raise that given by aromatic alcohols.

R. T.

**Mechanism of explosive reactions.** C. C. ANDREEV (Bull. Soc. chim., 1935, [v], 2, 2128—2134).—See A., 1935, 708.

F. L. U.

**Absolute rate of homogeneous atomic reactions.** H. EYRING, H. GERSHINOWITZ, and C. E. SUN (J. Chem. Physics, 1935, 3, 786—796; cf. A., 1935, 1205).—The abs. rate of recombination of 3 H atoms is calc. theoretically. The manner in which rotation determines the dimensions of the activated complex in cases having little or no activation energy is discussed. A result of the theory (cf. *ibid.*, 586) is that energy transfer occurs most effectively among particles which can react with each other, free atoms being more efficient than mols. A qual. application of potential surfaces to the problem of energy transfer is made.

M B

**Reality of chains in gas explosions.** M. POLJAKOV and I. MALKIN (Acta Physicochim. U.R.S.S., 1935, 2, 211—214).—Apparatus is described by means of which the theory that OH is an intermediate in the chain reaction occurring when a mixture of  $\text{H}_2$

and  $O_2$  in the vol. ratio 2:1 is exploded may be proved. It is supposed that two OH combine to form  $H_2O_2$ , which may be frozen out. 25 explosions gave sufficient  $H_2O_2$  to be detected. The amount of  $H_2O_2$  formed decreases with distance from the heated Pt spiral by which the explosion is started. This result is due to the removal of OH by the walls of the vessel. A. J. M.

**Influence of gas adsorbed by the vessel walls on the chain reaction of hydrogen-oxygen mixtures.** M. PRETTE (Compt. rend., 1935, 201, 962—964).—The initial rate of reaction of  $H_2$  and  $O_2$  at  $540^\circ$  in a glass vessel increases progressively when the vessel walls are allowed to adsorb (at  $540^\circ$ ) increasing quantities of  $H_2O$  vapour (5—70 mm. pressure) before carrying out the reaction. Preliminary treatment of the vessel with  $H_2$  at  $550^\circ$  retards the reaction and eliminates the induction period. H. J. E.

**Ignition limits of oxygen-hydrogen mixtures.** F. I. DUBOVITSKI (Acta Physicochim. U.R.S.S., 1935, 2, 761—778).—The reaction between stoichiometric proportions of  $H_2$  and  $O_2$  irradiated by a  $H_2$  tube at pressures and temp. close to the ignition limits has been investigated. The limits of ignition are not determined by the surface. A decrease in reaction rate at high pressures in presence of A indicates that chain breaking grows in consequence of increased probability of the triple collision  $O+H_2+M=H_2O+M$ . The primary process in the reaction is  $O_2+h\nu=O^*+O$ . The results obtained are combined with earlier data and interpreted through Semenov's chain theory. T. G. P.

**Experimental activation energies of elementary reactions between hydrogen and the halogens.** J. C. MORRIS and R. N. PEASE (J. Chem. Physics, 1935, 3, 796—802).—Available experimental data on reactions of the type  $H+X_2 \rightarrow HX+X$ ,  $X+H_2 \rightarrow HX+H$ , and  $H+HX \rightarrow X+H_2$  are analysed to give vals. of the activation energies of the intermediate reactions involved, and these are compared with calc. vals. N. M. B.

**Kinetics of oxidation of hydrides in the gaseous phase. I. Oxidation of silane.** P. S. SCHANTAROVITSCH (Acta Physicochim. U.R.S.S., 1935, 2, 633—646).—The lower ( $p_1$ ) and upper ( $p_2$ ) pressure limits for the ignition of mixtures of  $SiH_4$  and  $O_2$  have been determined. With falling temp.  $p_1$  increases and  $p_2$  diminishes. Ignition occurs the more readily, the smaller is the proportion of  $O_2$  below the stoichiometric ratio. Reducing the diameter of the vessel increases  $p_1$ , but has little effect on  $p_2$ . Addition of 0.1% of  $NO_2$  displaces the ignition curves towards lower temp. The kinetics of the reaction resemble those of  $H_2$ , CO,  $PH_3$ , etc., whilst differing entirely from those of hydrocarbons. At lower temp. an induction period is observed which is absent when  $t > 120^\circ$ , whence it is inferred that a chain mechanism is involved. F. L. U.

**Non-adiabatic reactions: decomposition of  $N_2O$ .** A. E. STEARN and N. EYRING (J. Chem. Physics, 1935, 3, 778—785; cf. A., 1935, 586).—The experimental and calc. abs. rates for the non-adiabatic decomp. of  $N_2O$  are in good agreement.

The amount of chemical inertia present in other reactions involving the singlet-triplet transition of  $O_2$  is examined. A convenient method of constructing potential functions for polyat. mols. is indicated, and employed for the  $N_2O$  mol. N. M. B.

**Heterogeneous oxidation of nitric oxide at the temperature of liquid air.** M. TEMKIN and V. PISHOV (Acta Physicochim. U.R.S.S., 1935, 2, 473—486).—The oxidation of NO by  $O_2$  at  $5 \times 10^{-3}$  to  $8 \times 10^{-2}$  mm. Hg and  $83-88^\circ$  abs. is a heterogeneous reaction between  $O_2$  mols. of the gas phase and NO mols. adsorbed on the surface. The reaction velocity  $v$  is given by  $v=4.2 \times 10^{-9} e^{4300/RT} S \cdot p_{O_2} \cdot p_{NO}$ , where  $S$ =area of surface in sq. cm.,  $p$ =partial pressure in mm. The reaction product has the composition  $N_2O_5$ . O. J. W.

**Thermal reaction between gaseous iodine monochloride and hydrogen.** W. D. BONNER, W. L. GORE, and D. M. YOST (J. Amer. Chem. Soc., 1935, 57, 2723—2724).—The kinetics of the reaction  $2ICl+H_2 \rightarrow I_2+2HCl$  at  $205-240^\circ$  have been investigated. A mechanism involving a slow and a rapid reaction is suggested. The energy of activation of the slow reaction is 33,900 g.-cal. E. S. H.

**Flame speeds during the inflammation of moist carbon monoxide-oxygen mixtures.** W. PAYMAN and R. V. WHEELER (Nature, 1935, 136, 1028).—A discussion. L. S. T.

**Critical explosion limits in oxidation of carbonyl sulphide and monosilane.** H. GUTSCHMIDT and K. CLUSIUS (Z. physikal. Chem., 1935, B, 30, 265—279).—The lower crit. limit for the stoichiometric mixture of COS and  $O_2$  in quartz and glass at  $190-480^\circ$  has been determined. The results agree well with Bawn's (A., 1933, 355) but are incompatible with Semenov's equation,  $\log(p_1+p_2) A/T B$ , ( $p_1, p_2$ =inflammation pressures of components) except over a very narrow temp. range. The effect of the diameter of the vessel,  $d$ , can be represented by  $(p_1+p_2)d^{0.7}=C$ , where  $C$  rises rapidly as the temp. falls. For mixtures of  $SiH_4$  and  $O_2$  in varying proportions the lower crit. limit has been determined at several temp. Semenov's equation,  $p_1 p_2 d^2$  const., for the case where the chains break on the wall, does not hold. The probable cause of this discrepancy is that the course of the reaction varies with the composition of the mixture, for the form of the inflammation isotherms suggests the simultaneous occurrence of reactions yielding at least two different final products. No evidence of crit. limits could be obtained with mixtures of NO with  $CS_2$  vapour or  $PH_3$ . In all the examples of non-stationary chain reactions so far observed explosion involves no increase in the total no. of mols. present. R. C.

**Kinetics of the reaction between oxygen and sulphur. I. Reaction at  $240-280^\circ$ .** L. A. SAYCE (J.C.S., 1935, 1767—1774).— $SO_2$  is formed and chemiluminescence frequently occurs when a mixture of S vapour and 25—760 mm.  $O_2$  at  $200-280^\circ$  is cooled rapidly. The yield of  $SO_2$  is (i) greatest with air-cooling and least with very slow cooling, (ii) max. with 100—300 mm. of  $O_2$ , (iii) independent of  $[S]$  and initial temp. between  $240^\circ$  and  $280^\circ$ , but is very small at

< 220°. Effects due to this reaction were largely eliminated by a new static method for following the principal S-O<sub>2</sub> reaction. The latter is entirely heterogeneous at 240–280° and the velocity,  $k$ , on liquid S is 16-fold that on glass (cf. J.C.S., 1923, 123, 3203). The heat of activation on glass, and probably on liquid S, is 46,430 g.-cal., suggesting similar mechanisms on these surfaces. There is a linear relation between  $k$  and [O<sub>2</sub>], but with [O<sub>2</sub>] > 4 × 10<sup>-4</sup> g. per c.c. there is a marked acceleration probably owing to the development of a chain reaction. J. G. A. G.

**Esterification as a gas reaction.** C. A. WINKLER and C. N. HINSHELWOOD (Trans. Faraday Soc., 1935, 31, 1739–1743).—Reaction between MeOH and HCl vapours occurs readily at 450°, mainly on the surface of the reaction vessel. MeOH and AcOH do not react with appreciable velocity below the temp. at which decomp. of the MeOH becomes rapid. Reaction between MeOH, AcOH, and HCl to yield MeOAc occurs rapidly at 300°, probably in an adsorbed layer of MeOH where ionisation of the HCl can occur. Quant. results were irregular. The rate of esterification in a MeOH solution of AcOH and HCl decreases only slowly as the MeOH is replaced by CCl<sub>4</sub> until the [MeOH] reaches a small val., beyond which it  $\propto$  the [MeOH]. In this region the velocity of reaction  $\propto$  [AcOH]<sup>r</sup>. Some erratic behaviour is observed, related to the size of the liquid-vapour interface, so that adsorption at interfaces may play a part and thus the system becomes analogous to a gaseous system. J. W. S.

**Kinetics of ethylene polymerisation.** II. H. H. STORCH (J. Amer. Chem. Soc., 1935, 57, 2598–2601; cf. A., 1934, 369).—Addition of about 0.1% of EtSH to C<sub>2</sub>H<sub>4</sub> decreases the rate of polymerisation about 10-fold; the induction period is not eliminated, but its duration is markedly reduced. The induction period appears to be due to an intermediate compound, which survives cooling at -180° and subsequent reevaporation into the reaction chamber at 393°. The polymerisation of C<sub>2</sub>H<sub>4</sub> is probably not a simple bimol. reaction. The activation energy is 43,500 g.-cal. E. S. H.

**Thermal decomposition of methyl hydrogen peroxide.** S. MEDVEDEV and A. PODJAPOLSKAJA (Acta Physicochim. U.R.S.S., 1935, 2, 487–504).—Decomp. of MeO<sub>2</sub>H in an atm. of N<sub>2</sub> gave the following products: MeOH, Me<sub>2</sub>O, CH<sub>3</sub>O, HCO<sub>2</sub>H, O<sub>2</sub>, CO, CO<sub>2</sub>, and H<sub>2</sub>O, but no H<sub>2</sub> or CH<sub>4</sub>. Two primary decomp. reactions take place, viz. (1) MeO<sub>2</sub>H → CH<sub>3</sub>O + H<sub>2</sub>O, and (2) 2MeO<sub>2</sub>H → 2MeOH + O<sub>2</sub>. At low temp. (1), which is followed by MeO<sub>2</sub>H + CH<sub>3</sub>O → MeO<sub>2</sub>·CH<sub>2</sub>·OH predominates. The activation energies for (1) and (2) are 10,950 and 25,330 g.-cal., respectively. O. J. W.

**Abnormally small steric factors in chemical kinetics.** H. HELLMANN and J. K. SIRKIN (Acta Physicochim. U.R.S.S., 1935, 2, 433–466).—The wave-mechanical theory of collision processes presented is able to account for abnormally small steric factors (of the order of 10<sup>-5</sup>–10<sup>-8</sup>) in the velocity coeff. expression. The influence of tunnel effects on the steric factor is discussed. O. J. W.

**Polymorphism.** III. Linear velocity of the transformation of  $\alpha$ - into  $\beta$ -*o*-nitroaniline. N. H.

HARTSHORNE, G. S. WALTERS, and (in part) W. O. M. WILLIAMS (J.C.S., 1935, 1860–1873; cf. A., 1931, 1407).—Irregularities of the contour of the advancing interface between  $\alpha$ - and  $\beta$ -*o*-nitroaniline (I) are not due to local variations in the thickness of the film, although in very thin films the average velocity,  $v$ , is > in films 0.01–0.02 mm. thick. The decrease of  $v$  as the interface advances is not primarily due to impurities and is attributed to the progressive widening of the gap between the  $\alpha$ - and  $\beta$ -forms, since the  $d$  of  $\alpha$ - is < the  $d$  of  $\beta$ -(I). There were considerable variations in  $v$  with different specimens at the same temp., but there was no overlapping between the results at 0°, 20°, 30°, and 40°. No relation was found between  $v$  and the degree of purity of the specimens. The data are represented, in general, by the semi-empirical equation  $t = k_1 s^3 + k_2 s$ , where  $s$  is the linear displacement of the interface in time  $t$  from zero. The temp. coeff. between 20° and 40° leads to the activation energy 17–18 kg.-cal. per mol. This val. is in harmony with the view that  $v$  is controlled by the difference between the rates of evaporation of  $\alpha$ - and  $\beta$ -(I). J. G. A. G.

**Mechanism of polymerisation reactions.** I, II. H. DOSTAL (Monatsh., 1935, 67, 1–9, 63–79, 222).—I. Theoretical. The treatment previously developed (A., 1935, 1206) is extended to the stabilisation of growing chains, which is regarded as a unimol. process, the velocity coeff. of which may vary with the chain length.

II. The theory is applied to the dependence on time of the total quantity of polymeride, and to the influence of a steric factor, and of the combination of partly grown chains, on polymerisation. Stabilisation of chains, both spontaneously and in the presence of a foreign substance, is further considered. F. L. U.

**Activation energies of some reactions involving free radicals.** C. E. SUN (J. Chinese Chem. Soc., 1935, 3, 293–295).—The activation energy of reactions involving free radicals can be calc. by Eyring's method. The val. for a reaction in which there is a transfer of H from a C of the normal mol. to a free radical, the rest of the mol. remaining unaltered, is 17 kg.-cal. A. J. M.

**Kinetics of the reduction of (A) copper sulphate, (B) bismuth chloride, by hypophosphorous acid in aqueous solutions.** (A) G. S. VOZDVISHENSKI and A. F. GERASIMOV. (B) A. F. GERASIMOV and B. M. KOZUREV (Trans. Butlerov Inst. Chem. Tech. Kazan, 1934, No. 1, 108–113, 126–133).—(A) The reaction was studied at 47°. The [Cu] at time  $t$  is given by  $\log [Cu] = 2.2932 - 0.48 \log t$ .

(B) The reaction was studied at 50°. The [Bi] at time  $t$  is given by  $\log [Bi] = -2.523 - 0.1 \log t$ .

CH. ABS. (e)  
**Velocity of decomposition of calcium carbonate solutions.** Y. KAUKO (Ann. Acad. Sci. fenn., 1934, A, 39, No. 9; Chem. Zentr., 1935, i, 2767).—The decomp. of Ca(HCO<sub>3</sub>)<sub>2</sub> at 0–15° by passage of CO<sub>2</sub>-free air follows the course HCO<sub>3</sub>' → OH' + CO<sub>2</sub>. At low [HCO<sub>3</sub>] the velocity is determined by the velocity of diffusion of CO<sub>2</sub>. J. S. A.

**Polar effects of the halogens in aromatic combination.** G. BADDELEY, G. M. BENNETT, S. GLASTONE, and B. JONES (J.C.S., 1935, 1827—1830; cf. A., 1933, 1151).—Data previously considered and new data (see below) are interpreted by means of the following factors: an electromeric effect (if any), a mesomeric polarisation, an inductive effect and field effects all varying in the order  $F > Cl > Br > I$ , and a polarisability effect varying in the order  $I > Br > Cl > F$ . The nature of these effects is discussed. J. G. A. G.

**Intermediate stages in aldehyde oxidation.**  
**III. Kinetics of the reaction between peracetic acid and aldehydes in aqueous solution.** G. D. LUBARSKI and M. J. KAGAN (Acta Physicochim. U.R.S.S., 1935, 2, 665—678; cf. A., 1935, 1084).—The reaction has been studied in various concns. of aq. AcOH. The velocity coeff. in presence of  $H_2O$  is  $>$  in non-aq. solution due to acceleration of the second stage  $OH\cdot CH_3CO\cdot OAc \rightarrow 2AcOH$ . In aq.  $MeCHO$  the velocity coeff. increases with  $H_2O$  content. The data do not support Wieland's hypothesis (A., 1932, 722). T. G. P.

**Kinetics of the bromination of benzaldehyde.** J. K. SIRKIN and A. T. GLADISHEV (Acta Physicochim. U.R.S.S., 1935, 2, 467—472).—The velocity of the bromination of  $PhCHO$  in  $CCl_4$  solution in the dark has been measured at 30°, 35°, and 40°. Assuming that the reaction is bimol. the activation energy is calc. to be 32,900 g.-cal. Quinol and I do not influence the velocity. As the reaction is very slow a unimol. equation is obeyed approx. O. J. W.

**Dilatometric method for following the hydrolysis of sucrose.** D. I. HITCHCOCK and R. B. DOUGAN (J. Physical Chem., 1935, 39, 1177—1188).—The vol. change of sucrose (I) solutions undergoing inversion by HCl follows strictly a unimol. formula, and the velocity coeffs. agree with those obtained polarimetrically. The total contraction per mol. of (I) at infinite dilution, for complete hydrolysis and with the products in mutarotation equilibrium, is by extrapolation 6.92 c.c. at 25°. Results obtained with invertase are similar but less simple. The dilatometric method may be used with confidence in studying the hydrolysis of (I) in acid solutions, and for comparing the activities under optimum conditions of preps. of yeast-invertase. F. L. U.

**Velocities of reaction of  $\beta$ -arylethyl chlorides with potassium iodide.** G. BADDELEY and G. M. BENNETT (J.C.S., 1935, 1819—1821).—The data refer to  $p\text{-}X\cdot C_6H_4\cdot C_2H_4Cl$ , where  $X=H, MeO, I, Br, Cl, F$ , and  $NO_2$ , in  $COMe_2$  solution at 55° and 75°. The velocity coeff. at 75° is  $halogens > MeO > H$ .

J. G. A. G.

**Velocities of reaction of substituted benzyl chlorides in two reactions of opposed polar types.** G. M. BENNETT and B. JONES (J.C.S., 1935, 1815—1819).—The data refer to the *o*-, *m*-, and *p*-monohalogen- and  $NO_2$ -, and *p*-Me-substituted benzyl chloride. The energy of activation,  $E$ , of the hydrolysis in 50% aq.  $COMe_2$  is approx. 20.9 kg.-cal. between 70° and 85°. The velocity coeff.,  $k$ , is approx. const. in the *m*-halogen series, but in the *o*- and *p*-halogen series  $F > Cl > Br > I$ . The  $k$  of the reaction

with KI in  $COMe_2$  at 0.1° and 20° has been determined.  $E$  is approx. 17.3 kg.-cal. for the *o*-compounds and 18.1 for the *m*- and *p*-derivatives. The anomalous vals. for  $k$  previously observed (A., 1925, i, 494) with *o*- and *p*- $C_6H_4Br\cdot CH_2Cl$  are due to the presence of *o*- and *p*- $C_6H_4Cl\cdot CH_2Br$ . The pure reagents were therefore prepared from the appropriate nuclear-substituted benzyl alcohol. J. G. A. G.

**Ester hydrolysis in pure water.** A. SKRABAL (Monatsh., 1935, 67, 118—128).—A discussion of papers by Kirmann (A., 1934, 847) and Poethke (A., 1935, 938). F. L. U.

**Energies and entropies of activation of the reaction between bromoacetate and thiosulphate ions.** V. K. LA MER and M. E. KAMNER (J. Amer. Chem. Soc., 1935, 57, 2662—2668).—The temp. coeffs. of the reaction have been studied over a range of temp. and concn. to obtain data for the effect of temp. and ionic environment on the energy of activation and the action const.  $B$ . The increase in  $\log k$  produced by the addition of  $Na^+$  is correlated with an increase of  $B$ . In presence of  $Ba^{++}$  and  $La^{+++}$  the energy of activation is increased, but is more than compensated by an increase in the entropy of activation. E. S. H.

**Influence of non-electrolytes on the kinetics of the reaction between bromoacetate and thiosulphate ions.** V. K. LA MER and M. E. KAMNER (J. Amer. Chem. Soc., 1935, 57, 2669—2673).—The velocity coeff. in  $H_2O$  is increased by adding  $CO(NH_2)_2$ , sucrose, glycerol, or dioxan, although  $CO(NH_2)_2$  raises the dielectric const. and the remainder lower it. The energy of activation is unchanged by  $CO(NH_2)_2$ , but decreased by the other non-electrolytes. In 32% sucrose solutions the positive salt catalysis arises from an increase in the entropy of activation, which more than compensates the retarding influence of an increase in the energy of activation. E. S. H.

**Temperature dependence of the energy of activation in the de-aldolisation of diacetone alcohol.** V. K. LA MER and M. L. MILLER (J. Amer. Chem. Soc., 1935, 57, 2674—2680).—The velocity coeff. in presence of dil. NaOH has been determined at 5° intervals between 0° and 50°; the proportionality between velocity coeff. and  $[NaOH]$  has been confirmed over a limited concn. range at 25°. The energy of activation is a function of temp., increasing from 15,850 g.-cal. at 5° to 17,250 g.-cal. at 32.5°, and then decreasing by about 400 g.-cal. at 45°. Addition of 18.5% MeOH causes an increase of  $>1700$  g.-cal. The corresponding vals. for the action const.  $B$  in  $H_2O$  and MeOH solutions are parallel. The data show the inadequacy of the collision theory and the importance of the entropy of activation. E. S. H.

**Kinetics of bimolecular reactions in solution.**  
**II. Formation of sulphonium salts.** J. K. SIRKIN and I. T. GLADISHEV (Acta Physicochim. U.R.S.S., 1935, 2, 291—302).—The kinetics of the reaction between  $MeI$  and  $Et_2S$  to yield  $SMeEt_2I$  has been studied at 17°, 27°, and 37° in MeOH, EtOH, PrOH, and  $COMe_2$  solutions. The calc. activation energies, corr. for the variation of frequency

of collision with viscosity, are 19,150, 20,760, 21,270, and 13,300 g.-cal. per mol., respectively. The velocities of reaction observed in alcohols are only about 0.01 of those calc. from the frequency of collision and activation energy, this being attributed to steric factors. In COMe, the velocity is only  $4 \times 10^{-7}$  of the calc. val. This reaction in these solvents is intermediate between a normal and a slow reaction. The mechanism of reaction in COMe<sub>2</sub> is discussed in detail.

J. W. S.

**Velocity of alkaline hydrolysis of crotonic esters.** E. SCHJANBERG (Z. physikal. Chem. 1935, 174, 465—471).—Branching of the C chain of the alkyl radical of the alcohol in the  $\alpha$ -position reduces the velocity coeff.,  $k$ , owing to fall in the action const.,  $\alpha$ . Comparison with the rates of hydrolysis of corresponding butyrates shows that an  $\alpha\beta$ -double linking in the acyl radical depresses  $k$ , whilst both the energy of activation,  $Q$ , and  $\alpha$  rise; the effect of the rise in  $Q$  outweighs that of the rise in  $\alpha$ , so that the net effect is a fall in  $k$ .

R. C.

**Coupled oxidation of alcohol.**—See this vol., 242.

**Relation between the apparent and true activation energy of heterogeneous reactions.** M. TEMKIN (Acta Physicochim. U.R.S.S., 1935, 2, 313—316).—Mathematical.

J. W. S.

**Reaction velocity in the system solid<sub>1</sub> gas  $\rightarrow$  solid<sub>2</sub>.** G. S. GARDNER (J. Math. Phys. Mass. Inst. Tech., 1935, 14, 241—259).—Based on Langmuir's treatment and Fourier's law for heat conduction, an equation is derived for the rate of a solid-gas reaction and is integrated for six special cases covering all types of available data. Results are illustrated by curves using available data for the reaction of anhyd. NH<sub>3</sub> with mixtures of powdered glass and  $\alpha$ - and  $\beta$ -C<sub>10</sub>H<sub>7</sub>-OH, phthalic acid, tartaric acid, and quinol, and for NH<sub>3</sub>-anhyd. CuSO<sub>4</sub>, N<sub>2</sub>-CaC<sub>2</sub>, *p*-anisidine in HCl-air, and  $\psi$ -cumenol in NH<sub>3</sub>-air.

N. M. B.

**Stability of solid pharmaceutical hydrogen peroxide preparations.**—See B., 1936, 74.

**Influence of fluid velocity on heterogeneous reactions. IV. Absorption of ammonia in wetted-wall towers.** S. UCHIDA and S. MAEDA. **V. Model experiment of chemical change in packed towers.** S. UCHIDA and S. SHONOYA (J. Soc. Chem. Ind. Japan, 1935, 38, 625B, 626—629B).—**IV.** Uchida's theoretical relationship (A., 1934, 1312) is roughly confirmed by experiment.

**V.** The factors governing the velocity of solid-liquid reactions in dynamic systems, where the rate of diffusion is predominant, have been correlated from experiments on the dissolution of sugar in packed columns.

J. S. A.

**Application of A. N. Schtschukarev's method of determining densities to the study of the reaction of polymorphic transformation of  $\beta$ -into  $\alpha$ -silver iodide.** V. LINITZKI (Ukrain. Chem. J., 1935, 10, 283—284).—The rate of transformation is determined by measuring the apparent change in wt. of a sample immersed in paraffin heated at 148°.

R. T.

**Velocity of absorption of oxides of nitrogen.** V. I. ATROSCITSCHENKO (Ukrain. Chem. J., 1935, 10, 295—304).—The relative velocity,  $V$ , of absorption of NO<sub>2</sub> at 20° by various liquids is: H<sub>2</sub>O 1, 6 and 20% HNO<sub>3</sub> 0.84 and 0.79, 4.5 and 20% NaOH 0.57 and 0.526, 17% KOH 0.515, 90.2% H<sub>2</sub>SO<sub>4</sub> 0.42, 10.6% Na<sub>2</sub>CO<sub>3</sub> 0.375, and liquid paraffin 0.072. The corresponding figures for NO-NO<sub>2</sub> mixture are 1, 0.85 and 0.65, 0.83 and 1.02, 1.05, 14.0, 0.134, and 0.0, and the corresponding ratios  $V_{\text{NO}_2}/V_{\text{N}_2\text{O}_5}$  are 4.2, 4.2, 5.0, 2.9, 2.2, 2.1, and 0.13 (Na<sub>2</sub>CO<sub>3</sub> and paraffin not given).

R. T.

**Kinetics of dehydration of gypsum.** P. P. BUDNIKOV and L. A. SCHTSCHUKAREVA (Kolloid-Z., 1935, 73, 334—339).—Determinations of loss of wt. show that the dehydration of CaSO<sub>4</sub>·2H<sub>2</sub>O at 107° follows the course of a unimol. reaction. The presence of small amounts of NaCl or KCl has a strong retarding action.

E. S. H.

**Deflagration of explosive substances by ultrasonic radiation.** N. MARINESCO (Compt. rend., 1935, 201, 1187—1189).—Substances very sensitive to shock, e.g., NI<sub>3</sub>, have been deflagrated by ultrasonic radiation. Others must be suspended in non-wetting liquids, when deflagration is induced by heating of the adhering air.

T. G. P.

**Kinetics of solid-phase reactions of certain carbonates with mullite, silica, and alumina.**—See B., 1936, 20.

**Reduction of iron oxides by gaseous reducing agents. I. Velocity of reduction of ferric oxide by hydrogen.** G. I. TSCHUFAROV and A. P. LOCHVITZKAJA (J. Phys. Chem. U.S.S.R., 1934, 5, 1103—1113).—Reduction of Fe<sub>2</sub>O<sub>3</sub> is not autocatalytic. The remaining stages are autocatalytic intersurface reactions. Data for the rates of reduction at 300—900° under various conditions are given. The porosity of the product is the greater the lower is the reduction temp.

CH. Abs. (c)

**Comparison between the effect of hydrogen-ion concentration on the rate of corrosion of steel in pure oxygen and air at 25°.** J. M. BRYAN (Trans. Faraday Soc., 1935, 31, 1714—1718; cf. A., 1933, 1251; 1935, 43).—The effect of a high [O<sub>2</sub>] on the corrosion of Fe in citric acid containing varying amounts of Na citrate is to equalise the attack over most of the  $p_{\text{H}}$  range 2.4—5.5. Using fast-corroding steel the evolution of H<sub>2</sub> is inhibited by pure O<sub>2</sub> at high acidity, thus counterbalancing the increase in rate of corrosion through depolarisation. As the [Fe] in the solution increases its effect overshadows that of the direct action of O<sub>2</sub> at the metal surface.

J. W. S.

**Rate of dissolution of iron in molten zinc.**—See B., 1936, 23.

**Explosive decomposition of tetryl.** A. LUKIN and S. ROGINSKI (Acta Physicochim. U.R.S.S., 1935, 2, 385—396; cf. J.C.S., 1921, 119, 721).—The time required for the explosion of tetryl to occur in a sealed vessel has been studied as a function of temp. and at 156° as a function of the amount of picric acid added.

J. W. S.

**Kinetics of the oxidation of fats and oils.**—See B., 1936, 27.

**Structure theory of chemical change. Complete system of doublet reactions.** A. A. BALANDIN (*Acta Physicochim. U.R.S.S.*, 1935, 2, 177—202; cf. A., 1929, 519, 890).—A complete system of "doublet" reactions in org. chemistry is drawn up. All have not been experimentally realised. The theory of structure of reactions may also be applied to heterogeneous reactions. Hydrogenation reactions are more fully discussed. A. J. M.

**Directions of reactions of decomposition and condensation.** A. A. BALANDIN (*Acta Physicochim. U.R.S.S.*, 1935, 2, 345—362; cf. preceding abstract).—The author's theory is extended to the determination of the different possible directions in which a complicated mol. can react. J. W. S.

**Application of the structure theory of reactions to Lebedev's synthesis of butadiene from alcohol and to Rice's theory of pyrolysis.** A. A. BALANDIN (*Acta Physicochim. U.R.S.S.*, 1935, 2, 363—376).—The author's theory (cf. preceding abstracts) is applied to the catalytic decomp. of EtOH at 450°, with special reference to the formation of  $(\text{CH}_2\text{:CH})_2$ . Rice's theory of thermal decomp., which is in accord with the doublet mechanism of decomp., is developed and applied to cyclic hydrocarbons. The results are in qual. agreement with experiment. J. W. S.

**Inhibition of homogeneous reactions by small quantities of nitric oxide.** L. A. K. STAVELEY and C. N. HINSHELWOOD (*Nature*, 1936, 137, 29—30).—Small amounts of NO (0.1—1 mm.) reduce the rate of decomp. of  $\text{Et}_2\text{O}$ ,  $\text{EtOPr}$ ,  $\text{Pr}^t_2\text{O}$ , and  $\text{EtCHO}$  to a well-defined limit.  $\text{MeOH}$ ,  $\text{COMe}_3$ , and  $\text{MeCHO}$  give negative results. The effect is as though short reaction chains were broken up by the NO. L. S. T.

**Catalysis of hydrogen peroxide [decomposition] by iron salts.** N. JERMOLENKO and E. NOVIKOVA (*Z. anorg. Chem.*, 1935, 225, 333—336).—A study of the catalytic decomp. of  $\text{H}_2\text{O}_2$  by Fe salts of varying solubility and tendency to colloid formation indicates that catalysis is mainly due to colloidal  $\text{Fe}(\text{OH})_3$  containing adsorbed  $\text{Fe}^{+++}$ . M. S. B.

**Efficiency of stabilisers used in the preservation of hydrogen peroxide.**—See B., 1936, 18.

**Homogeneous catalysis: decomposition of acraldehyde catalysed by iodine.** H. W. THOMPSON and J. J. FREWING (*Trans. Faraday Soc.*, 1935, 13, 1660—1668).—The decomp. of  $\text{CH}_2\text{:CH}\cdot\text{CHO}$ , catalysed by I, occurs 100° lower than in the absence of catalyst. The velocity of reaction  $\propto [\text{I}]^{\frac{1}{2}}$ . The reaction is only slightly retarded by packing the vessel, but is appreciably retarded by increasing  $[\text{CH}_2\text{:CH}\cdot\text{CHO}]$ . Probably catalysis occurs through  $\text{I}_2$  mols. and the short chains are propagated and broken both by  $\text{CH}_2\text{:CH}\cdot\text{CHO}$  and  $\text{I}_2$  mols. J. W. S.

**Kinetics of the autoxidation of pyrocatechol in presence of several foreign substances.** G. E. K. BRANCH and M. A. JOSLYN (*J. Amer. Chem. Soc.*, 1935, 57, 2388—2394).—Cysteine,  $\text{K}_2\text{SO}_3$ , and  $o\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$  inhibit the  $\text{O}_2$  absorption of pyrocatechol (I), whilst quinol (II), resorcinol, pyrogallol (III), gallic acid, and  $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$  accelerate it.

In mixtures of (I) with (II) or (III) the rate increases almost to that for pure (II) or (III). A chain-exchanging mechanism is postulated. E. S. H.

**Behaviour of chromic oxide towards alkali halogenate solutions. II. Autocatalysis in the system chromic oxide-bromate and the influence of bromides in solution.** R. LYDEN (*Z. anorg. Chem.*, 1935, 226, 46—56).—Oxidation of  $\text{Cr}_2\text{O}_3$  by neutral aq.  $\text{KBrO}_3$  (cf. A., 1935, 834) is entirely prevented by the previous addition of alkali hydroxide or carbonate. The reaction is catalysed by  $\text{H}^+$ , and since these are formed in the course of the reaction the latter is autocatalytic. The effect of added  $\text{Br}^-$  is to depress the catalytic action of  $\text{H}^+$ . F. L. U.

**Theory of heterogeneous catalysis.** P. D. DANKOV (*Compt. rend. Acad. Sci. U.R.S.S.*, 1935, 3, 253—256).—A theory which relates dispersion to catalytic activity renders possible the determination of the elementary catalysing area, indicates the connexion between the structure of the reacting mols. and the activity and structure of the catalyst, gives qualitatively new and quantitatively computable causes for the poisoning and promoting of catalysts, and points to new methods of interpreting and estimating chemical processes on the surface. W. R. A.

**Compact disperse materials. Action of hydrogen peroxide on ferric hydroxide.** H. W. KOHL-SCHUTTER and H. SIECKE (*Z. Elektrochem.*, 1935, 41, 851—860; cf. A., 1933, 1019).—The catalytic activity (in decomp.  $\text{H}_2\text{O}_2$ ) of pseudomorphic  $\text{Fe}(\text{OH})_3$  has been studied in relation to  $\text{H}_2\text{O}$  content, degree of dispersion, and chemical reactivity. The results are discussed from the point of view of its structure. F. L. U.

**Reality of the chains in heterogeneous-homogeneous catalysis.** M. POLJAKOV and A. ELKEN-BARD (*Acta Physicochim. U.R.S.S.*, 1935, 2, 397—400).—When a Pt spiral is heated to > about 250° in a 3 : 1  $\text{H}_2\text{-O}_2$  mixture contained in a vessel the walls of which are cooled in liquid air,  $\text{H}_2\text{O}_2$  is produced in a quantity which increases with rise of temp. of the Pt. If, however, a Pt gauze is interposed between the spiral and wall,  $\text{H}_2\text{O}_2$  formation is almost undetectable. The gauze therefore either eliminates the step in the reaction which gives rise to  $\text{H}_2\text{O}_2$  or causes stoppage of the chains. This observation proves the existence of a homogeneous process in this heterogeneous catalytic reaction, and also the chain mechanism of this process. J. W. S.

**Catalysis by fusions.** I. E. ADADUROV and P. D. DIDENKO (*J. Amer. Chem. Soc.*, 1935, 57, 2718—2722).—The catalytic activity of Sn in the oxidation of  $\text{NH}_3$  by air increases with rise of temp. beyond the m.p.; thus the crystal lattice of Sn is not involved, but it is shown that the catalysis is actually due to  $\text{SnO}_2$ . When Ag is used as the catalyst, no oxide is formed and the catalytic activity falls abruptly, with simultaneous change in the type of reaction, at the m.p. The bearing of these results on other catalytic reactions is discussed. E. S. H.

**Inflammability of ammonia in presence and absence of a catalyst.** H. ABESHAUS, N. TOKAREV, and N. NEKRASSOV (*Acta Physicochim. U.R.S.S.*,

1935, 2, 401—420).—The limiting pressures for the explosion of  $\text{NH}_3$ -air mixtures have been studied as a function of temp. and  $[\text{NH}_3]$  without a catalyst, and in presence of Pt gauze treated in various ways. The explosion region becomes narrower in presence of  $\text{H}_2\text{O}$  vapour, especially in decreasing the max.  $[\text{NH}_3]$  for explosion. The photochemical oxidation of  $\text{NH}_3$  has also been investigated, and the mechanism of the oxidation process is discussed.  
J. W. S.

**Velocity of decomposition of ammonia on thoriated tungsten.** I. MOTSCHAN, I. PEREVESSEV, and S. ROGINSKI (*Acta Physicochim. U.R.S.S.*, 1935, 2, 203—210).—The addition of Th to a W surface has no effect on the catalytic activity of W in the decomp. of  $\text{NH}_3$ .  
A. J. M.

**Dependence of the structure of an ammonia catalyst on the conditions of its reduction.** A. M. STEFANOVSKI, E. S. TATARSKI, and N. V. SELJAKOV (*Compt. rend. Acad. Sci. U.R.S.S.*, 1935, 3, 21—24).—Higher temp. of prep. cause a diminution in activity associated with readjustment of the crystal lattice.  
C. W. G.

**Active oxides. LXXXVII. Active states of the systems cadmium oxide-iron oxide and beryllium oxide-iron oxide with regard to their catalytic activity in the decomposition of nitrous oxides.** G. F. HUTTIG, G. SIEBER, and H. KITTEL (*Acta Physicochim. U.R.S.S.*, 1935, 2, 129—150).—Equimol. mixtures of  $\text{CdO}$  and  $\text{Fe}_2\text{O}_3$ , and  $\text{BeO}$  and  $\text{Fe}_2\text{O}_3$ , respectively, were heated at various temp. and the catalytic effect on the decomp. of  $\text{N}_2\text{O}$ , colour, and magnetic susceptibility was determined with respect to the temp. at which the systems were heated. The results of the catalytic action are expressed by  $\log \alpha = (-q/RT) + \log n'$ , where  $\alpha$  is the % of  $\text{N}_2\text{O}$  decomposed,  $T$  is the abs. temp. of heating, and  $q$  and  $n'$  are consts. for each system.  $q$  may be regarded as a heat of activation, whereas  $n' \propto$  the no. of active spots. The higher is  $q$ , the smaller is the activity of individual active spots. For the system  $\text{CdO-Fe}_2\text{O}_3$  there is no perceptible change in properties at temp.  $< 450^\circ$ . At about this temp. there is a slight colour change, accompanied by the commencement of catalytic action, which reaches a max. at about  $550^\circ$ . The magnetic susceptibility shows a sudden increase at about  $550^\circ$ , and reaches a max. at  $750^\circ$ . Similar results are obtained for the system  $\text{BeO-Fe}_2\text{O}_3$ , but in this case, unlike the first, the decrease in activity after the max. cannot be ascribed to compound formation. The ageing of active  $\text{MgO}$  (decrease of activity with time) has also been investigated.  
A. J. M.

**Acceleration of the reaction  $\text{C} + \text{CO}_2 \rightarrow 2\text{CO}$  by the presence of some salts.** U. NISHIOKA (*Kin.-no-Ken.*, 1935, 12, 42—48).—Rates of formation of  $\text{CO}$  from  $\text{C}$  and  $\text{CO}_2$  at  $1000^\circ$  were measured with various carbonates and chlorides of alkali and alkaline-earth metals as catalysts. The catalytic activity increased with the at. wt. of the metal forming the salt.  
CH. ABS. (e)

**Catalytic oxidation of carbon.** J. E. DAY, R. F. ROBEY, and H. J. DAUBEN (*J. Amer. Chem. Soc.*, 1935, 57, 2725—2726).— $\text{LiCl}$ ,  $\text{NaCl}$ ,  $\text{KCl}$ ,  $\text{CaCl}_2$ ,  $\text{SrCl}_2$ ,

$\text{BaCl}_2$ ,  $\text{Ca(OH)}_2$ ,  $\text{Ba(OH)}_2$ ,  $\text{Na}_2\text{SO}_4$ , and  $\text{K}_2\text{SO}_4$  catalyse the oxidation of films of deposited  $\text{C}$ . E. S. H.

**Kinetics of the reaction between carbon dioxide and hydrogen on platinum from the viewpoint of the adsorption theory of catalysis.** M. TEMKIN and E. MICHALLOVA (*Acta Physicochim. U.R.S.S.*, 1935, 2, 9—32).—Previous results (A., 1925, ii, 564; 1930, 551) are in error owing to poisoning of the Pt wire. The reaction, which has been studied in vessels at  $-78^\circ$  with filament temp. of about  $800^\circ$  abs., yields a small amount of  $\text{C}$  besides the main products  $\text{CO} + \text{H}_2\text{O}$ . The rate is given by  $dp_{\text{CO}}/dt = k_1 p_{\text{H}_2} / (k_2 p_{\text{H}_2} + p_{\text{CO}})$ , which has been derived from the assumption that the reaction velocity depends on the rate of evaporation of  $\text{CO}$  from the surface. Rates of evaporation observed at different temp. are in agreement with Langmuir's results (A., 1921, ii, 629) and the activation energy of evaporation (22,000—25,000 g.-cal.) approximates to the heat of adsorption of  $\text{CO}$ . The application of adsorption equilibrium equations to heterogeneous reactions is not always valid.  
R. S.

**Dissociation of antimony trihydride: an autocatalytic heterogeneous reaction.** J. GUERON and A. LALANDE (*Bull. Soc. chim.*, 1935, [v], 2, 2240—2258).—An expression is derived for the velocity of an irreversible gaseous reaction catalysed by a solid, using Langmuir's adsorption equation. The expression is shown to represent the autocatalytic thermal decomp. (2—95%) of  $\text{SbH}_3$  if the reaction in the adsorbed phase is unimol.  
F. L. U.

**Nature of the surface of copper catalysts.** W. W. RUSSELL and L. G. GHERING (*J. Amer. Chem. Soc.*, 1935, 57, 2544—2552).—Determinations of the catalytic activity of poisoned (with  $\text{O}_2$  or  $\text{N}_2\text{O}$ ) and unpoisoned surfaces of  $\text{Cu}$  by means of the  $\text{C}_2\text{H}_4\text{-H}_2$  reaction at  $0^\circ$ , and of the heat of sorption of  $\text{O}_2$ , show that the  $\text{Cu}$  surface is non-uniform and that the above catalytic reaction proceeds almost exclusively on a relatively few surface types, probably of intermediate character.  
E. S. H.

**Promoter action of gases on hydrogenation catalysts.** K. ABLESOVA and S. ROGINSKI (*Z. physikal. Chem.*, 1935, 174, 449—464; cf. A., 1935, 830).—The catalytic activity in respect of the hydrogenation of  $\text{C}_2\text{H}_4$  of  $\text{Ni}$  films formed by evaporation in presence of  $\text{H}_2$  passes through a marked max. with increase in the amount of  $\text{H}_2$  sorbed in the prep. of the film; this corresponds with  $\sim 1 \text{ H}_2$  mol. per 100  $\text{Ni}$  atoms. Such activated films are not affected by poisons, but, except at very low temp., are irreversibly deactivated by exposure to high vac. The promoter action of the sorbed gas is possibly due to its influence on activated sorption; the prevention of recrystallisation may also be an accessory factor.  
R. C.

**Activation of specific bonds in complex molecules at catalytic surfaces.** H. S. TAYLOR, K. MORIKAWA, and W. S. BENEDICT (*J. Amer. Chem. Soc.*, 1935, 57, 2735).—By following the reactions (1)  $\text{C}_2\text{H}_6 + m\text{D}_2 \rightarrow \text{C}_2\text{H}_x\text{D}_y$  (where  $x+y=6$  and  $m$  may be varied arbitrarily) and (2)  $\text{C}_2\text{H}_6 + \text{H}_2 = 2\text{CH}_4$ , which

involve, respectively, the C-H and C-C linkings, the specificity of catalyst surfaces may be studied.

E. S. H.

**Effect of adsorbed water on the catalytic decomposition of hydrocarbons (by a molecular beam method).** O. BEECK (Nature, 1935, 136, 1028—1029).—The catalytic decomp. of hydrocarbons at a hot Pt or C surface has been investigated by means of a mol. beam technique. No dehydrogenation of paraffins, olefines, or alcohols occurs unless traces of  $H_2O$  are present. It is probable that this  $H_2O$  is necessary to maintain a unimol. layer on the catalytic surface and that this layer is the true seat of dehydrogenation. Dehydrogenation is inhibited by an excess of  $H_2O$  on the Pt in the lower temp. region and the temp. at which the reaction falls off thus depends on the  $H_2O$  content of the gas investigated. Traces of air in presence of traces of  $H_2O$  do not affect the reactions. There is evidence that  $H_2O$  may be substituted by other mols. having H linkings with electronegative elements, *e.g.*,  $H_2S$ . The primary reaction appears to be the formation of free radicals by rupture of C-C, except in the case of  $CH_4$ , which may decompose into  $H_2$  and  $CH_2$ . The presence of  $H_2O$  is also necessary for the hydrogenation of unsaturated hydrocarbons. L. S. T.

**Decomposition of propane and *n*-butane at carbon filaments.** L. BELCHETZ and E. K. RIDEAL (J. Amer. Chem. Soc., 1935, 57, 2466—2469).—The gases were passed at high steaming velocity and low pressure (0.1 mm.) over a heated C filament placed 2—3 mm. from a Te mirror, kept at 100°, with which any radicals formed could react. The first step is the production of  $H_2$  and the complementary olefine. The latter can then dissociate to  $CH_2$  and the next lower olefine, except with  $\Delta^2$ -butene, which may be further dehydrogenated to butadiene.  $CH_2$  subsequently reacts with surrounding mols. The energies of activation for the two reactions are 94.2 and 93.2 kg.-cal., respectively. E. S. H.

**Reaction of hydrogen and deuterium with ethylene at a nickel surface.** T. TUCHOLSKI and E. K. RIDEAL (J.C.S., 1935, 1701—1704).—The combination of  $H_2$  and  $D_2$  with  $C_2H_4$  on a Ni filament at  $> 0^\circ$  is almost of zero order. At 0—140°, the velocity coeff.,  $k$ , for  $H_2$  is  $>$  for  $D_2$  and the difference between the energies of activation decreases from approx. 0.79 to approx. 0.5 kg.-cal. with rise of temp.  $k_H$  and  $k_D$  have max. vals. at approx. 140° and 160°, respectively, and at 165—168°,  $k_H$  and  $k_D$  are almost identical. The results negative zur Strassen's interpretation (A., 1934, 974) of the inversion of the temp. coeff., and a mechanism is suggested.

J. G. A. G.

**Hydrogenation of ethylene with nickel as a catalyst at low temperatures.** O. TOYAMA (Proc. Imp. Acad. Tokyo, 1935, 11, 319—321).—The velocity between  $-70^\circ$  and  $0^\circ$  increases with the pressure of  $H_2$  and decreases gradually with increasing pressure of  $C_2H_4$ .  $C_2H_6$  has little effect. The apparent heat of activation is approx. 6 kg.-cal. The rate of the initial reaction is increased by pretreating the catalyst with  $H_2$ , but  $C_2H_4$  has a retarding effect. The

reaction is probably a bimol. combination of  $H_2$  and  $C_2H_4$  at the Ni surface. J. G. A. G.

**Ferromagnetic transformation and catalytic activity. IV. Hydrogenation of carbon monoxide and ethylene over nickel, and formation of carbon dioxide from carbon monoxide over the Heusler alloy  $MnAlCu_2$ .** J. A. HEDVALL and R. HEDIN (Z. physikal. Chem., 1935, B, 30, 280—288; cf. A., 1935, 1467).—The course of each of these reactions changes abruptly when the ferromagnetic transformation of the catalyst occurs. R. C.

**Preparation of platinum oxide reduction catalysts.** W. F. SHORT (J.S.C.I., 1936, 55, 14T).—The  $H_2PtCl_6-NaNO_3$  fusion is conducted in a 50-c.c. Pyrex beaker resting in a cavity (47 mm. diameter, 25 mm. deep) in a Cu block (37—40 mm. high, 90 mm. diameter) provided with a thermometer pocket. By working at a definite temp. (usually 500—550°) catalysts of max. activity can be prepared with certainty.

**Catalytic properties of rhenium and of certain of its compounds.** S. B. ANISIMOV, V. M. KRASCHENNIKOVA, and M. S. PLATONOV (J. Gen. Chem. Russ., 1935, 5, 1059—1065).—The catalytic activity of Re (on kaolin) is small for reactions of hydrogenation, considerable for that of dehydrogenation of EtOH to MeCHO (max. yields at 300° and 600°, with a min. at 400°), and very small for those of oxidation, owing to formation of oxides of Re volatile at  $> 100^\circ$ . Re is readily recovered from the catalyst by heating the mass at 200° in an atm. of  $O_2$  in a sealed tube, when  $Re_2O_7$  condenses in the cooled upper part of the tube. R. T.

**Comparative action of mixed catalysts when used for the joint dehydration of ethyl alcohol and ammonia. I.** N. I. SCHUIKIN, A. A. BALANDIN, and Z. I. PLOTKIN. **Comparative action of mixed catalysts when used for the joint dehydration of ethyl alcohol and aniline. II.** N. I. SCHUIKIN, A. A. BALANDIN, and F. T. DIMOV (J. Physical Chem., 1935, 39, 1197—1205, 1207—1216; cf. A., 1932, 1232).—I. Mixtures of  $Al_2O_3$  with  $ZnO$  (10%),  $SnO$  (10%),  $Cr_2O_3$  (20%), and  $Fe_2O_3$  (10%) have been compared with pure  $Al_2O_3$  with regard to their activity in ethylating  $NH_3$ . All but the last-named decrease the reaction rate. The  $Al_2O_3-Fe_2O_3$  mixture is superior to  $Al_2O_3$  in causing less decomp. of EtOH. The results are discussed theoretically.

II. The activity of the above mixtures and of  $Al_2O_3+NiO$  (5%) in promoting the formation of  $NHPhEt$  and  $NPhEt_2$  from EtOH and  $NH_2Ph$  has been determined. All the mixtures studied are less active than  $Al_2O_3$ , but that with  $Fe_2O_3$  causes less decomp. of EtOH.  $NHPhEt$  is formed almost exclusively. F. L. U.

**Production of hydrocarbons from fatty acids by [catalytic] hydrogenation.**—See B., 1936, 10.

**Kinetics of catalytic oxidation of hydrocarbons and their derivatives.**—See B., 1936, 10.

[Asymmetric] catalysis with organic fibres. II. G. BREDIG, F. GERSTNER, and H. LANG (Biochem. Z., 1935, 282, 88—98; cf. A., 1932, 1062).—When PhCHO was replaced by MeCHO, cinnamaldehyde, anisaldehyde, and piperonal, part of the product was levorotatory in all cases. Bases other than  $\text{NH}_4\text{Et}_2$  (24 tested) combined with cotton fibres to produce substances which catalysed the production of mandelonitrile (I), levorotatory (I) being obtained in many cases. Catalysts from *tert.* bases produced no asymmetry; those from *sec.* produced asymmetry more often than those from primary bases. Catalyst from optically active bases other than coniine produced no asymmetry. *cis-d*-Diaminotrimethylcyclopentane (II) forms with the fibres a very active catalyst but this produces no asymmetry. (II) without fibres is less active but produces asymmetry. The decarboxylation of optically active and inactive camphorcarboxylic acid and bromocamphorcarboxylic acid by the catalysts (from optically active or inactive bases) yields no asymmetric products. Decarboxylation caused by (II) produces no asymmetry but the effect is greater with than without fixation on the fibres.

W. McC.

Influence of electrolyte on the concentration of heavy water. A. E. BRODSKI and N. P. SKRINNKOVA (Acta Physicochim. U.R.S.S., 1935, 2, 809—810; cf. this vol., 160).—The separation factors, determined by electrolysis 100 c.c. of 0.2*N*-salt solutions in 0.1%  $\text{D}_2\text{O}$  between Pt electrodes and measuring the concn. of  $\text{D}_2\text{O}$  in the residual liquid (12.5 c.c.), increase from 5.6 for KOH through  $\text{H}_2\text{SO}_4$ , KCl, NaCl, and  $\text{K}_2\text{CO}_3$  to 10.6 for  $\text{Li}_2\text{SO}_4$ .

T. G. P.

Electrolytic separation of the oxygen isotopes. G. OGDEN (Nature, 1935, 136, 912).—Using Ni electrodes and 1.25*N*-NaOH as electrolyte, the val. found for the electrolytic separation coeff.,  $\alpha$ , for the O isotopes is 0.87. Calc. vals. for  $\alpha$  lie between 0.86 and 1, depending on the width and height of the energy barrier, and allowing for the possibility of "tunnelling" of these barriers by complexes such as  $\text{O}^{16}\text{H}$  and  $\text{O}^{18}\text{H}$ . With the most favourable val. of  $\alpha$ , the  $[\text{O}^{18}]$  in pure  $\text{D}_2\text{O}$  prepared by electrolytic methods can never be > approx. 0.6%. L. S. T.

Theory of combustion of graphite. IV. V. SIHVONEN (Suomen Kem., 1935, 8, B, 47—49; cf. A., 1935, 1210).—Further experiments on the electrolytic oxidation of graphite (I) in fused  $\text{NaKCO}_3$  show  $\text{CO}$  and  $\text{CO}_2$  to be primary oxidation products in addition to electrolytically liberated  $\text{CO}_2$ . (I) with poorly developed crystal structure is more readily attacked by electrolytic oxidation than highly cryst. (I), but the lamellar structure of the latter favours formation of graphitic oxide.

J. S. A.

Electrolysis of bromides and iodides of zinc, nickel, and cobalt in mixtures of water and ethyl alcohol. C. CHARNETANT (Compt. rend., 1935, 201, 1174—1176; cf. A., 1935, 1086).—The nature of the products of electrolysis has been determined in relation to  $[\text{EtOH}]$ .

T. G. P.

Instantaneous action of certain colloids on the electrolytic deposition of copper. P. JACQUET

(Compt. rend., 1935, 201, 953—955; cf. A., 1935, 294).—Gelatin and serum-albumin influence the electro-deposition of Cu from aq.  $\text{CuSO}_4$  even during the first few secs. of the electrolysis. This is due to adsorption of the colloid on the metal surface. Other colloids which are not adsorbed (*e.g.*, gum arabic) must first be accumulated around the cathode by electrophoresis. Their action is not instantaneous.

H. J. E.

Electrolytic conduction of a solid insulator at high fields. Formation of anodic oxide film on aluminium. E. J. W. VERWEY (Physica, 1935, 11, 1059—1063; cf. A., 1935, 1307).—The formation of the  $\text{Al}_2\text{O}_3$  film is due to concn. of O ions at the Al anode.  $\text{Al}^{+++}$  ions liberated from the metal are then drawn into the O lattice. As soon as the field, which decreases with increasing thickness of the  $\text{Al}_2\text{O}_3$  layer, is insufficient for appreciable mobility of the cations, growth of the oxide coating stops.

H. J. E.

Electrolysis under the microscope. X. Crystallisation centres in cathodic deposition of gold. A. GLAZUNOV and B. HONZA (Chem. Obzor, 1934, 9, 124—126; Chem. Zentr., 1935, i, 2651).—The no. of crystallisation centres during electrolysis of  $\text{AuCl}_3$  increases with the c.d. Formation of complex Au ions leads to the deposition of colloidal Au. In acid solution or in presence of org. compounds, a higher c.d. is required for such colloidal deposition.  $\text{PdCl}_2$  behaves similarly.

J. S. A.

Action of silent electric discharge on nitric oxide. Production of active nitrogen. C. ZENGHELIS and K. EVANGELIDIS (Praktika, 1934, 9, 266—267; Chem. Zentr., 1935, i, 2770).—Reaction takes place in three stages: (i) decomp. into  $\text{N}_2$ ,  $\text{O}_2$ , and  $\text{O}_3$ , active N, which forms  $\text{NH}_3$  from  $\text{H}_2\text{O}$  present, and  $\text{NO}_x$ , (ii) oxidation of NO to  $\text{NO}_2$  and  $\text{N}_2\text{O}_5$ , (iii) reaction of NO with  $\text{NO}_2$  to form  $\text{N}_2\text{O}_5$ . Only stage (iii) is accelerated by the discharge.

J. S. A.

Influence of inert additions on the lower limit of the photochemical explosion of the  $\text{H}_2 + \text{Cl}_2$  mixture. F. A. LAVROV and T. PERELMAN (Acta Physicochim. U.R.S.S., 1935, 2, 91—102).—The influence of excess of  $\text{H}_2$  or  $\text{Cl}_2$  and additions of  $\text{N}_2$ , A,  $\text{CO}_2$ , and HCl on the lower explosion pressure  $P$  of stoichiometric  $\text{H}_2 + \text{Cl}_2$  mixtures has been studied.  $P$  is a min. at 70%  $\text{Cl}_2$  and then increases linearly with the pressure of added gas in accordance with a theoretical equation. Assuming equal deactivation probabilities  $\epsilon$  in each case, the ratio addition concn./ $[\text{N}_2]$  for a given  $P$  has been calc. and good agreement obtained with experimental ratios, except in the case of HCl, when  $\epsilon_{\text{N}_2} = 2.2\epsilon_{\text{HCl}}$ . It is supposed that HCl becomes excited and may then activate another  $\text{Cl}_2$ . The occurrence of  $P_{\text{min}}$  at 70%  $\text{Cl}_2$  is ascribed to excited  $\text{Cl}_2$  in the role of chain carrier.

R. S.

Photochemical decomposition of nitric oxide. P. J. FLORY and H. L. JOHNSTON (J. Amer. Chem. Soc., 1935, 57, 2641—2651).—Using radiation from the Hg arc or from sparks between electrodes of Al, Zn, Cd, Ni, Cu, or Sn over the range 0.02—7 mm., the final reaction products are  $\text{N}_2$  and  $\text{O}_2$ . The rate of decomp.  $\propto$  the rate of light absorption for light of the effective wave-length and, at very low pressures,

$\propto$  pressure. The rate is not influenced by dilution with  $N_2$ . Evidence of a primary process of pre-dissociation is adduced.

E. S. H.

**An error in photographic photometry.** J. LAGRULA (Compt. rend., 1935, 201, 1025—1026).

T. G. P.

[Photographic] image reversal in silver iodide and mercury iodide [emulsions]. LÜPPO-CRAMER (Z. wiss. Phot., 1935, 34, 292—304).—Similarly to AgI emulsions, HgI<sub>2</sub> emulsions (in gum arabic) give reversed images on development, if before or after the normal exposure to a 100-watt lamp they have been briefly exposed to diffuse daylight. Using either AgI or HgI<sub>2</sub> emulsions, prolonged exposure to sunlight produced lower densities than normal exposure to diffuse daylight. These and other similar data are compared with the usual types of solarisation (with AgBr emulsions), and the theory of solarisation is discussed at length; the regression theory (re-formation of Ag halide) is still supported, as it is claimed that no other hypothesis can explain the inhibition of solarisation by the presence of halogen acceptors (nitrites, sulphites).

J. L.

**Structure of the latent Röntgen [photographic] image.** W. HOFMANN (Z. wiss. Phot., 1935, 34, 267—275, 276—292).—An ordinary light image is formed mainly in the surface of a photographic layer, but an X-ray image is formed equally throughout the layer. Various experiments have been made on different aspects of the Villard effect (reduction of sensitivity to light by pre-exposure to X-rays). It is suggested that X-rays produce two kinds of latent image, one (R I) similar to an ordinary light image, and the other (R II) consisting of very small nuclei ("ultranuclei"). R II is not affected by physical or chemical development; the former produces a loose branching structure, not an image, and the latter, by dissolution of AgBr, causes assimilation of R II nuclei to R I nuclei, the R II image being therefore lost. Ordinary light converts R II into a new kind of image, L II, which is not physically developable, but after primary fixing gives nuclei more widespread and more developable than an ordinary light image, when subsequently chemically developed. The theory is applied to explain the Villard effect.

J. L.

**Effect of wave-length on the iodine-sensitised decomposition of ethylene iodide in carbon tetrachloride solution.** R. G. DICKINSON and N. P. NILES (J. Amer. Chem. Soc., 1935, 57, 2382—2386).—For  $\lambda$  4358, 5461, and 5770 with 5790 Å., the relative  $s$ . of the rate coeff. are 1 : 0.931 : 0.867. Light corresponding with continuous absorption in gaseous is slightly more effective in dissociating I in solution than is light corresponding with discontinuous absorption.

E. S. H.

**Photochemical investigations. II. Photochemical decomposition of ethylene iodide in solutions of carbon tetrachloride.** R. E. DEIGHT and E. O. WING (J. Amer. Chem. Soc., 1935, 57, 2411—2415; cf. A., 1930, 180).—The apparent quantum yield with  $\lambda$  303 and 313 m $\mu$  is 0.76, including the photo- and any subsequent thermal reactions. The

mechanism discussed involves primary dissociation into  $C_2H_4I$  and I atoms.

E. S. H.

**Photochemical reaction between sodium formate and iodine, and a relation between chemical reactivity and light absorption.** N. R. DHAR and P. N. BHARGAVA (J. Physical Chem., 1935, 39, 1231—1244).—The reaction between HCO<sub>2</sub>Na and aq. I in the absence of KI is unimol. in the dark and semimol. in the light. The velocity of the photochemical change  $\propto I^n$  ( $I$  intensity,  $n$  0.75—1.5). Einstein's law is not obeyed, the quantum yield increasing with temp. and with frequency of the incident radiation. More light is absorbed by the mixture than by the reactants separately owing, it is suggested, to weakening of the binding forces.

F. L. U.

**Photochemical reactions of SH-compounds in solution.** J. WEISS and H. FISCHGOLD (Nature, 1936, 137, 71—72).—When aq. neutral or alkaline solutions of NaSH, EtSH, thioglycollic acid, cysteine, etc. are exposed to the radiation of a strong Hg arc H<sub>2</sub> is produced with the simultaneous formation of the corresponding disulphide compound. The quantum efficiency with respect to H<sub>2</sub> formation is always much  $< 1$ , indicating that reverse reactions occur. Some decomp. of RSH into RH and S also takes place. Many SH compounds react with fluorescent dyes in the dark at a measurable rate, and by irradiating with light which is absorbed by the dye, this reduction reaction is accelerated. The possible bearing of these results on the assimilation of CO<sub>2</sub> by S bacteria is discussed.

L. S. T.

**Hydrolysis of glucosides and of certain organic compounds by ultra-violet rays.** A. GUILLAUME and G. TANRET (Compt. rend., 1935, 201, 1057—1060).—Various glucosides are hydrolysed by ultra-violet rays of  $\lambda$  1800—3100 Å., rise of temp. and acidity of the medium increasing the speed of hydrolysis. Certain esters and amides are also hydrolysed by ultra-violet rays but polypeptides and proteins are resistant.

W. O. K.

**Reduction of ferric chloride under the action of  $\alpha$ -,  $\beta$ -, and  $\gamma$ -rays.** G. W. SPICER (Trans. Faraday Soc., 1935, 31, 1706—1710).—Complete reduction occurs when aq. or Et<sub>2</sub>O solutions of FeCl<sub>3</sub> are exposed to  $\alpha$ -rays, and when Et<sub>2</sub>O solutions are exposed to  $\beta$ - and  $\gamma$ -rays. Partial reduction only is observed when solid anhyd. FeCl<sub>3</sub> is exposed to  $\alpha$ -rays, but is probably complete in the thin layer penetrated by the radiation. No reduction is observed on exposing aq. FeCl<sub>3</sub> solutions to  $\beta$ - and  $\gamma$ -rays.

J. W. S.

**Ortho-para-hydrogen conversion under the action of  $\alpha$ -particles.** P. C. CAPRON (Ann. Soc. Sci. Bruxelles, 1935, 55, B, 222—236).—The reaction has been studied at room temp. in presence of Hg, which exerts an inhibitory effect. The rate  $\propto [\text{para-H}][\text{Rn}]$ , whilst  $M/I \propto [\text{para-H}]$  and is independent of the radiation intensity. It is probable that 1—2 H are formed per ion-pair and that H disappears according to a unimol. law. The possibility of the conversion being due to H<sup>+</sup> has been considered, but the fact that no change occurs at  $-187^\circ$  suggests that H is the effective agent.

R. S.

**Chemical action caused by neutrons and  $\gamma$ -rays and the effects of these agents on colloids.** F. L. HOPWOOD and J. T. PHILLIPS (*Nature*, 1935, **136**, 1026).—The effect produced by a pure  $\gamma$ -ray source,  $\text{RaSO}_4$  in Pt or Rn in glass surrounded by Pb, on the oxidation of  $\text{K}_2\text{S}_2\text{O}_5$  or of  $\text{NaHSO}_3$  and on the decomp. of  $\text{H}_2\text{O}_2$  is increased by using a source of equal strength which also emits neutrons. With hydrosols of Ag, Au,  $\text{As}_2\text{S}_3$ ,  $\text{CdS}$ ,  $\text{V}_2\text{O}_5$ , and  $\text{Fe}(\text{OH})_3$ , a source emitting  $\gamma$ -rays or  $\gamma$ -rays and neutrons increases the stability of the negatively charged sols and decreases that of the positively charged sols. Anomalous results are obtained when electrolytes are added to the sol before irradiation. The effect attributed to the neutrons alone is of the same order of magnitude as that due to the  $\gamma$ -rays, but the efficiency of the slow neutrons is much the greater. L. S. T.

**Sensitised decomposition of hydrogen with electrons of controlled energy.** G. GLOCKER and L. B. THOMAS (*J. Amer. Chem. Soc.*, 1935, **57**, 2352—2357).— $\text{H}_2$  mols. have been dissociated by electrons of known speed, using Hg atoms as a sensitising agent. The reactions are analogous to the photochemical decomp. of  $\text{H}_2$ , using  $\lambda$  2537 Å. and Hg. At low pressures ( $\text{H}_2$  at 0.02 mm. and Hg at 0.002 mm.) the short-lived radiative states of Hg (4.9 and 6.7 e.v.) and the well-known metastable states ( $6^3\text{P}_{0,2}$ ) are not efficient or are too short-lived to cause reaction, but electrons of 7.7 e.v. energy can dissociate  $\text{H}_2$  in presence of Hg. The mechanism is discussed. E. S. H.

**Decomposition of  $\text{SO}_2$  through electron impacts.** N. NEKRASSOV and A. SCHNEERSON (*Acta Physicochim. U.R.S.S.*, 1935, **2**, 711—732).—The crit. reaction potentials  $12.2 \pm 0.5$ ,  $15.7 \pm 0.5$ , and  $24.5$ — $26.5$  volts, corresponding with the changes  $\text{SO}_2 \rightarrow \text{SO}_2^+$ ,  $\text{SO}_2 \rightarrow \text{SO}^+ + \text{O}$  and double the potential of formation of  $\text{SO}_2^+$ , and the dependence of reaction velocity and electron yield on  $\text{SO}_2$  pressure and anode current, have been measured using a triode as a reaction chamber without freezing out the reaction products. The velocity of reaction is independent of temp. The conclusions of previous workers regarding reactions in electrical discharges are criticised as leaving out of account energetic relationships and ion recombination. T. G. P.

**Interaction of gases with solids.** H. W. MELVILLE (*Nature*, 1935, **136**, 899—900). L. S. T.

**Use of topology and invariants to describe chemical reactions.** F. M. SCHEMJAKIN (*Acta Physicochim. U.R.S.S.*, 1935, **2**, 557—558).—A preliminary note suggesting that chemical reactions may be classified according to geometric systems. O. J. W.

**Perchlorates. IV. Ammonia derivatives of alkali perchlorates.** C. SMEETS (*Natuurwetensch. Tijds.*, 1935, **17**, 213—217).—Isotherms for systems of the type  $\text{MClO}_4 \cdot \text{NH}_3$  indicate the existence of the compounds,  $\text{LiClO}_4 \cdot 2\text{NH}_3$  (I),  $\text{LiClO}_4 \cdot 3\text{NH}_3$  (II),  $\text{LiClO}_4 \cdot 5\text{NH}_3$ ,  $\text{NaClO}_4 \cdot 4\text{NH}_3$ , and  $\text{NH}_4\text{ClO}_4 \cdot 3\text{NH}_3$ . Only (I) and (II) are stable at room temp.  $\text{KClO}_4$  does not combine with  $\text{NH}_3$  even at  $-79^\circ$ . D. R. D.

**Formation and composition of lithium aluminate.** H. A. HORAN and J. B. DAMLANO (*J. Amer.*

*Chem. Soc.*, 1935, **57**, 2434—2436).—When  $\text{Al}^{+++}$  solutions, containing sufficient  $\text{Li}^+$ , are made alkaline with  $\text{NH}_3$ , a Li aluminate (at. ratio  $\text{Li} : \text{Al} = 1 : 2$ ) is pptd. almost quantitatively. After ignition to const. wt. the residue has the composition  $\text{Li}_2\text{O} \cdot 2\text{Al}_2\text{O}_3$ . E. S. H.

**Chemical and mineralogical examination of the precipitate obtained from 50% NaOH and sodium sulphate.** D. BOBROVNIK (*Ukrain. Chem. J.*, 1935, **10**, 320—330).—The solid phases separating when  $\text{Na}_2\text{SO}_4$  is added to 50% aq. NaOH, and the solution is cooled, are triple salts of  $\text{Na}_2\text{CO}_3$ ,  $\text{Na}_2\text{SO}_4$ , and NaCl, in the ratios 1 : 2 : 2, 1 : 2 : 4, 1 : 2 : 5, and 1 : 3 : 13. R. T.

**Decomposition of copper sulphate pentahydrate by heat.** O. BINDER (*Compt. rend.*, 1935, **201**, 1035—1036; cf. this vol., 38).— $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  heated at  $650^\circ$  yields  $\text{SO}_3 \cdot 2\text{CuO}$  (I), which gives  $\text{SO}_3 \cdot 4\text{CuO} \cdot 4\text{H}_2\text{O}$  (II) +  $2\text{CuSO}_4$  with cold  $\text{H}_2\text{O}$ , and  $\text{SO}_3 \cdot 3\text{CuO} \cdot 2\text{H}_2\text{O}$  (III) +  $\text{CuSO}_4$  with boiling  $\text{H}_2\text{O}$ . X-Ray photographs of (I), (II), and (III) are reproduced. T. G. P.

**Organic cupric tetrachlorides and tetrabromides.**—See this vol., 212.

**Reactions between aqueous solutions of silver nitrate, lead nitrate, and potassium permanganate.** F. JIRSA (*Z. anorg. Chem.*, 1935, **225**, 302—304).— $\text{AgNO}_3$  is oxidised by  $\text{KMnO}_4 + \text{KOH}$  to  $\text{Ag}_2\text{O}_2$ .  $\text{Pb}(\text{NO}_3)_2$  is oxidised by  $\text{KMnO}_4$  to  $\text{PbO}_2$ , and  $\text{Mn}_2\text{O}_3$  is formed. E. S. H.

**Hydrolysis of magnesium boride.** R. C. RAY and P. C. SINHA (*J.C.S.*, 1935, 1694—1695).—At  $>0^\circ$ , the hydrolysis of  $\text{Mg}_3\text{B}_2$  by  $\text{H}_2\text{O}$  or dil. aq.  $\text{EtOH} \cdot \text{HCl}$  is essentially  $\text{Mg}_3\text{B}_2 + 6\text{H}_2\text{O} \rightarrow \text{Mg}_3\text{B}_2(\text{OH})_6$  (I) +  $3\text{H}_2$ , but at  $<-10^\circ$  the product is  $\text{H}_3\text{B}_2(\text{MgOH})_3$ , which has reducing properties and is hydrolysed by  $\text{H}_2\text{O}$  to (I) and  $\text{H}_2$ . J. G. A. G.

**Mechanism of hydrolysis in solutions of salts of heavy metals.** (MLLE.) M. QUINTIN (*Compt. rend.*, 1935, **201**, 1176—1178).—In  $\text{CdCl}_2$  solutions  $< 0.05M$  the activity of the Cd ion  $\propto [\text{H}^+]$ . The first stage in the hydrolysis of this and similar salts (A., 1927, 729; 1928, 241) therefore involves complex formation. T. G. P.

**Chemical curiosity.** F. P. DWYER (*J. Proc. Austral. Chem. Inst.*, 1935, **2**, 318—320).—Vermiform growths are obtained by the action of Hg on  $\text{Hg}_2(\text{NO}_3)_2$ ,  $\text{Co}(\text{NO}_3)_2$ , and  $\text{Ni}(\text{NO}_3)_2$  in 60—70%  $\text{HNO}_3$ . J. S. A.

**Boron hydrides. XX. Potassium diborane,  $\text{K}_2(\text{B}_2\text{H}_6)$ .** A. STOCK, W. SUTTERLIN, and F. KURZEN. **XXI. Potassium compounds of  $\text{B}_4\text{H}_{10}$  and  $\text{B}_5\text{H}_9$ .** A. STOCK, F. KURZEN, and H. LAUDENKLOS (*Z. anorg. Chem.*, 1935, **225**, 225—242, 243—253; cf. A., 1934, 497).—XX.  $\text{K}_2(\text{B}_2\text{H}_6)$  (I) is prepared by agitating K amalgam with excess of  $\text{B}_2\text{H}_6$  and separating from Hg by distillation. It is stable at  $300^\circ$ , but decomposes at  $400^\circ$  as follows: (I) =  $\text{KB}_2\text{H}_2 + \text{K} + 2\text{H}_2$ . (I) is insol. in the usual org. solvents, but is hydrolysed by  $\text{H}_2\text{O}$ . The mechanism of hydrolysis has been investigated. With  $\text{HBr}$  the reaction (I) +  $2\text{HBr} = 2\text{KBr} + \text{B}_2\text{H}_6 + \text{H}_2$  occurs.

XXI. (II) has been prepared from  $B_4H_{10}$  and K amalgam. Separation from Hg is complicated by the ready decomp. of (II); at  $170^\circ$   $K_2(B_4H_8)$  is formed. (II) appears to be an intermediate product in the thermal decomp. of (I). Evidence for the formation of  $K_2(B_5H_9)$  from  $B_5H_9$  and K amalgam is given. E. S. H.

X-Ray investigation of potassium diborane and its hydrolysis products, especially potassium dihydroxydiborane. E. S. VON BERGKAMPF (Z. anorg. Chem., 1935, 225, 254—257).—The mechanism of hydrolysis of  $K_2(B_2H_6)$  (cf. preceding abstract) is confirmed. E. S. H.

Boron halide additive compounds of anomalous composition. II. Action of phosphine on boron fluoride. E. WIBERG and V. HEUBAUM (Z. anorg. Chem., 1935, 225, 270—272; cf. A., 1933, 917).—PH, and BF<sub>3</sub> react at  $-145^\circ$  to form  $PH_3BF_3$ . E. S. H.

Conditions for the formation and existence of kernite,  $Na_2B_4O_7 \cdot 4H_2O$ . H. MENZEL, H. SCHULZ, and H. DECKERT (Naturwiss., 1935, 23, 832—833).—The chemical properties, artificial prep., and range of stability of kernite have been investigated. With  $H_2O$  it gives  $Na_2B_4O_7 \cdot 10H_2O$  or the metastable  $Na_2B_4O_7 \cdot 5H_2O$ . The formation of kernite starts from a dihydrate. It may be prepared artificially by heating  $Na_2B_4O_7$  with 4.5—6 mols. of  $H_2O$  at  $140^\circ$  for 20 hr. in a sealed tube. Its temp. range of existence is approx.  $58-152^\circ$ . A. J. M.

Somatoids. II. Influence of other dissolved constituents on the forms exhibited by monobasic aluminium sulphite. III. Topochemical reactions on aluminium sulphite somatoids. K. HUBER (Helv. Chim. Acta, 1935, 18, 1316—1326, 1327—1335; cf. A., 1935, 1072).—II. The influence of (a) mineral acids, and their hydrolysable heavy metal salts, (b) chromic sulphite, and (c) NaOAc,  $Na_2HPO_4$ , and  $UO_2(OAc)_2$  on the form of the somatoids of monobasic Al sulphite (I) has been investigated. From the absence of sp. effects, and the similarity of the effects to those produced by temp. and concn. changes in the absence of foreign salts, it is concluded that disturbances in the  $Al_2O_3-H_2O-SO_2$  equilibrium and in the intermediate formation of  $Al(OH)_3$  are involved.  $Cr^{+++}$  and  $UO_2^{++}$  are taken up by the (I) lattice without altering its structure or dimensions.

III. The effects of heat, hydrolysis by  $H_2O$  and alkali, and oxidation on somatoids of (I) show the presence of a lamellar structure, and a differentiation between the outer skin and the centre of the somatoids. By ignition at  $400-500^\circ$ , (I) is converted directly into  $\alpha-Al_2O_3$ . Evidence is advanced of inhomogeneities in the internal structure. J. S. A.

Preparation of aluminium carbide,  $Al_4C_3$ . O. RUFF (Chem.-Ztg., 1936, 60, 28).—Al and C are heated in  $H_2$  at  $2000^\circ$  for 30 min. E. S. H.

Compounds of aluminium bromide with lithium, copper, and silver bromides. V. A. PLOTNIKOV and E. J. GORENBEIN (J. Gen. Chem. Russ., 1935, 5, 1108—1111).—The compounds  $LiBr \cdot AlBr_3$ , m.p.  $192^\circ$ ,  $CuBr \cdot AlBr_3$ , m.p.  $241^\circ$ , and  $2AgBr \cdot 3AlBr_3$ ,

m.p.  $180-185^\circ$  (decomp.), are obtained by crystallising the mixed salts from EtBr. R. T.

Volatilisation of silicic acid and silicon as silicon sulphide. P. DOLCH (Chem. Fabr., 1935, 8, 512—514).—Published evidence of reactions involving the above is reviewed. E. S. H.

Reaction of titanium tetrachloride with phenol. G. P. LUTSCHINSKI [with E. S. ALTMANN] (Z. anorg. Chem., 1935, 225, 321—326).— $TiCl_4$  reacts vigorously with PhOH forming a dark red cryst. compound,  $TiCl_3 \cdot OPh$ . It fumes in moist air and reacts with  $H_2O$  giving PhOH and  $Ti(OH)_4 \cdot H_2O$ . Mixtures of  $TiCl_4$  and PhOH in  $CHCl_3$  solution show a max. light absorption for the equimol. mixture. The selective light absorption obeys the Lambert-Beer law and the reaction might be used for the colorimetric determination of either compound. M. S. B.

Reactions between solids. A. ALBERTO (Ann. Acad. brasil. Sci., 1934, 6, 49—52; Chem. Zentr., 1935, i, 2486).— $NH_4ClO_4$  is quoted as a very stable  $NH_4$  salt. J. S. A.

Slow action of fuming nitric acid vapour on metals. E. MONTIGNIE (Bull. Soc. chim., 1935, [v], 2, 2260—2261).—At  $15^\circ$  the vapour of fuming  $HNO_3$  reacts only with Na, Ag, and Hg. F. L. U.

Action of heat on the ortho-, pyro-, and meta-arsenates of calcium and strontium. H. GUÉRIN (Compt. rend., 1935, 201, 1133—1135).—Neutral arsenates of Ca and Sr may be heated in vac. to  $1200^\circ$  without change. Products containing excess of  $As_2O_5$  lose  $As_2O_3$  and  $O_2$  at  $>1000^\circ$ , forming neutral orthoarsenate. The pyroarsenates form orthoarsenates at  $>800^\circ$ ,  $As_2O_3$  and  $O_2$  being liberated. The two meta-arsenates yield the pyroarsenates at  $500-800^\circ$ , and the orthoarsenates at higher temp. H. J. E.

Quantitative separation of protoactinium from pitchblende by means of titanium oxide. CHENG DA-CHANG (J. Chinese Chem. Soc., 1935, 3, 381—387).—Pa can be quantitatively pptd. with  $TiO_2$  from a solution of pitchblende in HCl to which  $TiCl_4$  is added. The  $TiO_2$  deposited on hydrolysis contains all the Pa present in the mineral. The  $\alpha$ -ray activity of the ppt. gives the quantity of Pa present. Pa salts are shown to be readily hydrolysed in acid solution, easily soluble in dil. HF, and completely pptd. by aq.  $NH_3$  in absence of HF. A. J. M.

Ductile chromium. W. KROLL (Z. anorg. Chem., 1935, 226, 23—32).—Cr powder, obtained by the action of twice distilled Ca on  $Cr_2O_3$  in molten  $CaCl_2 + BaCl_2$  and in an atm. of A, is degassed in a vac. at  $1300^\circ$  and sintered at  $1600-1700^\circ$ . The resulting mass can be rolled at  $1250^\circ$ . Rolled Cr is brittle at room temp., but deformable at  $180^\circ$ . F. L. U.

Action of hydrogen sulphide on chromates. Potassium dichromate. H. B. DUNNIELLE, G. S. KOTWANI, and M. A. HAMID (J. Physical Chem., 1935, 39, 1217—1229; cf. A., 1932, 133).—The brown solid formed during the action of  $H_2S$  on 5% aq.  $K_2Cr_2O_7$  consists of  $CrO_2$ ,  $Cr(OH)_3$ ,  $Cr_2(S_4O_6)_3$ , a Cr thiosulphate, and S, whilst the filtrate contains unchanged  $K_2Cr_2O_7$ ,  $K_2S_2O_3$ , and  $K_2S_4O_6$ . The final

products are a ppt. of  $\text{Cr}(\text{OH})_3$ , S, and a complex Cr thiosulphate, and a solution containing  $\text{K}_2\text{S}_2\text{O}_3$  and  $\text{K}_2\text{S}_x$ . The course of the reactions is discussed.

F. L. U.

**Preparation of potassium molybdo- and molybdi-cyanides.** H. H. WILLARD and R. C. THIELKE (J. Amer. Chem. Soc., 1935, 57, 2609—2611).— $\text{K}_3\text{Mo}(\text{CN})_6 \cdot 2\text{H}_2\text{O}$  (I) is prepared by pptg.  $\text{Mo}^{\text{IV}}$  pyridine thiocyanate in aq.  $\text{NH}_3$  and treating the ppt. with KCN. A quant. yield of  $\text{K}_3\text{Mo}(\text{CN})_6$  is obtained by oxidising (I) with  $\text{KMnO}_4$  in acid solution.

E. S. H.

**Lower oxides of tungsten.** F. EBERT and H. FLASCH (Z. anorg. Chem., 1935, 226, 65—81).— $\text{WO}_3$  treated with active H at room temp. for 13—30 hr., is completely converted into the compound  $\text{W}_4\text{O}_{10}(\text{OH})_2$ . By isobaric dehydration at 0.001 mm., the latter substance yields the compound  $\text{W}_{12}\text{O}_{32}(\text{OH})_2$  (I), which is stable between 150° and 500°, above which it passes into  $\text{W}_4\text{O}_{11}$  (A., 1934, 378). The identity of the compounds has been established by chemical and X-ray analysis. The following lattice consts. are given:  $\text{W}_4\text{O}_{10}(\text{OH})_2$ , tetragonal,  $a$  3.79,  $c$  3.74 Å.;  $\text{W}_{12}\text{O}_{32}(\text{OH})_2$ , tetragonal,  $a$  3.85,  $c$  3.65 Å.;  $\text{W}_4\text{O}_{11}$ , monoclinic,  $a$  3.85,  $b$  3.79,  $c$  3.85 Å.,  $\beta$  79.45°. (I) is also formed in the reduction of  $\text{WO}_3$  by mol. H., at 500—550°, and it is suggested that such addition of H is a general preliminary stage in the reduction of higher oxides by  $\text{H}_2$ .

F. L. U.

**Composition and properties of potassium phosphotungstate.** E. A. NIKITINA (J. Gen. Chem. Russ., 1935, 5, 1133—1138).—The salts pptd. by adding KOH or NaOH to aq. phosphotungstic acid have the composition  $\text{K}_3\text{H}_4[\text{P}(\text{W}_2\text{O}_7)_6]$  (I) or  $\text{Na}_3\text{H}_4[\text{P}(\text{W}_2\text{O}_7)_6]$  (II); their solubilities in  $\text{H}_2\text{O}$  and in aq. acids have been determined at 0—90°. That of (II) > that of (I); for both salts it falls with increasing acidity, but more so for (I), which is insol. in 18% HCl at 0—43°. At the same time, elimination of alkali metal from the solid phases takes place, to yield successively the  $\text{M}_6$  and  $\text{M}_1$  salt. The results obtained for the determination of K in presence of Na are high, owing to pptn. of some (II) from solutions of the acidity necessary to ensure complete pptn. of (I).

R. T.

**Reduction of 1-phospho-18-tungstic acid by ascorbic acid.**—See this vol., 255.

**Fluorine and its compounds.** A. DAMIENS (Bull. Soc. chim., 1936, [v], 3, 1—22).—A lecture.

**Bromine.** I. Preparation of bromine dipyridine perchlorate and bromine dipyridine nitrate. II. Preparation, properties, and constitution of an aquo-pyridine compound of bromine monoxide. H. CARLSOHN (Ber., 1935, 68, [B], 2209—2211, 2212—2214).—I (cf. Uschakov *et al.*, A., 1935, 857).—Addition of Br in  $\text{CHCl}_3$  to  $\text{AgNO}_3$  in  $\text{CHCl}_3\text{--C}_5\text{H}_5\text{N}$  at 15—20° followed by removal of AgBr and addition of the filtrate to  $\text{Et}_2\text{O}$  containing a little  $\text{C}_5\text{H}_5\text{N}$  gives the hygroscopic Br dipyridine nitrate (I) in 75—80% yield. Br dipyridine perchlorate is obtained by adding Br in  $\text{CHCl}_3$  to Ag dipyridine perchlorate (from  $\text{AgNO}_3$ ,  $\text{C}_5\text{H}_5\text{N}$ , and  $\text{NaClO}_4$  in  $\text{H}_2\text{O}$ ) in  $\text{CHCl}_3\text{--C}_5\text{H}_5\text{N}$ .

II. Treatment of (I) with 0.4N-NaOH gives a pale yellow ppt. which when rapidly dried on porous clay and then for 1 hr. in a vac. over KOH has the composition  $\text{Br}_2\text{O} \cdot \text{H}_2\text{O} \cdot \text{C}_5\text{H}_5\text{N}$ . The constitution  $[\text{BrC}_5\text{H}_5\text{N}(\text{OH}_2)]\text{OBr}$  is suggested.

H. W.

**Reaction of atomic iodine with quartz glass.** G. BRAUER (Z. physikal. Chem., 1935, 174, 435—440).—Thermally dissociated  $\text{I}_2$  vapour forms from quartz glass Si, but if the O formed is not removed a film of  $\text{SiO}_2$  results. Optically dissociated  $\text{I}_2$  behaves similarly.

R. C.

**Iron, even when impure, is not oxidised in salt solutions.** P. RONCERAY (Bull. Soc. chim., 1935, [v], 2, 2171—2174; cf. A., 1935, 834).—Corrosion of impure Fe in NaCl solutions does not occur in the absence of foreign material in the surface.

F. L. U.

**Iron, when impure but rigorously freed from surface contamination, does not effervesce in dilute acids.** P. RONCERAY (Bull. Soc. chim., 1935, [v], 2, 2174—2178; cf. preceding abstract).—Impure Fe effervesces in 1%  $\text{H}_2\text{SO}_4$  only when the surface of the Fe is contaminated with certain "extrinsic" materials. A reaction, however, still takes place. An antagonism between the effervescent and quiet reactions is observed.

F. L. U.

**Iron, even when impure, is not oxidised at the ordinary temperature in pure distilled and aerated water.** P. RONCERAY (Bull. Soc. chim., 1935, [v], 2, 2179—2182; cf. preceding abstract).—Impure Fe, if suitably cleaned, is not attacked by  $\text{H}_2\text{O}$  containing dissolved  $\text{O}_2$ . Localised rusting is due to extrinsic impurities, and the rust spreads from the primary corrosion centres thus formed.

F. L. U.

[Iron, even when impure, is not oxidised in air saturated with moisture.] L. GUITTON (Bull. Soc. chim., 1935, [v], 2, 2258—2260).—A criticism of experiments and conclusions published by Ronceray (A., 1935, 834).

F. L. U.

**Action of carbonic acid on ferrous sulphide.** Y. KAUKO and P. HAULIO (Suomen Kem., 1935, 8, B, 49—50).—From the relevant equilibrium consts., aq.  $\text{CO}_2$  should be able to convert FeS into sol.  $\text{Fe}(\text{HCO}_3)_2$ , from which  $\text{FeCO}_3$  is pptd.

J. S. A.

**Action of oxidising agents on sodium hypoferrite.** X. THIESSE (Compt. rend., 1935, 201, 1135—1137; cf. A., 1935, 314).—In 35% aq. NaOH solution,  $\text{Cl}_2$  causes pptn. of  $\text{Fe}(\text{OH})_3$ . In 40% NaOH a mixture of olive-green crystals and of hydrated  $\text{Fe}_2\text{O}_4$  is formed. The product from  $\text{Cl}_2$  and a 50% NaOH solution at 130—140°, when washed and dried, is  $\text{Fe}(\text{ONa})_3 \cdot 10\text{H}_2\text{O}$ ; at 170—180° with 60—70% NaOH it is  $\text{Na}_2\text{Fe}_2\text{O}_4$ .  $\text{Pb}(\text{OH})_2$  in presence of 50% NaOH yields  $\text{Fe}(\text{ONa})_3$ .

H. J. E.

**Dehydration of hydrated cobaltic oxide.** H. A. PAGEL, W. K. NOYCE, and M. T. KELLEY (J. Amer. Chem. Soc., 1935, 57, 2552—2553).—Dehydration occurs slowly at < 90°, but rapidly at 100—180°. The rate varies greatly with differences in the physical state of the oxide.

E. S. H.

**Topochemical reactions of compact-disperse materials.** IV. Mixed precipitation of nickel-zinc and cobalt-zinc hydroxides. W. FEITKNECHT and W. LOTMAR (Helv. Chim. Acta, 1935, 18, 1369—1388).—Pptn. of aq.  $\text{Co}(\text{NO}_3)_2$ – $\text{Zn}(\text{NO}_3)_2$  or  $\text{Ni}(\text{NO}_3)_2$ – $\text{Zn}(\text{NO}_3)_2$  mixtures with  $\text{NaOH}$  yields completely unordered, partly amorphous, ppts.  $(\text{Ni,Zn})(\text{OH})_2$  low in  $\text{Zn}$  passes on ageing at room temp. into cryst.  $\text{Ni}(\text{OH})_2$ , type C6, in which  $\approx 15\%$  of  $\text{Ni}$  atoms may be replaced by  $\text{Zn}$ , with some expansion of the lattice. From 15 to 65% of  $\text{Zn}(\text{OH})_2$ , a new hexagonal double hydroxide is formed, having  $a$  3.07,  $c$  8.2 Å., and consisting of sheets of  $\text{Ni}(\text{OH})_2$  in which  $\text{Ni}$  is partly replaced by  $\text{Zn}$ , intercalated with unordered  $\text{Zn}(\text{OH})_2$ . By heating freshly pptd.  $(\text{Ni,Zn})(\text{OH})_2$ , mixed crystals with up to 25% of  $\text{Zn}(\text{OH})_2$  may be obtained, which pass on prolonged heating into a new double hydroxide of type C6. Similar results are obtained by copptn. of  $\text{Zn}$  and  $\text{Co}$ ; an unstable double hydroxide of very imperfect structure is formed in presence of 40–60% of  $\text{Zn}(\text{OH})_2$ . J. S. A.

**Structure of complex compounds.** H. BRINTZINGER and H. OSSWALD (Z. anorg. Chem., 1935, 225, 312–318).—The anions  $\text{SO}_4^{4-}$ ,  $\text{C}_2\text{O}_4^{4-}$ ,  $\text{PO}_4^{3-}$ ,  $\text{AsO}_4^{3-}$ ,  $\text{F}^-$ , etc. are capable of forming the complex anions containing a central complex cation, e.g.,  $[\{\text{Co}(\text{NH}_3)_5\text{H}_2\text{O}\}(\text{SO}_4)_4]^{4-}$ , the existence of which is shown by dialysis (A., 1935, 1091, 1471; this vol., 40). Other anions, viz.,  $\text{NO}_3^-$ ,  $\text{Cl}^-$ ,  $\text{S}_2\text{O}_8^{2-}$ ,  $\text{S}_2\text{O}_3^{2-}$ ,  $\text{CrO}_3^{3-}$ ,  $\text{MoO}_4^{2-}$ ,  $[\text{Co}(\text{CN})_6]^{3-}$ , etc., do not form such complex anion. A necessary condition of formation appears to be the possession, by either the partaking cation or anions, of a large electrostatic potential, i.e., residual valencies, recognisable by the formation in aq. solution of aquo-complexes of the type  $[\text{Mn}(\text{H}_2\text{O})_6]^{2+}$ ,  $[\text{Fe}(\text{H}_2\text{O})_{18}]^{3+}$ ,  $[\text{C}_2\text{O}_4(\text{H}_2\text{O})_4]^{2-}$ ,  $[\text{HPO}_4(\text{H}_2\text{O})_6]^{2-}$ , etc., as demonstrated by dialytic methods. M. S. B.

**New group of complex compounds: complex compounds of which the central ion is a complex cation.** IV. Double-shelled arsenato-complex compounds with complex cobalt cations as central ions. H. BRINTZINGER and H. OSSWALD (Z. anorg. Chem., 1935, 225, 365–368; cf. A., 1935, 1091, 1471; this vol., 40).—A no. of complex Co amines, slightly sol. in  $\text{H}_2\text{O}$ , are sol. in aq. arsenate, or, if decomposed by  $\text{H}_2\text{O}$ , are stable in aq. arsenate. Dialysis indicates that a complex anion is formed and consists of a central complex Co cation surrounded by a shell of arsenate anions; e.g.,  $[\{\text{Co}(\text{NH}_3)_6\}(\text{HAsO}_4)_4]^{4-}$  and  $[\{\text{Co}(\text{NH}_3)_5(\text{NO}_3)\}(\text{HAsO}_4)_4]^{4-}$  gives  $[\{\text{Co}(\text{NH}_3)_5(\text{NO}_3)\}(\text{HAsO}_4)_4]^{4-}$ . M. S. B.

**Nucleus formation on crystals of nickel sulphate heptahydrate.** W. E. GARNER and W. R. SOUTHOON (J.C.S., 1935, 1705–1709).—The nuclei formed by dehydrating  $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$  crystals in vac. consist of half-ellipses with one direction of growth on the crystal surface and the other into the interior at an angle of  $45^\circ$  to the surface. Before nuclei become visible, there is an induction period,  $t_i$ , which decreases with rise of temp. ( $1$ – $22^\circ$ ) and varies, within limits, from crystal to crystal, probably owing to variations in surface structure and the nature of the imperfections leading to nucleation. The rate of

growth of nuclei of diameter  $> 0.02$  mm. is linear, but is much smaller during  $t_i$ . After  $t_i$ , the no. of nuclei,  $N$ , increases with time,  $t$ , according to  $N = (t - t_i)^x$ , where  $x$  is 2, approx. The activation energy calc. from the temp. coeffs. of  $t_i$  and the linear rate of growth is 19.0 kg.-cal., approx. The interpretation of the results is discussed. J. G. A. G.

**Complex dipyridyl salts of nickel and copper.** F. M. JAEGER and J. A. VAN DIJK (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 972–977).—Addition of 3 equivs. of dipyridyl (I) to  $\text{Ni}(\text{NO}_3)_2$  solution, followed by slow evaporation, yields red crystals of the compound  $[\text{Ni}(\text{dipy})_3](\text{NO}_3)_2 \cdot 5\text{H}_2\text{O}$  (II). With 2 equivs. of (I) some (II) is first obtained and then the violet compound  $[\text{Ni}(\text{dipy})_2](\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$  (III). When only 1 equiv. of (I) is used, some (II) is deposited and then the compound  $[\text{Ni}(\text{dipy})(\text{H}_2\text{O})_2](\text{NO}_3)_2 \cdot \text{H}_2\text{O}$ , in an impure state.  $\text{NiCl}_2$  similarly yields the compounds  $[\text{Ni}(\text{dipy})_3]\text{Cl}_2 \cdot 7\text{H}_2\text{O}$  (IV) and  $[\text{Ni}(\text{dipy})(\text{H}_2\text{O})_2]\text{Cl}_2$ . The crystal structures of (II), (III), (IV), and  $[\text{Cu}(\text{dipy})_3]\text{Cl}_2 \cdot 7\text{H}_2\text{O}$  are detailed. J. W. S.

**Affinity.** LXVI. Rhodium sulphides. R. JUZA, O. HULSMANN, K. MEISEL, and W. BILTZ (Z. anorg. Chem., 1935, 225, 369–385).—By direct combination of  $\text{Rh}$  with  $\text{S}$ , by v.p. measurements, and by X-ray analysis, the existence of  $\text{Rh}_2\text{S}_3$ ,  $d_4^{25}$  6.40, and  $\text{Rh}_2\text{S}_5$ ,  $d_4^{25}$  5.00, 4.92, has been confirmed, but not that of  $\text{RhS}$  and  $\text{RhS}_2$  as given by earlier investigators. The compounds  $\text{Rh}_3\text{S}_8$ ,  $d_4^{25}$  7.51, and  $\text{Rh}_3\text{S}_4$ ,  $d_4^{25}$  6.33, have also been obtained.  $\text{Rh}_2\text{S}_5$  has a pseudo-pyritic structure. M. S. B.

**Alkali bromo-salts and bromo-pyridine derivatives of rhodium.** P. POULENC (Ann. Chim., 1935, [xi], 4, 567–657).—The preparation of the following compounds is described:  $\text{RhBr}_3$ ;  $[\text{RhBr}_6]\text{Na}_3 \cdot 12\text{H}_2\text{O}$ , deep red crystals;  $[\text{RhBr}_5]\text{Li}_2 \cdot 6\text{H}_2\text{O}$ , a deep red hygroscopic powder;  $[\text{Rh}_2\text{Br}_9](\text{NH}_4)_3$ , green hexagonal micro-crystals;  $[\text{Rh}_2\text{Br}_9]\text{K}_3$ , green hexagonal micro-crystals;  $[\text{Rh}_2\text{Br}_{10}]\text{K}_4 \cdot 6\text{H}_2\text{O}$ , deep red octahedra, decomp.  $120^\circ$ ;  $[\text{Rh}_2\text{Br}_{11}]\text{K}_5 \cdot 6\text{H}_2\text{O}$ , deep red plates, unstable;  $[\text{Rh}_2\text{Br}_9]\text{Rb}_3$ , deep green micro-crystals, insol.;  $[\text{Rh}_2\text{Br}_{10}]\text{Rb}_4 \cdot 6\text{H}_2\text{O}$ ;  $[\text{Rh}_2\text{Br}_{11}]\text{Rb}_5 \cdot 6\text{H}_2\text{O}$ ;  $[\text{Rh}_2\text{Br}_9]\text{Cs}_3$ , deep green hexagonal micro-crystals, insol.;  $[\text{Rh}_2\text{Br}_{11}]\text{Cs}_5 \cdot 6\text{H}_2\text{O}$ ;  $[\text{RhCl}_{4.5}\text{Br}_{1.5}]\text{K}_3 \cdot \text{H}_2\text{O}$ , deep violet crystals; and  $[\text{Rh}_2\text{Cl}_{1.5}\text{Br}_{9.5}]\text{K}_5 \cdot 6\text{H}_2\text{O}$ . The structures of the compounds and the influence of the halogen and the metallic ion, respectively, on the type produced are discussed. Compounds described by previous authors (A., 1908, ii, 200; 1911, ii, 45) could not be obtained. The following pyridine (Pyr) compounds have been prepared:  $[\text{Rh}_2\text{Br}_9]\text{Pyr}_3 \cdot \text{H}_3 \cdot 3\text{H}_2\text{O}$ , dark prisms;  $[\text{Rh}_2\text{Br}_9]\text{Cs}_3$ ,  $[\text{Rh}_2\text{Br}_9]\text{Pyr}_3 \cdot \text{H}_3$ ;  $[\text{Rh}_2\text{Br}_{10}]\text{Pyr}_4 \cdot \text{H}_4 \cdot 9\text{H}_2\text{O}$ , insol. octahedra;  $[\text{RhPyBr}]\text{Pyr} \cdot \text{H}$ , deep red prisms;  $[\text{RhPyBr}_5]\text{CsPyrH}$ , red needles;  $[\text{RhPyBr}_5][\text{RhCl}(\text{NH}_3)_5][\text{RhBr}_6]\text{Pyr}_3 \cdot \text{H}_3$ , green powder decomp. in solution yielding  $[\text{Rh}_2\text{Br}_9]\text{Pyr}_3 \cdot \text{H}_3$ , and giving  $[\text{Rh}(\text{H}_2\text{O})\text{Br}_5]\text{Cs}_2$ , green prisms, with  $\text{CsOH}$  and wine-red  $[\text{Rh}(\text{H}_2\text{O})\text{Br}_5][\text{RhCl}(\text{NH}_3)_5]$  with  $[\text{RhCl}(\text{NH}_3)_5]\text{Cl}_2$ . Treatment of  $\text{RhBr}_3$  with  $\text{C}_5\text{H}_5\text{N}$  led to the following compounds and derivatives:  $[\text{RhPyr}_2\text{Br}_4]\text{PyrH}$ , red crystals, giving orange crystals of  $[\text{RhBr}_3\text{Pyr}_3]$  in  $\text{EtOH}$ ,  $[\text{RhPyr}_2\text{Br}_4]\text{K} \cdot \text{H}_2\text{O}$ , brick-

red crystals,  $[RhPyr_2Br_4]NH_4.H_2O$ , brick-red needles, and  $[RhPyr_2Br_4]Cs.H_2O$ , brick-red needles, all of which give buff-coloured needles of  $[RhBr_3(H_2O)Pyr_2].2H_2O$  in  $H_2O$ , and  $[RhBr_3Pyr_3]$  orange crystals, insol. The thermal and photodecomp. of aq. and alcoholic  $[RhBr_3Pyr_4]Br$  has been studied. Three forms of  $[RhBr_3Pyr_3]$  are produced, viz., orange prisms, buff crystals, and octahedra, characterised by different solubilities and X-ray diagrams. Addition of  $H_2O$  to their  $C_5H_5N$  solutions yields identical prisms. Similar forms of  $[RhCl_3Pyr_3]$  have been obtained and it is supposed that the octahedra and the buff crystals are the two possible isomerides whilst the prisms constitute a third cryst. form.  $[RhBr(C_5O_4)Pyr_3]$  forms orange prisms, insol., reddens on heating and decomposed by light. Addition of  $C_5H_5N$  to excess of  $RhBr_3$  yields orange-yellow prisms of  $[RhBr_2Pyr_4]Br.6H_2O$ , which gives the double salt  $[RhPyr_2Br_4]_2$ , and which is converted in presence of Br into isomeric orange prisms having a different solubility and a different X-ray diagram. Treatment of  $[RhBr_2Pyr_4]Br$  with  $AgNO_3$  yields  $[RhBr_2Pyr_4]NO_3.HNO_3$ , yellow prisms, which forms yellow crystals of  $[RhBr_2Pyr_4]NO_3$  in  $H_2O$  and  $[RhBr_2Pyr_4Ag](NO_3)_2$  (1), yellow crystals, giving insol. yellow needles of  $[RhBr_2Pyr_4Ag]Br_2$  with  $HBr$ . (1) is unstable, yielding chiefly  $[Rh(NO_3)BrPyr_4]NO_3$ , orange crystals, and on prolonged treatment with  $AgNO_3$   $[Rh(NO_3)_3Pyr_3]$ , lozenge-shaped orange crystals, very sol. in  $H_2O$ . R. S.

**Spectral analytical investigations of W. Kraemer.** (A) W. GERLACH. (B) W. KRAEMER (Z. anal. Chem., 1935, 103, 356; cf. A., 1934, 981).—(A) Polemical. Kraemer's identifications of spectral lines are largely erroneous.

(B) The cogency of Gerlach's criticism is admitted. J. S. A.

**Determination of the [metal] content of a mineral by measuring its density.** E. BORGHESEAN (Reso. assoc. min. sarda, 1935, 40, No. 2, 14—17).—If  $S_0$  is the  $d$  of the pure mineral ( $\rightarrow T_0\%$  of metal), and if  $S_x$  is the  $d$  of a mixture containing  $x$  vol.-% of pure mineral and  $(100-x)\%$  of rock of  $d-s$ , the average content of metal in the mixture is  $T_x = T_0(S_x - s)/S_0(S_0 - s)$ . CH. ABS. (e)

**Areometric analysis. Technique in determining small amounts of heavy precipitates.** V. R. DAMERELL and M. AXELROD (J. Amer. Chem. Soc., 1935, 57, 2724—2725).—Compact, circular piles of ppt. of reproducible dimensions are obtained in the centre of the flask bottom. The areas of these spots are measured and compared with areas produced by known amounts of ppt. E. S. H.

**Reaction rates and indicator acidities.** L. P. HAMMETT (Chem. Rev., 1935, 16, 67—79).—An argument for the expression of acidity in terms of measurement with a basic indicator. CH. ABS. (e)

**Colorimetric determination of hydrogen-ion concentration in aqueous solution.** M. KILPATRICK (Chem. Rev., 1935, 16, 57—66).—A summary and discussion. CH. ABS. (e)

**Simplification of optical bathmometry by application of "spectral mixed-colour colori-**

**metry" and other improvements.** A. THIEL and H. LOGEMANN (Angew. Chem., 1935, 48, 799—802).—A colorimetric method for  $p_H$  determination is described. E. S. H.

**Photometric determination of hydrogen-ion concentration.** A. G. DE ALMEIDA (Diss., Lisbon, 1935).—By plotting dominant hue, determined colorimetrically and expressed as a  $\lambda$ , against  $p_H$ , for a series of indicators, curves are obtained from which the  $p_H$  of an unknown solution can be determined more accurately than by electrometric methods. D. R. D.

**Determination of  $p_H$  by means of the glass electrode.** D. WOLFERS (Bull. Soc. Chim. biol., 1935, 17, 1559—1572).—The glass electrode may be used to determine the  $p_H$  of solutions of strong acids, e.g.,  $HNO_3$  or  $HCl$  from  $2N$  to  $0.0001N$ . Vals. for the  $p_H$  of urine are  $<$  those obtained using the quinhydrone electrode. A. L.

**Titration of a dibasic acid in stages.** S. KILPI (Z. physikal. Chem., 1935, 174, 441—444).—In the potentiometric titration of a weak or moderately strong acid the jump in potential is a max. or a min. at the first stoichiometrical equiv. point according as  $K_1/K_2$  is  $>$  or  $<$  13.93. If  $K_1/K_2$  is large the  $[H^+]$  at the point of max. potential jump is equal to that at the first equiv. point, independently of the strength of the acid. R. C.

**Application of organic redox systems to analysis. I, II.** L. KULBERG (J. Gen. Chem. Russ., 1935, 5, 1085—1090, 1240—1245).—The application of redox indicators to the detection and determination of inorg. oxidising and reducing substances is discussed, and formulæ determining their applicability are given. R. T.

**Step-photometric determination of free chlorine in chlorinated water.**—See B., 1936, 46.

**Determination of chlorate and perchlorate in presence of large amounts of nitrate.** E. S. TOMULA (Z. anal. Chem., 1935, 103, 427—430).— $ClO_3'$  is reduced by warming the material with 40% aq.  $CH_3O$  in presence of  $FeCl_3$  as catalyst. Na salts are pptd. with an excess of  $HCl$ , and the  $HCl$  solution is evaporated to dryness.  $Cl'$  is removed by treating the residue with the calc. quantity of  $Ag_2SO_4$ , and  $ClO_4'$  is reduced with a Zn-Cd couple in presence of  $Ti^{IV}$ .  $Ti^{III}$  is oxidised with  $KMnO_4$ , and  $Cl'$  in the resulting solution is finally titrated with  $AgNO_3$ .  $ClO_3'$  in a separate portion is reduced with Zn and  $H_2SO_4$ . J. S. A.

**Qualitative reaction for bromates.** I. M. KORENMAN (Z. anal. Chem., 1935, 103, 269—271).— $BrO_3'$  but not  $IO_3'$ ,  $ClO_3'$ ,  $NO_3'$ , or  $S_2O_8^{2-}$  in  $4N-HCl$  solution decolorises Me-orange rapidly. The reaction is very much faster than with  $Cr_2O_7^{2-}$ ,  $Fe(CN)_6^{3-}$ , or  $NO_2'$ .  $BrO_3'$  may be so detected in presence of a large excess of these ions. The reaction of  $ClO_3'$  with Me-orange is catalysed by  $BrO_3'$ :  $10^{-6}$  g. of  $BrO_3'$  per c.c. may be so detected. J. S. A.

**Detection of small amounts of bromide in sodium chloride.** R. C. LÓPEZ (Farm. moderna, 1935, 46, 55—57).—One drop of fuchsin solution

(0.2%) (I) in 10 c.c. of  $\text{H}_2\text{O}$  is decolorised by aq.  $\text{Cl}_2$ , added drop by drop. To 10 c.c. of the test solution are added 1 drop of (I) and twice the no. of drops of aq.  $\text{Cl}_2$  solution required above. Presence of  $\text{Br}^-$  is shown by a pink colour, which becomes purple, perhaps with pptn., if sufficient  $\text{Br}^-$  is present. 0.0001 g. of  $\text{KBr}$  in 10 c.c. of 20% aq.  $\text{NaCl}$  may be detected. The reaction is prevented by  $\text{I}^-$ ,  $\text{SO}_3^{2-}$ ,  $\text{NO}_3^-$ ,  $\text{S}_2\text{O}_3^{2-}$ ,  $\text{CN}^-$ ,  $\text{SCN}^-$ , and  $\text{Fe}(\text{CN})_6^{4-}$ . Alkaline-reacting salts must be neutralised prior to the test.

CH. ABS. (p)

**Action of perchloric acid on iodine and iodine derivatives.** Determination of iodine in organic substances. E. KAHANE and T. TOMESCO (Compt. rend., 1935, 201, 1195—1198).— $\text{HClO}_4$  oxidises I compounds at 200—210° quantitatively to  $\text{HIO}_3$ . I may be determined in 2—10 mg. of substance by oxidation with  $\text{HNO}_3$ — $\text{H}_2\text{SO}_4$ — $\text{HClO}_4$ , followed by addition of  $\text{As}_2\text{O}_3$ , the whole of the I liberated in the processes being distilled into aq.  $\text{Br}$ , the excess of  $\text{Br}$  removed by boiling after acidification with  $\text{AcOH}$ , and the resulting  $\text{HIO}_3$  determined with  $\text{Na}_2\text{S}_2\text{O}_3$  after addition of  $\text{KI}$ .

T. G. P.

**Determination of fluorine in water by Sanchis' method.** E. H. DUCLOUX (Anal. Assoc. Quím. Argentina, 1935, 23, 63—66).—Modifications of the  $\text{Zr}(\text{NO}_3)_4$ —alizarin method (A., 1934, 500) are described.

F. R. G.

**Detection of small amounts of hydrogen peroxide.** J. PLANK (Magyar chem. Fol., 1934, 40, 105; Chem. Zentr., 1935, i, 2412).—Fresh  $\text{Ce}_2(\text{SO}_4)_3 + \text{K}_2\text{CO}_3$  detects 1 part of  $\text{H}_2\text{O}_2$  in 160,000 parts of solution.

J. S. A.

**Colour reaction between nitroprusside and sulphites (Bodeker's reaction).** G. SCAGLIARINI (Atti R. Accad. Lincei, 1935, [vi], 22, 155—159).—The formation of the complex ion  $[\text{Fe}(\text{CN})_5\text{NOSO}_3]^{4-}$  in the above reaction has been demonstrated by measurements of the oxidation-reduction potential of the process  $[\text{Fe}(\text{CN})_5\text{NO}]^{3-} + \text{SO}_3 + 2e = [\text{Fe}(\text{CN})_5\text{NOSO}_3]^{4-}$ . The normal val. for 0.1M solutions at 21° is 0.468 volt.

O. J. W.

**Potentiometric titration of sulphite and sulphoxylate, etc.** E. MÜLLER (Z. anal. Chem., 1935, 103, 340—341).—Polemical against Lobering (A., 1935, 1092). Reduction of  $\text{Cr}_2\text{O}_7^{2-}$  to  $\text{Cr}^{II}$  by  $\text{SO}_3^{2-}$  or  $\text{HSO}_2^-$ , and consequently the analytical method based thereon, is impossible.

J. S. A.

**Potentiometric titration of sulphite and sulphoxylate alone and in presence of hyposulphite.** A. MUTSCHIN (Z. anal. Chem., 1935, 103, 342—348).—Polemical against Lobering (A., 1935, 1092; cf. also preceding abstract). The reaction between  $\text{Cr}_2\text{O}_7^{2-}$  and  $\text{SO}_3^{2-}$  or  $\text{HSO}_2^-$  is neither quant. nor stoichiometric, and cannot be used analytically.

J. S. A.

**Washing strontium sulphate precipitate with its saturated solution.** A. M. VASILIEV and O. S. TSCHEVIR-KORSUNSKA (Trans. Kirov Inst. Chem. Tech. Kazan, 1935, No. 3, 73—77).—The amount of  $\text{SO}_4^{2-}$  pptd. as  $\text{SrSO}_4$  by addition of excess of  $\text{SrCl}_2$  to approx. 0.05N- $\text{H}_2\text{SO}_4$  is equal to that pptd. by  $\text{BaCl}_2$ , if the excess of  $\text{SrCl}_2$  renders the solution

N in respect of Sr. The ppt. must be washed with saturated aq.  $\text{SrSO}_4$ .

CH. ABS. (p)

**Accuracy of the titration of thiocyanate with mercuric mercury.** I. M. KOLTHOFF and J. J. LINGANE (J. Amer. Chem. Soc., 1935, 57, 2377—2379).— $\text{KCNS}$  is a satisfactory standard when the accuracy required is  $\pm 0.05\%$ . The sources of errors are traced to side reactions; the formation of  $\text{NH}_4^+$  was detected.

E. S. H.

**Determination of traces of gases in air with Cauver's absorption tubes.** E. QUITMANN (Z. anal. Chem., 1935, 103, 258—261; cf. this vol., 47).—The quant. absorption of traces of  $\text{NH}_3$ ,  $\text{I}$ ,  $\text{HCl}$ , and  $\text{O}_3$  in air is described.

J. S. A.

**Determination of total oxidising power, nitrite, ozone, and total chlorine content of ordinary and foetid air. I. [Total oxidising power.]** H. CAUER (Z. anal. Chem., 1935, 103, 321—334).—For air low in total oxidants, 100—200 litres of air are sucked through a wash-tube containing 3 c.c. of aq.  $\text{KI}$ , at  $p_H < 2.8$ , containing  $3 \times 10^{-5}$  g. of  $\text{I}^-$ , using the apparatus described previously (this vol., 47).  $\text{I}$  is thereby liberated and volatilised away. Complete absorption of  $\text{HNO}_2$  is detected by a wash-bottle of Ilosvay's reagent following the  $\text{KI}$  tube. 0.3 c.c. of the  $\text{KI}$  solution is treated with  $\text{H}_2\text{SO}_4$  containing  $\text{NaNO}_2$ , and is then emulsified with 0.02 c.c. of  $\text{CHCl}_3$ . The  $\text{CHCl}_3$  is separated centrifugally, and the amount of residual  $\text{I}$  determined colorimetrically by matching the  $\text{CHCl}_3$  drop against those from similarly treated solutions of known  $[\text{I}]$ . With air of higher oxidising power, larger initial amounts of  $\text{KI}$  and smaller vols. of air are used.

J. S. A.

**Determination of oxides of nitrogen in gaseous mixtures.** A. N. ZETTLIN (Ukrain. Chem. J., 1935, 10, 362—366).—The  $\text{NO} + \text{NO}_2$  is absorbed by 4%  $\text{KBrO}_3$  in  $\text{N-H}_2\text{SO}_4$  in an Orsat apparatus ( $< 10$  min.), and the difference in vol. of the sample is read.

R. T.

**Determination of phosphoric acid by precipitation as ammonium phosphomolybdate.** H. TERLET and A. BRIAU (Ann. Falsif., 1935, 28, 546—555; cf. B., 1935, 198).—Scheffer's method (J. Officiel, Aug. 30, 1934), which consists in the titration of the pptd.  $\text{NH}_4$  phosphomolybdate with aq.  $\text{NaOH}$  in presence of  $\text{CH}_3\text{O}$ , is trustworthy and accurate, provided steps are taken to remove  $\text{H}_2\text{MoO}_4$ , which is co-pptd. Procedures are outlined for the examination of natural  $\text{Ca}_3(\text{PO}_4)_2$ , fertilisers containing org. matter, superphosphates and the like, basic slag, and alkali phosphates.

E. C. S.

**Eliminating the effects of  $\text{PO}_4$  radical in qualitative analysis.** I—V. S. ISHIMARU (Sci. Rep. Tohoku, 1935, 24, 426—438, 439—447, 448—460, 461—472, 473—480).— $\text{I. PO}_4^{3-}$  can be removed completely from a solution rendered just acid to  $\text{Mc}$ -orange by addition of  $\text{Fe}(\text{NO}_3)_3$ . This method is more convenient in analysis than the  $\text{Pb}$  method, which can be applied satisfactorily only after removal of the  $\text{Al}$  group and  $\text{Mn}$ .

II. Pptn. with  $\text{Bi}^{III}$  leads to less occlusion and adsorption of other ions by the ppt. than the  $\text{Fe}$

method, but is unsatisfactory in presence of a high  $[\text{Fe}^{+++}]$ . The Zr method yields gelatinous ppts. and is of equal merit to the Fe method.

III. Pptn. with Sn leads to loss of Fe and Cr, but can be adopted after removal of the Al group and Mn. Reynoso's procedure (Ann. chim. phys., 1852, 34, 320) is the most satisfactory.

IV, V. Of analytical methods in which  $\text{PO}_4^{'''}$  or  $\text{C}_2\text{O}_4^{''}$  are added in excess to eliminate the effects of  $\text{PO}_4^{'''}$  already present Smith's phosphate method (A., 1933, 479) is the most satisfactory. J. W. S.

Rapid determination of assimilable phosphoric acid in freshly prepared superphosphates.—See B., 1936, 58.

Graphite formation. I. Determination of graphite. A. E. BALFOUR and H. L. RILEY (J.C.S., 1935, 1723—1728; cf. A., 1935, 453).—The  $\text{CO}_2$  evolved when a steady stream of air is bubbled through a suspension of 1 g. of C, graded between 60 and 100 I.M.M. sieves, in 50 c.c. of  $\text{CrO}_3\text{--H}_3\text{PO}_4$  (10 g. of  $\text{K}_2\text{Cr}_2\text{O}_7 + 50$  c.c. of  $\text{H}_3\text{PO}_4$ ,  $d$  1.75) at  $100^\circ$  is an approx. measure of the extent to which the sample is graphitised; e.g., electrode graphite, diamond, and sucrose carbonised at  $900^\circ$  gave 1600, 43, and 16 mg. of  $\text{CO}_2$ , respectively, under similar conditions. The differentiation disappears as the  $[\text{H}_3\text{PO}_4]$  is diminished and is small with conc.  $\text{H}_2\text{SO}_4$ .  $\text{H}_3\text{PO}_4$  probably reacts with graphitic C under sp. conditions. Coal carbonised at approx.  $650^\circ$  has a max. moisture absorption and a min. rate of wet oxidation, consistent with the view that graphitisation commences at approx.  $700^\circ$ . J. G. A. G.

Preservation of standard solutions of oxalic acid and sodium oxalate. II. S. ISHIMARU (Sci. Rep. Tohoku, 1935, 24, 411—425).—Either colourless or black bottles can be used safely for the storage of unacidified  $0.2N\text{--Na}_2\text{C}_2\text{O}_4$  or pure  $0.5N\text{--H}_2\text{C}_2\text{O}_4$  or of  $0.01N\text{--Na}_2\text{C}_2\text{O}_4$  and  $0.01N\text{--H}_2\text{C}_2\text{O}_4$  if 100 c.c. of conc.  $\text{H}_2\text{SO}_4$  are added per litre.  $0.01N\text{--Na}_2\text{C}_2\text{O}_4$  is also stable with 20 c.c. of  $\text{H}_2\text{SO}_4$  per litre in a black bottle. J. W. S.

Rapid determination of certain gases or vapours  $[\text{CO}_2, \text{HCN}]$  in air.—See B., 1936, 46.

Spectrophotometric determination of potassium chloride in sylvines. R. ROMANN and C. SPEITEL (Bull. Soc. chim., 1935, [v], 2, 2168—2170).—An aq. solution of a known wt. of the specimen is saturated with K. picrate, and the concn. of the latter, which is determined by the ratio K : Na in the specimen, is measured spectrophotometrically. The results agree with those obtained by the perchlorate method. F. L. U.

Determination of alkalis in silicates.—See B., 1936, 21.

Colorimetric determination of small amounts of silver with *p*-dimethylaminobenzylidenerhodanine. I. C. SCHOONOVER (J. Res. Nat. Bur. Stand., 1935, 15, 377—384).—Feigl's method (A., 1928, 1108) gives satisfactory results for Ag in concns. of 0.06—9 mg. per litre when  $\text{Cl}^-$ ,  $\text{Cu}^+$ , and  $\text{Hg}^+$  are absent and fused  $\text{SiO}_2$  vessels are used. Soft glass vessels adsorb appreciable amounts of Ag, but Pyrex adsorbs very little unless the solution is boiled. A. R. P.

Gravimetric determination of calcium and magnesium. A. M. VASILIEV and L. A. VASILIEVA (Trans. Kirov Inst. Chem. Tech. Kazan, 1935, No. 3, 67—72).—Appreciable quantities of  $\text{CaC}_2\text{O}_4$  are dissolved by washing with  $\text{H}_2\text{O}$ .  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  should be substituted. Pptd.  $\text{MgNH}_4\text{PO}_4$  should be washed with a saturated solution of this salt, instead of with aq.  $\text{NH}_3$ , which causes losses. CH. ABS. (p)

Determination of barium silicofluoride in insecticidal powders.—See B., 1936, 36.

Determination of the [radium] content of substances containing radium. A. E. KORVEZEE (Chem. Weekblad, 1935, 32, 726—731).—A lecture. D. R. D.

Volumetric micro-determination of magnesium with methylene-blue following its precipitation as magnesium picrolonate. A. BOLLIGER (J. Proc. Roy. Soc. New South Wales, 1935, 69, 68—74).—Solutions ( $> 0.01N$ ) of Mg salts with Li picrolonate at  $100^\circ$  afford Mg picrolonate in which the picrolonic acid is determined; alternatively, the excess of the acid used is titrated (cf. A., 1934, 1017). Alkali picrolonates in concns.  $< 0.01N$  do not interfere; in larger concns., they are pptd. and the error involved is determined by a differential titration. A modification for determining Ca and Mg separately in the same sample is described. J. L. D.

Organic compounds as analytical reagents. IV. *p*-Nitrobenzeneazoresorcinol as a reagent for magnesium. L. NEWELL, N. R. PIKE, and J. B. FICKLEN (Z. anorg. Chem., 1935, 225, 281—284; cf. A., 1935, 951).—The reagent is sp. for Mg when the ions of groups I, II, and III, and  $\text{NH}_4^+$  are removed. The sensitivity is 1 in 500,000. E. S. H.

Determination of traces of heavy metals in mineral waters.—See B., 1936, 46.

Organic flocculating agents in the quantitative precipitation of zinc sulphide. J. R. CALDWELL and H. V. MOYER (J. Amer. Chem. Soc., 1935, 57, 2372—2374).—Gelatin (0.5—2 mg.) or agar (2—5 mg.) produces immediate and complete flocculation of  $\text{ZnS}$  suspensions (0.3 g. in 300 c.c.). The solution may be filtered within 15 min. after pptn. Satisfactory separation from all metals but Co is obtained. E. S. H.

Separation of zinc from cobalt based on a new method for reducing post-precipitation. J. R. CALDWELL and H. V. MOYER (J. Amer. Chem. Soc., 1935, 57, 2375—2377).— $\text{ZnS}$  ppts., formed in presence of hydrophilic colloids (cf. preceding abstract), are not contaminated with Co when acetaldehyde is added. E. S. H.

Determination of small quantities of zinc. H. LUX (Z. anorg. Chem., 1935, 226, 1—20).—The method, which is intended for the examination of biological material, consists first in the incineration of the latter at a temp.  $> 550^\circ$ . The metal sulphides, pptd. from a  $\text{HNO}_3$  solution of the ash in presence of  $\text{CaCO}_3$ , are then oxidised in air at  $650\text{--}700^\circ$ , and the resulting oxides are heated in  $\text{H}_2$ . Zn volatilises and is condensed in a capillary, which is then drawn out to a conical end into which the whole of the Zn is driven. The Zn cone is measured microscopically. The method

is accurate to within  $\pm 2\%$  and can be used for quantities down to  $10^{-6}$  mg. Zn of biological origin obtained in this way is shown to contain  $< 0.1\%$  of Cd. F. L. U.

**Organic reagent for cadmium.** A. W. SCOTT and E. G. ADAMS (J. Amer. Chem. Soc., 1935, 57, 2541—2542).—The prep. of N-2 : 6-dihydroxyphenyl-N'-allylthiocarbamide, decomp.  $230^\circ$ , N-2-hydroxy-5-nitrophenyl-N'-allylthiocarbamide, m.p.  $122^\circ$ , and 1-(2-quinolyl)-4-allylthiosemicarbazide (I), m.p.  $158^\circ$ , is described. A saturated solution of (I) in 50% EtOH, in presence of KI, gives a yellow ppt. with solutions containing 1 part of  $\text{Cd}^{++}$  in  $10^6$  parts. E. S. H.

**Determination of small amounts of lead by photometric titration.** S. HIRANO (J. Soc. Chem. Ind. Japan, 1935, 38, 648—650B).—Pb is titrated photometrically with  $\text{Na}_2\text{S}$  (A., 1934, 856) in presence of AcOH and  $\text{NH}_4\text{OAc}$ . Pb may be first isolated as  $\text{PbSO}_4$ , which is dissolved in aq.  $\text{NH}_4\text{OAc}$  for titration. J. S. A.

**Separation of lead as sulphate.** A. M. VASILIEV (Trans. Kirov Inst. Chem. Tech. Kazan, 1935, No. 3, 61—65).—Washing  $\text{PbSO}_4$  ppts. with dil.  $\text{H}_2\text{SO}_4$  followed by 50% EtOH causes losses. Washing with saturated aq.  $\text{PbSO}_4$  gives accurate results.

CH. ABS. (p)

**Extraction of lead by means of diphenylthiocarbazone.** D. C. GARRATT (Analyst, 1935, 60, 817).—In the examination of org. substances for Pb by wet oxidation with  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  followed by extraction of the Pb with diphenylthiocarbazone and  $\text{CHCl}_3$ , errors are caused by the dissolution of resistant  $\text{NO}_2$ -compounds in the  $\text{CHCl}_3$ ; these may be avoided by evaporating the first extract to dryness, heating with 2 c.c. of  $\text{H}_2\text{SO}_4$  and 10 c.c. of 6%  $\text{H}_2\text{O}_2$  until acid fumes are evolved, adding 2 g. of  $(\text{NH}_4)_2\text{S}_2\text{O}_8$ , and continuing the heating for 30 min.; after cooling the Pb is extracted as before and comparison made with the standards. A. R. P.

**Determination of lead in official [B.P.] compounds and preparations.**—See B., 1936, 76.

**Determination of lead dioxide.** IV.—See B., 1936, 59.

**Volumetric determinations in strongly alkaline solutions.** III. Titration of thallium and cerium with hypobromite. O. TOMÍČEK and M. JAŠEK (J. Amer. Chem. Soc., 1935, 57, 2409—2411; cf. A., 1935, 838, 1094).—The titration of  $\text{Tl}^{\text{I}}$  salts with  $\text{NaOBr}$  is described.  $\text{NaOBr}$  solutions may be standardised by using  $\text{Ti}_2\text{CO}_3$  or  $\text{Ti}_2\text{SO}_4$  as standard.  $\text{Ce}^{\text{III}}$  salts can be titrated with  $\text{NaOBr}$  in 20—30%  $\text{K}_2\text{CO}_3$  solution, from which  $\text{O}_2$  has been removed, but the  $\text{K}_3\text{Fe}(\text{CN})_6$  method is preferred. E. S. H.

**Inorganic complex compounds in analytical chemistry.** III. Detection and determination of copper. C. MAHR (Z. anorg. Chem., 1935, 225, 386—392).— $\text{Cu}^{++}$ , freed from Hg, Ag, and Tl, is reduced to  $\text{Cu}^+$  by  $\text{K}_2\text{SnCl}_4 \cdot 2\text{H}_2\text{O}$  in aq. HCl. A drop of  $\text{NH}_4[\text{Cr}(\text{CNS})_4(\text{NH}_3)_2] \cdot \text{H}_2\text{O}$  in HCl is added and a yellow ppt.,  $\text{Cu}[\text{Cr}(\text{CNS})_4(\text{NH}_3)_2]$ , cryst. from warm solution, is formed. The method is very sensitive. One part of Cu in 15,000 of Bi, 10,000 of Cd, 20,000 of Zn, or 50,000 of Pb can be detected. The applic-

ation of the method to the determination of small quantities of Cu in the presence of a large no. of different metals is described. M. S. B.

**Determination of small amounts of mercury by photometric titration.** S. HIRANO (J. Soc. Chem. Ind. Japan, 1935, 38, 646—647B).—Hg, present in neutral solution as chloride or nitrate, is titrated photometrically (cf. A., 1934, 856) with 0.01N- or 0.001N- $\text{Na}_2\text{S}$ , using gum arabic as protective colloid. Cu and As do not interfere. J. S. A.

**Determination of small amounts of mercury with dithizone.** H. FISCHER and G. LEOPOLDI (Z. anal. Chem., 1935, 103, 241—257).—For the colorimetric determination of Hg, the Hg in dil.  $\text{HNO}_3$  solution, containing  $> 5 \times 10^{-6}$  g. of Hg per c.c., is extracted quantitatively with successive portions of a  $\text{CCl}_4$  solution of diphenylthiocarbazone (I). The excess of (I) is washed out of the united  $\text{CCl}_4$  extracts with very dil. aq.  $\text{NH}_3$ . The orange Hg-(I) compound is decomposed with slightly acid aq. KI, and the green colour of (I) remaining is either matched against that produced similarly with known amounts of Hg, or measured photometrically. Small amounts of Hg may be determined colorimetrically from the mixed orange-green colour of the original  $\text{CCl}_4$  extract. Volumetrically, Hg is extracted as before with a measured small excess of a solution of (I) previously standardised against Ag. The excess of (I) is bound by adding a standard solution of  $\text{Ag}^+$ , and the excess of  $\text{Ag}^+$  is titrated back with (I).  $\text{Cl}^-$  in large excess does not interfere. In presence of Zn, Cd, Pb, or Bi, Hg alone is extracted from acid solution. Any Zn etc. dissolved is removed by washing with 0.2N-acid. In presence of Cu, Hg is extracted preferentially, and may be determined volumetrically, but not colorimetrically. J. S. A.

**Electrocapillary method of detection of the cations of the first sub-group of group IV.** A. F. ORLENKO (J. Gen. Chem. Russ., 1935, 5, 1091—1092).—Al electrodes are placed on wet filter-paper, crystals of  $\text{K}_4\text{Fe}(\text{CN})_6$ , pyrogallol (I),  $\text{K}_2\text{Cr}_2\text{O}_7$ , and KI are placed at different points around the cathode, and drops of the solution, containing  $\text{Hg}^{++}$ ,  $\text{Cu}$ ,  $\text{Bi}^{+++}$ , and  $\text{Cd}^{++}$ , are placed around the anode, and a current is passed. A few min. later the  $\text{K}_4\text{Fe}(\text{CN})_6$  turns pink, and then brown, and the (I) red, pointing to the presence of  $\text{Cu}^{++}$ . A yellow stain due to formation of  $\text{BiO}_2 \cdot \text{Cr}_2\text{O}_7$  then forms around the  $\text{K}_2\text{Cr}_2\text{O}_7$ , and a pink coloration due to  $\text{HgI}_2$  around the KI crystal. The entire procedure requires 10—15 min. R. T.

**Spectral analysis of complex mixtures.** B. J. DAIN, I. V. GRANOVSKI, and E. S. PUZENKIN (J. Gen. Chem. Russ., 1935, 5, 1093—1097).—A system of standard Co-Mn mixtures giving invariant homologous pairs of spectral lines is proposed. The relative intensity of the lines is unaffected by Na, K, Ba, Al, and Ni, but the Mn lines are relatively more damped by Fe, and more so by Fe+Al, whence it follows that Fe must be eliminated from the mixtures for spectral analysis. R. T.

**Step-photometric determination of manganese in waters.**—See B., 1936, 46.

**Analytical applications of 8-hydroxy-5-methylquinoline.** C. E. GIETZ and A. SÁ (Anal. Asoc. Quím. Argentina, 1935, **23**, 45—57).—The detection of traces of the following is described:  $\text{Fe}^{+++}$ ,  $\text{Cu}^{++}$ ,  $\text{Co}^{++}$ ,  $\text{Ni}^{++}$ ,  $\text{Pd}^{++}$ ,  $\text{Ti}^{+++}$ ,  $\text{Zn}^{++}$ ,  $\text{Fe}^{++}$ ,  $\text{Cd}^{++}$ ,  $\text{Mg}^{++}$ ,  $\text{VO}_3'$ ,  $\text{MoO}_4''$ ,  $\text{WO}_4''$ . F. R. G.

**Influence of silicic acid on the magnetic behaviour of dissociated mixtures with ferric oxide.** W. LEITGEBEL and K. BOCKEMUHL (Z. anorg. Chem., 1935, **225**, 209—212).—The amount of  $\text{Fe}_3\text{O}_4$  formed under different conditions has been determined by magnetic measurements. E. S. H.

**Detection of traces of iron in mercury salts.**—See B., 1936, 59.

**Determination of iron and aluminium by Crispo's method in natural phosphates.**—See B., 1936, 18.

**Determination of small amounts of nickel and cobalt in iron ores.**—See B., 1936, 63.

**Rapid determination of nickel in high-chromium steels and alloys.**—See B., 1936, 64.

**Importance of hydrogen-ion concentration in determination of molybdenum and vanadium by the 8-hydroxyquinoline method and solubility of 8-hydroxyquinoline in various solvents.** H. GOTO (J. Chem. Soc. Japan, 1935, **56**, 314—321).—Complete pptn. of Mo occurs in the  $p_{\text{H}}$  range 3.3—7.6 and that of V at  $p_{\text{H}}$  2.7—6.1. The solubility of 8-hydroxyquinoline in the  $\text{EtOH-COMe}_n$  mixture is small at  $p_{\text{H}}$  5.5—8.5. CH. ABS. (p)

**Iodometric titration of tin.** F. L. OKELL and J. LUMSDEN (Analyst, 1935, **60**, 803—810).—Low results in Sn titrations are shown to be due to  $\text{O}_2$  dissolved in the I solution and not to incomplete exclusion of air from the flask. In the analysis of Sn ores the presence of Ti gives erratic results; this is ascribed to its acting as a negative catalyst for the oxidation of  $\text{Sn}^{++}$  by dissolved  $\text{O}_2$ . No interference of Ti occurs if O-free I is used for titration. Reduction with Al turnings is recommended in ore analysis. A. R. P.

**Quantitative spectral analysis. IV.** R. BRECKTOR and A. MEVIS (Ann. Soc. Sci. Bruxelles, 1935, **55**, B, 266—292; cf. A., 1935, 719).—The spectral determination of Ti, V, Cr, Mn, Co, Ni, Mo, and In using a Cu base is discussed and tables of data are given. The Cu line previously described as 2480.13 Å. is actually 2479.8 Å., and coincident with an Fe line persistent at feeble amperages. R. S.

**Colorimetry of titanium. IV.** H. GINSBERG (Z. anorg. Chem., 1935, **226**, 57—64; cf. A., 1933, 566).—Errors in the colorimetric determination of  $\text{TiO}_2$  are discussed. By using a Pulfrich photometer 0.07 mg. of  $\text{TiO}_2$  per 100 c.c. can be determined within  $\pm 10\%$ . F. L. U.

**Determination of zirconium.** G. A. AMPT (J. Proc. Austral. Chem. Inst., 1935, **2**, 321—334).—A review of analytical methods for the determination of Zr and complete analysis of Zr minerals. J. S. A.

**Determination of the zirconium-hafnium ratio.** G. WERNIMONT and T. DE VRIES (J. Amer.

Chem. Soc., 1935, **57**, 2386—2387).—An equation for the calculation of the mol. ratio Hf : Zr in mixtures, when the effect of a known wt. of the mixed oxides on the rotation of certain reference tartrate solutions has been measured, is given. Results on two samples of mixed oxides are compared with those obtained by other methods. The procedure is not more accurate, but is rapid and convenient. E. S. H.

**Potentiometric determination of metavanadates with silver nitrate.** P. SPACU (Z. anal. Chem., 1935, **103**, 422—424).— $\text{VO}_3'$  is titrated potentiometrically with  $\text{AgNO}_3$  in 20% aq. EtOH solution. J. S. A.

**Electrometric determination of vanadium in (A) high-chromium steels, (B) slags.**—See B., 1936, 65.

**Determination of antimony in white metals.**—See B., 1936, 64.

**Determination of bismuth with 8-hydroxyquinoline.** F. HECHT and R. REISSNER (Z. anal. Chem., 1935, **103**, 261—269).—Determination of Bi as  $\text{C}_9\text{H}_6\text{N}\cdot\text{OH}\cdot\text{HBI}_4$  (cf. A., 1927, 847) is unsatisfactory, the ppt. undergoing partial decomp. during washing. Pptn. with 8-hydroxyquinoline from AcOH solution at 70° under the exact conditions described gives good macro- and micro-results. The ppt. is dried at 105° and weighed as  $\text{Bi}(\text{C}_9\text{H}_6\text{ON})_3\cdot\text{H}_2\text{O}$ . J. S. A.

**Colorimetric assay of bismuth pharmaceuticals.**—See B., 1936, 43.

**Potentiometric determination of quadrivalent osmium with chromous sulphate.** W. R. CROWELL and H. L. BAUMBACH (J. Amer. Chem. Soc., 1935, **57**, 2607—2609).—Apparatus and technique for (1) storing and titrating  $\text{CrSO}_4$  solutions, (2) standardising  $\text{CrSO}_4$  with  $\text{K}_3\text{Fe}(\text{CN})_6$  and  $\text{K}_2\text{Cr}_2\text{O}_7$ , and (3) determining Os in  $\text{K}_2\text{OsBr}_6$  and  $\text{K}_2\text{OsCl}_6$  by potentiometric titration are described. E. S. H.

**Separation of the six platinum metals from one another and their gravimetric determination.** R. GILCHRIST and E. WICHES (J. Amer. Chem. Soc., 1935, **57**, 2565—2573).—Os is isolated by distilling  $\text{OsO}_4$  from  $\text{HNO}_3$  solution. Ru is next isolated by distilling  $\text{RuO}_4$  from a solution of the sulphates in dil.  $\text{H}_2\text{SO}_4$  containing  $\text{NaBrO}_3$ . A suitable reagent for absorption of  $\text{OsO}_4$  or  $\text{RuO}_4$  is 6N-HCl saturated with  $\text{SO}_2$ . The separation of Pt, Pd, Rh, and Ir is effected by controlled hydrolytic pptn. In the recovery and determination of these metals, Os, Ru, and Ir are pptd. as hydrated oxides, ignited, and weighed as metal; Rh and Pt are obtained as sulphides and ignited to metal; Pd is recovered as the glyoxime compound, which may be weighed directly or ignited and weighed as metal. The accuracy is equal to that of the best analytical procedures. E. S. H.

**Comparison of some platinum thermometers with the helium thermometer between 0° and -183°.** W. H. KEESOM and B. G. DAMMERS (Physica, 1935, **11**, 1080—1090).—A  $\text{C}_5\text{H}_{12}$  cryostat for use at 0° to -150° is described. H. J. E.

**Construction of platinum thermometers and determination of their basic points.** W. H. KEESOM and B. G. DAMMERS (Physica, 1935, **11**,

1051—1058).—The construction and calibration are described. The optimum annealing temp. was 840—850°.  
H. J. E.

**Micro-determination of m.p.** M. MEZENER and S. WEHRLI (Helv. Chim. Acta, 1935, 18, 1281—1283).—A sealed m.-p. tube is used, the specimen being observed through a low-power microscope.  
J. S. A.

**Calorimeter for measurement of continued heat effects.** W. SWIENTOSELAWSKI (Rocz. Chem., 1935, 15, 343—350).—A flow calorimeter is described in which heat effects of the order of 1—400 g.-cal. per hr. are determined by measuring the difference in temp. between a liquid entering and leaving the calorimeter at const. velocity. Efficient heat exchange is achieved by surrounding the reaction vessel and the thermometer with labyrinths through which the liquid circulates.  
R. T.

**Thermocouples from 2° to 90° abs.** J. E. AHLBERG and W. O. LUNDBERG (J. Amer. Chem. Soc., 1935, 57, 2722—2723).—Methods of calibration are discussed.  
E. S. H.

**Precision thermostat for use down to -20°.** G. A. BENFORD (J. Sci. Instr., 1936, 13, 4—6).—A commercial refrigerating element acts in opposition to a controlled heater.  
C. W. G.

**Thermal conductivity method for following the electrolytic separation of hydrogen isotopes.** W. C. NEWELL, R. H. PURCELL, H. S. GREGORY, and H. J. T. ELLINGHAM (Nature, 1936, 137, 69—70).—A method, accurate to approx. 0.1% of D<sub>2</sub>, using gas at 10 cm. pressure is described.  
L. S. T.

**Determination of transformation points [in alloy systems].** H. NIPPEN and E. LIPS (Z. Metallk., 1935, 27, 242—243).—An apparatus for the automatic registration of the torsion angle of wires at various temp. is described; a sharp change in the direction of the resulting curve indicates a change in the constitution of the alloy. The use of the apparatus in determining the solidus of Cu-Ag alloys is illustrated.  
A. R. P.

**Physical methods in the chemical laboratory. XXVII. Application of roentgenographic methods to chemical problems.** R. BRILL and H. HALLE (Angew. Chem., 1935, 48, 785—795).—X-Ray methods for the study of gases, liquids, crystals, fibres, etc. are reviewed.  
R. S.

**Accurate determination of glancing angles and lattice constants by the method of Debye and Scherrer.** M. STRAUMANIS and A. IEVINS (Naturwiss., 1935, 23, 833).—The usual method is improved by a different arrangement of the film in the camera.  
A. J. M.

**Subjective photometer.** W. D. WRIGHT and J. H. NELSON (J. Sci. Instr., 1935, 12, 373—377).—The intensity of a patch viewed by the left eye is compared with that of one viewed by the right, in order to measure the variation in sensitivity of the eye for different conditions of the visual mechanism.  
C. W. G.

**Use of a selenium photo-electric cell for the measurement of solar ultra-violet radiation near 3200 Å.** G. LIANDRAT (Compt. rend. Acad. Sci.

U.R.S.S., 1935, 3, 19—20).—A surface of 30 sq. cm. is used, behind a Ag filter.  
C. W. G.

**Cuprous oxide "sperrschicht" photo-electric cell as precision sunshine recorder.** H. MAYER (Meteorol. Z., 1935, 52, 15—18; Chem. Zentr., 1935, i, 2565).—The photo-electric cell has advantages over the glass-sphere instrument.  
J. S. A.

**X-Ray powder camera for specimens at various known temperatures.** W. H. BARNES and W. F. HAMPTON (Canad. J. Res., 1935, 13, 73—81).—The specimen is placed over a hole in a Cu block through which the X-rays are directed by a pinhole system. The temp. of the block is maintained const. by circulation of COMe<sub>2</sub> or other liquid, which passes through two coils at -78° and is then warmed to any desired temp. between 0° and -60° by an electric heater.  
R. S.

**Mapping ultra-violet absorption spectra, using a special hydrogen lamp and a microphotometer.** H. C. GULL and A. E. MARTIN (J. Sci. Instr., 1935, 12, 379—388).—The spectra are photographed with a H<sub>2</sub> lamp, of const. output. They are traversed in the microphotometer by a series of lines corresponding with known extinction coeffs.  
C. W. G.

**Square reagent glasses for comparators.** H. BAUSCH (Woch. Brau., 1935, 52, 397).—A reagent tube, part of which has a square cross-section, is described. The uniformity and enlargement of the field which are thus made possible facilitate colorimetric comparisons.  
I. A. P.

**Spectrograph with high illumination for Raman spectra.** G. DUPONT and J. TABUTEAU (Bull. Soc. chim., 1935, [v], 2, 2152—2156).—Apparatus and method of working are described.  
F. L. U.

**Sedimentometer.** J. MILBAUER (Z. anal. Chem., 1935, 103, 419—422).—A photo-electric cell is employed to measure velocity of sedimentation.  
J. S. A.

**Photo-electric half-shadow method for determination of rotational dispersion.** O. SCHONROCK and E. EINSPOHN (Physikal. Z., 1936, 37, 1—12).—The method employs a single photo-electric cell.  
A. J. M.

**Observing fluorescence.** D. W. DANA (Rev. Sci. Instr., 1935, [ii], 6, 417).—Corning glass No. 038, "Noviol A," may be used when the source of excitation extends into the visible violet.  
C. W. G.

**Resolving power of the two-crystal X-ray spectrometer.** L. G. PARRATT (Rev. Sci. Instr., 1935, [ii], 6, 387—399).—The physical meaning of resolving power when the shape of the diffraction pattern is unknown has been studied experimentally. New criteria of spectrometric perfection of calcite crystals are proposed.  
C. W. G.

**Illuminator for printing Laue photographs.** C. H. DWIGHT and H. KERSTEN (Rev. Sci. Instr., 1935, [ii], 6, 418; cf. A., 1935, 1340).—The priority of Trendelenburg and Franz (A., 1934, 504) is admitted.

**Double ionisation chamber for detection of corpuscular particles.** B. ZIPPRICH (Z. Physik, 1935, 96, 328—336).  
A. B. D. C.

**Mechanism of action of solid rectifiers.** V. P. SHUSÉ (Physikal. Z. Sovietunion, 1935, 7, 1—18).—A method for making rectifiers with blocking layers of  $\text{SiO}_2$ ,  $\text{B}_2\text{O}_3$ ,  $\text{NaCl}$ ,  $\text{S}$ , glass, and bakelite, and with rectification coeffs. up to 100 is described.

CH. ABS. (e)

**Measurement of electromotive force and very weak direct current by means of electron tubes.** F. MÜLLER and W. DURICHEN (Z. Elektrochem., 1936, 42, 31—43).—A review.

**Magnification of currents of the order of  $10^{-13}$  amp.** H. ALFVEN (Z. Physik, 1935, 97, 708—717).—The valve circuit described automatically differentiates, with respect to time, the potential of the first grid, and so records the true form of the applied small current.

A. B. D. C.

**Hydraulic counter for elementary rays and photo-electrons.** H. GREINACHER (Helv. phys. Acta, 1934, 7, 514, 641; Chem. Zentr., 1934, ii, 2096; 1935, i, 2319).

J. S. A.

**Further hydroelectric counter for elementary rays and photo-electrons. III.** H. GREINACHER (Helv. phys. Acta, 1935, 8, 89—96; Chem. Zentr., 1935, i, 2852).—Elementary rays or photo-electrons initiate a discharge between a liquid surface and an Fe point electrode. The counter has advantages over the author's hydraulic counter (see above).

J. S. A.

**Further improvements in the Curie-Cheneveau magnetic balance.** F. W. GRAY, A. CLOW, and J. H. CRUIKSHANK (J. Sci. Instr., 1936, 13, 13—20).—Alterations in apparatus and technique are described (cf. Gray *et al.*, *ibid.*, 1932, 9, 1).

C. W. G.

**Routine gas analysis apparatus.** H. K. SEN, K. ROY, and P. ROY (J. Indian Chem. Soc., 1935, 12, 654—658).—The method of fractional combustion is employed.

R. S. B.

**Gas micro-analysis [apparatus] for following the course of oxidation of hydrocarbons.**—See B., 1936, 50.

**Container for analysing gases by combustion.** V. MATSCHKARIN (Novo. Tech., Seri. Gorn. Prom., 1935, No. 2, 13).—The sealed-in Pt wires of the explosion vessel are cooled by Hg, contained in glass tubes sealed to the outside of the vessel. Risk of cracking at the seals is thus eliminated.

CH. ABS. (e)

**Manometric device for gas analysis.**—See this vol., 259.

**Air analysis apparatus.**—See this vol., 259.

**Apparatus for determining the concentration of ammonium fluoride solutions.** M. SCRUTZA (Woch. Brau., 1935, 52, 405—406).—The described apparatus minimises the difficulties met with in titrating  $\text{NH}_4\text{HF}_2$  solution (I) with 0.1N-Ba(OH)<sub>2</sub> solution (litmus). The concn. of free HF varies in commercial samples of (I) from 29 to 33%, and a correction table is therefore supplied for the elimination of errors due to this variation.

I. A. P.

**Modified Rehberg burette for use with titrating solutions which react with mercury.** B. B. LONGWELL and R. M. HILL (J. Biol. Chem., 1936, 112, 319—321).—The Rehberg micro-burette (A.,

1925, i, 852) is modified so that Hg does not touch the titrating fluid.

H. D.

**Logarithmic head correction in viscometry.** G. BARR (J.C.S., 1935, 1793—1795).—The effects of several shapes of bulbs on the "head correction" for viscosimeters are evaluated. Bury's procedure (A., 1934, 1195) is modified.

J. G. A. G.

**Microscopical method for measuring the viscosity of a liquid.** F. HIRATA (Bull. Chem. Soc. Japan, 1935, 10, 507—524).—The velocity of flow of liquids under a known pressure through a capillary is observed under a microscope by using particles of C and SiC, 0.1—0.002 mm. in diameter, as indicators of flow. The particles have no effect on  $\eta$  within the experimental error.  $\eta$  has been measured for glycerol and for solutions of cellulose acetate in  $\text{COMe}_2$ , results agreeing with those obtained with the Oswald viscosimeter, and with theory.

R. S. B.

**Regulation of liquid flow by capillary tubes.** I. HVIDBERG (Kem. Maanedst., 1934, 15, 152; Chem. Zentr., 1935, i, 2409).—A simple device for fine flow regulation is described.

J. S. A.

**Sulphuric acid hygrometer.** A. BLACKIE (J. Sci. Instr., 1936, 13, 6—9).—The change of pressure of air at const. vol. on drying is measured.

C. W. G.

**Simple humidity chamber.** F. C. MEAD (J. Sci. Instr., 1935, 12, 394—395).—Suitable solutions are placed inside an air thermostat controlled by a bi-metallic regulator.

C. W. G.

**Obtaining and controlling high humidities at high temperatures.** W. LETHERSICH (J. Sci. Instr., 1935, 12, 388—391).—Separate heating is provided for a dish of  $\text{H}_2\text{O}$  inside a heated oven.

C. W. G.

**Chemical hygrometer.** T. M. CARPENTER (J. Biol. Chem., 1935, 112, 123—133).—An apparatus, on the principle of that used in gas analysis, for the determination of  $\text{H}_2\text{O}$  vapour by vol. in air is described. The vols. before and after removal of  $\text{H}_2\text{O}$  by  $\text{Mg}(\text{ClO}_4)_2 \cdot 3\text{H}_2\text{O}$  are read against a const. vol. kept dry by  $\text{P}_2\text{O}_5$ . The agreement with results obtained by wt. of the absorbed  $\text{H}_2\text{O}$  is within 0.02%.

J. N. A.

**Development of air-driven spinning top as transparent centrifuge.** J. W. MCBAIN and C. M. O'SULLIVAN (J. Amer. Chem. Soc., 1935, 57, 2631—2641).—Apparatus and technique are described.

E. S. H.

**Mercury float-valves [taps] for high-vacuum work.** H. LUX (Z. anorg. Chem., 1935, 226, 21—22).—The greaseless taps devised by Stock (A., 1915, ii, 339; 1925, ii, 1195) have been modified by using floats provided with thin sintered glass plates, thus permitting rapid evacuation.

F. L. U.

**Rapid weighings with a Troemner solution balance.** E. T. BARTHOLOMEW and E. C. RABY (Science, 1935, 82, 468).—Modifications to ensure quicker and more convenient weighing with a 20-kg. capacity balance are described.

L. S. T.

**Modern developments in chemical balances.** J. L. BUCHAN (J. Sci. Instr., 1936, 13, 1—4).—Historical.

C. W. G.

**Determination of low gas pressures.** H. KLUMB and T. HAASE (Physikal. Z., 1936, 37, 27—32).—An apparatus for determining low gas pressures uses an electrically heated bimetal strip (invar-constantan), the loss of heat, varying with the pressure of the gas, being measured by the bending of the strip. The instrument is useful for pressures down to  $10^{-4}$  mm., and may also be used for determining the composition of a gas, since the effect is dependent on mol. wt. A. J. M.

**Laboratory apparatus.** A. OSTROGOVICH (Annali Chim. Appl., 1935, 25, 563—568).—Apparatus for drying substances in a vac., a reflux condenser, and a flask with neck adaptable to reflux condenser or distillation head are described and illustrated. F. O. H.

**Device for drilling oriented holes in spheres required in the construction of crystal structure models.** M. J. BUERGER (Rev. Sci. Instr., 1935, [ii], 6, 412—416).—Full constructional diagrams are given. C. W. G.

**Simple oil micromanometer.** O. BEECK (Rev. Sci. Instr., 1936, [ii], 6, 399—400).—Movement of Hg is magnified by transfer to movement of oil in a capillary. C. W. G.

**Apparatus for studying the elastic properties of filamentous materials.** I. J. SAXL (Rev. Sci. Instr., 1935, [ii], 6, 409—412).—Chainomatic wt. application is used. C. W. G.

**Making extremely thin films.** K. LARK-HOROVITZ, J. D. HOWE, and E. M. PURCELL (Rev. Sci. Instr., 1935, [ii], 6, 401—403).—The film is deposited on a layer of material such as camphor which is subsequently removed by vaporisation. C. W. G.

**Apparatus for the determination of colloid osmotic pressure in small amounts of fluid.** R. DUBACH and R. M. HILL (J. Biol. Chem., 1936, 112, 313—318).—The Krogh-Nakazawa osmometer (A., 1927, 1104) is modified by using brass parts, thus dispensing with washers around the membrane and allowing a view of the latter when in place. H. D.

## Geochemistry.

**Gases of the borate-carrying soffioni, with special reference to their content of helium and other noble gases.** U. SBORGI (Mem. R. Accad. Ital., Cl. Sci. fis. mat., 1934, 5, 667—713; Chem. Zentr., 1935, i, 2792).— $O_2$  is absent from soffioni gases, which vary little in composition from different sources. He and Ar are present, with little Ne. The Rn : He ratio is not const. J. S. A.

**Mineral composition of atmospheric dust collected at Baton Rouge, Louisiana.** R. D. RUSSELL (Amer. J. Sci., 1936, [v], 31, 50—66).—From dust storms of April, 1934 (and April, 1935) were compared. The vol. % size of particles 0—100, < 1 (1); 0.025—0.050, 4 (9); 0.005—0.0025, 20 (50); < 0.005 mm., 65 (40). The material was separated into lighter and heavier portions by centrifuging in  $CHBr_3$ , and particles > 0.01 mm. were identified and counted under the microscope. The lighter portion contained volcanic glass 42 (24), plant fragments etc. 18 (5), quartz 21 (53)%; and 11 other minerals were identified. In the heavier portion ( $d > 2.88$ ; 1% of the whole) 35 minerals were identified, including "black metallics" 25 (22), hematite with some limonite 18 (25), epidote 21 (27)%, etc. The relative abundance of volcanic glass is evidently due to its concn. by suspension in the air. The 1934 dust came from the northern plains, and that of 1935 from the south. L. J. S.

**Concentration of  $D_2O$  in natural ice.** II. E. BARONI and A. FINK (Monatsh., 1935, 67, 131—36; cf. A., 1935, 953).—Results of determinations of  $D_2O$  in samples of ice taken systematically from definite parts of glaciers (Caucasus) are given. Variations of 50 to +25% from the normal are recorded. F. L. U.

**Mineral waters of Harrogate.** A. WOODMANSEY (Analyst, 1936, 61, 23—26).—The composition,

pharmacology, transport, and storage of the waters are discussed. E. C. S.

**Analysis of water from Torrente Iungari, Calabria.** B. RICCA and P. MEDURI (Annali Chim. Appl., 1935, 25, 571—586).—Chemical, physico-chemical, and bacteriological data are given and the therapeutic val. of the  $H_2O$  is discussed. F. O. H.

**Chemical and biological aspects of Orbetello lagoon water.** I, II. C. M. MALDURA (Atti R. Accad. Lincei, 1935, [vi], 22, 64—68, 140—145).—I. Data for annual variations in temp., salinity, and oxygenation are given and discussed.

II. Data for variations in temp., salinity,  $pH$ , alkalinity, and content of  $Cl^-$ ,  $SO_4^{2-}$ ,  $O_2$ ,  $NH_3$ ,  $NO_2^-$ , and  $NO_3^-$ -N, P, and Si are tabulated. F. O. H.

**Hydrogen-ion concentration and temperature of surface waters of several seas.** R. C. MILLER (Proc. V Pacific Sci. Congr., 1934, 3, 2111—2113).—The  $pH$  varied from 8.23 to 8.03. CH. ABS. (e)

**Determination and quantity of boron in sea-water.** M. W. HARDING and E. G. MOBERG (Proc. V Pacific Sci. Congr., 1934, 3, 2093—2095).—The B in sea-water is titrated in presence of mannitol. The content was 4.3—4.8 mg. of B per kg. of sea-water. CH. ABS. (e)

**Probable role of boron in the buffer mechanism of sea-water.** R. REVELLE and E. G. MOBERG (Proc. V Pacific Sci. Congr., 1933, 3, 2147—2151).—The modification of the buffer relations of sea-water by borates is discussed. CH. ABS. (e)

**Simultaneous change in chemical composition of sea-water and *Mytilus crassitesta*, Lischke, influenced by season.** K. HAYASHI (Proc. V Pacific Sci. Congr., 1934, 3, 2069—2071).—The correlation between changes in the composition of sea-

for Cs 8521 and 8944 Å. The mineral is mixed with NaCl and evaporated in the C arc. Saturation of the arc with Na ions secures evaporation under comparable conditions. Comparison is made with known Cs and Rb contents, or with Ba and Li. In agreement with the authors' views and the large ionic radius of Cs and Rb, Cs and Rb are enriched relatively to Ca and Na in magmatic rocks and sedimentary rocks. J. S. A.

The pair chalcostibite-empлектite, and the agreement between dimensions of unit cells and the crystallographic parameters. M. H. UNGEMACH (Bull. Soc. franç. Min., 1934, 57, 186—207; Chem. Zentr., 1935, i, 2657).—Agreement with X-ray and crystallographic data for emplectite is obtained by a choice of new co-ordinate axes for chalcostibite. J. S. A.

Determination of the specific volume of fused masses at temperatures up to 1400°. M. P. VOLAROVITSCH and A. A. LEONTJEVA (Z. anorg. Chem., 1935, 225, 327—332).—By a dilatometric method, the sp. vol. of the rocks diorite, basalt, and diabase, and the salts  $K_2SiO_3$ ,  $NaBO_2$ , and  $K_2B_4O_7$ , in the fused state, has been determined at different temp. and the expansion coeff. calc. M. S. B.

Distribution of useful metals in the earth's crust. I. NODDACK and W. NODDACK (Angew. Chem., 1936, 49, 1—5).—A discussion. E. S. H.

Determination of activity of rocks with the tube counter. J. N. HUMMEL (Nach. Ges. Wiss. Göttingen, 1935, [ii], 1, 73—81; Chem. Zentr.,

1935, i, 2643—2644).—The Geiger counter is applied to the determination of the radioactivity of rocks. Separation of the effects of the Th and U families is possible only under (under-ground) conditions of screening from cosmic radiation. J. S. A.

Radioactivity of rocks in the Far East and its influence on forests. L. L. LAGUNOV (Bull. Far East. Branch Acad. Sci. U.S.S.R., 1934, No. 9, 105—109).—Increase in radioactivity of soil increases self-seeding, growth, and the no. of trees per unit area. CH. ABS. (e)

Enelectrite, a new mineral found in chemawinitite. T. L. WALKER (Univ. Toronto Studies, Geol. Ser., 1934, No. 36, 11—12).—The mineral (hydrocarbon?) forms colourless, lath-shaped monoclinic crystals. CH. ABS. (e)

Chemawinitite or Canadian amber. T. L. WALKER (Univ. Toronto Studies, Geol. Ser., 1934, No. 36, 5—10).—Cedarite and chemawinitite are identical. Physical properties are recorded. Analysis gave C 81.40, H, 10.70, O 7.23, N 0.02, ash 0.65%. CH. ABS. (e)

Distribution of sulphur in Illinois coals and its geological implications. G. H. CADY (Ill. State Geol. Survey, Rept. Invest., 1935, No. 35, 23—41).—Data are discussed. CH. ABS. (e)

Influence of structural irregularities on the chemical character of No. 6 coal in Franklin and Williamson counties, Illinois. E. T. BENSON and G. H. CADY (Ill. State Geol. Survey, Rept. Invest., 1935, No. 35, 5—22). CH. ABS. (e)

## Organic Chemistry.

Tautomerism. B. NILSEN (Tidsskr. Kjemi, 1935, 15, 145—150).—A review. M. H. M. A.

Hydrogenation of unsaturated compounds. N. K. JURASCHEVSKI (J. Gen. Chem. Russ., 1935, 5, 1098—1107).—Addition of  $H_2$  (Pd on Ni) to the second double linking of geraniol and linalyl acetate commences before complete saturation of the first, whilst in limonene (I) the two processes proceed simultaneously. The following pairs of substituted ethylenes behave similarly to (I): stilbene-benzoyl-eugenol (II), allyl alcohol (III)— $CHPh:CH \cdot CO_2Na$  (IV); in the pairs (IV)—pulegone (V), fumaric acid (VI)—(V), (V)— $CHMe:CM_e$ , (III)—(VI), (III)—(IV), (IV)—(I),  $CHPh:CH \cdot CO_2Me$  (VII)—(IV), and (VII)— $CHPh:CH \cdot CO_2H$  the second component is hydrogenated after complete or almost complete saturation of the first. The pair (II)—(IV) occupies an intermediate position. R. T.

Determination of butadiene by condensation with quinones. A. B. DOLGOPLOSK (Sintet. Kautschuk, 1934, No. 2, 29—31).—The rectified butadiene was bubbled through a solution of benzoquinone in PhOH at 120°. The condensation product is 1:4:5:8-tetrahydroanthraquinol. The method is applicable in presence of other olefines,  $Et_2O$ , and  $MeCHO$ . CH. ABS. (e)

Polymerisation products of normal ( $\Delta^2$ -) pentene at high temperature. H. I. WATERMAN, J. J. LEENDERTSE, and J. DE HULSTER (J. Inst. Petroleum Tech., 1935, 21, 952—958).—The polymerised product obtained from  $\Delta^2$ -pentene by treatment with  $AlCl_3$  at 0° did not undergo any appreciable change by heating at 200° (a) in presence of a Ni catalyst in  $N_2$ , or (b) in presence of  $H_2$  without a catalyst; hence with Ni and  $H_2$  it is probable that the mol. structure remains unaltered. At 300°, however, depolymerisation occurs under conditions (a) and (b). Rapid hydrogenation (high-pressure  $H_2$ ; Ni) protects the product from destruction, the product being similar to that obtained at 200° under the same conditions. At 435° an unsaturated and cyclic liquid product (with increased no. of rings) was obtained under conditions (a), whereas under (b) considerable destruction was also observed, but the total no. of rings had not appreciably changed. Under conditions (a) and (b) the higher-mol. fraction contained more rings per mol. than the raw material. C. C.

Reaction between sulphur dioxide and olefines. III. Higher olefines. Limitations of the reaction. L. L. RYDEN and C. S. MARVEL (J. Amer. Chem. Soc., 1935, 57, 2311—2314; cf. A., 1935, 1349).—*iso*- $C_4H_8$ ,  $\Delta^2$ - and  $\Delta^3$ -pentene,  $\Delta^2$ -nonene,  $\gamma$ -cyclohexylpropene, and 3-methylcyclohexene give

alcoholic polysulphones, m.p. (block) 340°, 290—300° (215—220° in a tube), 340°, >300°, 330°, and 270°, respectively, but further substitution on the ethylenic linking hinders addition. Mol. wt. determination by means of the Cl content of the  $\text{CH}_2\text{Cl}\cdot\text{CO}$  and  $\text{CCl}_3\cdot\text{CO}$  derivatives is inaccurate owing to difficulties of purification and low Cl content; mol. wts. are about 100,000—200,000. The N content of the anilide of propylenepolysulphone indicates a mol. wt. of about 50,000. Undecenyl alcohol and  $\Delta^8$ -heptenene give polysulphones, darkens at 330° ( $\text{CH}_2\text{Cl}\cdot\text{CO}$  derivative) and m.p. 160—169°, respectively. R. S. C.

$\alpha\gamma$ -Disubstituted allene.  $\Delta^{8\gamma}$ -Hexadiene. H. VAN RISSEGHEM (Bull. Soc. chim. Belg., 1935, 44, 593—596).—Hexane- $\gamma\delta$ -diol with  $\text{PBr}_3$  affords the  $\gamma\delta$ -dibromide and  $\gamma$ -bromo- $\Delta^7$ -hexene, b.p. 49.0—49.2°/26 mm., which with KOH in  $\text{CH}_2\text{Ph}\cdot\text{OH}$  gives  $\Delta^{8\gamma}$ -hexadiene, b.p. 67.75—68.25°/760 mm.

J. L. D.

Chloroform-*d* (deuteriochloroform). F. W. BREUER (J. Amer. Chem. Soc., 1935, 57, 2236—2237).— $\text{CCl}_3\cdot\text{CHO}$  and  $\text{D}_2\text{O}$  give the deuterate (I), which with NaOD gives deuteriochloroform, m.p. —64.69° to —64.15°, b.p. 0.5° > that of  $\text{CHCl}_3$ . Physical data are given. (I) and NaOD are less sol. in  $\text{D}_2\text{O}$  than are  $\text{CCl}_3\cdot\text{CH}(\text{OH})_2$  and NaOH, respectively, in  $\text{H}_2\text{O}$ . R. S. C.

Synthesis of  $\alpha\beta$ -dichlorobutadiene, and its polymerisation. A. L. KLEBANSKI, A. S. VOLKENSCHTEIN, and A. P. ORLOVA (J. Gen. Chem. Russ., 1935, 5, 1255—1267).— $\text{CH}_2\text{:CH}\cdot\text{C}\cdot\text{CH}$ , b.p. 55—57°, obtained in 57% yield by shaking  $\text{CH}_2\text{:CH}\cdot\text{C}\cdot\text{CH}$  with aq. NaOCl for 10 hr. at room temp., yields  $\alpha\beta$ -dichloro- $\Delta^{\alpha\gamma}$ -butadiene (I), b.p. 60—65°/105 mm., when shaken with  $\text{CuCl}+\text{NH}_4\text{Cl}$  in 50% HCl (16 hr., room temp.); the structure of (I) is established by treating it with  $\text{O}_3$ , when  $\text{CHCl}\cdot\text{CCl}\cdot\text{CO}_2\text{H}$  is obtained. (I) polymerises spontaneously at room temp., to yield a gelatinous product, sol. in org. solvents; the velocity of polymerisation is intermediate between that of chloroprene and chlorobutadiene, and increases with rising temp. and intensity of illumination. An ebonite-like product is obtained by hot-pressing the mixture (I) 5, MgO 1, ZnO 0.25, neozone 0.1, and colophony 0.25 pts.

R. T.

Initial formation of methyl alcohol in the oxidation of methane. W. A. BONE (Nature, 1935, 136, 910).—Small amounts of MeOH (0.13%) and  $\text{CH}_2\text{O}$  (0.03%) have been detected in the suddenly-cooled products of the explosion of a  $5\text{CH}_4+2\text{O}_2$  mixture at an initial pressure of approx. 50 atm. L. S. T.

Presence of active *sec*-butyl alcohol in fermentation propyl alcohols. Qualitative and quantitative analysis by Raman spectra. G. DUPONT and R. DULOU (Bull. Soc. chim., 1935, [v], 2, 2156—2163).—Samples of supposedly pure fermentation ProH are shown by Raman spectra to contain up to 19% of *l*-*sec*-BuOH. R. S. C.

South American drugs. I. Bixol. II. *Canavalia obtusifolia*.—See this vol., 123.

Application of the xanthic reaction to the dehydration of di-tertiary  $\alpha$ -glycols. V. A. FOMIN (J. Gen. Chem. Russ., 1935, 5, 1192—1194).— $\text{OH}\cdot\text{CMe}_2\cdot\text{CMe}_2\cdot\text{OK}$  in xylene and  $\text{CS}_2$  (100°; 4 hr.), followed by addition of MeI and further heating (100°; 6 hr.), yield the substance  $\begin{matrix} \text{CMe}\cdot\text{O} \\ | \\ \text{CMe}\cdot\text{O} \end{matrix} > \text{CS}$ , m.p. 156°, converted into pinacolin,  $\text{H}_2\text{S}$ , and  $\text{CO}_2$  by heating with  $\text{H}_2\text{SO}_4$ . R. T.

Reaction of ethylene oxide with acetylenic Grignard reagents. J. P. DANEHY, R. R. VOGT, and J. A. NIEUWLAND (J. Amer. Chem. Soc., 1935, 57, 2327).—The Grignard reagent from 2 mols. of  $\Delta^8$ -heptenene (I) with  $(\text{CH}_2)_2\text{O}$  gives  $\text{OH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{Br}$ , (I), and  $\Delta^7$ -heptenen- $\alpha$ -ol. The reagents from  $\Delta^8$ -hexinene and  $\text{CH}\cdot\text{CPh}$  react similarly. R. S. C.

Acetylene polymerides and their derivatives. XXIII. Preparation and polymerisation of oxy-prenes [ $\beta$ -alkoxybutadienes]. H. B. DYKSTRA (J. Amer. Chem. Soc., 1935, 57, 2255—2259; cf. A., 1935, 1480).—Me  $\beta$ -alkoxyethyl ketones and alkyl orthoformates give  $\alpha\gamma\gamma$ -trialkoxybutanes (I), which at >130° afford  $\beta$ -alkoxybutadienes (termed oxy-prenes). At lower temp. with acid catalysts unsaturated ketals (II),  $\text{CH}_2\text{:CH}\cdot\text{CMe}(\text{OR})_2$ , with basic catalysts  $\alpha\gamma$ -dialkoxy- $\Delta^8$ -butenes (III), are formed. Below the dissociation temp. (II) and (III) add alcohols, phenols, and thiophenols to give (I) and its S derivatives, mixed oxy-prenes being thus obtainable. Oxy-prenes alone polymerise very slightly in several months; in ultra-violet light at room temp. *ethoxy*prene ( $\beta$ -ethoxybutadiene) (IV) gives in 7 days 20% of rubbery polymeride (VI) only; at 100° (daylight) in 6 days 15% of polymerisation [1 part of liquid, largely dimeric polymeride and 3 of (VI)] occurs, at 130° 100% [equal parts of liquid and (VI)] in 2 weeks; certain catalysts, notably I and HCN, rapidly produce liquid polymerides of low mol. wt., metal halides and AcOH produce resins;  $\text{SnCl}_4$  acts explosively. (VI) is plastic and sol. in EtOAc and  $\text{C}_6\text{H}_6$ , but lacks the resilience of rubber; with hot dil. HCl it gives a polymeride,  $(\text{C}_4\text{H}_6\text{O})_x$ . Structures are established by reactions given below, but some doubt attaches to those of (III). The following are described.  $\alpha\gamma\gamma$ -*Tri-methoxy*-, b.p. 61—63°/20 mm., -*ethoxy*- (VII), b.p. 75°/9 mm., and -*n*-butoxy-*n*-butane, b.p. 120°/3 mm. *Me vinyl ketone*  $\text{Me}_2$ , b.p. 98—100°, *Et*, (VIII), b.p. 69°/100 mm.,  $\text{Bu}^{\alpha\alpha}_2$ , b.p. 79—80°/8 mm., and  $\text{Ph}_2$  ketal, b.p. 81°/2 mm.  $\alpha\gamma$ -*Di-ethoxy*- (IX), b.p. 101°/100 mm., and -*ethoxy*- $\Delta^8$ -butene, b.p. 91—93°/4 mm. *ethoxy*-, b.p. 75°, and -*n*-butoxy-*butadiene*, b.p. 65°/54 mm., and (IV), b.p. 96.5°, called *methoxy*prene etc. (IV) and EtOH at 100 or 130° give (VII), and with  $(\text{CH}_2\cdot\text{OH})_2$  at 110° gives a substance (—*hydroxyethoxybutadiene* or  $\text{CH}_2\text{:CH}\cdot\text{CMe}\begin{matrix} \text{O}\cdot\text{CH}_2 \\ | \\ \text{O}\cdot\text{CH} \end{matrix}$ ), b.p. 56°/100 mm.; PhOH and PhSH add on at room temp. (IV) and naphthaquinone give a product, oxidised to 2-ethoxyanthraquinone, m.p. 136° (lit. 135°). With  $\text{H}_2$ -PtO<sub>2</sub>-EtOH (IV) is only partly hydrogenated, yielding  $\beta$ -ethoxy- $\Delta^8$ - or - $\Delta^8$ -butene or a mixture thereof. With dil. HCl (IV) and (VIII) give  $\text{CH}_2\text{:CH}\cdot\text{COMe}$ . (VIII) and  $\text{H}_2$ -PtO<sub>2</sub> give 40% of  $\text{CMeEt}(\text{OEt})_2$ . (IX) with dil.

HCl gives  $\text{OEt}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{COMe}$  and with  $\text{KMnO}_4$   $\text{AcOH}$  and  $\text{EtOAc}$ . Physical data are given.

R. S. C.

**Ester condensation and keten acetals.** F. ADICKES and M. MEISTER (Ber., 1935, 68, [B], 2191—2205).—Contrary to Scheibler (cf. A., 1926, 711; 1927, 338, 1051; 1929, 1296, etc.), no intermediate products are known between the ether enolates, which probably play a part in the reaction, and the enolates of the reaction products. A definite "primary reaction product" does not exist, and theories based thereon and on its fission to keten  $\text{Et}_2$  acetal are devoid of experimental foundation. The distillate from Scheibler's "primary product" consists of  $\text{EtOH}$ , the "acetal" reaction of which depends on the presence of small and varying amounts of  $\text{CH}_2\text{Ac}\cdot\text{CO}_2\text{Et}$ . Treatment of the "primary product" in  $\text{Et}_2\text{O}$  with  $\text{CO}_2$  shows it to be mainly a mixture of  $\text{NaOEt}$  and  $\text{ONa}\cdot\text{CMe}\cdot\text{CH}\cdot\text{COEt}$ ; a substance  $\text{ONa}\cdot\text{CMe}\cdot\text{CH}\cdot\text{CO}_2\text{Et}+\text{EtOH}$  or  $\text{EtOAc}+\text{NaOEt}$  is not present. Similar observations apply to the condensation of  $\text{PhCHO}$  with  $\text{EtOAc}$ . Repetition of Scheibler's condensation of  $\text{CHPhK}\cdot\text{CO}_2\text{Et}$  with  $\text{BzCl}$  or  $\text{ClCO}_2\text{Et}$  shows that the supposed *o*-benzoylphenylketen acetal is *Et*  $\beta$ -benzoyloxy- $\alpha\beta$ -diphenylacrylate (I), m.p.  $103^\circ$ , the constitution of which is established by analysis, determination of  $\text{OEt}$ , hydrolysis by  $\text{KOH}\cdot\text{EtOH}$  to  $\text{BzOH}$  (2 mols.) and  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{H}$  (1 mol.), and by conc.  $\text{H}_2\text{SO}_4$  alone or in presence of  $\text{AcOH}$  to  $\text{BzOH}$  (1 mol.) and  $\text{CHPhBz}\cdot\text{CO}_2\text{Et}$  (1 mol.). (I) is converted by  $\text{NHPh}\cdot\text{NH}_2$  into benzphenylhydrazide and 1:3:4-triphenylpyrazol-5-one, m.p.  $204\text{--}205^\circ$ . Hydrogenation ( $\text{PtO}_2$ ) of (I) leads to *Et*  $\beta$ -benzoyloxy- $\alpha\beta$ -diphenylpropionate (II), m.p.  $170^\circ$ , also obtained by use of  $\text{Al}\cdot\text{Hg}$  in moist  $\text{Et}_2\text{O}$  and hydrolysed by  $\text{KOH}\cdot\text{EtOH}$  to  $\text{BzOH}$  and phenylcinnamic acid, m.p.  $171^\circ$ . (I) is obtained synthetically by addition of  $\text{BzCl}$  to the enolate from  $\text{CHPhBz}\cdot\text{COEt}$  and powdered  $\text{K}$  or  $\text{NaNH}_2$  in  $\text{Et}_2\text{O}$ , whilst (II) is readily prepared from  $\text{BzCl}$  and  $\text{OH}\cdot\text{CHPh}\cdot\text{CHPh}\cdot\text{CO}_2\text{Et}$  in  $\text{C}_5\text{H}_5\text{N}$ . When heated above its m.p., (I) is converted into a second (?) polymorphic variety, m.p.  $112^\circ$ . A third, obviously stereoisomeric form, m.p.  $105^\circ$ , which cannot be isomerised by heat, is not hydrogenated in presence of  $\text{Pt}$  and only incompletely reduced by  $\text{Al}$  in moist  $\text{Et}_2\text{O}$ , is obtained from  $\text{CHPhBz}\cdot\text{CO}_2\text{Et}$  and  $\text{BzCl}$  in  $\text{CHCl}_3\text{--C}_5\text{H}_5\text{N}$ ; it is almost quantitatively hydrolysed by conc.  $\text{H}_2\text{SO}_4$  to  $\text{BzOH}$  and  $\text{CHPhBz}\cdot\text{CO}_2\text{Et}$ . *Et*  $\alpha\beta$ -dibromo- $\alpha\beta$ -diphenylpropionate, m.p.  $81\text{--}82^\circ$ , is incidentally described. Scheibler's pyrolytic product is identified as 4:6-diketo-5-benzoyl-2:3:5-triphenyl-5:6-dihydropyran (III), m.p.  $200\text{--}201^\circ$ , converted by conc.  $\text{H}_2\text{SO}_4$  into 4:6-diketo-2:3:5-triphenyl-5:6-dihydropyran, m.p.  $236^\circ$  (*K* salt), which gives (III) with  $\text{BzCl}$  in  $\text{C}_5\text{H}_5\text{N}$  and is transformed by  $\text{AcCl}$  in  $\text{CHCl}_3\text{--C}_5\text{H}_5\text{N}$  into 4:6-diketo-5-acetyl-2:3:5-triphenyl-5:6-dihydropyran (IV), m.p.  $182^\circ$ . (III) or (IV) is transformed by conc.  $\text{NH}_3$  at  $160^\circ$  into 4:6-dihydroxy-2:3:5-triphenylpyridine, m.p.  $288\text{--}289^\circ$  (*K* salt;  $\text{Ac}_2$  derivative, m.p.  $143\text{--}144^\circ$ ). The product of the action of  $\text{ClCO}_2\text{Et}$  on  $\text{CHPhK}\cdot\text{CO}_2\text{Et}$  (Scheibler's *o*-carbethoxyphenylketen acetal) is identified as  $\text{CHPh}(\text{CO}_2\text{Et})_2$  mixed with  $\text{CPh}(\text{CO}_2\text{Et})_3$ ; the product decolorises

$\text{KMnO}_4\text{--Na}_2\text{CO}_3$ , which is not suitable for the identification of keten acetals.

H. W.

**Isotopic exchange reactions of organic compounds. I. Intermolecular nature of three-carbon tautomerism.** D. J. G. IVES and H. N. RYDON (J.C.S., 1935, 1735—1742).—The partition of D and H between butyric (I), crotonic (II), and vinylacetic (III) acids and dil.  $\text{D}_2\text{O}$  at  $100^\circ$  in presence of 1.05 mol. of  $\text{NaOH}$  is studied using a new method of isotopic analysis depending on *d* determinations accurate to 1 p.p.m. As (III) shows appreciable isotopic interchange with the solvent, whilst (I) and (II) do not, it is concluded that purely intramolecular mechanisms for this type of three-C tautomerism are unacceptable.

F. N. W.

**Configurative relationships of phenylmethyl- and methylhexyl-acetic acids. Correlation of the configurations of  $\alpha$ -hydroxy-acids with those of disubstituted acetic acids containing a methyl group.** P. A. LEVENE and S. A. HARRIS (J. Biol. Chem., 1935, 112, 195—208).—Correlation is established in the series,  $\text{CHMeRR'}$ , in which  $\text{R}=\text{Et}$  or  $\text{CO}_2\text{H}$  and  $\text{R'}=\text{Ph}$ ,  $\text{CH}_2\text{Ph}$ ,  $\text{CH}_2\text{Ph}\cdot\text{CH}_2$ ,  $\text{C}_6\text{H}_{13}$ ,  $\text{C}_6\text{H}_{15}$ ,  $\text{C}_6\text{H}_{11}$ ,  $\text{C}_6\text{H}_{11}\cdot\text{CH}_2$ , or  $\text{C}_6\text{H}_{11}[\text{CH}_2]_2$ . Speculations are given concerning correlation of the series,  $\text{OH}\cdot\text{CHR}\cdot\text{CO}_2\text{H}$  and  $\text{OH}\cdot\text{CHRR'}$ , with those,  $\text{CHMeR}\cdot\text{CO}_2\text{H}$  and  $\text{CHMeRR'}$ , respectively ( $\text{R}$  and  $\text{R'}=\text{alkyl}$ ,  $\text{aryl}$ , and  $\text{aralkyl}$ ).  $\text{CHMeEt}\cdot\text{CO}_2\text{Et}$ ,  $[\alpha]_D^{25} -7.11^\circ$ , and  $\text{MgBr}[\text{CH}_2]_5\cdot\text{MgBr}$  give 60% of  $\eta$ -methyl- $\Delta^8$ -nonen- $\zeta$ -ol (dibromide, b.p.  $161^\circ/4$  mm.) and 40% of 1-sec.-butylcyclohexan-1-ol, which on distillation gives  $\text{H}_2\text{O}$  and 1-1-sec.-butyl- $\Delta^1$ -cyclohexene, b.p.  $172\text{--}174^\circ$ ,  $[\alpha]_D^{25} -4.06^\circ$ , hydrogenated ( $\text{PtO}_2$ ) in abs.  $\text{EtOH}$  to d-sec.-butylcyclohexane, b.p.  $176\text{--}178^\circ$ ,  $[\alpha]_D^{25} +0.59^\circ$ .  $\text{C}_5\text{H}_{11}\cdot\text{MgBr}$  (from  $\text{C}_5\text{H}_{11}\text{Br}$ ,  $[\alpha]_D^{25} +2.40^\circ$ ) and  $\text{C}_6\text{H}_{13}\cdot\text{CHO}$  give  $\gamma$ -methylundecan- $\epsilon$ -ol, b.p.  $70\text{--}75^\circ/0.1$  mm.,  $[\alpha]_D^{25} +3.54^\circ$ , converted into the iodide, b.p.  $88^\circ/1$  mm.,  $[\alpha]_D^{25} +5.85^\circ$ , and thence (Raney  $\text{Ni}$ ) into  $\gamma$ -methylundecane, b.p.  $94^\circ/15$  mm.,  $[\alpha]_D^{25} +3.87^\circ$ .

R. S. C.

**Acetylenes. II. Pharmacological properties of the acetylenic linking.** G. B. BACHMAN (J. Amer. Chem. Soc., 1935, 57, 2167—2168; cf. A., 1935, 193).— $\beta$ - $\text{NEt}_2\cdot\text{C}_2\text{H}_4$  octoate, b.p.  $162\text{--}164^\circ/20$  mm.,  $\Delta^8$ -octenoate, b.p.  $171\text{--}173^\circ/20$  mm., and  $\Delta^8$ -octinenate, b.p.  $150\text{--}152^\circ/7$  mm.,  $\text{NEt}_2[\text{CH}_2]_3$  octoate, b.p.  $178\text{--}181^\circ/20$  mm.,  $\Delta^8$ -octenoate, b.p.  $183\text{--}186^\circ/20$  mm., and  $\Delta^8$ -octinenate, b.p.  $164\text{--}166^\circ/7$  mm., and  $\text{NBu}_2[\text{CH}_2]_3$  octoate, b.p.  $212\text{--}215^\circ/20$  mm.,  $\Delta^8$ -octenoate, b.p.  $217\text{--}220^\circ/20$  mm., and  $\Delta^8$ -octinenate, b.p.  $193\text{--}195^\circ/7$  mm., are prepared.  $\Delta^8$ -Octenoyl chloride (prep. by  $\text{SOCl}_2$ ) has b.p.  $109\text{--}111^\circ/30$  mm. Physical data are given. The effectiveness of aliphatic novocaine analogues as local anaesthetics is, within limits,  $\propto$  the mol. wt. of the alcoholic component and inversely  $\propto$  the degree of unsaturation of the acid.

R. S. C.

**Direct esterification of higher fatty acids with glycerol and with ethylene glycol.** T. P. HILDITCH and J. G. RIGG (J.C.S., 1935, 1774—1778).—A mixture of mono- (I) and di-glycerides in which the latter predominate is obtained by the interaction of higher fatty acids and excess (10:1) of glycerol (II) at  $140\text{--}$

160° and reduced pressure. The yield of (I) [ $\alpha$ -monolaurin (100%), -palmitin (93%), -stearin (82%), -olein (95%)] is greatly increased by using an inert solvent (PhOH), and camphor- $\beta$ -sulphonic acid (III) (about 0.1%) as catalyst. Increase in the time or temp. of reaction or in the amount of (III) increases the total yield, but lowers the yield of (I), whilst a preponderance of (II) favours the formation of (I). Identical results, but higher yields, are obtained by using  $(\cdot\text{CH}_2\cdot\text{OH})_2$  in place of (II). F. N. W.

**Seeds of *Allanblackia klainei*.**—See this vol., 258.

**Crystalline substance from oil of *Lachnophyllum gossypinum*, Bge.**—See this vol., 259.

**Destructive distillation of calcium oleate and undecenoate.** G. BREUER and K. WEINMANN (Monatsh., 1935, 67, 42—50).—Ca oleate at 130—170°/15 mm. gives oleones, m.p. 58.5°, and liquid (*oxime* of the latter, an oil), and a little *hydroxyheptadecyl heptadecenyl ketone*, m.p. 60.5°, which with  $\text{H}_2\text{SO}_4$  give *di(hydroxyheptadecyl) ketones*, m.p. 89°, 90°, and 86°, respectively (possibly identical). Ca undecenoate at 90—120°/20 mm. gives *didecenyl ketone*, m.p. 51°.

R. S. C.

**Elaidinisation of oleic acid and *cis-trans* isomerism.** S. H. BERTRAM (Chem. Weekblad, 1936, 33, 3—5).—0.03—0.1% of Se at 150—200° is a most powerful catalyst for elaidinising unsaturated oils and fatty acids. Unlike other catalysts, it is very mild in its action and produces no by-products. Elaidinised castor oil is dimorphous, m.p. 47.5° and 55.4°, and has the same  $[\alpha]$  as the original oil. Elaidinisation of oleic acid is a balanced reaction irrespective of the catalyst used, the equilibrium mixture containing 2 mols. of elaidic and 1 mol. of oleic acid. The results are in accordance with the supposition that oleic acid has a *s*-configuration. S. C.

**Polymerisation of fatty oils. XI. Hydrogenation of polymerised ethyl linoleate.** A. STEGER and J. VAN LOON (Fettchem. Umschau, 1935, 42, 217—219; cf. A., 1935, 1482).—Vac.-distilled Et linoleate (I) (prepared from tetrabromolinoleic acid pptd. from the fatty acids of safflower oil) was polymerised by heating at 290° in an atm. of  $\text{CO}_2$  for 15 hr.; the product was saponified, the unsaponifiable matter removed, and the fatty acids were recovered and converted into Et esters, which were examined by fractional distillation and hydrogenation of the principal fractions over Pd-C at 170°/50 atm. and over colloidal Pd in EtOH solution at room temp. at 1 atm. The analyses of the hydrogenated fractions indicate that the polymerised ester contained [in addition to unchanged (I)] low-mol. decomp. products, small amounts ( $\approx 10\%$ ) of a cyclic ester which could not be reduced by  $\text{H}_2$ , high-mol. compounds formed by the combination of several mols. of linoleate and/or decomp. products (also unreducible to stearic acid or its ester), and  $\approx 5\%$  of a conjugated linoleic acid (II); the presence of (II) was confirmed quantitatively by a study (L. N. J. VAN DER HULST) of the ultra-violet absorption spectrum of the polymerised (I). E. L.

**Separation of physeteric acid from sardine and pilot-whale oils.** Y. TOYAMA and T. TSUCHIYA (J.

Soc. Chem. Ind. Japan, 1935, 38, 680—684B).—Physeteric acid has been isolated from sardine and pilot-whale (body) oils, and is shown by oxidation to be the  $\Delta^3$ -tetradecenoic acid.  $\Delta^6$ -Tetradecenoic acid was not isolated. H. G. M.

**Highly unsaturated acids in sardine oil. IX. Constitution of docosahexaenoic acid,  $\text{C}_{22}\text{H}_{32}\text{O}_2$ .**

**X. Separation of highly unsaturated  $\text{C}_{24}$  acids.**

**XI. Constitution of nisinic acid,  $\text{C}_{24}\text{H}_{36}\text{O}_2$ , in sardine oil.** Y. TOYAMA and T. TSUCHIYA (Bull. Chem. Soc. Japan, 1935, 10, 539—543, 543—547, 547—551).—IX. Ozonolysis of amyl docosahexaenoate (A., 1935, 1482) (containing a little amyl clupanodionate) affords  $\text{MeCHO}$ ,  $\text{AcOH}$ ,  $\text{CO}_2$ ,  $(\cdot\text{CH}_2\cdot\text{CO}_2\text{H})_2$ , and its amyl H ester. Docosahexaenoic acid is therefore either  $\text{CH}_2\cdot\text{CH}\cdot\text{CH}_2\cdot[\text{CH}\cdot\text{CH}\cdot\text{CH}_2]_4\cdot(\text{CH}\cdot\text{CH}\cdot[\text{CH}_2]_2)_3\cdot\text{CO}_2\text{H}$ , or  $\text{CHMe}\cdot\text{CH}\cdot[\text{CH}_2\cdot\text{CH}\cdot\text{CH}]_4\cdot[\text{CH}_2]_2\cdot\text{CH}\cdot\text{CH}\cdot[\text{CH}_2]_2\cdot\text{CO}_2\text{H}$ .

X. Separation of the  $\text{C}_{24}$  unsaturated acids (obtained by hydrolysis of the Me ester residues of high b.p.) by the Na salt-COME<sub>2</sub> method (*loc. cit.*), re-esterification and fractionation of the Me esters up to b.p. 215°/2 mm., and hydrolysis and refractionation as Na salts affords nisinic acid (I) (A., 1934, 1381) as the only pure product, but the presence of less saturated acids  $\text{C}_{24}\text{H}_{38}\text{O}_2$  and  $\text{C}_{24}\text{H}_{40}\text{O}_2$  was indicated.

XI. Ozonolysis of the amyl ester of (I) affords  $\text{EtCHO}$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{MeCHO}$ , and  $\text{AcOH}$  [as secondary products from  $\text{CH}_2(\text{CO}_2\text{H})_2$ ],  $\text{CO}_2$ ,  $(\cdot\text{CH}_2\cdot\text{CO}_2\text{H})_2$  and its amyl H ester. On the basis of these results the structure  $\text{CHEt}\cdot\text{CH}\cdot[\text{CH}_2\cdot\text{CH}\cdot\text{CH}]_3\cdot[\text{CH}_2]_2\cdot\text{CH}\cdot\text{CH}\cdot[\text{CH}_2]_2\cdot\text{CO}_2\text{H}$  is suggested for (I). J. W. B.

**Hydrogenation of fish oil. V. Formation of an unsaturated fatty acid of the linolenic series in the hydrogenation of methyl clupanodionate.** M. TAKANO (J. Soc. Chem. Ind. Japan, 1935, 38, 652—653B).—Me clupanodionate, b.p. 206—208°/0.8 mm., prepared from the acids obtained from sardine oil, when hydrogenated (Ni) affords a product which contains acids of the linoleic and linolenic series. The existence of two isomerides, one giving a tetra- and the other a hexa-thiocyanate, of the linolenic series is suggested. H. G. M.

**Catalytic hydrogenation of acetone compounds of  $\alpha$ -hydroxy-acids.** H. ŌEDA (Bull. Chem. Soc. Japan, 1935, 10, 531—539).—Reduction of the  $\text{CMe}_2\cdot$

derivatives of  $\alpha$ -OH-acids,  $\text{CMe}_2\cdot\begin{smallmatrix} \text{O}\cdot\text{CHR} \\ \text{O}\cdot\text{CO} \end{smallmatrix}$ , with  $\text{H}_2$  and a  $\text{CuO}\cdot\text{BaO}\cdot\text{Cr}_2\text{O}_3$  catalyst at 240—260°/100—120 atm. effects cleavage at both O linkings to give both alcohols and glycols. Thus the *isopropylidene* derivative of *dl*-lactic acid gives  $\text{Pr}^{\beta}\text{OH}$  (I) ( *$\alpha$ -naphthylurethane*, m.p. 104—105°) and  $\text{OH}\cdot\text{CHMe}\cdot\text{CH}_2\cdot\text{OH}$  (*bisphenylurethane*, m.p. 143—144°); that of *l*-leucic acid gives (I),  $\text{CH}_2\text{Bu}^{\beta}\cdot\text{CH}_2\cdot\text{OH}$ , and an active *isohexylene glycol*,  $\text{OH}\cdot\text{CHBu}^{\beta}\cdot\text{CH}_2\cdot\text{OH}$ , b.p. 111—113.5°/15 mm. (*bisphenylurethane*, m.p. 115—116°); that of *dl*-mandelic acid gives (I),  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{OH}$  (*phenylurethane*, m.p. 78—79°), and an aromatic hydrocarbon containing  $\text{PhEt}$ ; and that of *l*- $\alpha$ -hydroxy- $\beta$ -phenylpropionic acid affords (I),  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$  (*phenylurethane*, m.p. 45—46°), active  $\text{CH}_2\text{Ph}\cdot\text{CHMe}\cdot\text{OH}$  (*phenylurethane*, m.p. 88—89°), and  $\text{CH}_2\text{Ph}\cdot\text{CH}(\text{OH})\cdot\text{CH}_2\cdot\text{OH}$  [*bisphenylurethane*,

obtained in two interconvertible forms *A*, m.p. 108—109° (cryst.), and *B*, m.p. 132—133° (amorphous)].

J. W. B.

**Action of hydrogen peroxide on simple carbon compounds. III. Glycollic acid.** H. S. FRY and K. L. MILSTEAD (J. Amer. Chem. Soc., 1935, 57, 2269—2272; cf. A., 1931, 819).—The  $\text{HCO}_2\text{H}$ ,  $\text{CO}_2$ ,  $\text{H}_2$ ,  $\text{O}_2$ , and unattacked  $\text{OH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  (I) formed when (I) reacts with acidified  $\text{H}_2\text{O}_2$  give the following percentages of the reactions occurring, the figures recorded being those obtained with 0.5 and 4 mols. of  $\text{H}_2\text{O}_2$ , respectively: (a) 6.3—37%:  $(\text{I}) \rightarrow \text{H}_2\text{O} + \text{CO}_2\text{H}\cdot\text{CH}_2\cdot\text{O}_2\text{H} \rightarrow \text{H}_2\text{O} + \text{CHO}\cdot\text{CO}_2\text{H} \rightarrow \text{HCO}_2\text{H} + \text{CO}_2 + \text{H}_2\text{O}$ ; (b) 1.84—12.9%:  $(\text{I}) \rightarrow \text{CH}_3\text{O} + \text{H}_2\text{O} + \text{CO}_2$ ;  $2\text{CH}_3\text{O} \rightarrow 2\text{HCO}_2\text{H} + \text{H}_2$ ; (c) 23.2—39.9%:  $\text{HCO}_2\text{H} \rightarrow 2\text{H}_2\text{O} + \text{CO}_2$ .

R. S. C.

**Anhydrous glyoxylic acid.** A. TALVITIE (Suomen Kem., 1935, 8, B, 32).—Evaporation of a dil. aq. solution of  $\text{CHO}\cdot\text{CO}_2\text{H}$  over  $\text{H}_2\text{SO}_4$  at room temp./vac., extraction of the residual syrup with dry  $\text{Et}_2\text{O}$  (removes  $\text{CaC}_2\text{O}_4$ ), and re-evaporation of the  $\text{Et}_2\text{O}$  extract over  $\text{H}_2\text{SO}_4$  at room temp./< 1 mm. affords the anhyd. acid.

J. W. B.

**Application of the indophenine test to the detection of polycarboxylic acids.** J. V. SANCHEZ (Farm. moderna, 1935, 46, 58—63).—The aq. solution of the free acid is neutralised with  $\text{Na}_2\text{CO}_3$  (phenolphthalein), and a drop of the solution is evaporated to dryness in a small tube. The residue is heated (120°) and mixed with powdered  $\text{P}_2\text{S}_5$ . A solution of isatin in conc.  $\text{H}_2\text{SO}_4$  is added, and the mixture heated until fusion begins and S sublimes. A green or blue colour indicates the presence of succinic (I), pyrotartaric (II), tartaric, fumaric, maleic, or citric acid. Oxidation with acid  $\text{KMnO}_4$  oxidises all except (I) and (II), which may be detected separately. Glutaric, adipic, suberic, azelaic, and sebatic acids interfere and may be removed with  $\text{Pb}(\text{OAc})_2$ .

CH. ABS. (p)

**Detection of oxalate ions.** N. A. TANANAEV and A. A. BUDKEVITSCH (Z. anal. Chem., 1935, 103, 353—355).—To the test solution, acidified aq.  $\text{K}_2\text{Cr}_2\text{O}_7$  is added, followed by indigotin (I). In presence of  $\text{C}_2\text{O}_4^{2-}$  ( $\leq 10^{-4}N$ ), decolorisation occurs, due to the induced mutual oxidation of  $\text{C}_2\text{O}_4^{2-}$  and (I).  $\text{S}^{2-}$ ,  $\text{SO}_3^{2-}$ , and  $\text{S}_2\text{O}_3^{2-}$  must first be removed by boiling with  $\text{H}_2\text{SO}_4$ .  $\text{C}_2\text{O}_4^{2-}$  may alternatively be pptd. as  $\text{CaC}_2\text{O}_4$ , which is dissolved in  $\text{H}_2\text{SO}_4$  and detected by the decolorisation of 0.01*N*- $\text{KMnO}_4$ .

J. S. A.

**Potentiometric determination of oxalates with silver nitrate.** P. SPACU (Z. anal. Chem., 1935, 103, 272—274).— $\text{C}_2\text{O}_4^{2-}$  may be titrated potentiometrically with  $\text{AgNO}_3$  in 60% aq.  $\text{EtOH}$ .

J. S. A.

**Optical activity. IV. Racemisation of the optically active oxalates.** C. H. JOHNSON. V. Racemisation of the strychnine salts of *d*- and *l*-chromioxalate in the crystalline state. C. H. JOHNSON and A. MEAD. VI. Racemisation of potassium chromioxalate in aqueous solution. The accelerating influence of ions. N. W. D. BEESE and C. H. JOHNSON (Trans. Faraday Soc., 1935, 31, 1612—1621, 1621—1632, 1632—1642; cf. A., 1933, 114, 581, 585).—IV. The optical activity

and racemisation of compounds of the type  $\text{M}_3[\text{M}^{\text{III}}(\text{C}_2\text{O}_4)_3]$  are discussed. The experimental evidence accepted as supporting the theory of secondary ionisation in racemisation is untrustworthy and based on a misconception, since if ionisation were responsible for loss of rotatory power it could not be determined by ordinary chemical methods for compounds racemising at measurable rates. The racemisation of chromi- and cobalti-oxalates in the cryst. state suggests that intramol. rearrangement may occur in solution as well as in the crystals. The racemisation of these compounds is greatly accelerated by presence of  $\text{H}_2\text{O}$ .

V. The velocity of racemisation of tristrychnine *d*- and *l*-chromioxalates at 47.7—100° has been studied. The loss of rotatory power occurs principally after dehydration. The mechanism of the intramol. rearrangement is discussed.

VI.  $(\text{C}_2\text{O}_4)^{2-}$  does not affect the rate of racemisation of  $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3]$ , this being in accord either with the racemisation being a measure of the rate of ionisation, or with racemisation not involving ionisation. Loss of optical activity is accelerated by positive ions, the more so the higher is the valency of the ions. The results indicate that the  $\text{Hg}^{\text{I}}$  ion is  $\text{Hg}_2^{2+}$ . The effects of adding  $\text{CaCl}_2$ ,  $\text{MnCl}_2$ , and  $\text{CuCl}_2$  have been studied in detail.

J. W. S.

**Oxalates and formates in organic fluids.** M. PITTARELLI (Minerva Med., 1935, 1, 428—429).—Mg powder converts  $\text{H}_2\text{C}_2\text{O}_4$  into  $\text{CHO}\cdot\text{CO}_2\text{H}$ , and  $\text{HCO}_2\text{H}$  into  $\text{CH}_2\text{O}$ . On adding  $\text{NHPh}\cdot\text{NH}_2$  and *p*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$ , and making alkaline with  $\text{NaOH}$ , the Pittarelli test is obtained. The red-violet colour is extractable with amyl alcohol. If Mg salts are present, a blue-violet lake is formed. CH. ABS. (e)

**Complex formation with malonates.**—See this vol., 160.

**Hydrogenation of aldonic  $\delta$ - and  $\gamma$ -lactones and of aldoses.** J. W. E. GLATTFIELD and G. W. SCHIMPF (J. Amer. Chem. Soc., 1935, 57, 2204—2208).—The best yields of aldoses by hydrogenation of aldonic lactones are obtained in 0.2*M* aq. solution with moderate amounts of catalyst and rapid agitation.  $\gamma$ -Lactones give more alcohol than do  $\delta$ -lactones. Aldoses give 63—80% of alcohols.

R. S. C.

**Dimeride of thiocarbonyl chloride and its derivatives, chloro-oxysulphide,  $\text{C}_2\text{S}_2\text{OCl}_2$ , and a new chlorosulphide,  $\text{C}_2\text{S}_3\text{Cl}_2$ .** M. DELÉPINE, L. LABRO, and F. LANGE (Bull. Soc. chim., 1935, [v], 2, 1969—1980).—The structure of  $\text{C}_2\text{S}_2\text{Cl}_4$  (I) is discussed (cf. A., 1933, 487). By the action of  $\text{EtOH}$  on (I) the compound, probably  $\text{S}(\text{CS}\cdot\text{Cl})_2$ , m.p. 58—59°, is obtained. The prep. and properties of  $\text{C}_2\text{S}_2\text{OCl}_2$  are described, and the structure

it affords the following thiuram oxides:  $\text{Me}_4$ , m.p. 79°;  $(\text{CH}_2\text{Ph})_4$ , m.p. 100—101°;  $\text{Ph}_2\text{Me}_2$ , m.p. 116°;  $\text{Ph}$ , *Et*, m.p. 147.5—148°; *di*-*o*-tolyl dimethyl-, m.p. 93—94°; diphenyl dibenzyl-, m.p. 128.5—129.5°; *di*-*o*-anisyl dimethyl-, m.p. 158°.

O. J. W.

Catalytic action of monoses on the form-aldehyde condensation. III. Intermediate products of the reaction. A. KUSIN (Ber., 1935, 68, [B], 2169—2173; cf. A., 1935, 733, 1224).—Attempts to isolate the intermediate products of the catalysis of the  $\text{CH}_2\text{O}$  condensation are unsuccessful when glucose or fructose is used as accelerator, but succeed if benzoin (I), which behaves analogously, is employed. The mechanism,  $\text{OH}\cdot\text{CR}\cdot\text{CR}\cdot\text{OH} + \text{CH}_2(\text{OH})_2 \rightarrow \text{OH}\cdot\text{CH}_2\cdot\text{CR}(\text{OH})\cdot\text{CH}(\text{OH})_2 \rightarrow \text{OH}\cdot\text{CH}\cdot\text{CR}\cdot\text{CO}\cdot\text{R}$  (II);  $(\text{II}) + \text{CH}_2(\text{OH})_2 \rightarrow \text{OH}\cdot\text{CH}_2\cdot\text{CH}(\text{OH})\cdot\text{CR}(\text{OH})\cdot\text{CO}\cdot\text{R} + \text{H}_2\text{O} \rightarrow \text{OH}\cdot\text{CHR}\cdot\text{CO}\cdot\text{R} + \text{OH}\cdot\text{CH}\cdot\text{CH}(\text{OH})_2$  (III);  $(\text{III}) - \text{H}_2\text{O} \rightarrow \text{OH}\cdot\text{CH}\cdot\text{CH}\cdot\text{OH}$  (IV);  $(\text{IV}) + \text{CH}_2(\text{OH})_2 \rightarrow \text{OH}\cdot\text{CH}_2\cdot\text{CH}(\text{OH})\cdot\text{CH}(\text{OH})_2$  etc., is suggested. (I) and  $\text{CH}_2\text{O}$  with  $\text{Ca}(\text{OH})_2$  in  $\text{H}_2\text{O}-\text{MeOH}-\text{EtOH}$  at  $37-40^\circ$  afford *benzoylphenylhydroxymethylcarbinol* (V), m.p.  $85.5^\circ$ , also obtained from (I),  $\text{CH}_2\text{O}$ , and  $\text{NaOH}$  in  $\text{EtOH}$ , which contains 2 OH (Zerevitinov) and with  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{NH}_2$  gives the compound  $\text{C}_{21}\text{H}_{18}\text{O}_4\text{N}_3$ , m.p.  $166.5^\circ$ . In 50%  $\text{EtOH}$  (V) gives a feeble fuchsin- $\text{H}_2\text{SO}_3$  reaction, and immediately reduces Fehling's solution (to Cu),  $\text{Ag}_2\text{O}-\text{NH}_3$ , and dichlorophenol-indophenol in alkaline but not in acid solution. (V) exactly resembles (I) in accelerating the  $\text{CH}_2\text{O}$  condensation with formation of sugar-like products; it is converted into (I) during the change.

H. W.

Thermal decomposition of certain gaseous organic compounds. M. W. TRAVERS (Nature, 1935, 136, 909—910).—Processes involved in the thermal decomp. of  $\text{MeCHO}$  and  $(\text{CH}_2)_2\text{O}$  are further discussed (cf. A., 1935, 708). Additional experiments support the view that the reactions depend on the surface of the system and involve a chain mechanism.

L. S. T.

Volumetric determination of carbonyl compounds. II. Determination of acetaldehyde by the hydrogen sulphite method. S. HAHNEL (Svensk Kem. Tidskr., 1935, 47, 275—285; cf. A., 1935, 1390).—The direct determination of  $\text{MeCHO}$  by  $\text{I}-\text{HSO}_3'$  gives more reproducible results than the indirect method. The formation of acetals in aq. alcoholic solutions has been studied, and methods for the determination of free and total  $\text{MeCHO}$  in such solutions are given. For the reaction  $\text{CHMe}(\text{OEt})_2 + \text{H}_2\text{O} \rightleftharpoons \text{CHMe}(\text{OH})\cdot\text{OEt} + \text{EtOH}$ ,  $K=0.94$ .

M. H. M. A.

$\beta$ -Chloropropaldehyde and its derivatives. A. KIRRMANN, M. GOUDARD, and M. CHAHIDZADEH (Bull. Soc. chim., 1935, [v], 2, 2143—2152).—The halogen of  $\beta$ -halogenopropaldehydes is very labile, but elimination of  $\text{HCl}$  often takes precedence over exchange reactions.  $\text{CH}_2\cdot\text{CH}\cdot\text{CHO}$  (I) and dry  $\text{HCl}$  at  $-10^\circ$  give  $\beta$ -chloropropaldehyde (II), b.p.  $130-131^\circ$  ( $\text{NaHSO}_3$  compound, from which it cannot be recovered), the  $\text{Me}_2$  acetal, b.p.  $51^\circ/19$  mm., of which with  $\text{HCl}$  gives  $\alpha\gamma$ -dichloro- $\alpha$ -methoxypropane (III), b.p.  $55^\circ/19$  mm.  $\beta$ -Bromopropaldehyde ( $\text{NaHSO}_3$  compound, from which it cannot be recovered) could not be obtained pure, but yielded a mixture of  $\beta$ -bromo- (IV), b.p.  $58-60^\circ/17$  mm., and  $\beta$ -methoxypropaldehyde  $\text{Me}_2$  acetal, b.p.  $45-46^\circ/17$  mm.,  $146^\circ/760$  mm., and  $\alpha\gamma$ -dibromo- $\alpha$ -methoxypropane, b.p.  $15^\circ/16$  mm. (II) with  $\text{NaOAc}$  or  $\text{NaOEt}$  loses  $\text{HCl}$  to re-form (I), but with  $\text{Ac}_2\text{O}$  gives the diacetate, m.p.  $43^\circ$ ,

$\alpha$ -chloroallyl acetate, and the trimeride, m.p.  $36^\circ$ . (IV) loses  $\text{HBr}$  with  $\text{NaOAc}$ ,  $\text{NaOMe}$ , or  $\text{Ag}_2\text{O}$ , but with  $\text{NHET}_2$  in hot  $\text{COMe}_2$  gives  $\beta$ -dimethylamino-propaldehyde  $\text{Me}_2$  acetal, b.p.  $85^\circ/16$  mm.  $\beta$ -Cyano-propaldehyde  $\text{Me}_2$  acetal, b.p.  $93^\circ/17$  mm., with  $\text{MgMeBr}$  gives laevulaldehyde  $\text{Me}_2$  acetal, b.p.  $85^\circ/16$  mm. (IV) does not react with  $\text{MgMeBr}$ , but (III) gives  $\alpha$ -chloro- $\gamma$ -methoxy- $n$ -butane, b.p.  $125^\circ$ , and with  $\text{MgPhBr}$  affords  $\alpha$ -chloro- $\gamma$ -methoxy- $\gamma$ -phenylpropane (V), b.p.  $113-114^\circ/16$  mm. (III) and  $\text{AlCl}_3$  in  $\text{C}_6\text{H}_6$  give  $\alpha$ -methoxy- $\alpha\gamma$ -diphenylpropane, m.p.  $34^\circ$ , also obtained in traces similarly from (V). (III) does not react readily with  $\text{Mg}$  in hot  $\text{Et}_2\text{O}$  or  $\text{Bu}_2\text{O}$ . R. S. C.

Phytochemical reduction of lactaldehyde. E. OCHIAI and K. MIYAKI (Biochem. Z., 1935, 282, 293—296).—The production of optically inactive propylene glycol using a Japanese bottom yeast is described.

P. W. C.

Constitution of dimeric keten. W. R. ANGUS, A. H. LECKIE, C. G. LE FÈVRE, R. J. W. LE FÈVRE, and A. WASSERMANN (J.C.S., 1935, 1751—1755).—The dipole moment ( $3.15$  at  $25^\circ$  in  $\text{C}_6\text{H}_6$ ;  $3.30$  in  $\text{CCl}_4$ ), mol. refraction, and heat of combustion ( $447.1$  kg.-cal. per mol. in the liquid and  $456 \pm 2$  kg.-cal. per mol. in the gaseous state) of dimeric keten favour the view that it exists predominately in the keto-enol form. Dissolution has little effect on the Raman spectrum, and therefore presumably on the constitution.

F. N. W.

Preparation of acyloins of high mol. wt. V. L. HANSLEY (J. Amer. Chem. Soc., 1935, 57, 2303—2305).—The appropriate ester and  $\text{Na}$  (2 atoms) in hot  $\text{PhMe}$  or xylene give 80—95% yields of the acyloins,  $\text{R}\cdot\text{CO}\cdot\text{CHR}\cdot\text{OH}$ , in which  $\text{R}=\text{C}_8\text{H}_{17}$ , m.p.  $45^\circ$ ,  $\text{C}_9\text{H}_{19}$ , m.p.  $51-62^\circ$  (osazone, m.p.  $79-80^\circ$ ),  $\text{C}_{11}\text{H}_{23}$  (I), m.p.  $61-62^\circ$  (osazone, m.p.  $61-63^\circ$ ),  $\text{C}_{13}\text{H}_{27}$ , m.p.  $71-72^\circ$  (osazone, m.p.  $44-46^\circ$ ),  $\text{C}_{15}\text{H}_{31}$ , m.p.  $77-78^\circ$ , and  $\text{C}_{17}\text{H}_{35}$ , m.p.  $82-83^\circ$ ; those in which  $\text{R}=\text{Me}$ ,  $\text{Pr}^a$ , m.p.  $-10^\circ$  (osazone, m.p.  $140-141^\circ$ ), and  $\text{C}_5\text{H}_{11}$ , m.p.  $9^\circ$  (osazone, m.p.  $119-120^\circ$ ), are best prepared in  $\text{Bu}^a_2\text{O}$  or  $\text{Bu}^n_2\text{O}$ . Oxidation of (I) gives *di-n-undecyl ketone*, m.p.  $71-72.5^\circ$ . Hydrogenation (Pt at room temp or Ni at  $125-150^\circ$ ) affords the glycols,  $(\text{OH}\cdot\text{CHR})_2$ , in which  $\text{R}=\text{C}_{17}\text{H}_{35}$ , m.p.  $123-124^\circ$  (diacetate),  $\text{C}_{13}\text{H}_{27}$ , m.p.  $124^\circ$  (diacetate),  $\text{C}_{11}\text{H}_{23}$ , m.p.  $125-126^\circ$  (diacetate),  $\text{C}_7\text{H}_{15}$ , m.p.  $129-130^\circ$  (diacetate),  $\text{C}_5\text{H}_{11}$ , m.p.  $135-136^\circ$ , and  $\text{Pr}$ , m.p.  $123-124^\circ$ . R. S. C.

Tetrose sugars. I. Crystalline triacetate of *d*-threose from the degradation of strontium xylonate with hydrogen peroxide. Nomenclature in the tetrose group. II. Degradation of *d*-xylose by Wohl's method. Rotation of *d*-threose. R. C. HOCKETT (J. Amer. Chem. Soc., 1935, 57, 2260—2264, 2265—2268).—I. By electrolytic oxidation xylose yields *Sr d*-xylonate,  $+5\text{H}_2\text{O}$ ,  $[\alpha]_D +13.2^\circ$  in  $\text{H}_2\text{O}$ , oxidised by  $\text{Fe}_2(\text{SO}_4)_3-\text{Ba}(\text{OAc})_2$  to *d*-threose triacetate, m.p.  $117-118^\circ$  (corr.),  $[\alpha]^{20} +35.55^\circ$  in  $\text{CHCl}_3$ , which by  $\text{NaOMe}$  at  $<0^\circ$  yields solutions of *d*-threose (I),  $[\alpha]^{20} -12.3^\circ$  in  $\text{H}_2\text{O}$ . Errors in nomenclature, due to overlooking Fischer's error in calling *d*-xylose *l*-xylose, are corr. The name erythritol should be confined to the inactive alcohol, the active tetrils being named *d*- and *l*-threitol.

II. *d*-Xylose oxime (syrupy mixture) with  $\text{Ac}_2\text{O}$  (dropwise) in dioxan gives tetra-acetyl-*d*-xylonitrile, m.p. 81–82° (corr.),  $[\alpha]_D^{20} +50.3^\circ$  in  $\text{CHCl}_3$ , which with conc. aq.  $\text{NH}_3$  yields diacetamido-*d*-threose (I), m.p. 165–167° (corr.),  $[\alpha]_D^{20} -10.86^\circ$  in  $\text{H}_2\text{O}$  (triacetate, m.p. 179–180°,  $[\alpha]_D^{20} +74.2^\circ$  in  $\text{CHCl}_3$ ), which gives (I) with  $[\alpha]$  as stated. R. S. C.

Detosylation [deacylation] of isopropylidene-*l*-methylrhamnoside-4- and -5-*p*-toluenesulphonates. P. A. LEVENE and J. COMPTON (J. Amer. Chem. Soc., 1935, 57, 2306–2316).—The high-boiling fraction obtained on alkaline hydrolysis of isopropylidene-*l*-methylrhamnoside 5-*p*-toluenesulphonate (I) is isopropylidene-*l*-methylrhamnopyranoside (II), derived from pyranoside present in (I) (cf. Muskat, A., 1935, 199). The following data appear new. (I), m.p. 82–83°,  $[\alpha]_D^{20} -13.6^\circ$  in MeOH. isopropylidene-*l*-methylpyranoside 4-*p*-toluenesulphonate, m.p. 61–62°,  $[\alpha]_D^{24} +21.94^\circ$  in MeOH. (II), b.p. 84–85°/0.3 mm.,  $[\alpha]_D^{25} -21.3^\circ$  in MeOH. The ring structure of the *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_2$  derivatives is proved by their relative rates of hydrolysis. R. S. C.

Carbohydrates and furfuraldehyde. II. Reactions with  $\beta$ -methylglucoside and glucose; preparation of  $\beta$ -methylglucoside 2:3-diacetate. H. BREDERECK (Ber., 1935, 68, [B], 2299–2302; cf. A., 1935, 847).—Furfuraldehyde (I) containing a little  $\text{HNO}_3$  (*d* 1.20) and anhyd. glucose at 170–175° yield a non-cryst. product which when treated with  $\text{Ac}_2\text{O}$  and anhyd. NaOAc at 100° affords  $\beta$ -4:6-furfurylidene-glucose 1:2:3-triacetate (II), m.p. 203–204°,  $[\alpha]_D^{25} -46.6^\circ$  in  $\text{CHCl}_3$ , in modest yield. The constitution of (II) is established by elimination of (I) and transformation of the product into non-cryst.  $\beta$ -6-triphenylmethylglucose 1:2:3-triacetate, converted by  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  into  $\beta$ -6-triphenylmethylglucose 1:2:3:4-tetra-acetate, m.p. 165–166°,  $[\alpha]_D^{25} +48.3^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ . Similarly (I) and  $\beta$ -methylglucoside at 170–175° yield 4:6-furfurylidene- $\beta$ -methylglucoside, m.p. 160–162°,  $[\alpha]_D^{25} -97.2^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , transformed by  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  into 4:6-furfurylidene- $\beta$ -methylglucoside 2:3-diacetate, m.p. 205–207°,  $[\alpha]_D^{25} -85.1^\circ$  in  $\text{CHCl}_3$ , which is converted by  $\text{HCl}\cdot\text{EtOH}$  at 60° into  $\beta$ -methylglucoside 2:3-diacetate, m.p. 109–111°,  $[\alpha]_D^{25} -51.8^\circ$  in  $\text{CHCl}_3$ , whence  $\beta$ -methylglucoside 2:3-diacetate 4:6-dibenzoate, m.p. 167–168°,  $[\alpha]_D^{25} -11.8^\circ$  in  $\text{CHCl}_3$ . 4:6-Furfurylidene- $\alpha$ -methylmannoside and  $\text{PhCHO}$  do not react when heated in  $\text{CO}_2$ ; when shaken in presence of  $\text{ZnCl}_2$  they yield dibenzylidene- $\alpha$ -methylmannoside. H. W.

Syntheses with 5:6-anhydroisopropylidene-glucose. I. 6-Thiol-*d*-glucose, *d*-glucomethylglucose-6-sulphonic acid, and 6-acyl derivatives of isopropylideneglucose. H. OHLE and W. MERTENS [with, in part, M. ANDREE and E. EULER] (Ber., 1935, 68, [B], 2176–2187).—The action of  $\text{H}_2\text{S}$  on an aq. solution of  $\text{Ba}(\text{OH})_2$  and 5:6-anhydroisopropylideneglucose (I) at 0° rapidly affords isopropylidene-6-thiogluco-*d*-glucose (II), m.p. 96–97°, b.p. 200–220°/high vac.,  $[\alpha]_D^{21} -18.2^\circ$  in  $\text{CHCl}_3$ ,  $[\alpha]_D^{20} -14.35^\circ$  in  $\text{H}_2\text{O}$ ,  $[\alpha]_D^{20} -11.87^\circ$  in  $\text{COMe}$ , (triacetate, m.p. 69°,  $[\alpha]_D^{20} +44.15^\circ$  in  $\text{CHCl}_3$ ). The position of SH in (II) is

established, since (I) is transformed by  $\text{COMe}$ , containing conc.  $\text{H}_2\text{SO}_4$  at 20° into diisopropylidene-6-

thiogluco-*d*-glucose (III), b.p. 120° (bath)/0.06 mm., m.p. 7.4°,  $[\alpha]_D^{20} +16.67^\circ$  in  $\text{CHCl}_3$ , which contains a free SH and with  $\text{HgCl}_2$  gives a white ppt. similar to but not identical with that yielded by (II). S is retained so firmly in (II) and (III) that it cannot be removed without fundamental alteration of the mol. The acidity of SH is slight; the alkali mercaptides are extensively hydrolysed in  $\text{H}_2\text{O}$ , and a marked tendency to autoxidation is absent. 6-Thiogluco-*d*-glucose could not be obtained cryst.; it gives ill-defined products with  $\text{NHPh}\cdot\text{NH}_2$ . Acetylation in  $\text{C}_5\text{H}_5\text{N}$  gives a mixture of penta-acetates from which 6-thio- $\beta$ -glucose penta-acetate, m.p. 123°,  $[\alpha]_D^{20} -14.5^\circ$  in  $\text{CHCl}_3$ , is isolated in small amount; the mixture does not give a cryst. product with  $\text{HBr}\cdot\text{AcOH}$  or  $\text{TiCl}_4$ . (II),  $\text{NaHCO}_3$ , and I afford 1:2-1':2'-diisopropylidenedi-*d*-glucosyl 6:6'-disulphide, m.p. 127°,  $[\alpha]_D^{20} -7.1^\circ$  in  $\text{CHCl}_3$  (tetra-acetate, m.p. 121°), which is hydrolysed to non-cryst. di-*d*-glucosyl 6:6'-disulphide, the non-homogeneous octa-acetate of which is transformed by  $\text{HBr}\cdot\text{AcOH}$  into  $\alpha\alpha'$ -hexa-acetyldi-*d*-glucosyl 6:6'-disulphide 1:1'-dibromohydrin, m.p. 160°,  $[\alpha]_D^{20} +193.2^\circ$  in  $\text{CHCl}_3$ . (I) condenses with (II) in boiling  $\text{C}_5\text{H}_5\text{N}$  containing  $\text{C}_5\text{H}_5\text{N}$  giving 1:2-1':2'-diisopropylidenedi-*d*-glucosyl 6:6'-sulphide, m.p. 125–126°,  $[\alpha]_D^{20} +9.3^\circ$  in  $\text{CHCl}_3$  (tetra-acetate, m.p. 122°); non-cryst. di-*d*-glucosyl 6:6'-sulphide, its non-homogeneous octa-acetate and  $\alpha\alpha'$ -hexa-acetyldi-*d*-glucosyl 6:6'-sulphide 1:1'-dibromohydrin, m.p. 175°,  $[\alpha]_D^{20} +231.1^\circ$  in  $\text{CHCl}_3$ , are described. Exhaustive oxidation of (II) with  $\text{Br}\cdot\text{NaHCO}_3$  or preferably with alkaline  $\text{KMnO}_4$  leads to *d*-glucomethylglucose-6-sulphonic acid (*K* salt,  $[\alpha]_D^{20} +59.5^\circ$  to  $+38.1^\circ$  in  $\text{H}_2\text{O}$ ; *K* salt of  $\text{Ac}_4$  derivative,  $[\alpha]_D^{20} +65.9^\circ$  in  $\text{H}_2\text{O}$ ) best characterised as the phenylhydrazine salt of the phenylosazone, m.p. 168–170°,  $[\alpha]_D^{20} -66.6^\circ$  to  $-39.2^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ . Addition of H halide to (I) is not possible in  $\text{H}_2\text{O}$  on account of the readier hydrolysis, and is complicated in  $\text{C}_5\text{H}_5\text{N}$  by the formation of quaternary salts. The adducts are, however, readily isolated in modest yield when acetylation occurs simultaneously, and thus are obtained diacetylisopropylidene-glucose 6-chlorohydrin, m.p. 129°,  $[\alpha]_D \pm 0^\circ$  in  $\text{CHCl}_3$ , the corresponding bromohydrin, m.p. 115°,  $[\alpha]_D^{20} -8.49^\circ$  in  $\text{CHCl}_3$ , and iodohydrin, m.p. 74–75°,  $[\alpha]_D^{20} -22^\circ$  in  $\text{CHCl}_3$ , in each of which the halogen is very firmly retained. Addition of carboxylic acid occurs when a few drops of  $\text{C}_5\text{H}_5\text{N}$  are added to a mixture of the components at 140°, the acid residue occupying position 6. Sulphonic acids are not added similarly. (I) and  $\text{MgMeI}$  could not be caused to react. H. W.

Improved preparation of diisopropylidene-glucose. D. J. BELL (J.C.S., 1935, 1874–1875).—Diisopropylideneglucose (72% yield) is obtained

by the interaction of glucose and  $\text{COMe}_2$  in presence of 4% of  $\text{H}_2\text{SO}_4$  during 5 hr. F. N. W.

**Fructose anhydride from the leaves of the barley plant.**—See this vol., 258.

**Advantageous preparation of isoglucosamine; catalytic hydrogenation of osazones.** K. MAURER and B. SCHLEDT (Ber., 1935, 68, [B], 2187—2191).—Hydrogenation of glucosazone in  $\text{AcOH-EtOH-H}_2\text{O}$  containing Pd acetate at room temp./3 atm. readily yields 1-aminofructose (isoglucosamine) acetate (I), m.p.  $137^\circ$ ,  $[\alpha]_D^{20} -63.7^\circ$  in  $\text{H}_2\text{O}$  (corresponding oxalate,  $[\alpha]_D^{20} -58.5^\circ$  in  $\text{H}_2\text{O}$ , and sparingly sol. *reineckate*). Treatment of (I) with  $\text{NH}_2\text{Et}$  in  $\text{MeOH}$  rapidly affords 2:5-ditetrahydroxybutylpyrazine, m.p.  $236^\circ$ ,  $[\alpha]_D^{20} -79.60^\circ$  in  $\text{H}_2\text{O}$  (identical with fructosepyrazine from fructose and  $\text{NH}_3$ ), which with  $\text{NaOAc}$  and boiling  $\text{Ac}_2\text{O}$  gives the *octa-acetate*, m.p.  $176^\circ$ ,  $[\alpha]_D^{20} -6.22^\circ$  in  $\text{CHCl}_3$ . Glucosazone *tetra-acetate* has m.p.  $116^\circ$ ,  $[\alpha]_D^{20} -57.22^\circ$  in  $\text{C}_6\text{H}_5\text{N}$ . Similar hydrogenation of acetophenone-ketazine leads to *s-di- $\alpha$ -phenylethylhydrazine* (*hydrochloride*, m.p.  $174^\circ$ ; *sulphate*, m.p.  $236^\circ$ ; *reineckate*), transformed by  $\text{NPh:C:O}$  into 4-phenyl-1:2-di- $\alpha$ -phenylethylsemicarbazide. H. W.

**Crystalline *d*- $\alpha$ -galaheptose and its derivatives.** R. M. HANN, (Miss) A. T. MERRILL, and C. S. HUDSON (J. Amer. Chem. Soc., 1935, 57, 2100—2103).—*d*- $\alpha$ -Galaheptose (I) closely resembles the configuratively related mannose in chemical and physical properties. The prep. of *d*- $\alpha$ -galahepton-amide and -lactone, *d*- $\alpha$ -galaheptonic acid (optical behaviour recorded; Na salt,  $+\text{H}_2\text{O}$ ,  $[\alpha]_D^{20} +9.7^\circ$  in  $\text{H}_2\text{O}$ ), and (I) is improved. The following derivatives of (I) are prepared:  $\beta$ -*Me*, cryst.,  $[\alpha]_D^{20} -70.2^\circ$  in  $\text{H}_2\text{O}$  (*penta-acetate*, m.p.  $108^\circ$ ),  $[\alpha]_D^{20} -20.4^\circ$  in  $\text{CHCl}_3$ , and  $\beta$ -*Et d*- $\alpha$ -galaheptoside, m.p.  $138^\circ$ ,  $[\alpha]_D^{20} -65.4^\circ$  in  $\text{H}_2\text{O}$  (*penta-acetate*, m.p.  $92^\circ$ ,  $[\alpha]_D^{20} -24.9^\circ$  in  $\text{CHCl}_3$ ); *benzylthiol* derivative, m.p.  $191^\circ$ ,  $[\alpha]_D^{20} +30.3^\circ$  in  $\text{C}_6\text{H}_5\text{N}$  (*hexa-acetate*, m.p.  $120^\circ$ ,  $[\alpha]_D^{20} -10.6^\circ$  in  $\text{CHCl}_3$ , and *benzoate*, m.p.  $129^\circ$ ,  $[\alpha]_D^{20} -48.1^\circ$  in  $\text{CHCl}_3$ ). M.p. are corr. R. S. C.

**Caramelisation of sucrose.** A. JOSZT and S. MOLINSKI (Biochem. Z., 1935, 282, 269—276).—By heating sucrose in vac. (3—5 mm.) up to 10% wt. loss at a bath temp. just above the m.p. of sucrose ( $187.5-189.5^\circ$ ), no gaseous but only liquid substances separated, consisting largely of  $\text{H}_2\text{O}$  and 20% of dry substance which is chiefly  $\omega$ -hydroxymethylfurfuraldehyde. P. W. C.

**Syntheses in the sugar series. II. Derivatives of cellobiose.** J. BRSKO and H. ZAK (Monatsh., 1935, 67, 111—117; cf. A., 1930, 583).—Hepta-acetylcellobiosidyl bromide with the appropriate Ag salt in dry xylene gives the *thiocyanate*, m.p.  $201^\circ$ ,  $[\alpha]_D^{19} -7.48^\circ$  in  $\text{EtOAc}$ , *phthalimide*, m.p.  $141-142^\circ$ , and *theophyllide*, m.p.  $174^\circ$  after sintering at  $165^\circ$ ,  $[\alpha]_D^{19} +14.1^\circ$  in  $\text{EtOAc}$ , all unstable in  $\text{H}_2\text{O}$ ; the cyanide and theobromide could not be obtained. 1-Menthylcellobioside *hepta-acetate*, m.p.  $163-165^\circ$ ,  $[\alpha]_D^{18} -11.2^\circ$  in  $\text{EtOAc}$ , was prepared, but the *d*-bornyl, vanillyl, and thymyl glucosides are unobtainable.  $[\alpha]$  are for white light. R. S. C.

**Polysaccharides synthesised by micro-organisms. II. Molecular structure of varianose produced from glucose by *Penicillium varians*,**

G. SMITH. W. N. HAWORTH, H. RAISTRICK, and M. STACEY (Biochem. J., 1935, 29, 2668—2678).—The mould grown in Czapek-Dox medium at  $24^\circ$  containing glucose yields a polysaccharide, *varianose* (I),  $(\text{C}_6\text{H}_{10}\text{O}_5)_n$ ,  $[\alpha]_D^{20} +15^\circ$  in  $\text{H}_2\text{O}$ , reducing Fehling's solution slightly and giving no colour with I. Hydrolysis with  $\text{HCl}$  affords galactose. The  $(1c_3)_n$  derivative,  $[\alpha]_D^{20} +30.0^\circ$  in  $\text{CHCl}_3$ ,  $+38.2^\circ$  in  $\text{COMe}_2$ , is homogeneous. Complete methylation of (I) or its acetate gives the  $(Me_3)_n$  derivative, m.p.  $90-100^\circ$ ,  $[\alpha]_D^{22} +20^\circ$  in  $\text{CHCl}_3$ ,  $+23^\circ$  in  $\text{C}_6\text{H}_6$ ,  $[\alpha]_D^{20} +15^\circ$  in  $\text{H}_2\text{O}$ , hydrolysed ( $\text{MeOH-HCl}$ ) to 2:3:4:6-tetramethylmethylglucopyranoside [14%; corresponding with a chain of 8 hexose members of mol. wt. 1300 for (I)] and trimethylmethylgalactoside (70%) which hydrolyses to a trimethylgalactose (II). (II) is oxidised by Br to a trimethyl- $\gamma$ -galactonolactone (III), m.p.  $99^\circ$  (amide, m.p.  $135^\circ$ ), and methylated by  $\text{MeI}$  to tetramethylmethylgalactoside, b.p.  $95/0.05$  mm., hydrolysed to a mixture of the pyranose (isolated as anilide, m.p.  $198^\circ$ ) and furanose forms of tetramethylgalactose. This indicates (III) to be the 2:3:6-isomeride (cf. A., 1932, 1113). Methylation of (I) also yields a trimethylmethylhexoside, hydrolysed to a trimethylhexose (IV), oxidised by Br to a trimethylhexono- $\gamma$ -lactone, b.p.  $110-115/0.04$  mm. (*Me* derivative; *phenylhydrazide*, m.p.  $175^\circ$ ), which on further oxidation ( $\text{HNO}_3$ ) and treatment with  $\text{NH}_3$  affords oxamide and *d*-dimethoxysuccinamide. Methylation of (IV) yields a tetramethylmethylhexoside, b.p.  $90-95/0.03$  mm., hydrolysis and subsequent oxidation of which affords a tetramethylhexonolactone (*phenylhydrazide*, m.p.  $172^\circ$ ). (IV) appears to be a derivative of either *d*-idose or *l*-altrose. Hence (I) is a chain of 6—8  $\beta$ -galactopyranose units with a glucopyranose unit at one end of the chain and a unit of either *l*-altrose or *d*-idose at the reducing end. F. O. H.

**Structure of deoxyriboside of thymus-nucleic acid.** K. MAKINO (Biochem. Z., 1935, 282, 263—264).—The author's earlier result (A., 1935, 772) according to which deoxyribosenucleoside from ox intestine must possess a pyran structure, since it gives a positive  $\text{H}_3\text{BO}_3$  test, is now negated in view of the fact that the pure nucleosides (hypoxanthine-, guanine-, and thymine-deoxyribosides) all give negative  $\text{H}_3\text{BO}_3$  reactions. P. W. C.

**Structure of [the mono]sodium sulphate ester of galactan from *Iridaea laminarioides* (Rhodophyceae).** W. Z. HASSID (J. Amer. Chem. Soc., 1935, 57, 2046—2050).—This ester (I) is probably as shown. It gives a  $Me_2$  derivative and  $Me_2$  ether (II),  $[\alpha]_D^{19}$

$+17.2^\circ$  in  $\text{CHCl}_3$ , is hydrolysed by hot 0.5N- $\text{H}_2\text{SO}_4$  or 5% aq.  $\text{Ba(OH)}_2$  to a galactan,  $[\alpha]_D^{19} +82.2^\circ$  in  $\text{H}_2\text{O}$ , the  $Me_2$  ether,  $[\alpha]_D^{19} +32.4^\circ$  in  $\text{H}_2\text{O}$ , of which with hot 2N- $\text{HCl}$  gives a trimethylgalactose (III), b.p.  $94/0.1$  mm. (III) does not give an osazone and,

when oxidised successively by Br and  $\text{HNO}_3$  and then esterified, gives *Me<sub>2</sub> arabodimethoxyglutarate*, b.p.  $115^\circ/0.1$  mm. Hydrolysis of (II) by 2%  $\text{H}_2\text{SO}_4$  affords a reducing monosaccharide, which with  $\text{HCl-MeOH}$  affords a *methylidimethylgalactoside*,  $[\alpha]_D^{20} +97.2^\circ$  in  $\text{H}_2\text{O}$ . When titrated, (I) behaves as the salt of a strong acid. Its mol. wt. is determined in  $\text{H}_2\text{O}$ .

R. S. C.

**Specific polysaccharide from the bacillus Calmette-Guerin (BCG).**—See this vol., 248.

**Constitution of starch and mode of action of starch-splitting enzymes.** W. ZIESE (Z. Spiritus-ind., 1936, 59, 3—4).— $\beta$ -Diasatase has no action on  $\text{PO}_4$ -free hydroxyethylstarch (I), whilst the action of  $\alpha$ -diasatases is restricted to the production of non-reducing derivatives of high mol. wt. The latter fact, together with viscosity measurements during the hydrolysis of (I) by  $\alpha$ -diasatases, indicates that other factors besides principal valency are concerned in the constitution of (I). Further, the distinctions between the dextrinising and saccharifying actions of diastase are thus emphasised.

I. A. P.

**Importance of Svedberg's ultracentrifuge for the determination of the mol. wt. of cellulose.** M. ULMANN (Cellulosechem., 1935, 16, 114—118).—A lecture.

R. S. C.

**Preparation and properties of double chlorides and bromides of bivalent nickel and of organic bases.** J. AMIEL (Compt. rend., 1935, 201, 1198—1200).—The following compounds, for which a co-ordination structure cannot yet be assigned, are prepared by evaporating conc. solutions of the mixed Ni and org. halides:  $\text{NiCl}_2 \cdot \text{NH}_3 \cdot \text{MeCl}$ ;  $\text{NiCl}_2 \cdot \text{NH}_3 \cdot \text{EtCl}$ ;  $\text{NiCl}_2 \cdot \text{NH}_3 \cdot \text{Pr}^i \text{Cl}$ ;  $2\text{NiCl}_2 \cdot (\text{C}_2\text{H}_5)_2\text{NH}_3 \cdot \text{Cl}_2$ , anhyd. or  $+6\text{H}_2\text{O}$ ;  $\text{NiCl}_2 \cdot \text{C}_3\text{H}_7\text{N} \cdot \text{HCl}$ ;  $\text{NiCl}_2 \cdot \text{C}_5\text{H}_{10}\text{N} \cdot \text{HCl}$ ;  $2\text{NiCl}_2 \cdot \text{C}_4\text{H}_8(\text{NH}_2)_2$ , anhyd. or  $+6\text{H}_2\text{O}$ ;  $\text{NiCl}_2 \cdot \text{C}_6\text{H}_7\text{N} \cdot \text{HCl}$ ;  $\text{NiBr}_2 \cdot \text{NH}_3 \cdot \text{MeBr}$ ;  $\text{NiBr}_2 \cdot \text{NH}_3 \cdot \text{EtBr}$ ;  $\text{NiBr}_2 \cdot \text{NH}_3 \cdot \text{Pr}^i \text{Br}$ ;  $2\text{NiBr}_2 \cdot (\text{CH}_3)_2\text{NH}_3 \cdot \text{Br}_2$ ;  $\text{NiBr}_2 \cdot \text{C}_5\text{H}_5\text{N} \cdot \text{HBr}$ ;  $\text{NiBr}_2 \cdot \text{C}_6\text{H}_9\text{N} \cdot \text{HBr}$ ;  $2\text{NiBr}_2 \cdot \text{C}_4\text{H}_8(\text{NH}_2)_2$ , anhyd. or  $+6\text{H}_2\text{O}$ ;  $\text{NiBr}_2 \cdot \text{C}_6\text{H}_7\text{N} \cdot \text{HBr}$ . When heated the above decompose without melting. In solution the only Ni ions detected are  $\text{Ni}^{++}$ .

E. W. W.

**Preparation of ethyleneimine from ethanolamine.** H. WENKER (J. Amer. Chem. Soc., 1935, 57, 2328).— $(\text{CH}_2)_2\text{NH}$ , b.p.  $55-56.5^\circ$ , is readily prepared by heating  $\text{OH} \cdot \text{C}_2\text{H}_4 \cdot \text{NH}_2 \cdot \text{H}_2\text{SO}_4$  at  $250^\circ$  and boiling the resulting  $\text{NH}_2 \cdot \text{C}_2\text{H}_4 \cdot \text{SO}_3\text{H}$  with 40% aq. NaOH.

R. S. C.

**Preparation and properties of *d*- and *l*- $\beta$ -methylcholine *N*-chloride *O*-acetate.** R. T. MAJOR and H. T. BOUNATT (J. Amer. Chem. Soc., 1935, 57, 2125—2126).—*NN*-Dimethyl- $\beta$ -hydroxy-*n*-propylamine with bromocamphorsulphonic and *d*-tartaric acid gives the *d*- (bromocamphorsulphonate,  $[\alpha]_D^{20} +83.5^\circ$ ) and *l*- (*d*-tartrate,  $[\alpha]_D^{20} -10.7^\circ$ ) forms, b.p.  $124.5-126^\circ/770$  mm.,  $[\alpha]_D^{20} +17.1^\circ$  and  $-14.8^\circ$ , respectively, which lead to the *d*- and *l*-forms of  $\beta$ -methylcholine, m.p.  $165-167^\circ$ ,  $[\alpha]_D^{20} +38.8^\circ$ ,  $-38.2^\circ$  (iodide, m.p.  $176.5-177.5^\circ$ ,  $[\alpha]_D^{20} \pm 24.7^\circ$ ), and  $\beta$ -methylcholine *N*-chloride *O*-acetate, m.p.  $201-202^\circ$ ,  $[\alpha]_D^{20} +41.9^\circ$ ,  $-41.3^\circ$ .

R. S. C.

**Hydrogenation of carbon dioxide. Correction of the reported synthesis of urethanes.** M. W. FARLOW and H. ADKINS (J. Amer. Chem. Soc., 1935, 57, 2222—2223).— $\text{CO}_2$  and  $\text{H}_2$  in presence of amines and Raney Ni at  $80-150^\circ$  or brass at  $250^\circ$  gives  $\text{HCO}_2\text{H}$  (as amine formate) and  $\text{HCO}$ -derivatives (of primary bases). In presence of brass *s*-di-( $\beta$ -phenylethyl)- and *s*-di-*n*-amyl-carbamide, m.p.  $88^\circ$ , are also obtained. The following are incidentally described. *N*-Formyl-*n*-amylamine, b.p.  $124-125^\circ/10$  mm., and  $\beta$ -phenylethylamine, b.p.  $180-181^\circ/14$  mm.; formates of  $\text{CH}_2\text{Ph} \cdot \text{CH}_2 \cdot \text{NH}_2$ , m.p.  $128-129^\circ$  (decomp.), 4-hydroxy-2:2:6:6-tetramethylpiperidine, m.p.  $207^\circ$  (decomp.), and  $\alpha$ -phenylpropyl- $\beta$ -amine, m.p.  $160^\circ$  (decomp.). The so-called pentamethyleneurethanes previously recorded (cf. A., 1935, 70) are const.-boiling mixtures of formylpiperidine ( $\text{HgCl}_2$  compound, m.p.  $147-148^\circ$ ) and ROH.

R. S. C.

**Multivalent amino-acids and polypeptides.** V. Cystinecyamidene. J. P. GREENSTEIN (J. Biol. Chem., 1935, 112, 35—38; cf. A., 1935, 1203).—Di- $\alpha$ -guanidinopropionic acid  $\gamma$ -disulphide and conc. HCl give the dianhydride, decomp.  $>240^\circ$  (dihydrochloride, m.p.  $150^\circ$ ; monopicate, m.p.  $188^\circ$ ), readily hydrolysed by NaOH at both C-S and C-N linkings to give  $\text{AcCO}_2\text{H}$ .

R. S. C.

**Isolation of homocysteine. Its conversion into a thiolactone.** B. RIEGEL and V. DU VIGNEAUD (J. Biol. Chem., 1935, 112, 149—154).—*S*-Benzoyl-homocysteine and  $\text{Na-NH}_3$  give an 80% yield of homocysteine (I), m.p.  $232-233^\circ$  (corr.) (photomicrograph), converted by acid into the thiolactone [hydrochloride, m.p.  $200-201^\circ$  (corr.); hydriodide, also obtained similarly from methionine]. Lactonisation occurs as follows: with hot 0.1*N*-, 20%, and cold conc. HCl 50% in 3 hr., 100% in a few min., and 50% in 5 min. (100% in 1 hr.), respectively; with conc.  $\text{H}_2\text{SO}_4$  with much oxidation hot, but little cold; with *N*- or 6*N*- $\text{H}_2\text{SO}_4$  mainly ring-closure.

R. S. C.

**Carbon monoxide-ferroglutathione.** F. KUBOWITZ (Biochem. Z., 1935, 282, 277—281).—The ability of Fe to enable glutathione (I) to absorb CO as does ferrocytochrome depends on the concn. of (I). Ferroglutathione (II) itself dissociates. Using a const. concn. of  $\text{Fe}^{++}$  salt and increasing the amount of (I), the amount of (II) and of CO absorbed increase until finally the Fe becomes saturated with (I) and 2CO are fixed per atom of Fe. CO-(II) is split by visible light into (II)+CO.

P. W. C.

**Formation of amides from nitriles by the action of hydrogen peroxide.** L. McMASTER and C. R. NOLLER (J. Indian Chem. Soc., 1935, 12, 652—653).—Conditions are given for obtaining max. yields of amide from 13 nitriles by  $\text{H}_2\text{O}_2$ .

R. S. C.

**Micro-determination of carbamide in very dilute solutions.** K. W. HOU (Bull. Nat. Acad. Peiping, 1932, 3, No. 5, 7 pp.).—Pptn. with xanthlydrol gives results, of approx. 2% accuracy, with solutions containing 10—100 mg. of  $\text{CO}(\text{NH}_2)_2$  per litre.

CH. ABS. (p)

**Explosion in the preparation of guanidine nitrate from ammonium thiocyanate.** C. SCHOFF and H. KLAPPROTH (Angew. Chem., 1936, 49, 23).—

Gockel's method of prep. (A., 1935, 1111) may lead to an explosion, the cause of which has not been traced.

E. S. H.

[Explosion in the preparation of guanidine nitrate from ammonium thiocyanate.] H. GOCKEL (Angew. Chem., 1936, 49, 23; cf. preceding abstract).—The explosion is probably due to decomp. of  $\text{NH}_4\text{NO}_3$ .

E. S. H.

Separation of guanidine and methylguanidine by naphthalene-2-sulphonic acid. W. C. HESS and M. X. SULLIVAN (J. Amer. Chem. Soc., 1935, 57, 2331–2332).—2-Naphthalenesulphonyl guanidine, m.p. 204–206°, and -methylguanidine, m.p. 101–102°, are prepared. The bases can be separated by these derivatives, since the former is obtained preferentially with a limited amount of alkali.

R. S. C.

Second synthesis of *d*-glutamine. H. NIENBURG (Ber., 1935, 68, [B], 2232–2234).—*d*-Glutamic acid is converted into the Et  $\gamma$ -ester, the carbobenzyloxy-derivative of which is transformed by liquid  $\text{NH}_3$  at 15–20° into *N*-carbobenzyloxy-*d*-glutamine, hydrogenated (Pd–AcOH–EtOH) to *d*-glutamine, m.p. 184–185°,  $[\alpha]_D +8.3^\circ$  in  $\text{H}_2\text{O}$ .

H. W.

Formation of hydrocyanic acid from organic compounds in the presence of ammoniacal copper sulphite. J. PARRON (Compt. rend., 1935, 201, 993–995; cf. A., 1935, 1109).—Besides *d*-fructose, other sugars and allied compounds yield HCN at 58–62°. Lactose, maltose, and rhamnose give HCN only at higher temp. (80–85°). Yields of about 20 mols. of HCN per 100 C atoms in the compound have been obtained. CO and  $\text{CH}_2\text{O}$  do not yield HCN.

F. A. A.

Photolytic and thermal decomposition products of azomethane. Thermal reaction rates in quartz at 260–290°. L. J. HEIDT and G. S. FORBES (J. Amer. Chem. Soc., 1935, 57, 2331).—Pressure changes during the decomp. of azomethane at –183° to 30° and for the thermal reaction at 300° in  $\text{SiO}_2$  indicate decomp. to  $\text{N}_2$  and much  $\text{CH}_4$ . The 10° temp. coeff. for 260–290° is 2.9 and is but little affected by the presence of Hg.

R. S. C.

Compounds of the type  $\text{BCl}_{3-n}(\text{OR})_n$ . III. Preparation of  $\text{BCl}_2\cdot\text{OMe}$  and  $\text{BCl}(\text{OMe})_2$  from boron trichloride and methyl borate. E. WIBERG and H. SMEDSRUD (Z. anorg. Chem., 1935, 225, 204–208; cf. A., 1935, 459).—Improved methods of preparing  $\text{BCl}_2\cdot\text{OMe}$  and  $\text{BCl}(\text{OMe})_2$  are described.

F. L. U.

Preparation of magnesium dialkyl compounds from Grignard reagents. A. C. COPE (J. Amer. Chem. Soc., 1935, 57, 2238–2240).—The extent of disproportionation,  $2\text{MgRX} \rightarrow \text{MgR}_2 + \text{MgX}_2$ , in  $\text{Et}_2\text{O}$  is  $>$  in  $\text{Bu}_2\text{O}$ , and is raised by rise in temp. The mobility of the equilibrium is shown by gradual dissolution of the  $\text{MgPh}_2$  pptd. by dioxan. Dioxan ppts.  $\text{MgCl}_2$  etherate from  $\text{MgMeI}$  solutions.

R. S. C.

Constitution of platinum compounds with thioethers. K. A. JENSEN (Z. anorg. Chem., 1935, 225, 115–141).—Contrary to the inferences of Drew and others (cf. A., 1935, 100), there is no structural difference between the  $\alpha$ - (I) and  $\beta$ - (II) isomerides

of the type  $[\text{PtCl}_2(\text{Et}_2\text{S})_2]$ . The marked difference in the electrical conductivities of (I) and (II) in  $\text{H}_2\text{O}$  or  $\text{MeOH}$  is due to the change  $[\text{PtCl}_2(\text{Et}_2\text{S})_2] + 2\text{H}_2\text{O} \rightarrow [\text{Pt}(\text{H}_2\text{O})_2(\text{Et}_2\text{S})_2]^{++} + 2\text{Cl}^-$  (or similarly with  $\text{MeOH}$ ) occurring rapidly with (II) and slowly with (I). Only two isomerides of this type exist, and "super-numerary isomerides" reported by various workers are shown to have been mixtures. Mol. wt. determinations show that compounds from equimol. proportions of  $\text{PtCl}_2$  and  $\text{R}_2\text{S}$  have the formula  $\text{Pt}_2(\text{R}_2\text{S})_4\text{Cl}_4$ .

F. L. U.

Complex metallic salts. III.—See this vol., 140.

1-Benzyl- $\Delta^1$ -cyclohexene and benzylidene-cyclohexane. K. VON AUWERS (Ber., 1935, 68, [B], 2174–2175; cf. A., 1915, i, 789).—A reply to Prevost *et al.*, (A., 1934, 649).

H. W.

Monodeutero benzene. N. MORITA and T. TITANI (Bull. Chem. Soc. Japan, 1935, 10, 557–558).—PhD (97% pure) is obtained by distillation of  $\text{Ca}(\text{OBz})_2$  with  $\text{Ca}(\text{OD})_2$  at 300°.

J. W. B.

Preparation of partly deuterated benzenes. I. H. P. WELDON and C. L. WILSON (Nature, 1936, 137, 70).—1 : 3 : 5-Trideutero benzene, m.p. 6.1°, has been prepared [(?) from trimesic acid] by decarboxylation with  $\text{Ca}(\text{OD})_2$ .

L. S. T.

Mechanism of aromatic side-chain reactions with special reference to the polar effects of substituents. IV. Mechanism of quaternary salt formation. V. Polar effects of alkyl groups. J. W. BAKER and W. S. NATHAN. VI. Effects of *p*-alkyl substituents on prototropy in the methyleneazomethine system. J. W. BAKER, W. S. NATHAN, and C. W. SHOPPEE (J.C.S., 1935, 1840–1844, 1844–1847, 1847–1849; cf. A., 1935, 710).—IV. Data for the velocity of interaction of the following benzyl bromides with  $\text{C}_5\text{H}_5\text{N}$  (I) in dry  $\text{COMe}_2$  show that the alkyl substituents increase the reaction velocity, and that with a single *p*-alkyl substituent, the velocity decreases in the order  $\text{Me} > \text{Et} > \text{Pr}^i > \text{Bu}^i$ : *p*-Me-, b.p. 84°/0.8 mm., m.p. 14.5–15.2°; *p*- $\text{Pr}^i$ -, b.p. 75°/0.4 mm., 2 : 4-*Me*-, b.p. 79°/1.2 mm., m.p. 15° [all obtained from the corresponding chlorides, prepared by Sommelet's method (A., 1914, i, 156), by refluxing with aq.- $\text{COMe}_2$  solution of  $\text{NaBr}$ ]; *p*- $\text{Bu}^i$ -, b.p. 99°/0.3 mm., m.p. 15.1° (prep. by direct bromination of *p*- $\text{C}_6\text{H}_4\text{MeBu}^i$ ), and 2 : 4-dinitrobenzyl bromide (II), m.p. 46.4° (modified prep.) [with (I) yields 2 : 4-dinitrobenzylpyridinium bromide, m.p. 196° (decomp.)]. The energy of activation of the reaction is 12.2–12.57 kg.-cal. and the probability factors ( $\times 10^6$ ) are 0.75–2.61. Data for the reaction between (I) and (II) in aq.  $\text{COMe}_2$  and aq.  $\text{EtOH}$ , and between (II) and  $\text{EtOH}$  are given.

V. An explanation of the unexpected order of electron release capacity shown by the alkyl groups studied in Part IV is given, based on the tentative supposition that when Me is attached to a conjugated system the duplet of electrons forming the C–H linking in this group are appreciably less localised (and hence more easily released) than those in a similarly placed C–C linking.

VI. In the azomethine system (*A*)  $p$ - $C_6H_4R\cdot CH=N\cdot CH_2Ph \rightleftharpoons$  (*B*)  $p$ - $C_6H_4R\cdot CH_2\cdot N\cdot CHPh$  the following order of mobility is obtained:  $p$ - $Bu^t > p$ - $Pr^i > p$ - $Me$ , whilst the % of form (*A*) at equilibrium are  $Me$  45.0,  $Pr^i$  56.0,  $Bu^t$  60.0. From these sequences it is inferred that the type of electron release by  $Me$  outlined in Part V is permanent (mesomeric). The Schiff's bases: *benzylidene-p*-*tert*-*butyl*-, b.p. 155—157°/0.4 mm.; *p*-*tert*-*butylbenzylidene*-, b.p. 161°/0.5 mm.; and *p*-*isopropylbenzylidene-benzylamine*-, b.p. 155°/0.5 mm., are obtained directly from the aldehyde and amine by Shoppee's method (A., 1931, 834). *p*-*tert*-*Butyl*- (*p*-*nitrophenylhydrazone*-, m.p. 214°) and *p*-*isopropylbenzaldehyde* (*p*-*nitrophenylhydrazone*-, m.p. 190°) are prepared by oxidation [boiling aq.  $Cu(NO_3)_2$  in  $CO_2$ ; 24 hr.] of the corresponding benzyl bromide and chloride, respectively. *p*-*tert*-*Butylbenzylamine*-, b.p. 124°/16 mm. [carbamido-derivative, m.p. 137°; *picrate*-, m.p. 270° (decomp.)], is obtained by the action of  $N_2H_4\cdot H_2O$  on *phthalop*-*tert*-*butylbenzylamine*-, m.p. 103°, which results from the interaction of  $K$  phthalimide and *tert*-*butylbenzyl bromide* (180°; 2–3 hr.). F. N. W.

**Derivatives of *p*-fluorobenzenesulphonic acid.** R. M. HANN (J. Amer. Chem. Soc., 1935, 57, 2166—2167).— $PhF$ ,  $HCl$ ,  $SO_2$ , and  $AlCl_3$  in  $CS_2$  give *Na p*-fluorobenzenesulphinate,  $+2H_2O$ , cryst., which leads to the *benzyl- $\psi$* -thiocarbamide salt, m.p. 161°, and the corresponding *sulphonate*-, m.p. 166°, *p*- $C_6H_4F\cdot CH_2Bz$ -, m.p. 151°, and *p*- $NO_2\cdot C_6H_4\cdot CH_2$  *sulphone*-, m.p. 185°, *p*-fluorophenylsulphonyl-*acetic acid*-, m.p. 110—111° [*benzyl- $\psi$* -thiocarbamide salt, m.p. 144° (decomp.)]; *p*- $C_6H_4Br\cdot CO\cdot CH_2$  ester-, m.p. 126°, and *-acelone*-, m.p. 66°, and *s*-*di-p*-fluorophenylsulphonylacetone-, m.p. 144°. All are ineffective against pneumococcal infections. M.p. are corr. R. S. C.

**Ullmann reaction.** H. C. YUAN and M. TSAO (J. Chinese Chem. Soc., 1935, 3, 358—364).—3-*Bromo-4*-*iodo-5*-*nitrotoluene* (I), m.p. 82—83° (prepared by boiling diazotised 3-bromo-5-nitro-*p*-toluidine with  $KI$ ), when heated with  $Cu$ -bronze at 230—250° in the absence of solvent yields 3-bromo-5-nitrotoluene (II), but when boiled in  $PhNO_2$  with  $Cu$ -bronze affords 2:2'-*dibromo-4*:4'-*dimethyl-6*:6'-*dinitrodiphenyl*-, m.p. 195—196°. The formation of (II) is considered to be due to the catalytic dehydrogenation by  $Cu$  of a part of (I) and the replacement of I in the remainder by the H thus formed. 3:5:6:1- $C_6H_2Cl_2I\cdot NO_2$  when heated with  $Cu$ -bronze, with or without  $PhNO_2$ , yields only 2:2':4:4'-*tetrachloro-6*:6'-*dinitrodiphenyl*-, m.p. 128—129°; no 3:5:1- $C_6H_3Cl_2\cdot NO_2$  was isolated. It is considered therefore that in (I) it is mainly the  $Me$  which is dehydrogenated. H. G. M.

**Butylcymenes and their nitro-derivatives.** H. BARBIER (Rev. Marques Parfum. Savonn., 1934, 12, 325—327; Chem. Zentr., 1935, i, 2350; cf. A., 1932, 729).—Condensation ( $AlCl_3$ ) of  $Pr^iCl$  and *p*-*tert*-*butyltoluene* (I) or (with  $H_2SO_4$ ) of  $Pr^iOH$  and (I) yields (?) *isopropyl-4*-*tert*-*butyltoluene*-, b.p. 230°, which on nitration affords a *dinitro-4*-*tert*-*butyltoluene*-, m.p. 90°. (?) *isoPropyl-3*-*tert*-*butyltoluene*-, b.p. 235°, and the corresponding  $(NO_2)_2$ -derivative, m.p. 172°, are obtained similarly. Condensation

( $H_2SO_4$ ) of  $PhPr^i$  and  $Bu^tOH$  affords (?) *isopropyl*- (?) *tert*-*butylbenzene*-, b.p. 221°, which, with  $CH_3O$  and  $HCl$ , yields an *isopropyl-tert*-*butylbenzyl chloride*-, b.p. 98°/2 mm., converted, through the  $Mg$  compound, into a *tert*-*butylcymene*-, b.p. 236°, which yields a liquid  $(NO_2)_2$ -compound. H. N. R.

**s-Tetradiphenylvinylethane**, a tetra-substituted ethane hydrocarbon which decomposes into radicals. G. WITTIG and B. OBERMANN (Ber., 1935, 68, [B], 2214—2218).— $\alpha\alpha\epsilon\epsilon$ -Tetraphenylpentane- $\alpha\epsilon$ -diol is converted by boiling  $AcOH$  containing a little conc.  $H_2SO_4$  into  $\alpha\alpha\epsilon\epsilon$ -tetraphenyl- $\Delta^{\alpha\epsilon}$ -*penta*-*diene* (I), m.p. 76—77° (in absence of mineral acid the product is 2:2:6:6-tetraphenylpentamethylene oxide, m.p. 176—177°), transformed by successive treatment with  $LiPh$  and  $C_2Me_5Br$  into  $\alpha\alpha\beta\beta$ -tetra- $\beta'\beta'$ -*diphenylvinylethane* (II), m.p. 169—171.5° (slight decomp.), more conveniently obtained by dehydrogenating (I) with  $PhNO$ ,  $KMnO_4$ , or  $SeO_2$ . An unsymmetrical structure for (II) involving a conjugated system is excluded, since it does not react with maleic anhydride, behaves sluggishly towards  $KMnO_4$  and  $NaOH$  in  $COMe$ , and is converted by  $O_3$  or  $CrO_3$  in boiling  $AcOH$  mainly into  $COPH_2$ . When heated in boiling xylene or  $PhOMe$  (II) affords a yellowish-green solution the colour of which disappears on cooling. The instability of the ethane bridge is demonstrated by the reduction of (II) with  $P$  and  $HI$  in boiling  $AcOH$  to  $\alpha\alpha\epsilon\epsilon$ -tetraphenylethane. H. W.

**Bromine derivatives of indene and indane.** H. D. PORTER and C. M. SUTER (J. Amer. Chem. Soc., 1935, 57, 2022—2026).—Many of Jacobi's results (A., 1931, 354) are incorrect. 2-Bromo-1-hydroxyindane (I) (prep. from crude indane-containing oil) at 155—160°, with  $PhBr$  at 156°, or best, with  $P_2O_5$  in hot  $CCl_4$ , gives 2-bromoindene (II), m.p. 38—39°, b.p. 125—127°/3 mm. This with hot  $NaOEt$  gives indan-2-one (III), but does not react with hot 2*N*- $NaOH$  or  $HCO_2K\cdot MeOH$ . (II) yields (Grignard) a little indene-2-carboxylic acid only. With  $HBr\cdot AcOH$  (II) gives an oil, hydrolysed to (I) by aq.  $COMe_2$ ; with  $Br$  in  $CCl_4$  it gives 1:2:3-tribromoindene (IV), an oil, oxidised by  $KMnO_4$  to  $\alpha$ - $C_6H_4(CO_2H)_2$ , and hydrolysed by  $CaCO_3$  in aq.  $COMe_2$  to an oily dibromoindanol. (I) and 47%  $HBr$  at 100° give indene dibromide (V), which at 200—210° alone or, better, in tetrahydronaphthalene gives (III). (V) with  $C_5H_5N$  in  $EtOH$  or  $CaCl_2$  and  $Na_2CO_3$  in aq.  $EtOH$  gives 38% of 2-bromo-1-ethoxyindane, b.p. 147—148°/19 mm., converted by  $NaNH_2$  in liquid  $NH_3$  or by hot 18%  $H_2SO_4$  into indan-1-one (VI), by  $Br\cdot CCl_4$  into (IV) and 2:2-dibromoindan-1-one. *trans*-1:2-Dihydroxyindane [improved prep. from (I); 60% yield; gives also a substance, m.p. >285°] with 10%  $H_2SO_4$  gives 71% of (III). (I) and 7%  $H_2SO_4$  give (VI) in 80.6% yield. R. S. C.

**Polymerisation. I. Formation, properties, and constitution of polyindenes, in particular of "tri-indene."** J. RISI and D. GAUVIN (Canad. J. Res., 1935, 13, 228—255).—"Tri-indene" (I) is shown to be a mixture of polymerides by fractional crystallisation. It is formed with a small amount of a substance (II),  $C_{27}H_{18}$ , m.p. 214°, by polymerisation of indene (III). Unsaturated di-indene (2-1'-hydrynd-

enylindene; modified prep. in 73% yield) at 215° gives 60% of truxene, m.p. 116°, and a mixture of polymerides. (I) is saturated (Br gives only substitution products) and unreactive. Pyrolysis of (I) at 325—340° gives (III) (30—40%), (II) (20%), and truxene (10%). HNO<sub>3</sub> (d 1.25) and the polymerised products give o-C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub> and a NO<sub>2</sub>-acid,

m.p. 160—165°, the amount of the latter increasing with the degree of polymerisation of the substance oxidised. (I) is probably as annexed. Polystyrenes are probably  $\text{CHPh}\langle\text{CH}_2\rangle\text{CPh}\cdot[\text{CH}_2\cdot\text{CHPh}]_x\cdot\text{CH}_2\cdot\text{CH}_2\text{Ph}$  and caoutchouc is probably

the latter thus resembling many natural polyterpenes.

R. S. C.

**Sulphonation of naphthalene. II. Mechanism of the monosulphonation.** R. LANTZ (Bull. Soc. chim., 1935, [v], 2, 2092—2108; cf. A., 1935, 1116).—The rates of sulphonation of C<sub>10</sub>H<sub>8</sub>, of hydrolysis of 1- and 2-C<sub>10</sub>H<sub>7</sub>·SO<sub>3</sub>H, and of transformation of one acid into the other are determined in sealed tubes at 60—180° in presence of 45—94% H<sub>2</sub>SO<sub>4</sub>. Hydrolysis of the 1-acid is about 50 times as fast as that of the 2-acid and is increased to a greater extent by rise in temp. and/or concn. of H<sub>2</sub>SO<sub>4</sub>. No 2-acid is formed from 1-acid by H<sub>2</sub>SO<sub>4</sub>, which, although strong enough to effect hydrolysis, is too weak to cause sulphonation. The relative amounts of 1- and 2-acid formed are independent of the concn. of the H<sub>2</sub>SO<sub>4</sub>. Only 2—4% of sulphones are formed at 140° with 45—70% H<sub>2</sub>SO<sub>4</sub> in 39 hr. and none in 2 hr. Increase in the amount of 2-acid at high temp. is due to the more rapid hydrolysis of the 1-acid.

R. S. C.

**Asymmetric syntheses. IV. Action of optically active nitrates on 2-bromofluorene.** J. T. THURSTON and R. L. SHRINER (J. Amer. Chem. Soc., 1935, 57, 2163—2166; cf. A., 1934, 76).—2-Bromofluorene (from fluorene, Br, and a trace of I in hot C<sub>6</sub>H<sub>6</sub>), m.p. 113°, *d*- or *l*-octan-β-ol nitrate, and KOEt in EtOH-Et<sub>2</sub>O give the *K* salts (I), [α]<sub>D</sub><sup>25</sup> +4.48°, -1.71° in dry EtOH, of 2-bromo-9-nitrofluorene (II), which with air give KNO<sub>2</sub> and 2-bromofluorenone, m.p. 196° (lit. 194—195°), with dil. AcOH give the acid-form (III), m.p. 132°, of (II) [converted in hot EtOH into the normal form (IV), m.p. 170°], with Br in EtOH yields 2:9-dibromo-9-nitrofluorene, m.p. 139°, [α]<sub>D</sub><sup>0</sup>, and leads by way of the *Ag* salt to 2-bromo-9-nitrofluorene *O*-Me ether (V), m.p. 72—80°, readily decomposed to CH<sub>3</sub>O and 2-bromofluorenone oxime (VI). (I), (III), (IV), (V), and (VI) absorb 0.9, 0.5, 0, 0.49—0.53, and 0.51 mol. of Br, respectively.

R. S. C.

**Dissociable anthracene oxides: influence of mesonaphthyl groups.** A. WILLEMART (Compt. rend., 1935, 201, 1201—1202).—9:10-Dihydroxy-9:10-di-β-naphthylidihydroanthracene is converted by KI in AcOH into 9:10-di-β-naphthylanthracene, m.p. —379°. Both this and the di-α-naphthyl compound, in solutions exposed to sunlight in presence of

air, yield photo-oxides, which when heated at 180—200° lose O<sub>2</sub> and regenerate the hydrocarbons.

E. W. W.

**Dissociable organic oxides. Diphenyldi-*p*-bromophenyldibromorubene and its dissociable oxide.** C. DUFRAISSE and H. ROCHER (Bull. Soc. chim., 1935, [v], 2, 2235—2240).—(*p*-C<sub>6</sub>H<sub>4</sub>Br)<sub>2</sub>CO and CPh·C·MgBr give *γ*-phenyl-α-di-*p*-bromophenyl-Δ<sup>β</sup>-propinen-α-cl (I), m.p. 170—171°, which yields an unstable chloride, m.p. 122—123°, converted at 115°/vac. in quinoline into diphenyldi-*p*-bromophenyldibromorubene, m.p. 309—310°, yellow and garnet-red forms (absorption spectra given). In Et<sub>2</sub>O-C<sub>6</sub>H<sub>6</sub> in light this gives a cryst. oxide, which at 195—220° rapidly dissociates (45—58% of O<sub>2</sub> liberated). (I) (31c ether, m.p. 103°) with H<sub>2</sub>SO<sub>4</sub>-EtOH gives Ph ββ-di-*p*-bromophenylvinyl ketone, m.p. 112—113°. R. S. C.

**Cholanthrene and related hydrocarbons.** L. F. FIESER and A. M. SELIGMAN (J. Amer. Chem. Soc., 1935, 57, 2174—2176).—4-Bromohydrindone, m.p. 97°, prepared in 70% yield from β-*o*-bromophenylpropionic acid (best obtained from *o*-C<sub>6</sub>H<sub>4</sub>BrMe), gives (Clemmensen) a 77% yield of 4-bromohydrindene, b.p. 118°/18 mm., the Grignard reagent (I) of which with α-C<sub>10</sub>H<sub>7</sub>·COCl gives 4-α-naphthoylhydrindene, an oil (50% yield), pyrolysed at 400—405° to cholanthrene (34%), m.p. 173—173.5° (corr.) [picrate, m.p. 169—170° (corr.)]. (I) and β-C<sub>10</sub>H<sub>7</sub>·COCl give 4-β-naphthoylhydrindene, m.p. 68—69°, and thence 5:10-dimethylene-1:2-benzanthracene, m.p. 176.5—177° (corr.) [picrate, m.p. 158—159° (corr.)]. Fluorenone-1-carboxylic acid (modified prep. from 7:8-benzacenaphthene; 48% yield), m.p. 191—193°, and 4% Na-Hg and H<sub>2</sub>O give 83% of fluorene-1-carboxylic acid, m.p. 245°, the Grignard reagent (II) from the chloride of which with 1-C<sub>10</sub>H<sub>7</sub>Br in C<sub>6</sub>H<sub>6</sub>-Et<sub>2</sub>O gives 56% of 1-α-naphthoylfluorene (III), m.p. 113—114°, giving at 415° in N<sub>2</sub> 60% of 15:16-benzdehydrocholanthrene (IV), m.p. 181—181.3° (picrate, m.p.

174.5—175.5° (corr.)]. (II), C<sub>10</sub>H<sub>8</sub>, and AlCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub>Cl<sub>4</sub> give mainly 1-β-naphthoylfluorene, m.p. 159—162°, yielding 7:8-benz-1:2:1':2'-naphthacenaphthene (V), m.p. 178—179° (corr.) [picrate, m.p. 181—182° (corr.)]; in CS<sub>2</sub>, however, much (III) is formed.

R. S. C.

**Amides of benzene-sulphinic [and -sulphonic] acid.** L. C. RAIFORD and S. E. HAZLET (J. Amer. Chem. Soc., 1935, 57, 2172—2174).—The following are prepared, the yields varying greatly. Benzenesulphinic-*o*, m.p. 107—108°, -*m*-, m.p. 106°, and -*p*-chloroanilide, m.p. 155.5°, -*o*-, m.p. 108—110°, -*m*-, 112—114°, and -*p*-bromoanilide, m.p. 150.5°, -*o*-, m.p. 124—125°, -*m*-, m.p. 102—103°, and -*p*-toluidide, m.p. 100—101°, -*o*-, m.p. 108—113°, -*m*-, 133—134°, and -*p*-anisidide, m.p. 131°, -*p*-carbethoxyanilide, m.p. 114—115°, -4-nitro-*o*-toluidide, m.p. 133°, -β-naphth-

*alide*, m.p. 143—144°, *-benzylamide*, m.p. 100—104°, *-4'-diphenylamide*, m.p. 165.5°, *-4-chlorodiphenyl-2'*-, m.p. 206°, and *-4'-amide*, m.p. 165—166°; *benzenesulphon-o-*, m.p. 130—131°, and *-m-bromoanilide*, m.p. 117.5—118.5°, *-o-toluidide*, m.p. 122—123° (lit. 124—125°), *-m-anisidide*, m.p. 82.5—83.5°, *-p-carboethoxyanilide*, m.p. 183.5—184°, *-4-nitro-o-toluidide*, m.p. 175—176° (lit. 172°), *-4'-diphenylamide*, m.p. 147—148°, *-4-chlorodiphenyl-2'*-, m.p. 136—138°, and *-4'-amide*, m.p. 145—145.5°. R. S. C.

**Phenylthiocarbamides. Triad N·C·S. I. Aniline thiocyanate.** K. KRALL and R. D. GUPTA. **II. Action of hydrolytic agents on phenylthiocarbamide.** **III. Action of nitrous acid on phenylthiocarbamide.** S. MEHTA and H. KRALL (J. Indian Chem. Soc., 1935, 12, 629—634, 635—639, 640—646).—I. *NH<sub>2</sub>Ph.HCNS*, best obtained from *NH<sub>2</sub>Ph* and *HCNS* in *Et<sub>2</sub>O*, at above 85° rapidly gives *NHPh·CS·NH<sub>2</sub>* (I) with evolution of heat. Yields never exceed 80—83%, suggesting an equilibrium, but the reverse change cannot be realised. (I) is best obtained (80%) from dry *NH<sub>2</sub>Ph.HCl* and *KCNS* at 110° (1 hr.).

II. At high *p<sub>H</sub>* (I) hydrolyses in *H<sub>2</sub>O* mainly to *H<sub>2</sub>S* and *NHPh·CN*, at low *p<sub>H</sub>* mainly to *NH<sub>3</sub>* and *PhNCS*, with minor amounts of hydrolysis to *HCNS* and *NH<sub>2</sub>Ph*. The last reaction predominates at about *p<sub>H</sub>* 7. This indicates dynamic isomerism.

III. With aq. *NaNO<sub>2</sub>·HCl* (I) reacts mainly thus:  $2(I) + 4HNO_2 \rightarrow C_6H_5N_4S$  (A., 1889, 872) +  $4NO + 4H_2O + S$ , but with aq. *NaNO<sub>2</sub>·AcOH* mainly thus:  $(I) + HNO_2 \rightarrow PhNCS + N_2 + H_2O$ . Traces of *PhNC* are also formed. R. S. C.

**Organic reagent for cadmium.**—See this vol., 179.

**Mechanism of amination by sodamide. Preparation of substituted amidines.** A. KIRSSANOV and J. IVASTCHENKO (Bull. Soc. chim., 1935, [v], 2, 2109—2124).—As anticipated from their containing a C·N group (cf. *C<sub>2</sub>H<sub>5</sub>N*), arylideneamines react with *NaNH<sub>2</sub>* in hot *PhMe*. *CHPh·NHPh* (I) affords *NH<sub>2</sub>Ph* (12%), phenylbenzamidine (II) (19.6%), *NHPh·CH<sub>2</sub>Ph* (III) [14.9%; Ac derivative, m.p. 56—57° (lit. an oil)], and 2:4:5-triphenylglyoxaline (IV) (12.8%), the probable mechanism being:  $(I) \rightarrow NH_2·CHPh·NPhNa \rightarrow NaH + NH_2·CPh·NPh$  (V)  $\rightarrow NHNa·CPh·NPh$  (VI) +  $H_2$ ;  $(I) + H_2 \rightarrow (III)$ ;  $(V) + NaNH_2 \rightarrow (VI) + NH_3$ ;  $3(I) + 2NH_3 \rightarrow 3NH_2Ph + 2:4:5$ -triphenyl-4:5-dihydroglyoxaline  $\rightarrow$  (IV). *CHPh·N·C<sub>6</sub>H<sub>4</sub>Me·p* affords *p-C<sub>6</sub>H<sub>4</sub>Me·NH<sub>2</sub>* (22.6%), *p-tolylbenzamidine* (22.6%), *p-C<sub>6</sub>H<sub>4</sub>Me·NH·CH<sub>2</sub>Ph* (20.6%), m.p. 19—20° (lit. an oil; NO-derivative, m.p. 45.5—48.5°), and the glyoxaline derivative (12.3%). Piperonylideneaniline gives 13% of the *amidine*, m.p. 138—139°, and a little piperonylaniline, m.p. 78—79°. This is the best way of preparing benzamidines. R. S. C.

**Preparation and geometrical isomerism of asymmetric quaternary ammonium salts and betaine hydrates derived therefrom.** (MME.) M. GUAINET-PILAUD (Ann. Chim., 1935, [xi], 4, 365—448).—The geometrical isomerism of the betaine hydrates previously described (A., 1930, 1563;

1933, 387, 948, 1004; 1934, 763) depends on the order of introduction of the hydrocarbon radicals. The quaternary iodide from *NPhEt·CH<sub>2</sub>·CO<sub>2</sub>Me* (*Et* ester, b.p. 149—150°/13 mm. and 150—151°/15 mm.) and *MeI* with *Ag<sub>2</sub>O* gives a new stable betaine monohydrate, m.p. 104° [*platinichloride*, m.p. 169°; *picrate*, 186° (decomp.) (not identical with the *picrate*, m.p. 158.5° [decomp.], of the betaine hydrates previously described), *d-camphorsulphonate*, m.p. 190—191° (decomp.); *oxalate*, m.p. 173° (decomp.) and 134.5°]. Similarly the quaternary iodide from *Et phenylpropylaminoacetate*, b.p. 161—162°/14 mm. (from *NHPhMe* with *CH<sub>2</sub>I·CO<sub>2</sub>Et* or *CH<sub>2</sub>Cl·CO<sub>2</sub>Et*), yields a stable betaine monohydrate, m.p. 108° [*picrate*, m.p. 189° (decomp.) [not identical with the *picrate*, m.p. 127° (decomp.)], of the betaine hydrates previously described, of which the following new derivatives are described: *platinichloride*, m.p. 198° (decomp.); *oxalate*, m.p. 208°; *d-camphorsulphonate*, m.p. 227—227.5° (decomp.)]. Similarly the quaternary iodide from *CH<sub>2</sub>I·CO<sub>2</sub>Et* and *p-C<sub>6</sub>H<sub>4</sub>Me·NEt<sub>2</sub>* gives a single betaine hydrate, *cryst.* (*oxalate*, m.p. 138—139°). The following were also prepared from the appropriate bases and iodides: *NPhMe<sub>2</sub>EtI*, m.p. 134° (decomp.); *p-C<sub>6</sub>H<sub>4</sub>Me·NEt<sub>2</sub>I*, m.p. 156.5°. *NHMePr picrate* has m.p. 105.5—106°. F. R. G.

**Decomposition of *p*-iodoaniline.** F. B. DAINS, R. Q. BREWSTER, and J. A. DAVIS (J. Amer. Chem. Soc., 1935, 57, 2326—2327).—Purified *p-C<sub>6</sub>H<sub>4</sub>I·NH<sub>2</sub>* in a glass-stoppered bottle in diffused light after 3 years had decomposed giving traces of *I* and *NH<sub>2</sub>Ph* and much 2:4-*C<sub>6</sub>H<sub>3</sub>I<sub>2</sub>·NH<sub>2</sub>*. R. S. C.

**Identification of carboxylic acids as salts of benzylamine and  $\alpha$ -phenylethylamine.** C. A. BUEHLER, L. CARSON, and R. EDDS (J. Amer. Chem. Soc., 1935, 57, 2181—2182).—The following *CH<sub>2</sub>Ph·NH<sub>2</sub>* and *CHMePh·NH<sub>2</sub>* salts, respectively, are prepared. Formate, m.p. 95—97°, 97.8—98.8°, acetate, m.p. 96.3—97.1°, 92.1—92.5°, propionate, m.p. 46.7—47.5°, b.p. 120—121°/42 mm., *n*-butyrate, b.p. 109—110°/15 mm., 125°/37 mm., *n*-valerate, m.p. 51.7—52.7°, —, chloro-, m.p. 119.9—120.9°, 94.7—95.5°, and trichloro-acetate, m.p. 120.3—121.3°, —, phenylacetate, m.p. 122—122.6°, 115.6—116.4°, *o*-toluate, m.p. 145.4—146.4°, 113.3—113.7°, cinnamate, m.p. 135.9—136.3°, 144.5—145.1°, benzoate, m.p. 127.2—128.4°, 140.6—141.2°, *o*-, m.p. 112—113.2°, 111—111.6°, *m*-, m.p. 135.9—136.5°, 168.9—169.4°, and *p*-amino-, m.p. 197.6—198.6°, 185.6—186.4°, *m*-bromo-, m.p. 160.6—161.2°, 148.9—149.7°, *o*-, m.p. 150.5—151.5°, 130.9—131.9°, *m*-, m.p. 149.2—149.8°, 144.7—145.3°, and *p*-chloro-, m.p. 160.3—161.3°, 152.3—153.3°, *m*-, m.p. 188.2—189.6°, 137.2—138.4°, and *p*-hydroxy-, m.p. 216.2—217.2°, 199.3—199.9°, *o*-, m.p. 121.5—122.3°, 158.7—159.1°, *m*-, m.p. 113.1—114.1°, 131.4—131.8°, and *p*-methoxy-, m.p. 144.8—145.6°, 132.8—133.4°, *o*-, m.p. 143.9—145.7°, 129.5—130.1°, *m*-, m.p. 174.9—175.5°, 170.7—171.1°, and *p*-nitro-benzoate, m.p. 197.3—198.9°, 195.8—196.8°, and salicylate, m.p. 94.3—95.5°, 102.1—102.9°. The low-melting salts can be distilled in vac. The aliphatic salts are hygroscopic. M.p. are corr. R. S. C.

**Organic sulphur-nitrogen linking. VIII.** E. RIESZ (Monatsh., 1935, 67, 51—62; cf. A., 1928, 748; 1931, 1295).—The product obtained from 4'-chloro-2'-nitrophenylthiol-*p*-dimethylaminoanilide (I) and  $K_2Cr_2O_7$  is 4'-chloro-2'-nitrophenyl-*p*-benzoquinonethioliminedimethyliminium dichromate. (I) and  $PbO_2$  in  $Et_2O$  or  $CHCl_3$  give a green solution, which slowly oxidises, contains 1 H less than (I) (quinol titration), and is fairly stable at  $-60^\circ$ . The green solution is considered to contain a free radical. Complete reduction of this green solution with quinol gives a mixture containing 4 : 4'-dichloro-2 : 2'-dinitrodiphenyl disulphide, also obtained by I with a substance,  $C_8H_{10}N_2I_2$  (*p*-di-iodoaminodimethyl-aniline or *p*-benzoquinoneiodoiminedimethyliminium iodide). Formulae are discussed for the product, m.p.  $260-270^\circ$  (decomp.), about  $C_{48}H_{20-28}O_{12}N_{10}S_6Cl_6$ , obtained from *s*-di-4'-chloro-2'-nitrophenylthiol-*p*-phenylenediamine and  $CrO_3$ . R. S. C.

**Molecular compounds of benzidine with certain phenols and acids.** K. HRYNAKOWSKI, H. STASZEWSKI, and M. SZMYTOWNA (Rocz. Chem., 1935, 15, 391—399).—The m.p. diagrams suggest compounds of 1 mol. of benzidine with 2 of resorcinol, m.p.  $137^\circ$ , with 2 of salicylic acid, m.p.  $156^\circ$ , with 1 of quinol, m.p.  $130^\circ$ , with 3 of  $BzOH$ , m.p.  $108^\circ$ , and with 1 of  $\alpha$ -, m.p.  $97^\circ$ , and  $\beta$ -naphthol, m.p.  $178^\circ$ . The composition of the eutectic mixture can be predicted by Kordes' formula only when one of the components is present in large excess. R. T.

**as-Diphenylhydrazine (supercooling of the liquid and mol. form).** D. VORLANDER and C. BITTINS (Ber., 1935, 68, [B], 2269—2276).—The ease with which liquid  $NPh_2NH_2$  can be supercooled is not due to the presence of impurities, but is a consequence of its mol. dissymmetry. Examination of its derivatives shows that the relationships between supercooling and constitution are not simple. Treatment of  $NPh_2NH_2$  with  $CH_2BrCO_2Et$  in boiling  $EtOH$  or of  $NPh_2NH_2HCl$  and  $NaOEt$  with  $CH_2BrCO_2Na$  followed by hydrolysis of the ester with  $NaOH$  yields *Na as-diphenylhydrazinoacetate* (I),  $NPh_2NHCH_2CO_2Na$ , anhyd., decomp.  $180-185^\circ$  ( $+5H_2O$ ), m.p. about  $80^\circ$  (corresponding  $Pb$ ,  $Hg^{II}$ ,  $Mg$ ,  $Ca$ ,  $Sr$ ,  $Zn$ ,  $Cd$ ,  $Al$ , and  $K$  salts). The free acid (hydrochloride) gives a moss-green solution in conc.  $H_2SO_4$  at  $15-20^\circ$ , whereas non-oxidising acids ( $PhSO_3H$ ;  $p$ - $C_6H_4MeSO_3H$ ) give no colour.  $HClO_4$  gives a colourless salt. With  $PbO_2$  in  $AcOH$  it gives an immediate dark red and subsequently a comparatively stable reddish-violet colour. *N-Acetyl-as-diphenylhydrazinoacetic acid*, m.p.  $185^\circ$  (corr.  $+2^\circ$ ), from (I) and  $Ac_2O$  at about  $95^\circ$ , is converted by  $HNO_3$  (d 1.4) in  $AcOH$  at  $15-20^\circ$  into a  $(NO_2)_2$ -derivative, m.p. about  $210^\circ$  (decomp.). *as-Diphenylhydrazinoacet-as-diphenylhydrazide*, m.p.  $214^\circ$  (decomp.) after softening [hydrochloride; *Ac* derivative, m.p.  $229^\circ$  (corr.)], and non-cryst.  $\alpha$ -*diphenylhydrazino- $\beta$ - $\beta$ -diacetic acid* are obtained as by-products in the prep. of (I) under different conditions.  $NPh_2NHAc$  and sodio-*p*-nitrophenylnitrosoamine afford  $\alpha$ -acetyl- $\beta$ -phenyl- $\beta$ -*p*-nitrobenzeneazophenylhydrazine, m.p.  $246^\circ$  (corr.);  $\alpha$ -acetyl- $\beta$ -phenyl- $\beta$ -*p*-nitrobenzeneazophenylhydrazinoacetic acid is described. H. W.

**Ammonium character of tetra-arylhydrazines. II. Ammonium character of tetra(dimethylaminophenyl)hydrazine.** E. WEITZ and L. MÜLLER (Ber., 1935, 68, [B], 2306—2312; cf. A., 1927, 658).—The action of  $ClO_2$  on tetra-(*p*-dimethylaminophenyl)-hydrazine (I) gives a green product which is difficult to purify. (I) and tritolyllaminium perchlorate in  $PhBr$  afford the perchlorate of Bindschedler's green,  $NMe_2C_6H_4N:C_6H_4NMe_2ClO_4$  (obtained also from the chloride and  $NaClO_4$ ), and identified by its absorption spectrum and titration with di-*N*-ethylcollidinium (II)  $[C_5H_2Me_2N^+Et]_2$ , of which 2 equivs. are required, and the resulting yellow solution, when shaken with  $H_2O$  gives tetramethyldiaminodiphenylnitrosoamine, m.p.  $155^\circ$  (decomp.). The change is explained by dissociation of (I) into the free radicals and reaction of the latter in the valency-tautomeric form. By use of a deficiency of  $Cl$  or  $Br$ , (I) can be transformed into the chloride or bromide of Bindschedler's green, but the analogous use of  $I$  leads to a (?) periodide,  $RI + RI(I_2)$ , identical with the "hydriodide" of Drew *et al.* (A., 1933, 516), which has not the constitution assigned by the latter authors. Reduction of the salts with (II) leads to (I); the change can also be effected with  $Zn$  dust or  $Na-Hg$  in  $C_5H_5N$  or  $COMe$ , but the product has not yet been isolated in substance. During the reduction of the salts or of the more readily available  $ZnCl_2$  or  $ZnBr$  compounds, particularly with  $Zn$  dust in  $C_5H_5N$ , intermediate dark blue solutions are formed, from which by addition of  $Et_2O$  the substance  $[N(C_6H_4NMe_2)_2]Cl$ ,  $ZnCl_2$  and the analogous bromide are pptd. The corresponding iodide decomposed during its prep. 1 mol. of the blue salts requires 0.5 mol. of (II), and (I) is identified in the reddish-yellow solutions in the usual manner. H. W.

**Diazo-compounds. VI. Action of dilute solutions of alkalis on diazonium salts.** G. ODDO and INDOVINA (Gazzetta, 1935, 65, 939—993).—Earlier work is reviewed. Velocity of decomp. of diazo-compounds from chloro-, bromo-, iodo-, and nitroanilines, and aminophenols (*o*-, *m*-, and *p*- in each case), *o*- and *p*-anisidine, *m*-aminobenzaldehyde, *o*-, *m*-, and *p*-aminobenzoic acids, and their  $Et$  esters, in presence of 0.4, 0.8, and 1.6%  $NaOH$  at room temp. (from  $11^\circ$  to  $26^\circ$ ) is measured by  $N_2$  evolved, resin pptd., and stable diazotates and isodiazotates remaining; the results are tabulated and discussed. Increased  $[NaOH]$  normally increases stability, but accelerates decomp. of the esters. Diazotates derived from *o*- and *p*-nitroaniline are stable; those from *m*- and *p*-aminobenzoic acid are stable in presence of 1.2%  $NaOH$ ; those from *m*-iodo- and *m*-nitro-aniline decompose rapidly. Partial transformation into isodiazotates is normal, except where  $\cdot OH$  or  $\cdot CO_2H$  is the substituent. Decomp. graphs correspond approx. with unimol. reactions. The slow decomp. of isodiazotates is also studied. The industrial application of the decomp. tables is suggested. E. W. W.

**Reaction of titanium tetrachloride with phenol.**—See this vol., 173.

**Halogenation of phenolsulphonic acids in nitrobenzene.** R. C. HUSTON and A. H. NELEY (J. Amer. Chem. Soc., 1935, 57, 2176—2178).— $PhOH$  is

sulphonated and the product dissolved in  $\text{PhNO}_2$ , treated successively with oleum at  $< 10^\circ$  and Br in  $\text{PhNO}_2$ , and hydrolysed with steam at  $200^\circ$ . There are formed 10.4—46.5% of  $o\text{-C}_6\text{H}_4\text{Br}\cdot\text{OH}$  (I), 72.7—9.5% of  $2:6\text{-C}_6\text{H}_3\text{Br}_2\cdot\text{OH}$  (II), and a little  $\text{C}_6\text{H}_5\text{Br}_3\cdot\text{OH}$ , the proportion of (I) and (II) depending on the amount of  $\text{H}_2\text{SO}_4$  used in the sulphonation. Similar procedure leads to 17—72% of  $o\text{-C}_6\text{H}_4\text{Cl}\cdot\text{OH}$ , and 70.3—24% of  $2:6\text{-C}_6\text{H}_3\text{Cl}_2\cdot\text{OH}$ , 3-bromo-*o*-cresol, b.p.  $206\text{--}207^\circ/740$  mm. (60%) and 3:5-dibromo-*o*-cresol (13%), 3-chloro- (30%), and 3:5-dichloro-*o*-cresol (12%), 2-bromo-*m*-cresol, m.p.  $61\text{--}62^\circ$  (7—40%), with ? some 4-Br- and 0—8% of 6-Br-compound, m.p.  $58\text{--}59.5^\circ$  (*p*-toluenesulphonate, m.p.  $112\text{--}113^\circ$ ), and 0—23% of 2:4-dibromo-*m*-cresol, m.p.  $36.5\text{--}37.5^\circ$  (*p*-toluenesulphonate, m.p.  $131\text{--}132^\circ$ ), and 2-chloro-, 2:6-, m.p.  $58\text{--}59^\circ$ , b.p.  $75\text{--}80^\circ/4$  mm.,  $235\text{--}236^\circ/745$  mm., and 2:4-dichloro-*m*-cresol, b.p.  $80\text{--}85^\circ/4$  mm.,  $239.5\text{--}240.5^\circ/745$  mm. The structures of the cresol derivatives are proved by their prep. also from nitrocresols and/or their chlorination to substances prepared from nitrocresols.

R. S. C.

**Pyrolysis of allyl-*p*-phenetidine.** F. L. CARNAHAN (J. Amer. Chem. Soc., 1935, 57, 2210—2211).—*N*-Allyl-*p*-phenetidine (prep. by  $\text{C}_3\text{H}_5\text{Br}$ , b.p.  $134.5^\circ/10$  mm.,  $265^\circ$  (decomp.)/ $745$  mm. ( $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{SO}_2$  derivative, m.p.  $81^\circ$ , also obtained from *p*-toluenesulphon-*p*-phenetidine and  $\text{C}_3\text{H}_5\text{Br}$  in *N*-KOH), when refluxed, gives  $p\text{-OEt}\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$  (0.465 mol.),  $\text{C}_3\text{H}_6$  (0.4 mol.), and resin (equiv. to 0.447 mol.), but no  $\text{H}_2$  or quinoline derivative, probably by the following steps:  $\text{NHR}\cdot\text{C}_3\text{H}_5$  (I)  $\rightarrow$   $\text{NHR}\cdot + \text{C}_3\text{H}_5$ ; (I) +  $2\text{NHR}\cdot \rightarrow 2\text{NHLR} + \text{NR}\cdot\text{CH}\cdot\text{CH}\cdot\text{CH}_2$  (II); (I) +  $2\text{C}_3\text{H}_5 \rightarrow$  (II) +  $2\text{C}_3\text{H}_6$ ; (II)  $\rightarrow$  resin.

R. S. C.

**Acetylation of dulcin (*p*-phenetylcarbamide).** C. ALBERTI (Gazzetta, 1935, 65, 922—925).—*p*-Phenetylcarbamide (I) with  $\text{AcCl}\cdot\text{C}_5\text{H}_5\text{N}$  yields the Ac derivative (II);  $\text{Ac}_2\text{O}\cdot\text{NaOH}$  gives only a small quantity of (II), phenacetin (III) and  $\text{NH}_2\text{Ac}$  being formed.  $\text{AcOH}$  also decomposes (I), but yields, with (III), di-*p*-phenetylcarbamide and  $\text{NH}_4$  salts. Mechanisms are suggested (cf. A., 1928, 485).

E. W. W.

**Pyrolysis of *p*-phenetylcarbamide and of acetyl-*p*-phenetylcarbamide.** C. ALBERTI (Gazzetta, 1935, 65, 926—929).—*p*-Phenetylcarbamide (I) and its Ac derivative (II) are decomposed at about  $250^\circ$  to give di-*p*-phenetylcarbamide, with, from (I),  $\text{NH}_3$  and some  $\text{HNCO}$ , and, from (II),  $\text{CO}_2$ ,  $\text{NH}_2\text{Ac}$ ,  $\text{MeCN}$ , and some  $\text{NH}_3$ .

E. W. W.

**Derivatives of diphenyl ether.** L. C. RAIFORD and J. C. ZIMMERMANN (Amer. J. Pharm., 1935, 107, 472—475; cf. A., 1926, 1242; 1930, 767).—The product obtained by nitration of 2':4'-dibromo-4-nitrodiphenyl ether is 2':4'-dibromo-2:4:5'-trinitrodiphenyl ether, which, with piperidine (I), gives 2:4-dinitrophenylpiperidine and 2:4-dibromo-5-nitrophenol. (I) also reacts with other substituted diphenyl ethers giving substituted phenols.

W. McC.

**Preparation of [alkyl]aminoisopropylidene-pyrocatechols.** J. DRUEY (Bull. Soc. chim., 1935, [v], 2, 2261—2263).—Addition of  $\text{P}_2\text{O}_5$  to  $o\text{-C}_6\text{H}_4(\text{OH})_2$  in  $\text{CH}_2\text{Cl}\cdot\text{COMe}$  gives a 40—45% yield of the chloroiso-

propylidene derivative, b.p.  $104\text{--}105^\circ/13$  mm. ( $\text{NO}_2$ -derivative, m.p.  $80\text{--}81^\circ$ ), the Cl of which is inactive, but with the appropriate base in  $\text{C}_6\text{H}_6$  at  $180^\circ$  gives slowly poor yields of dimethylamino-, b.p.  $115\text{--}117^\circ/22$  mm. [hydrochloride, m.p.  $217\text{--}218^\circ$  (decomp.)], diethylamino-, b.p.  $123\text{--}125^\circ/20$  mm. (hydrochloride, an oil), and piperidino-isopropylidenepyrocatechol, b.p.  $150\text{--}151^\circ/17$  mm. [hydrochloride, m.p.  $224\text{--}225^\circ$  (decomp.)].

R. S. C.

**Syntheses of pharmacologically important amines. XI. Preparation of arylethylamines and arylethanolamines by catalytic reduction.** K. KINDLER, W. PESCHKE, and E. BRANDT (Ber., 1935, 68, [B], 2241—2245).—The interference of intermediate products in the smooth reduction of ketoximes and cyanohydrins to amines is avoided by the gradual addition of a solution of the substance to be reduced to the catalyst charged with H. In the prep. of primary amines, conc.  $\text{H}_2\text{SO}_4$  is added. The following examples are cited:  $\text{CPhMe}\cdot\text{N}\cdot\text{OH}$  to  $\text{CHPhMe}\cdot\text{NH}_2$  (yield 83%); *p*-methylacetophenone-oxime to  $\alpha$ -*p*-tolylethylamine (80% yield) [hydrochloride, m.p.  $167\text{--}168^\circ$ ]; *p*-methoxyacetophenone-oxime to  $\alpha$ -*p*-anisylethylamine (yield 70%); 3:4-dimethoxybenzaldehyde cyanohydrin to  $\beta$ -hydroxy- $\beta$ -3:4-dimethoxyphenylethylamine (yield 47%) and  $\beta$ -3:4-dimethoxyphenylethylamine (yield 18%); 3:4-diethoxybenzaldehyde cyanohydrin to  $\beta$ -hydroxy- $\beta$ -3:4-diethoxyphenylethylamine, m.p.  $93^\circ$  (picrate, m.p.  $171^\circ$ ), and  $\beta$ -3:4-diethoxyphenylethylamine; 3-methoxy-4-ethoxybenzaldehyde cyanohydrin to  $\beta$ -hydroxy- $\beta$ -3-ethoxy-4-ethoxyphenylethylamine, m.p.  $110^\circ$  (picrate, m.p.  $161^\circ$ ); hydrochloride, m.p.  $176^\circ$ ), and  $\beta$ -3-methoxy-4-ethoxyphenylethylamine, b.p.  $155^\circ/10$  mm. (picrate, m.p.  $182^\circ$ ).

H. W.

**Preparation of resorcinol methyl ether. Correction.** B. B. DEY (J. Indian Chem. Soc., 1935, 12, 685—686).—Details given for the prep. of this ether (A., 1935, 211) are corr.

R. S. C.

**M.p. of resorcinol.** N. A. VALJASCHKO and M. M. SCHTSCHERBAK (Ukrain. Chem. J., 1935, 10, 305—310).—The f.p. is  $109.8^\circ$  and the m.p.  $110.2^\circ$ .

R. T.

**Alkyl ethers of  $\beta\beta$ -di-*p*-hydroxyphenylpropane. I. Dialkyl ethers.** G. R. YONE and J. F. VITCHA (J. Amer. Chem. Soc., 1935, 57, 2259—2260).—An excess of  $\text{CMe}_2(\text{C}_6\text{H}_4\cdot\text{OH}\cdot p)_2$  with alkyl sulphates in aq. NaOH or KOH gives mono- and di-alkyl ethers; the  $\text{Me}_2$ , m.p.  $59\text{--}61.5^\circ$ , b.p.  $190^\circ/5$  mm.,  $\text{Et}_2$ , m.p.  $49\text{--}50^\circ$ ,  $\text{Pr}^n$ , b.p.  $200\text{--}202^\circ/3$  mm.,  $\text{Bu}^n$ , m.p.  $20^\circ$ , b.p.  $212\text{--}213^\circ/3$  mm., and di-*n*-amyl ether, m.p.  $34.5\text{--}35.5^\circ$ , b.p.  $225\text{--}230^\circ/3$  mm., are described.  $n\text{-C}_8\text{H}_{17}\cdot\text{OH}$  and  $\text{SOCl}_2$  are kept for 1 week and neutralised with NaOH, and the resulting mixture is then used for alkylation.

R. S. C.

**Production of dihydroxydihydroanthracene from anthracene.**—See this vol., 234.

**Molecular rearrangement of *N*-thiolanilides. II.** M. L. MOORE and T. B. JOHNSON (J. Amer. Chem. Soc., 1935, 57, 2234—2236; cf. A., 1935, 1359).—With hot KOH-EtOH *N*-thiolanilides give *o*-thioldiphenylamines, possibly by way of *o*-aminodiphenyl sulphides. *N*-*o*-Nitrophenylthiol-anilide, -*o*-

and *p*-toluidide thus give *o*-nitro-*o*'-thiol-, -2'-thiol-5'-methyl-, and -2'-thiol-3'-methyl-diphenylamine (Na salts, which with MeI-EtOH give the *Me* ethers, m.p. 98°, 94°, and 84—85°), respectively. R. S. C.

**Spatial configurations of 1:2-dialkylcyclopentan-1-ols.** G. CHIURDOGLU (Bull. Soc. chim. Belg., 1935, 44, 527—550).—2-Methylcyclopentanone (cf. A., 1926, 1238) [phenylhydrazone, decomp. at 60°; Et 2-methylcyclopentanonecarboxylate (phenylhydrazone, decomp. at 68°)] is converted into 1:2-dimethylcyclopentan-1-ol, which when fractionally distilled yields *trans*- and *cis*-isomerides, m.p. 27.3° and 28.9°, respectively. The former is the more quickly converted into 1:2-dimethyl- $\Delta^1$ -cyclopentene by 85%  $\text{HCO}_2\text{H}$ , and is the more rapidly reduced ( $\text{H}_2$ -Pt), and has OH and H in *trans*-positions (cf. A., 1931, 954; 1932, 844). *trans*-Isomerides with different pairs of 1:2-substituents are reduced ( $\text{H}_2$ -Pt) at the same rate as are the *cis*-, and suffer no change in configuration prior to reduction. Reduction of either isomeride gives mainly a *trans*-product. A mechanism is suggested to explain these reactions. J. L. D.

**Addition of chloroform and bromoform to *p*-chlorobenzaldehyde.** J. W. HOWARD (J. Amer. Chem. Soc., 1935, 57, 2317—2318).—*p*- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{CHO}$ ,  $\text{CHCl}_3$ , and KOH give *p*-chlorophenyltrichloromethylcarbinol, b.p. 187—188°/26 mm. (acetate, m.p. 120—121°; propionate, m.p. 71—72°; benzoate, m.p. 128—129°). *p*-Chlorophenyltribromomethylcarbinol, m.p. 90—91°, is similarly obtained. R. S. C.

**Chemical study of the functions of ephedrine.** I. New method for its determination. J. A. SANCHEZ (J. Pharm. Chim., 1935, [viii], 22, 489—496).—The formation from ephedrine of BzOH by alkaline oxidation,  $\text{PhCHO}$  and an amine by the action of  $\text{KMnO}_4$  or  $\text{NaOCl}$ , and nitrosoephedrine by the action of  $\text{NaNO}_2$  and  $\text{HCl}$ , the reactions of the diazo-compound, and the products of pyrogenic decomp. are described. Ephedrine reacts with  $\text{NaOH}$  and  $\text{I}$  giving  $\text{CHI}_3$ , and a method of determination based on this sensitive reaction is proposed. E. H. S.

**Phenanthrene series. IX. Amino-alcohols derived from 1:2:3:4-tetrahydrophenanthrene.** E. MOSETTIG and A. BURGER (J. Amer. Chem. Soc., 1935, 57, 2189—2192; cf. A., 1935, 973).—Some phenanthrene derivatives carrying a basic and OH group in one reduced ring have analgesic action comparable with that of codeine. 2-Bromo-1-keto-1:2:3:4-tetrahydrophenanthrene (I), m.p. 84—85° [by bromination of the 1-CO-compound (II) in dry  $\text{Et}_2\text{O}$  containing a little  $\text{HCl}$ ], with the appropriate base affords 2-dimethylamino- [hydrochloride, m.p. 219—220 (decomp.)], 2-diethylamino- (III) (hydrochloride, m.p. 156° after sintering at 138°), 2-piperidino-, m.p. 138—140° [hydrochloride, m.p. 236—238° (decomp.)], and 2-1':2':3':4'-tetrahydroisoquinolino-1-keto-1:2:3:4-tetrahydrophenanthrene [hydrochloride, m.p. 226—227° (decomp.)], hydrogenated ( $\text{PtO}_2$ ) in  $\text{MeOH}$  to 2-dimethylamino-, m.p. 105—108° after sintering at 95°, sublimes at 90°/high vac. [hydrochloride, m.p. 223—224° (decomp.)]; Bz derivative, m.p. 179—181° (decomp.)], 2-diethylamino-, m.p. 70—72° after softening at 60°, b.p. 90°/high vac. [hydro-

chloride, m.p. 221—223° (decomp.); 3:5- $\text{C}_6\text{H}_3(\text{NO}_2)_2\cdot\text{CO}$  derivative, m.p. 209—211° (decomp.)], 2-piperidino-, m.p. 121—126°, sublimes at 105°/high vac. [hydrochloride, m.p. 259° (decomp.)], and 2-1':2':3':4'-tetrahydroisoquinolino-1-hydroxy-1:2:3:4-tetrahydrophenanthrene, m.p. 155—156° [hydrochloride, m.p. 227° (decomp.)]. As by-products to (III) are obtained 1-hydroxyphenanthrene (IV), m.p. 153°, and an additive 1:1-compound (V), m.p. 119°, of (IV) and (I). (IV) is also obtained from (I) and  $\text{NPhEt}$ , or (II) and Se at 295°. (V) with hot  $\text{KOH}\cdot\text{EtOH}$  gives (I) and (IV), from which it is obtained by crystallisation of the 1:1 mixture, and with semicarbazide gives the semicarbazone of (I). 3-Bromo-4-keto-1:2:3:4-tetrahydrophenanthrene (VI), m.p. 104—105°, leads similarly to (a) 3-dimethylamino- [hydrochloride, m.p. 208—210° (decomp.)], 3-diethylamino- [hydrochloride, m.p. 184—185° (decomp.)]; picrate, m.p. 173—174° (decomp.)], 3-piperidino- [hydrochloride, m.p. 248—250° (decomp.)], and 3-1':2':3':4'-tetrahydroisoquinolino-4-keto-1:2:3:4-tetrahydrophenanthrene [hydrochloride, m.p. 164—166° (decomp.)]; perchlorate, m.p. 210° (decomp.)], (b) 3-dimethylamino- [hydrochloride, m.p. 230° (decomp.)]; Bz derivative, m.p. 89—90° (hydrochloride, m.p. 177—178°)], 3-diethylamino- [hydrochloride, m.p. 239.5—240° (decomp.)]; picrate, m.p. 206—208° (decomp.)]; Bz derivative [picrate, m.p. 173—174° (decomp.)]; 3:5- $\text{C}_6\text{H}_3(\text{NO}_2)_2\cdot\text{CO}$  derivative, m.p. 216—217.5°, 3-piperidino- [hydrochloride, m.p. 246—247° (decomp.)]; Bz derivative [hydrochloride, m.p. 181—182° (decomp.)], and 3-1':2':3':4'-tetrahydroisoquinolino-4-hydroxy-1:2:3:4-tetrahydrophenanthrene [hydrochloride, m.p. 230—231° (decomp.)], (c) 4-hydroxyphenanthrene, m.p. 113°, and the 1:1 additive compound thereof with (VI), m.p. 107°. M.p. are corr. R. S. C.

**Adrenal cortex. I. Fractionation of hormone concentrates. II. Isolation of physiologically inactive crystalline compounds from active extracts.**—See this vol., 115.

**Auxochromes and resonance.** C. R. BURY (J. Amer. Chem. Soc., 1935, 57, 2115—2117).—The theory that dyes owe their colour to resonance and that the function of auxochromes is to render resonance possible is applied to various classes of dyes.

R. S. C.

**Carotenoid origin of cholesterol.** W. M. D. BRYANT (Chem. and Ind., 1935, 1082—1083).—Arguments are presented in favour of the carotenoid origin of sterols and related compounds. Sterols containing "extra" Me and Et groups may arise by degradation of more highly cyclised carotenoids.

R. S. C.

**Constitution of  $\beta$ -ergosterol.** F. LAUCHT (Z. physiol. Chem., 1935, 237, 236—246).—Ozonisation of  $\alpha$ -ergosterenyl acetate suspended in  $\text{AcOH}$  and reductive fission of the ozonides yields at least two isomeric dehydroergosterols, m.p. (indef.) 132,  $[\alpha]_D^{25} -56.1^\circ$  in  $\text{CHCl}_3$ , and m.p. 114—116°,  $[\alpha]_D^{25} -81.0^\circ$  in  $\text{CHCl}_3$ , respectively.  $\text{O}_3$  functions therefore as a dehydrogenating agent, and its action affords no evidence of the position of the double linking in  $\alpha$ -ergosterol. Similar ozonisation of  $\beta$ -ergosterenyl acetate

affords the keto-alcohol,  $C_{16}H_{26}O_2$ , and its acetate (I) described by Achtermann (A., 1934, 1000) and an aldehyde containing 12 C (*semicarbazone*,  $C_{13}H_{25}ON_2$ , m.p. 125—131°). Since dehydrogenation of (I) by

Se at 320° yields 2-methylphenanthrene, the above constitution is established for  $\beta$ -ergosterol. This view is confirmed by the isolation from the acidic products of ozonolysis of an *enol-lactone* (II), m.p.

144°,  $[\alpha]_D^{25} +92.5^\circ$  in  $CHCl_3$ , which is insol. in cold alkali and is transformed with some difficulty by boiling KOH-MeOH followed by acid into the corresponding non-cryst. acid, transformed by  $CH_2N_2$  into the Me ester,  $C_{29}H_{50}O_4$ , m.p. (indef.) 51°,  $[\alpha]_D^{25} -24.6^\circ$  in  $CHCl_3$  (acetate,  $C_{31}H_{52}O_5$ , m.p. 124°,  $[\alpha]_D^{25} +14.3^\circ$  in  $CHCl_3$ ). H. W.

Sexual hormones and related substances.

VI. Degradation of acetylepidihydrocincholinol to  $\beta$ -3-hydroxynorallocholanolic acid or to 3-hydroxynorallocholanolic acid. W. DIRSCHERL (Z. physiol. Chem., 1935, 237, 268—272).—Dihydrocincholinol acetate has been oxidised to  $\beta$ -3-hydroxynorallocholanolic acid and epidihydrocincholinol acetate to 3-hydroxynorallocholanolic acid. Dihydrocincholinol has therefore the following structure.

Action of hydrogen sulphide on acid chlorides.

VI. Hydrogen sulphide and 3:4-dimethylbenzoyl chloride. L. SZPERL and L. OZIEBŁO (Rocz. Chem., 1935, 15, 408—413).—1:2:4- $C_6H_3Me_2Br$  and Mg yield a Grignard compound, converted by  $CO_2$  into 3:4-dimethylbenzoic acid, the chloride of which, when treated with  $H_2S$  in boiling xylene, yields chiefly *di*-3:4-dimethylbenzoyl sulphide (I) m.p. 119—120°, together with some *disulphide*, m.p. 127—128°. (I) is converted by  $EtOH-NH_3$  into 3:4-dimethylbenzamide, m.p. 111—113.5°, and  $NH_4$  3:4-dimethylthiobenzoate. R. T.

Preparation of  $\beta$ -1-naphthylpropionic,  $\beta$ -2-naphthylpropionic, and  $\beta$ -2-tetrahydronaphthylpropionic acids. Synthesis of dihydrophenalene and 5:6-tetrahydrobenzindan-1-one. G. DARZENS and A. LEVY (Compt. rend., 1935, 201, 902—904).—1-Naphthylmethyl- and 2-tetrahydronaphthyl-

methyl-malonic esters (cf. A., 1935, 975) when hydrolysed and decarboxylated at 175—195° afford  $\beta$ -1-naphthylpropionic, m.p. 156° [amide, m.p. 133°; Me ester, b.p. 162°/2 mm.; chloride (I), m.p. 26°] (cf. A., 1922, i, 740), and  $\beta$ -2-tetrahydronaphthylpropionic acid, m.p. 127° [amide, m.p. 133°; Me ester, b.p. 183°/15 mm.; chloride (II), b.p. 162°/2 mm.], respectively; the Me ester of the latter with S or Se gives  $\beta$ -2-naphthylpropionic acid. (I) in  $PhNO_2$  containing  $AlCl_3$  gives 7:8-dihydrophenal-9-one (*perinaphthindanone*) (A, annexed). Similarly, (II) affords 5:6-tetrahydrobenzindan-1-one, m.p. 47° (oxime, m.p. 224°), which when oxidised ( $HNO_3$ ) gives 1:2:4:5- $C_6H_2(CO_2H)_4$ .

J. L. D.

Apparent cases of liquid-crystal formation in *p*-alkoxybenzoic acids. B. JONES (J.C.S., 1935, 1874).—The following acids, prepared by interaction of *p*-OH- $C_6H_4$ -CO $_2$ H (1 mol.) and the alkyl iodide (2 mol.) in presence of NaOH (1mol.; 1 hr.; 100°), show liquid crystal formation (the recorded temp. are the transition point and the true m.p.): *p*-n-amyloxy- (122°, 148°); *n*-hexyloxy- (105°, 150°); *n*-heptyloxy- (91°, 145°); *n*-octyloxy- (100°, 145°); *c*-tyloxy-benzoic acid (99°, 131°). The corresponding *m*-series does not show this formation. F. N. W.

Condensation of phenylglyoxyanilide with acetone, ethyl phenylacetate, and ethyl malonate. J. V. SCUDI and H. G. LINDWALL (J. Amer. Chem. Soc., 1935, 57, 2302—2303).—NHPh-COBz (I), COMe, and 5 drops of NH $Et_2$  at room temp. give  $\alpha$ -hydroxy- $\gamma$ -keto- $\alpha$ -phenyl-*n*-valerianilide, m.p. 137—138° [phenylhydrazone, m.p. 174—175° (decomp.); decomposed by hot aq. alkali into the starting products], which with more (I) gives  $\alpha\alpha'$ -dihydroxy- $\gamma$ -keto- $\alpha\alpha'$ -diphenylpimeldianilide, m.p. 171—172°.  $CH_2Ph$ -CO $_2$ Et, (I), and a little NH $Et_2$  give slowly diphenylmaleinanil, m.p. 178—179°, reduced by  $Na_2S_2O_4$  to  $\alpha\alpha'$ -diphenylsuccinanil.  $CH_2(CO_2Et)_2$  and (I) give *Et* $\beta$ -carbonanilido- $\beta$ -phenylpropane- $\alpha\alpha\gamma\gamma$ -tetracarboxylate, m.p. 107—108°, which, when distilled/25 mm., affords *Et*OH,  $CH_2(CO_2Et)_2$ , and  $\alpha$ -carbethoxyphenylmaleinanilide, m.p. 111°, reduced ( $Na_2S_2O_4$ ) to  $\alpha$ -carbethoxy- $\alpha'$ -phenylsuccinanil, m.p. 104—105°, which with conc. HCl gives phenylsuccinanil. R. S. C.

Walden inversion reactions of the *p*-toluenesulphinic and *p*-toluenesulphonic esters of ethyl *d*- $\beta$ -hydroxy- $\beta$ -phenylpropionate. J. KENYON, H. PHILLIPS, and G. R. SMUTT (J.C.S., 1935, 1663—1668).—*dl*- $\beta$ -Hydroxy- $\beta$ -phenylpropionic acid may be resolved through the brucine salt (cf. J.C.S., 1910, 97, 121). The *d*-acid with  $EtOH-HCl$  yields the *Et d*-(+)-ester (I), which with  $EtI$ ,  $Ag_2O$ , and anhyd.  $Et_2O$  yields *Et d*-(+)- $\beta$ -ethoxy- $\beta$ -phenylpropionate (II), b.p. 85—86°/0.1 mm.,  $\alpha_{441}^{25} +7.59^\circ$ , but with  $K-Et_2O$  gives chiefly  $CHPh:CH-CO_2Et$ . (I) when heated with  $Ac_2O$  or anhyd.  $HCO_2H$  affords, respectively, the corresponding *d*-(+)- $\beta$ -acetoxy- and *d*-(+)- $\beta$ -formoxy-derivatives, also obtained when *Et d*-(+)- $\beta$ -*p*-toluenesulphinoxy- $\beta$ -phenylpropionate (III),  $\alpha_{441}^{25} +3.77^\circ$  [an undistillable oil prepared from (I), *p*-toluenesulphonyl chloride, and  $C_5H_5N$ ], is heated respectively with  $AcOH-Ac_2O$  and anhyd.  $HCO_2H$ .

(III) when treated with  $\text{Cl}_2\text{-CHCl}_3$ ,  $\text{Cl}_2\text{-H}_2\text{O}$ ,  $\text{ICl}$ , or  $\text{HOCl}$  gives *Et l*-( $-$ )- $\beta$ -chloro- $\beta$ -phenylpropionate (IV); with  $\text{HOCl}$  some *Et l*-( $-$ )- $\beta$ -hydroxy- $\beta$ -phenylpropionate (V) was also formed. Similarly, (III) with  $\text{Br-CHCl}_3$  yields *Et l*-( $-$ )- $\beta$ -bromo- $\beta$ -phenylpropionate, b.p.  $82\text{--}84^\circ/\text{0.1 mm.}$ ,  $\alpha_{\text{D}}^{17} -1.43^\circ$ ; with  $\text{Br-H}_2\text{O}$  some (V) was also formed. (III) with  $\text{CNCl}$  in light petroleum yields *Et l*-( $-$ )- $\beta$ -cyano- $\beta$ -phenylpropionate, b.p.  $78\text{--}79^\circ/\text{0.1 mm.}$ ,  $\alpha_{\text{D}}^{17} -0.53^\circ$ . (III) when treated with  $\text{HNO}_2$  (in a freezing mixture) yields (V), and when refluxed in  $\text{EtOH}$  with  $\text{N}_2$  yields *Et l*-( $-$ )- $\beta$ -ethoxy- $\beta$ -phenylpropionate, but with  $\text{EtOH-K}_2\text{CO}_3\text{-N}_2$  yields mainly optically pure (I), no trace of the  $\text{OEt}$ -derivative being obtained. (III) when refluxed in  $\text{N}_2$  with  $\text{LiCl}$ ,  $\text{K}_2\text{CO}_3$ , and  $\text{EtOH}$  yields (II). (III) is oxidised by  $\text{H}_2\text{O}_2$  to *Et d*-( $+$ )- $\beta$ -*p*-toluenesulphonoxy- $\beta$ -phenylpropionate (VI), which when refluxed with  $\text{K}_2\text{CO}_3\text{-EtOH}$  affords (V), but with  $\text{K}_2\text{CO}_3$ ,  $\text{LiCl}$ , and  $\text{EtOH}$  yields (II). (II) is also obtained when (IV) is refluxed with  $\text{K}_2\text{CO}_3\text{-EtOH}$ . (VI) with  $\text{AcOH}$  affords *Et l*-( $-$ )- $\beta$ -acetoxy- $\beta$ -phenylpropionate, also obtained together with some *Et*-( $-$ )- $\beta$ -chloro- $\beta$ -phenylpropionate (VII) from (VI),  $\text{Ac}_2\text{O}$ , and  $\text{LiCl}$ . (I) when treated in  $\text{Et}_2\text{O}$  with  $\text{PCl}_5$ ,  $\text{PCl}_5\text{-C}_6\text{H}_5\text{N}$ ,  $\text{PCl}_3$ ,  $\text{PCl}_3\text{-C}_6\text{H}_5\text{N}$ , or  $\text{SOCl}_2\text{-C}_6\text{H}_5\text{N}$  yields (VII), but with  $\text{SOCl}_2$  alone yields *Et*-( $+$ )- $\beta$ -chloro- $\beta$ -phenylpropionate (cf. A., 1930, 598; 1931, 480). (I) with  $\text{PBr}_3$  or  $\text{PBr}_3\text{-C}_6\text{H}_5\text{N}$  yields *Et*-( $-$ )- $\beta$ -bromo- $\beta$ -phenylpropionate. Reasons are given for the relative configurations ascribed to the various products obtained from (I). H. G. M.

**4-Hydroxy-3-phenylbenzoic acid.** K. H. SLOTTA and A. E. NOLD (Ber., 1935, 68, [B], 2226—2231).—Treatment of K 2-hydroxy-3-phenylbenzoate with  $\text{CO}_2$  under pressure at  $220\text{--}230^\circ$  does not cause migration of  $\text{CO}_2\text{K}$ . When similarly treated *o*- $\text{C}_6\text{H}_4\text{Ph-OH}$  acquires  $2\text{CO}_2\text{H}$ . Treatment of *o*- $\text{C}_6\text{H}_4\text{Ph-OH}$  with anhyd.  $\text{HCN}$  and  $\text{AlCl}_3$  in  $\text{C}_6\text{H}_6$  gives an aldehyde, m.p.  $69\text{--}71.3^\circ$  (*p*-nitrophenylhydrazone, m.p.  $229^\circ$ ), scarcely oxidised by  $\text{KMnO}_4$ ,  $\text{KOB}$ , or  $\text{H}_2\text{O}_2$ , but converted by molten  $\text{KOH}$  into 2-hydroxy-3-phenylbenzoic acid. [ $3:4\text{-CH}_2\text{O}_2\text{:C}_6\text{H}_3\text{:CHO}$  is oxidised by  $\text{H}_2\text{O}_2$  in alkaline solution much more readily than  $3:4\text{-C}_6\text{H}_3(\text{OMe})_2\text{:CHO}$  or  $3:4\text{-C}_6\text{H}_3(\text{OEt})_2\text{:CHO}$ ]. Oxidation of 4-acetyl-2-phenylphenol with  $\text{CaOCl}_2$  gives amorphous, smeary products. *o*- $\text{C}_6\text{H}_4\text{Ph-OH}$  is transformed by  $\text{NaOH}$  and  $\text{Me}_2\text{SO}_4$  into *o*-phenylanisole, b.p.  $146\text{--}149^\circ/11\text{ mm.}$ , which with  $\text{AlCl}_3$  and  $\text{AcCl}$  in  $\text{CS}_2$  affords 4-acetyl-2-phenylanisole, m.p.  $91.5\text{--}92^\circ$ , in 92% yield. The latter compound is oxidised by  $\text{CaOCl}_2$  to 4-methoxy-3-phenylbenzoic acid, m.p.  $217.5\text{--}218^\circ$ , demethylated by  $\text{HBr}$  ( $d$  1.49) in boiling  $\text{AcOH}$  to 4-hydroxy-3-phenylbenzoic acid, m.p.  $148\text{--}149^\circ$  after softening at  $142^\circ$ . *Me*, m.p.  $91\text{--}92^\circ$ , and *Et*, m.p.  $62\text{--}63^\circ$ , 4-methoxy-3-phenylbenzoate and *E*, m.p.  $112\text{--}114^\circ$ , and *Pr*<sup>a</sup>, m.p.  $92\text{--}93^\circ$ , or m.p.  $104^\circ$ , 4-hydroxy-3-phenylbenzoate are described.

H. W.

**Diaryls and their derivatives. VI. Oxidation of  $\beta$ -naphthol-3-carboxylic acid. VII. Oxidation of 2-hydroxyanthracene.** I. S. JOFFE (J. Gen. Chem. Russ., 1935, 5, 1205—1209, 1210—1212).—[with I. Z. SMOLJANTSKAJA].  $\beta$ -Naphthol-3-carboxylic acid (I) in boiling  $\text{H}_2\text{O}$  or aq.  $\text{NaOH}$  and excess

of  $\text{FeCl}_3$  yield chiefly 2:2'-dihydroxy-1:1'-dinaphthyl-3:3'-dicarboxylic acid (II), together with some 1-chloro- $\beta$ -naphthol-3-carboxylic acid, which is the chief product when the reaction mixture is acid. (I) and  $\text{CuO}$  in  $\text{PhNO}_2$  ( $210\text{--}220^\circ$ ; 6 hr.) yield (II), which is converted into dinaphthylene dioxide by more prolonged treatment with  $\text{CuO}$  at  $300^\circ$ . (II) is not further oxidised by  $\text{FeCl}_3$ . The  $\text{Pb}$  salt of (II) undergoes a perylene condensation when heated with  $\text{AlCl}_3$  ( $160^\circ$ ; 1 hr.) to yield an acid orange dye, probably 1:12-dihydroxyperylene-2-carboxylic acid, m.p.  $> 330^\circ$ , converted into the quinone by  $\text{CrO}_3$ , and into perylene by distillation from  $\text{Zn}$  dust.

VII. 2-Hydroxyanthracene in boiling  $\text{AcOH}$  and conc. aq.  $\text{FeCl}_3$  yield 2-hydroxy-1:1':9:2'-dianthrillene oxide (*Ac* derivative, m.p.  $247\text{--}250^\circ$ ), converted at  $> 200^\circ$  into an unidentified product (probably the dioxide). R. T.

**Preparation of  $\beta$ -naphthol-3-carboxylic acid.** P. P. KARPUGHIN and I. E. CHUSIN (Ukrain. Chem. J., 1935, 10, 375—391).—At  $< 110^\circ$   $\beta\text{-C}_{10}\text{H}_7\text{ONa}$  and  $\text{CO}_2$  yield  $\text{C}_{10}\text{H}_7\text{O}\cdot\text{CO}_2\text{Na}$ , which at  $< 180^\circ$  is transformed into  $\beta$ -naphthol-1-carboxylic acid (I), converted into the 2:3-isomeride (II) at  $180\text{--}225^\circ$ . (II) can be obtained in good yield, and of high purity, by adding aq.  $\text{NaOH}$  to  $\beta\text{-C}_{10}\text{H}_7\text{OH}$  (III), drying at  $< \text{atm. pressure}$  at  $> 200^\circ$ , and treating the product with  $\text{CO}_2$  at  $225\text{--}260^\circ/2\text{--}50\text{ atm.}$  Methods involving esters of (I) as intermediates, or involving carboxylation in liquid media in presence of excess of (III), do not give as good results as the above. R. T.

**Condensation of aldehydes with malonic acid in presence of organic bases. IV. Piperonal.** T. A. VAHIDY and K. C. PANDYA (Proc. Indian Acad. Sci., 1935, 2, A, 402—405).—The condensation of piperonal (I) with  $\text{CH}_2(\text{CO}_2\text{H})_2$  (II) in presence of any of 19 different bases gives varying yields of piperonylacrylic acid, new m.p.  $242^\circ$ , also obtained from (I) and (II) alone, heated at  $100^\circ$  for 18 hr. E. W. W.

**Preparation of isovalerylsalicylic acid.** J. MILLOTIS (Bull. Soc. chim., 1935, [v], 2, 2134—2135).—This acid (prep. by  $\text{Bu}^t\text{COCl}$ ) has m.p.  $95^\circ$  (cf. A., 1911, i, 53; 1928, 1005). R. S. C.

**Action of selenium on acid anhydrides.** W. THIELE and G. TRAUTMANN (Ber., 1935, 68, [B], 2245—2247).—In connexion with the production of 2:3- $\text{C}_{10}\text{H}_6\text{Me}_2$  by dehydrogenation of vitamin-maleic anhydride adducts it is shown that 1- $\text{C}_{10}\text{H}_7\text{Me}$  is formed by the action of  $\text{Se}$  on 1:8- $\text{C}_{10}\text{H}_6(\text{CO})_2\text{O}$  at  $320\text{--}330^\circ$  in presence of cholesterol or from 1:8- $\text{C}_{10}\text{H}_6(\text{CO})_2\text{O}$  in absence of a  $\text{H}$  donor. Similarly, 2:3- $\text{C}_{10}\text{H}_6(\text{CO})_2\text{O}$  in presence of *p*-cyclohexylphenol yields 2:3- $\text{C}_{10}\text{H}_6\text{Me}_2$ . H. W.

**Synthesis of phenanthrene and hydrophenanthrene derivatives. II. Hydrocarbon synthesis.** L. F. FIESER and E. B. HERSHBERG (J. Amer. Chem. Soc., 1935, 57, 2192—2196; cf. A., 1935, 1358).—3:4-Dihydronaphthalene-1:2-dicarboxylic anhydride (I), 1:2-dihydrophenanthrene-3:4-dicarboxylic anhydride, and the 3:4-dihydro-1:2-anhydride analogue of the latter add dienes slowly but smoothly; the acids derived from the product obtained from (I) have the expected properties; decarboxylation is

difficult and leads to mixed hydrophenanthrenes from which phenanthrene and its derivatives are readily obtained. (I) and  $(\text{CH}_2\cdot\text{CMe})_2$  at  $100^\circ$  (20–25 hr.) give 2:3-dimethyl-1:4:9:10:11:12-hexahydrophenanthrene-11:12-dicarboxylic anhydride (II), *forms*, m.p.  $75\text{--}76^\circ$  (unstable) and  $95\text{--}96^\circ$ , b.p.  $175\text{--}185^\circ/1\text{ mm.}$ , respectively, hydrolysed by hot 6*N*-KOH to the corresponding acid (III), m.p.  $176\text{--}177^\circ$  with loss of  $\text{H}_2\text{O}$ , or by hot KOH-MeOH to the *H Me* ester (IV), m.p.  $157\text{--}159^\circ$  with loss of MeOH; (III) or (IV) with  $\text{CH}_2\text{N}_2$  gives the  $\text{Me}_2$  ester, m.p.  $93\cdot5\text{--}94^\circ$ , which is resistant to hydrolysis and with 50% KOH gives (III). Hydrogenation ( $\text{PtO}_2$ ) of (II) in AcOH gives 2:3-dimethyl-1:2:3:4:9:10:11:12-octahydrophenanthrene-11:12-dicarboxylic anhydride, m.p.  $117\text{--}118^\circ$ , hydrolysed to the acid (V),  $+0\cdot5\text{C}_6\text{H}_6$ , m.p.  $183\text{--}184^\circ$ . (III) or (V) with Se undergo reversal of the Diels-Alder reaction and S leads to a S-containing compound, m.p.  $73\text{--}74^\circ$ . (III) or (IV) with KOH at  $325\text{--}350^\circ$  and then at  $400\text{--}420^\circ$  gives much  $\text{H}_2$  and a mixture of (?)  $\text{H}_4$ - and  $\text{H}_8$ -hydrocarbons; the  $\text{K}_2$  salt of (III) gives CO and a similar mixture; these mixtures with Se give 2:3-dimethylphenanthrene, m.p.  $79\text{--}80^\circ$  [picrate, m.p.  $146\text{--}147^\circ$ ; styphnate, m.p.  $147\text{--}148^\circ$ ; quinone, m.p.  $237\cdot5\text{--}238\cdot5^\circ$  (quinoxaline derivative, m.p.  $208\text{--}209^\circ$ ); cf. lit.; oxidised to pyromellitic acid]. (I) and  $(\text{CH}_2\cdot\text{CH})_2$  give 1:4:9:10:11:12-hexahydrophenanthrene-11:12-dicarboxylic anhydride, m.p.  $83\cdot5\text{--}84^\circ$ , b.p.  $160\text{--}170^\circ/1\text{ mm.}$ , converted by KOH into a hexahydrophenanthrene, b.p.  $179\text{--}180^\circ/23\text{ mm.}$  (no picrate), which with Se gives 86% of phenanthrene. Similarly are obtained in dioxan 4:5-dimethyl-1:2:3:6:15:16-hexahydrochrysene-15:16-dicarboxylic anhydride, m.p.  $196\text{--}196\cdot5^\circ$ , 1:4:9:10:11:12-hexahydro-5:6-benzphenanthrene-11:12-dicarboxylic anhydride, m.p.  $161\cdot5\text{--}162^\circ$ , and 2:3-dimethyl-1:4:9:10:11:12-hexahydro-5:6-benzphenanthrene-11:12-dicarboxylic anhydride, m.p.  $128\text{--}128\cdot5^\circ$ . R. S. C.

**Derivatives of diphenyl ether. II. Monoaldehydes.** G. LOCK and F. H. KEMPTER (Monatsh., 1935, **67**, 24–35; cf. A., 1930, 767).—*p*- $\text{OPh}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  (amide, m.p.  $130^\circ$ ) with  $\text{PCl}_5$  or  $\text{SOCl}_2$  gives, after distillation, xanthone, but the crude chloride, prep. by  $\text{SOCl}_2$ , when hydrogenated, affords *o*-phenoxybenzaldehyde (I), b.p.  $172\text{--}174^\circ$  (phenylhydrazone, m.p.  $147^\circ$ ; anil, m.p.  $66\text{--}67^\circ$ ), which is also obtained from *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{O}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$  by reduction and diazotisation of the crude unstable  $\text{NH}_2$ -aldehyde; with  $\text{Ag}_2\text{O}$  (I) gives the acid and with 50% KOH at  $60^\circ$  also *o*-phenoxybenzyl alcohol, an oil. *m*-Phenoxybenzaldehyde, b.p.  $175\text{--}176^\circ/11\text{ mm.}$ , m.p.  $13\text{--}14^\circ$  (NaHSO<sub>3</sub> compound; phenylhydrazone, m.p.  $102^\circ$ ; oxime, m.p.  $45\text{--}46^\circ$ ; semicarbazone, m.p.  $217^\circ$ ; anil, m.p.  $58^\circ$ ), is obtained by  $\text{HCl}\text{--}\text{SnCl}_2\text{--}\text{Et}_2\text{O}$ -reduction of the nitrile, b.p.  $179\text{--}180^\circ/13\text{ mm.}$  (prep. from the  $\text{NO}_2$ -compound), and by hydrogenation of *m*-phenoxybenzoyl chloride, b.p.  $174\text{--}175^\circ/12\text{ mm.}$  (corresponding amide, m.p.  $127^\circ$ ), and is converted by boiling 50% aq. KOH into *m*-phenoxybenzyl alcohol, m.p.  $71^\circ$ , and *m*-phenoxy-cinnamic acid, m.p.  $115^\circ$ . *p*-Phenoxybenzaldehyde, m.p.  $24\cdot5\text{--}25^\circ$ , b.p.  $185^\circ/14\text{ mm.}$  (anil, m.p.  $48\text{--}49^\circ$ ),

is obtained by hydrogenation of the acid chloride and leads to *p*-phenoxybenzyl alcohol, m.p.  $53^\circ$ , and *p*-phenoxy-cinnamic acid, m.p.  $155^\circ$ . Temp. are corr. R. S. C.

**Pharmacology of phenanthrene derivatives.** V.—See this vol., 106.

**Action of oxidising agents on cyclobutylamine.** N. J. DEMJANOV and Z. I. SCHUJKINA (J. Gen. Chem. Russ., 1935, **5**, 1213–1225).—cyclobutylamine (I) is oxidised by  $\text{CrO}_3$ ,  $\text{CrO}_3\text{--H}_2\text{SO}_4$ ,  $\text{KMnO}_4$ , and  $\text{O}_2\text{--O}_3$  to cyclobutanone (II), by the stages: (I)  $\rightarrow$  cyclobutylhydroxylamine  $\rightarrow$  (II) ketoxime  $\rightarrow$  (II)+ $\text{NH}_2\text{OH}$ ; (II)  $\rightarrow$  succinic acid (III);  $\text{NH}_2\text{OH} \rightarrow \text{HNO}_2$ . In presence of atm.  $\text{O}_2$  and Cu, or of  $\text{O}_2$  and osmic anhydride (IV) the process consists of (I)  $\rightarrow$  (II)+ $\text{NH}_3$ ; (II)  $\rightarrow$  (III). The highest yields of (II) (25%) are obtained using (IV) (12 hr. at room temp.). R. T.

**Multiplanar cyclohexane rings.** R. D. DESAI and R. F. HUNTER (Nature, 1935, **136**, 953–954; A., 1935, 1495).—In a further examination of the Sachse-Mohr hypothesis the condensation of the cyanohydrins of the methylcyclohexanones with arylamines has been investigated. The formation of two, but never  $>$  two, isomeric cyanoarylamino-methylcyclohexanes has been observed in certain cases. L. S. T.

**Reduction of oximes.** (MLLE.) A. WOHL (Bull. Soc. chim., 1935, [v], **2**, 2135–2140).—Hydrogenation ( $\text{PtO}_2$ ) of  $\text{CHPh}\cdot\text{NOH}$  in 95% EtOH gives  $\text{NH}(\text{CH}_3\text{Ph})$ , (absorption spectrum given), but ketoximes [ $\text{CPhMe}\cdot\text{N}\cdot\text{OH}$  (I) and  $\text{CMe}_2\text{Bu}\cdot\text{CPh}\cdot\text{N}\cdot\text{OH}$  (II)] are unaffected. (I) and (II) are not reduced by  $\text{CaCl}_2\text{--Zn}$  in hot EtOH. With Al-Hg in moist  $\text{Et}_2\text{O}$  (I) gives  $\text{CHPhMe}\cdot\text{OH}$ , but (II) is unaffected owing to its isooxime structure. R. S. C.

**Chemistry and spectroscopy of oxime acetates.** (MLLE.) A. WOHL (Bull. Soc. chim., 1935, [v], **2**, 2140–2143).—The absorption spectra of oximes and their acetates are very similar. With Al-Hg  $\text{CPhMe}\cdot\text{N}\cdot\text{OAc}$  gives  $\text{CHPhMe}\cdot\text{OH}$  and  $\text{CHPhMe}\cdot\text{OAc}$ , m.p.  $75^\circ$  (lit.  $65^\circ$ ), but *Ph*  $\alpha$ -dimethylbutyl ketoxime acetate, b.p.  $172\text{--}173^\circ/17\text{ mm.}$ , is not affected owing to its isooxime structure. R. S. C.

**Reaction of ketens with Grignard reagents.** C. D. HURD, R. N. JONES, and F. H. BLUNCK (J. Amer. Chem. Soc., 1935, **57**, 2033–2036).—The ester groups of  $\text{CO}_2\text{Et}\cdot\text{C}\cdot\text{CO}$  (I) and  $\text{CO}_2\text{Et}\cdot\text{C}\cdot\text{CO}$  (II) do not react with  $\text{MgEtBr}$  or  $\text{MgPhBr}$ .  $\text{CHEt}(\text{CO}_2\text{Et})_2$  (prep. in 62% yield by EtBr or 80–88% yield by  $\text{Et}_2\text{SO}_4$ ) with  $\text{P}_2\text{O}_5$  at  $180\text{--}200^\circ$  gives 23% of (I), b.p.  $45\text{--}55^\circ/11\text{--}12\text{ mm.}$ , stable at  $-78^\circ$ , and a little  $\text{Pr}^+\text{CO}_2\text{H}$ . (I) reacts with  $\text{NH}_3\text{Ph}$ , but not with  $\beta\text{-C}_{10}\text{H}_7\cdot\text{NH}_2$  in  $\text{C}_6\text{H}_6$ . (I) and  $\text{MgPhBr}$  (1 mol.) give, after hydrolysis,  $\text{CHBzEt}\cdot\text{CO}_2\text{Et}$  (III), but with 3 mols. of  $\text{MgPhBr}$  affords also some *Ph*  $\alpha$ -benzhydrylidene-propyl ketone (IV), m.p.  $126\text{--}127^\circ$  (with  $\text{O}_3$  gives  $\text{COPh}_2$ ,  $\text{BzOH}$ , and  $\text{EtCO}_2\text{H}$ ), probably arising thus: (I)  $\rightarrow \text{CO}_2\text{Et}\cdot\text{C}\cdot\text{CPh}\cdot\text{OMgBr} + \text{MgPhBr} \rightarrow \text{CBzEt}\cdot\text{CPh}\cdot\text{OMgBr} \rightarrow (+\text{MgPhBr} + \text{H}_2\text{O})$  (IV). (II) and  $\text{MgPhBr}$  lead to (III). (I) and  $\text{MgEtBr}$  (1 mol.) give a product, hydrolysed to  $\text{COEt}\cdot\text{CHEt}\cdot\text{CO}_2\text{Et}$  (V)

and pyrolysed at 200—300° to EtBr and an unsaturated substance, b.p. 100—110°. (III) and MgEtBr give (V). R. S. C.

**Attempted resolution of oximes.** (MILLER) A. WOHL (Bull. Soc. chim., 1935, [v], 2, 2163—2168).—CPhEt·N·ONa, CH<sub>2</sub>Cl·CO<sub>2</sub>H, and NaOAc in EtOH give *propiofenoneoxime O-glycollic acid ether*, m.p. 58°, which resembles the parent oxime in absorption. CMe<sub>2</sub>Bu·CPh·N·OH (I) gives similarly *Ph α-dimethylbutyl ketoxime O-glycollic acid ether*, m.p. 70°, which, since it resembles (I) in absorption, has the *isoxime* structure, but could, nevertheless, not be resolved by alkaloids or moulds; the *brucine* salt has  $[\alpha]_D^{25} +15^\circ$ . (I) with NaOEt and CMe<sub>2</sub>Br·CO<sub>2</sub>Na in EtOH gives an ether, m.p. 135°, and in a second experiment an (?) isomeric ether, m.p. 79°. R. S. C.

**Ketones obtained by condensation of acetyl chloride with saturated hydrocarbons in presence of aluminium chloride.** C. D. NENTZESCU and G. G. VANTU (Bull. Soc. chim., 1935, [v], 2, 2209—2219).—cycloHexane (I), AlCl<sub>3</sub>, and excess of AlCl<sub>3</sub> give only 2-acetyl-1-methylcyclopentane (II), but with less AlCl<sub>3</sub> some 2-acetyl-1-methyl-Δ<sup>1</sup>-cyclopentene (III) is also formed by the following steps: (I) methylcyclopentane → 1-methyl-Δ<sup>1</sup>-cyclopentene → 1-chloro-2-acetyl-1-methylcyclopentane → HCl

+ (III) or — HCl + (II). 1-Methylcyclopentane-2-carboxyl chloride (IV) gives by the Br-azide method 2-methylcyclopentanone and a little 1-methyl-Δ<sup>1</sup>-cyclopentene-2-carboxylic acid. (II) gives (Clemmensen) a mixture of 78.7% of *trans*- and 21.3% of *cis*-1-methyl-2-ethylcyclopentane, b.p. 121°/753 mm. 1-Methyl-2-α-hydroxyethylcyclopentane is dehydrated by the xanthate method to 2-ethylidene-1-methylcyclopentane, b.p. 123—124°, but H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> or KHSO<sub>4</sub> gives a mixture thereof with a little 1:3-dimethyl-Δ<sup>1</sup>-cyclohexene. (II) and PhCHO give 2-cinnamoyl-1-methylcyclopentane, b.p. 153°/4 mm. (*dibromide*, m.p. 107°). *Et* 1-methylcyclopentane-2-carboxylate, b.p. 179—180°, and Na·EtOH give 1-methylcyclopentyl-2-carbinol, b.p. 171—172°/758 mm., and thence the *bromide*, b.p. 65°/14 mm., 1:2-dimethylcyclopentane, b.p. 93—94°, and β-1-methylcyclopentyl-2-propionic acid, b.p. 147—148°/15 mm. (*chloride*, b.p. 98°/15 mm.; *amide*, m.p. 93°). Hydrogenation of (IV) gives 1-methylcyclopentane-2-aldehyde, b.p. 148—150° (*semicarbazone*, m.p. 121.5°). Physical data are given. R. S. C.

**Benzophenones from carboxylic acids.** H. P. NEWTON and P. H. GROGGINS (Ind. Eng. Chem., 1935, 27, 1397—1399; cf. A., 1935, 214).—Boiling PhCl (3—6 mols.) with *p*-C<sub>6</sub>H<sub>4</sub>Cl·CO<sub>2</sub>H (1 mol.) and AlCl<sub>3</sub> gives 4:4'-dichlorobenzophenone (>80%) and the 2:4'-isomeride. 4-Chloro- (82%), 4-chloro-4'-methyl- (81%), and 3:4-dichloro-benzophenone (79%) are prepared similarly. *p*-C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub> with PhCl and AlCl<sub>3</sub> at 175—180° gives 3:4-dichloro-4':4''-dichlorobenzoylbenzophenone, m.p. 253° (*oxime*, m.p. 210°; *anilide*, m.p. 288°). Cu increases the yield of 4:4'-diaminobenzophenone (prepared from the Cl-compound and NH<sub>3</sub>) to a greater extent at 180° than at 200°; at the higher temp. the extent of non-catalytic amination increases greatly. KClO<sub>4</sub> sometimes exerts a beneficial effect. In the absence of

catalysts, 4'-chloro-4-aminobenzophenone is the main product. 4'-Amino-4-methylbenzophenone is prepared from the Cl-compound. J. L. D.

**Reversibility of the Friedel-Crafts condensation. Hydrogenation phenomena.** L. L. ALEXANDER, A. L. JACOBY, and R. C. FUSON (J. Amer. Chem. Soc., 1935, 57, 2208—2209).—In presence of AlCl<sub>3</sub> the reaction, C<sub>6</sub>H<sub>5</sub>X·CH·CHR (R=CO·R or Ph) + C<sub>6</sub>H<sub>6</sub> → (+2H) 2C<sub>6</sub>H<sub>5</sub>X + CH<sub>2</sub>Ph·CH<sub>2</sub>R, occurs, but the origin of the 2H is unknown. Thus Ph ββ-di-*p*-chlorophenylvinyl ketone and Ph ββ-diphenylvinyl ketone both give Ph ββ-diphenylethyl ketone, the latter perhaps by simple hydrogenation; similarly, ββ-diphenylvinyl Bu<sup>ν</sup> ketone adds H<sub>2</sub>. β-*p*-Chlorophenylcinnamic acid, m.p. 168°, with C<sub>6</sub>H<sub>6</sub> and AlCl<sub>3</sub> gives ββ-diphenylpropionic acid; *pp'*-dichlorostilbene, (CH<sub>2</sub>Ph)<sub>2</sub>; stilbene, (CH<sub>2</sub>Ph)<sub>2</sub>; *p*-bromostilbene, (CH<sub>2</sub>Ph)<sub>2</sub>. *p*-C<sub>6</sub>H<sub>4</sub>Cl·COPh gives (Reformatsky) *Et* β-hydroxy-β-phenyl-β-*p*-chlorophenylpropionate, m.p. 79—80.5°, hydrolysed to the acid, m.p. 188.5—189° (decomp.), which with Ac<sub>2</sub>O·NaOAc yields (II). R. S. C.

**Chemistry and physiology of the androsterone group.** K. TSCHERNING (Angew. Chem., 1936, 49, 11—16).—A summary.

**Oestrogenic activity of 1-keto-1:2:3:4-tetrahydrophenanthrene.** A. BUTENANDT and G. SCHRAMM (Ber., 1935, 68, [B], 2303; cf. this vol., 76).—The physiological activity of 1-keto-1:2:3:4-tetrahydrophenanthrene is confirmed (cf. Cook *et al.*, A., 1933, 323). H. W.

**Anhydrobismethone (bithon).** N. J. TOIVONEN, T. FJADER, and A. HEIKEL (Suomen Kem., 1935, 8, B, 32—33).—When boiled in aq. solution containing 0.2—0.5 mol. of NaOH and NH<sub>4</sub>Cl dimedon (I) (1:1-dimethylcyclohexane-3:5-dione) gives a condensation product, "*bithon*" (II), m.p. 155—157°, probably 4-(5'-keto-3':3'-dimethylcyclohexylidene)-1:1-dimethylcyclohexane-3:5-dione (*Ag* and *Cu* salts). (II) is also obtained by boiling a C<sub>6</sub>H<sub>6</sub> solution of (I) with K, or by heating (I) at 150—170°. Prolonged boiling of (II) in aq. solution partly reconverts it into (I). J. W. B.

**Self-condensation of acetylacetone.** A. HEIKEL (Suomen Kem., 1935, 8, B, 33—34).—When boiled with very dil. aq. NaOH, CH<sub>2</sub>Ac<sub>2</sub> affords 4-acetyl-*m*-5-xyleneol (von Auwers, A., 1915, i, 145; 1916, i, 34). A mechanism is suggested. J. W. B.

**Dimesityl diketones and their derivatives.** II. Isomerism of βε-dibromo-αζ-dimesityl-αζ-hexanedione. T. Y. KAO and Y. J. LO (J. Chinese Chem. Soc., 1935, 3, 355—357).—αζ-Dimesityl-αζ-hexanedione, m.p. 105—107° (lit. 102—103°), prepared from adipyl chloride and mesitylene, with Br affords two forms of βε-dibromo-αζ-dimesityl-αζ-hexanedione, m.p. 203—204° and 151—152°, respectively. The former is the chief product, and is also obtained when the latter is heated to 155°. H. G. M.

**Attempted preparation of vanilloylformic acid.** W. E. BARCH (J. Amer. Chem. Soc., 1935, 57, 2330).—Contrary to Mottern (A., 1934, 1354) this acid is not obtained from apocyanin (I), PhNO<sub>2</sub>, and alkali,

a result confirmed by other workers. (I) is best obtained by a low-temp. Fries isomerisation. R. S. C.

**Action of the Grignard reagent on fuchsones.** P. L. JULIAN and W. J. GIST (J. Amer. Chem. Soc., 1935, 57, 2030—2033).—1:6-Addition of  $\text{MgMeI}$  to fuchsones (I) is confirmed by methylation ( $\text{Me}_2\text{SO}_4\text{--NaOH}$ ) of the product to  $\alpha$ -diphenyl- $\alpha$ -p-anisylethane, m.p. 77°, also prepared from  $p\text{-OMe-C}_6\text{H}_4\text{-CPh}_2\text{Cl}$  and  $\text{MgMeI}$  (3 mols.). 4-Benzoyl-1-naphthyl Me ether and  $\text{MgPhBr}$  give diphenyl-4-methoxynaphthyl-1-carbinol, m.p. 162°, converted by  $\text{SOCl}_2$  (not  $\text{HCl}$  in  $\text{Et}_2\text{O}$ ) into the chloride, m.p. 151°, which at 180—200° yields naphthafuchsones (II), m.p. 83°. 1:6-Addition of  $\text{MgMeI}$  to (II) occurs, but only in small amount; the product,  $\alpha$ -diphenyl- $\alpha$ -4-methoxynaphthyl-1-ethane, b.p. 220—230° (bath)/0.1 mm., m.p. 144°, is also obtained from  $\text{OMe-C}_{10}\text{H}_6\text{-CPh}_2\text{Cl}$  and  $\text{MgMeI}$ . Anthrafuchsones (III) reacts with  $\text{MgMeI}$ , however, by 1:2-addition to give 10-benzhydrylidene-9-methyl-9:10-dihydroanthranol, m.p. 223°, oxidised by  $\text{CrO}_3$  to  $\text{COPh}$ , and anthraquinone. Little or no 1:6-addition occurs with  $\text{MgPhBr}$ , (I) and (II) giving gums, whilst (III) yields 9-phenyl-10-benzhydrylidene-9:10-dihydroanthranol (IV), converted by  $\text{HCl-Et}_2\text{O}$  into 9-chloro-9-phenyl-10-benzhydrylidene-9:10-dihydroanthracene, m.p. 220° (decomp. from 185°), reconverted into (IV) by moist  $\text{CaCO}_3$  in  $\text{COMe}_2$  and giving with  $\text{Ag}$  in  $\text{C}_6\text{H}_6$  followed by air an oily peroxide. The corresponding 9-Br-compound, m.p. 165°, differs from a Br-derivative (V), m.p. 143°, prepared from (?) 9-phenyl-10-benzhydrylanthracene (A., 1930, 903). Hydrolysis of (V) does not give (IV). R. S. C.

**Vat dyes of the benzanthrone series.** XIII. XIV. 6:6'- and 8:8'-Derivatives of isoviolanthrone. T. MAKI and Y. NAGAI (J. Soc. Chem. Ind. Japan, 1935, 38, 560—564B, 564—567B; cf. A., 1935, 1499).—XIII. 6:13-Dichlorobenzanthrone (I) when heated with  $\text{KOH-PhOH-EtOH}$  at 143° (1 hr.) yields chiefly 6:6'-dichloroisoviolanthrone (II) and a compound, insol. in alkaline  $\text{Na}_2\text{S}_2\text{O}_4$  and converted by hot conc.  $\text{H}_2\text{SO}_4$  into a vat dye (cf. B., 1934, 752); provisional structures are proposed for the two last-mentioned compounds. Some alkali- and  $\text{AcOH-sol.}$  products are also formed. (II), when heated repeatedly with  $\text{KOH-MeOH}$  at 180° (7 hr.), is converted into 6:6'-dimethoxyisoviolanthrone, whilst with  $\text{KOH-PhOH}$  at 200° it yields 6:6'-dihydroxyisoviolanthrone (di-p-nitrobenzoyl derivative). These compounds form vats with  $\text{Na}_2\text{S}_2\text{O}_4\text{-EtOH-H}_2\text{O}$  at 80°, and dye cotton various shades of blue.

XIV. 8:13-Dichlorobenzanthrone (III) with  $\text{KOH-PhOH-EtOH}$  at 143° (1 hr.) yields 8:8'-dihydroxyisoviolanthrone (di-p-nitrobenzoyl derivative; converted into Me<sub>2</sub> ether when boiled with  $\text{PhNO}_2\text{-Me}_2\text{SO}_4\text{-NaOH}$ ) and a "B-dyestuff" (cf. loc. cit.), sol. in alkaline  $\text{Na}_2\text{S}_2\text{O}_4$ , and converted by hot conc.  $\text{H}_2\text{SO}_4$  into a dark grey-violet vat dye. The Cl at position 8 is much more labile than at 6. The 8:8'-substitution has little bathochromic effect; the derivatives form vats more readily than the 6:6'-derivatives, and dye cotton violet. H. G. M.

**Grignard reagent of pinene hydrochloride.** Action of phthalic anhydride. R. BOUSSET (Bull.

Soc. chim., 1935, [v], 2, 2182—2187).—Pinene hydrochloride, m.p. 125—126°, under  $\text{H}_2$  gives a Grignard reagent, which with  $o\text{-C}_6\text{H}_4(\text{CO})_2\text{O}$  (1 mol.) yields d-2-o-carboxybenzoylcamphane, m.p. 154°, with small amounts of another acid, m.p. 337° (rapid heating; sublimes if slowly heated), d-bornylene, and dl-camphane. R. S. C.

**Simultaneous formation of two diastereoisomeric alcohols in the action of organomagnesium derivatives on active camphenyl ketones.** M. TIFFENEAU, J. LEVY, and E. DITZ (Bull. Soc. chim., 1935, [v], 2, 1855—1866; cf. A., 1931, 848).—Campholenamide with  $\text{MgEtX}$  and  $\text{MgPhX}$  yields respectively camphenyl Et ketone (I), b.p. 77°/2 mm.,  $[\alpha]_{\text{D}}^{20} + 27.5^\circ$ ,  $[\alpha]_{\text{D}}^{19} + 30.6^\circ$  (semicarbazone, m.p. 162°; oxime, b.p. 145°/14 mm.), and Ph camphenyl ketone (II), b.p. 121°/2 mm.,  $[\alpha]_{\text{D}}^{20} + 34.1^\circ$ ,  $[\alpha]_{\text{D}}^{20} + 38.6^\circ$  (semicarbazone, m.p. 167°; oxido-derivative, m.p. 64—65°,  $[\alpha]_{\text{D}}^{19} + 27.8^\circ$ ,  $[\alpha]_{\text{D}}^{19} + 31.0^\circ$ ) (cf. loc. cit.). (I) and  $\text{MgPhX}$  gives an oil which with  $\text{BzO}_2\text{H}$  yields mainly  $\alpha$ -oxidocamphenylphenylethylcarbinol, m.p. 98°,  $[\alpha]_{\text{D}}^{19} - 42.7^\circ$ ,  $[\alpha]_{\text{D}}^{19} - 51.7^\circ$ , and some of the  $\beta$ -isomeride, m.p. 133.5—134°,  $[\alpha]_{\text{D}}^{20} + 15.0^\circ$ ,  $[\alpha]_{\text{D}}^{20} + 17.5^\circ$  (cf. loc. cit.). By similar methods (II) and  $\text{MgEtX}$  give the same two products (with slightly higher  $[\alpha]$ ), the relative amounts being inverted. These results show that a  $\beta$ -asymmetric C with respect to the CO causes the double linking of the CO to react partly unsymmetrically. H. G. M.

**Camphor series.** I. D. C. SEN (J. Indian Chem. Soc., 1935, 12, 647—652).—dl- or l-Camphor,  $\text{HCl}$ , and  $\text{H}_2\text{S}$  in dry  $\text{EtOH}$  at 0° give 50% of dl-thiocamphor (I), m.p. 145°, but d-camphor gives l-thiocamphor, m.p. 146°,  $[\alpha]_{\text{D}}^{20} - 12^\circ$  in  $\text{EtOH}$ ; (I) gives nearly quantitatively camphoroxime and the semicarbazone and phenylhydrazone, and with  $\text{Zn-HCl-EtOH}$  yields thioborneol, m.p. 120° (lit. 65°), converted by I into dibornyl disulphide, m.p. 198° (lit. 178°). R. S. C.

**6-Hydroxycamphor.** K. MIYAKE and M. WATANABE (Proc. Imp. Acad. Tokyo, 1935, 11, 322—323; cf. A., 1935, 754).—4-Carboxymethyl-2:3:3-trimethylcyclopentan-1-one at 280—300° affords 6-hydroxycamphor, m.p. 194—195° [dioxime, m.p. 241—242° (decomp.); disemicarbazone, m.p. 228°], which is hydrolysed to the original acid; its semicarbazone is reduced to camphane. J. L. D.

**Synthesis of "ketonopinone."** P. C. GUHA and K. GANAPATHI (Current Sci., 1935, 4, 312—313).—Me pinonate (cf. A., 1935, 975) with Na in PhMe or NaOMe in MeOH gives ketonopinone, m.p. 104° (Cu derivative, sinters 238°), which is (A), since with  $\text{Ba(OH)}_2$  it gives pinonic acid. F. R. G.

**Sulphur compounds of terpenes.** VI. Action of gold chloride on  $\text{C}_{10}\text{H}_{18}\text{S}$  ( $\geq \text{C-S-C} \leq$  type). VII. Action of gold chloride on  $\text{C}_{10}\text{H}_{18}\text{S}$  ( $\geq \text{C-S-C} \leq$  type) at higher temperature. VIII. Action of gold chloride on thioborneol and thiocamphor. IX. Action of gold chloride on various terpene sulphur compounds. A. NAKATSUCHI (J. Soc. Chem. Ind., Japan, 1935, 38, 511—512B, 512—513B, 617B, 617—618B).—VI.  $\text{C}_{10}\text{H}_{18}\text{S}$  (I) (cf. A., 1932,

1038) and  $\text{AuCl}_3\text{-H}_2\text{O}$  at  $30^\circ$  yield  $\text{C}_{10}\text{H}_{18}\text{S}\cdot\text{AuCl}_3$  (II), which on keeping with (I) and  $\text{H}_2\text{O}$  yields  $\text{C}_{10}\text{H}_{18}\text{S}\cdot\text{AuCl}$  (III),  $\text{C}_{10}\text{H}_{18}\text{SO}$ , and  $\text{HCl}$ . In the presence of excess of (I), the reaction between (I) and (II) is pseudo-unimol. (II) in  $\text{CHCl}_3$  at  $50^\circ$  is partly reduced to Au by limonene,  $\text{PhNO}_2$ , and amyl alcohol, but not by (I).

VII. (II) when heated at  $116\text{--}120^\circ$  (sealed vessel; 30 min.) is reduced to Au, but when (I) is present, the amount of Au formed is diminished. Similarly the amount of Au obtained when (III) is heated at  $120^\circ$  (sealed; 5 hr.) with  $\text{H}_2\text{O}$  is diminished by addition of (I), but is increased at  $109\text{--}111^\circ$  if colophony, ester gum, and ethylcellulose, but not organo-sulphur compounds, are also added. (III) with excess of (I) is stable at  $100^\circ$ , but at  $120^\circ$  decomposes rapidly giving Au and  $\text{Cl}_2$ . (I) and  $\text{AuCl}_3\text{-H}_2\text{O}$ , and (I) and (II) at  $110^\circ$  yield a compound, decomp.  $166^\circ$ , which contains 71.35% Au and 8.11% S.

VIII. A white Au compound,  $\text{C}_{10}\text{H}_{17}\text{SAu}$ , obtained from thioborneol, has m.p.  $194\text{--}195^\circ$ , decomp.  $206^\circ$ . Thiocamphor gives rise to a greenish-black amorphous compound, and a compound, m.p.  $179\text{--}180^\circ$  (decomp.).

IX. Similarly the S compound from  $\Delta^3$ -*p*-menthene (cf. A., 1933, 830) and  $\text{AuCl}_3\text{-H}_2\text{O}$  yield a Au compound,  $\text{C}_{10}\text{H}_{17}\text{SAu}$ , m.p.  $92^\circ$ , decomp.  $171^\circ$ , whilst the S compound from  $\Delta^{8(9)}$ -*p*-menthene and  $\text{AuCl}_3\text{-H}_2\text{O}$  yield a Au compound, decomp.  $169.5\text{--}171^\circ$ . The Au compounds obtained from the S compounds of  $\alpha$ -phellandrene, linaloolene, and linalyl acetate decompose at  $158\text{--}163^\circ$ ,  $161^\circ$ , and  $192\text{--}193^\circ$ , respectively. Most of the above Au compounds are sol. in certain org. solvents.

H. G. M.

Diterpene, "sciadopitene," from leaf- and wood-oil of *Sciadopitys verticillata*, S. and Z. I. Properties. K. NISHIDA and H. UOTA (J. Agric. Chem. Soc. Japan, 1935, 11, 489—494).—Fractional distillation/1—2 mm. affords approx. 5% of a diterpene, *sciadopitene*,  $\text{C}_{20}\text{H}_{32}$ , m.p.  $95\text{--}96^\circ$ ,  $[\alpha]_D^{25} + 11.06^\circ$  in  $\text{CHCl}_3$  [nitrosochloride, decomp.  $127\text{--}128^\circ$ ; nitrosate,  $\text{C}_{20}\text{H}_{32}\text{O}_4\text{N}_2$ , decomp.  $126\text{--}127^\circ$ ; monohydrochloride, m.p.  $106^\circ$  (decomp.), which with  $\text{KOAc-EtOH}$  yields the isomeride, *isosciadopitene*, m.p.  $106\text{--}107^\circ$ , also prepared (m.p.  $108\text{--}109^\circ$ ) by isomerisation of the diterpene with  $\text{H}_2\text{SO}_4$ , but not  $\text{HCO}_2\text{H}$ ]. F. O. H.

Number of primary dicyclic terpene alcohols. R. BOUSSER (Bull. Soc. chim., 1935, [v], 2, 2187).—Myrtenol is not the first of these alcohols, as claimed by Dupont *et al.* (A., 1935, 624; cf. A., 1930, 1591; 1935, 219).

R. S. C.

Balata resin. I. Crystalline constituents of Surinam sheet balata resin. Y. TANAKA, T. KUWATA, and T. SUZUKI (J. Soc. Chem. Ind. Japan, 1935, 38, 504—505b).—The cryst. constituents of the resin are the acetates of three triterpene alcohols,  $\beta$ -amyrin (Bz derivative, m.p.  $229\text{--}230^\circ$ ), *isolupeol* (Bz derivative, m.p.  $269\text{--}270^\circ$ ), and *balatol* (Ac, m.p.  $100\text{--}101^\circ$ , and Bz derivative, m.p.  $121\text{--}121.5^\circ$ ).

H. G. M.

Constitution of matairesinol. L. H. BRIGGS, D. A. PEAK, and J. L. D. WOOLLOXALL (J. Proc. Roy. Soc. New South Wales, 1935, 69, 61—67).—Contrary to Easterfield (J.C.S., 1910, 97, 1028), matairesinol (I) [ $\text{B}_7$ -derivative, m.p.  $169\text{--}169.5^\circ$ ;  $\text{Ac}_2$  (lit.,  $\text{Ac}_1$ )

derivative, m.p.  $110^\circ$ ] is  $\text{C}_{20}\text{H}_{32}\text{O}_6$ , isomeric with pinoresinol (lit.,  $\text{C}_{19}\text{H}_{20}\text{O}_6$ ). With  $\text{Me}_2\text{SO}_4$  in  $\text{NaOH}$  it affords a  $\text{Me}_2$  derivative (II), m.p.  $126.5\text{--}127^\circ$ , hydrolysed ( $\text{NaOH}$ ) to *dimethylmatairesinolic acid*, m.p.  $80\text{--}84^\circ$ , which indicates the persistence of the lactone ring in the former derivative, and of two phenolic groups. (I) is not reduced by  $\text{Pd-H}_2$ , but with  $\text{KMnO}_4$  in  $\text{NaOH}$  at  $100^\circ$  affords veratric acid in  $> 50\%$  yield, which shows that two veratryl residues are present, and as no veratroylformic acid is obtained (cf. A., 1929, 1064), the aromatic nuclei must be linked through  $\text{-CH}_2\text{-}$ . The formula

[ $\text{R} = 4 : 3\text{-C}_6\text{H}_3(\text{OH})\cdot\text{OMe}$ ] is proposed on chemical and phytochemical evidence.

J. L. D.

Pigment of ebony wood. E. WEDEKIND (Ber., 1935, 68, [B], 2363—2366).—West African ebony sawdust is freed from lignin by treatment with dioxan containing 3—5% of conc.  $\text{HCl}$  at  $100^\circ$  and the residue after being washed with dioxan and  $\text{COMe}_2$  is shaken with 72%  $\text{H}_2\text{SO}_4$  or treated with superconc.  $\text{HCl}$  at  $0^\circ$  to remove cellulose. The black, amorphous residue contains small amounts of adsorbed lignin, which are removed by  $\text{PhOH}$ . The composition of the black pigment (I), which is insol. in all org. and inorg. media, corresponds closely with the formula  $\text{C}_9\text{H}_6\text{O}_3$ . Alkali hydroxides partly dissolve (I) to colloidal solutions. Fusion with  $\text{KOH}$  does not lead to recognisable products. Powerful oxidising agents, particularly  $\text{NaOCl}$ , cause decomp., but no defined product could be isolated. The possible relationship of (I) to lignin  $\text{C}_9\text{H}_{12}\text{O}_3$  (Freudenberg's min. empirical formula) is examined by dehydrogenating the lignin extracted by dioxan from ebony wood with S at  $180\text{--}200^\circ$ , whereby  $\text{H}_2\text{S}$  is only very slowly evolved, giving a black, amorphous, completely insol., non-homogeneous product containing somewhat less C and somewhat more H than (I) and also 0.92% of S. A closely similar product is obtained from beechwood (dioxan) lignin. Dehydrogenation with Se is impossible, since the requisite high temp. induces decomp. of (I). Similar treatment of the wood of *Eucalyptus marginata* gives a red-brown pigment the H content of which is  $<$  that of lignin. H. W.

Hydrolysis of pine and beech wood. K. STORCH (Ber., 1935, 68, [B], 2367—2374).—Treatment of pine wood with 64%  $\text{H}_2\text{SO}_4$  at  $15\text{--}20^\circ$  during 3—48 hr. shows the presence of 28—30% of lignin; when hydrolysis of the cellulose has proceeded so far that the solution remains clear when diluted, it is immaterial whether or not the mixture is diluted with  $\text{H}_2\text{O}$  previous to filtration. Under similar conditions red beech wood appears to contain about 12% of lignin when the mixture is directly filtered and about 24% when it is diluted (and boiled) previously to filtration. After 16 hr. the lignin retains the fibrous structure of the wood; that from pine contains C 65.0, H 5.4, OMe 14.9%, whereas that from beech has C 63.0, H 5.6, and OMe 19.2%. Pine lignin retains 84% of the OMe in wood; the filtrate contains about 5% as  $\text{MeOH}$  and the remaining 11% is present in sol. org. compounds. In the beech residue (12% of wood) only 37% of the total OMe is retained. The matter pptd. by dilution contains 39% of the

OMe whereas  $\approx 9\%$  is present as MeOH and the remaining 15% in OMe-compounds. Hilpert's view that beech lignin is a product of the action of conc. acid on the carbohydrates of wood is difficult to reconcile with the fibrous structure of insol. beech lignin. The beech lignin sol. in acid is sol. also in NaOH,  $C_5H_5N$ , and  $COMe_2 \cdot H_2O$  and retains this property after intense desiccation. Pine-wood ( $H_2SO_4$ ) lignin is not appreciably sol. in NaOH. Similar behaviour is shown by the woods. Beech wood is dissolved by 5% NaOH to the extent of 28% and 35% at room temp. and 100°, respectively, and the treatment does not cause enrichment of the residue in lignin. It is therefore probable that the sol. and insol. lignin components of beech are in some manner (possibly anatomically) separated from one another. The insol. component has the same composition when isolated after 16 or 48 hr. treatment; after complete hydrolysis, the sol. portion closely resembles it in elementary composition and OMe content. H. W.

**Sapinic acids from various species of pine and spruce.** T. HASSELSTROM and M. T. BOGERT (J. Amer. Chem. Soc., 1935, 57, 2118—2121).—These are shown by hydrogenation and isomerisation to be a mixture of *l*- (I) and *d*-pimaric acid. Since (I) belongs to the abietic class, it is renamed *l*-sapietic acid.

R. S. C.

**An acid ester contained in the root of official valerian.** E. CIONGA (Compt. rend., 1935, 201, 1152—1154).—From industrial residues, an acid (I),  $C_{10}H_{18}O_4$ , b.p. 120—122°/0.6 mm.,  $[\alpha]_D^{20} +4.83^\circ$ , has been separated, yielding on hydrolysis  $Bu^sCO_2H$  and *d*- $\alpha$ -hydroxy- $\beta$ -methylbutyric acid, b.p. 124—125°/13 mm., m.p. 66.5—67.5°,  $[\alpha]_D^{24} -1.56^\circ$  in  $H_2O$ . (I) is therefore  $Bu^sCO_2O \cdot CHPr^s \cdot CO_2H$ . W. O. K.

**Vegetable heart poisons. VII. Constitution of uzarigenin.** R. TSCHESCHE and K. BOHLE [with, in part, P. T. P. SAH] (Ber., 1935, 68, [B], 2252—2256).—Fresh analyses of anhydrouzarigenin (I) [obtained by Windaus *et al.* (A., 1930, 1024) from *Gomphocarpus* root] and its derivatives ( $\alpha$ -benzoate, m.p. 261—262°) shows it to be a monoanhydro-compound,  $C_{23}H_{32}O_3$ . This view is in harmony with the observed absence of conjugation in the  $\alpha$ - or  $\beta$ -compound or in  $\alpha$ -anhydrouzarigenone, m.p. 255° [oxime, m.p. 283—285° (decomp.); semicarbazone, dc-comp. 266—268°], and with the catalytic

absorption of  $2H_2$ . Uzarin (II) is therefore  $C_{35}H_{54}O_{14} \cdot 2H_2O$ . (I) is pptd. by digitonin and hence contains OH attached to C-3. Since (II) is converted by the successive action of KOH-MeOH and AcOH into isouzarin,  $C_{35}H_{54}O_{14} \cdot 3H_2O$ , m.p. 240° (decomp.),  $[\alpha]_D^{21} -6.7^\circ$  in MeOH, the *tert*-OH is very probably united to C-14 and uzarigenin is (III). (I) is also obtained from uzaren, the second *Gomphocarpus* glucoside. H. W.

**Manchurian kaoliang (*Andropogon sorghum*, Brot.).**—See this vol., 124.

**Carotenoids of purple bacteria.**—See this vol., 259.

**New type of plant lipochrome.**—See this vol., 259.

**Carotenoids from the anthers of *Lilium tigrinum*: antheraxanthin.**—See this vol., 259.

**Antineuritic vitamin.**—See this vol., 253.

**Oxidation-reduction during dehydration of furyl alcohols.** R. PAUL (Bull. Soc. chim., 1935, [v], 2, 2220—2227).—Partly already reviewed (A., 1935, 867). 2- $\alpha$ -Hydroxypropylfuran at 400° gives 2- $\Delta^2$ -propenylfuran, b.p. 132—133°/756 mm., and 2-propionylfuran. 2- $\alpha$ -Hydroxy-*n*-butylfuran gives 2- $\Delta^2$ -*n*-butenyl-, b.p. 59—60°/24 mm., 2-*n*-butyl-, b.p. 48—49°/24 mm., and 2-*n*-butyryl-furan, b.p. 92—94°/18 mm. (semicarbazone, m.p. 182°). 2-Alkylene-furans are stable under  $N_2$  in presence of a trace of quinol. R. S. C.

**$\delta$ -Diketones and 1:4-pyrans.** A. P. DE CARVALHO (Ann. Chim., 1935, [xi], 4, 449—522).—PhCOMe with  $CO(p-C_6H_4Br)_2$  or  $COPH_2$  in  $Et_2O$  yields  $\alpha\epsilon$ -diphenyl- $\gamma\gamma$ -di-*p*-bromophenyl-, m.p. 195—196°, or  $\alpha\gamma\gamma\epsilon$ -tetraphenyl-penta- $\alpha\epsilon$ -dione (I), m.p. 182—183° ( $\beta\delta$ - $Br_2$ -derivative, m.p. 133—134°; dioxime, m.p. 191—192°; diphenylhydrazone, m.p. 184.5—185.5°).  $\alpha\alpha\epsilon\epsilon$ -Tetrachloro- $\alpha\gamma\gamma\epsilon$ -tetraphenylpentane has m.p. 159—160°. The dione with the appropriate Grignard reagent gives  $\alpha\alpha\gamma\gamma\epsilon\epsilon$ -hexaphenylpentane-(II), m.p. 193—194°,  $\alpha\gamma\gamma\epsilon$ -tetraphenyl- $\alpha\epsilon$ -diethylpentane-, m.p. 189—190° (alcoholate, m.p. 130°), and  $\alpha\gamma\gamma\epsilon$ -tetraphenyl- $\alpha\epsilon$ -dimethylpentane- $\alpha\epsilon$ -diol, m.p. 166—167°. When heated at 200° it gives  $\alpha$ -benzoyl- $\beta\beta$ -diphenylethylene; with  $CrO_3$  it gives BzOH and  $CHPh_2 \cdot CO_2H$ , with  $P_2O_5$  in boiling xylene gives 2:4:4:6-tetraphenyl-1:4-pyran, m.p. 157—158° (3:5- $Br_2$ -derivative, m.p. 215—216°), and with  $NH_4OAc$  in AcOH yields 2:4:4:6-tetraphenyl-1:4-dihydropyridine, m.p. 235—236°. With deficiency of the above Grignard reagent there are formed 2:4:4:6-tetraphenyl-2-ethylidihydropyran, m.p. 167—168° (5- $Br$ -derivative, m.p. 112—113°), and 2:2:4:4:6:6-hexaphenyltetrahydropyran (3:5- $Br_2$ -derivative, m.p. 177—178°), also obtained by dehydration of (II). Hydrogenation ( $PtO_2$ ) of (I) gives 2:4:4:6-tetraphenyltetrahydropyran (III), m.p. 145—146°. PhCHO and (I) give 3:5-dibenzoyl-2:4:4:6-tetraphenyltetrahydropyran (IV), m.p. 178—179°. The phototropy of (I), (III), and (IV) is discussed. F. R. G.

**Dibenzfuran. [Diphenylene oxide.] VII. Derivatives of tetrahydrodibenzfuran.** H. GILMAN, E. W. SMITH, and L. C. CHENEY (J. Amer. Chem. Soc., 1935, 57, 2095—2099; cf. A., 1935, 985).—With 1:2:3:4-tetrahydrodibenzfuran (I) the Friedel-Crafts reaction, sulphonation, and nitration involve the 7- and metalation the 8-position. (I) gives the 7- $NO_2$ -derivative (II), m.p. 124—125°, giving with Br 2-nitrodibenzfuran and on reduction 7-amino-1:2:3:4-tetrahydrodibenzfuran (III) (Ac derivative, m.p. 146°). (I) with  $Ac_2O-SnCl_4$  in  $C_6H_6$  gives the 7-Ac derivative (IV), m.p. 66—67°, b.p. 210°/15 mm. [and a little dibenzfuran (V)], oxidised by NaOI to 1:2:3:4-tetrahydrodibenzfuran-7-carboxylic acid, m.p. 247—248° (Me ester, m.p. 72.5—

73.5°), giving dibenzfuran-2-carboxylic acid with Br. (I) and  $\text{ClSO}_3\text{H}$  in  $\text{CCl}_4$  at 10° yield the 7-sulphonic acid (Ba salt), the amide, m.p. 207.5—208.5°, of which with Br affords dibenzfuran-2-sulphonamide, m.p. 241—242°, which was synthesised (diazo-reaction;  $\text{Cu-SO}_2$ ) from 2-aminodibenzfuran by way of the sulphonyl chloride, m.p. 148.5°. (I) with  $\text{LiPh}$  or, less well,  $p\text{-C}_6\text{H}_4\text{MeLi}$  or  $\text{LiBu}^+$  gives a product which with  $\text{CO}_2$  affords 1:2:3:4-tetrahydrodibenzfuran-8-carboxylic acid, m.p. 197°, dehydrogenated by Br to dibenzfuran-1-carboxylic acid. The latter acid with  $\text{Na-EtOH}$  gives 1:2:3:4-tetrahydrodibenzfuran-1-carboxylic acid, m.p. 168°. The structure of 8-methoxy-1:2:3:4-tetrahydrodibenzfuran is confirmed by dehydrogenation by S at 275° to 1-methoxydibenzfuran. The "dihydrodibenzfuran" of Honigschmidt (A., 1901, i, 700) was impure (V). Hexahydrodibenzfuran (von Braun, A., 1923, i, 103) may exist, but the so-called  $\text{H}_6$ -derivatives are really (II), (III), and (IV), and it gives a picrate, m.p. 97°, whence (I) is formed by distillation in steam. Hydrogenation of (V) in presence of noble metals at moderate temp. and pressure gives only decahydrodibenzfuran, b.p. 258—259°/740 mm., 108—110°/7 mm. R. S. C.

**Amino-alcohols from dibenzfuran [diphenylene oxide].** E. MOSETTIG and R. A. ROBINSON (J. Amer. Chem. Soc., 1935, 57, 2186—2189).—2- $\beta$ -Amino- $\alpha$ -hydroxyethylidibenzfuran (I) and certain *N*-derivatives thereof have no morphine-like pharmacological action on the cat; they are more analgesic and toxic than similar phenanthrene derivatives. 2-Acetyldibenzfuran (II) and Br in dry  $\text{Et}_2\text{O}$  at 0° give 55% of 2- $\alpha$ -bromoacetyldibenzfuran, m.p. 105—106° [with  $\text{NaOCl}$  gives dibenzfuran-2-carboxylic acid (III)], which with the appropriate amine in  $\text{Et}_2\text{O}$  affords 2-dimethyl-, m.p. 82—83° (hydrochloride,  $+\text{H}_2\text{O}$ , m.p. 212—235°), -diethyl-, an oil (hydrochloride, m.p. 200—212°), -piperidino-, sinters at 97—98° (hydrochloride, m.p. 255—265°), ?-methyl- (IV) (hydrochloride, m.p. 225—250°), and -ethyl-aminoacetyldibenzfuran, unstable, m.p. 65—75° [hydrochloride, m.p. 254—256° (decomp.); 30% yield; some (III) also obtained]. (IV) (30% yield) is accompanied by some (III) and di(dibenzfuran-2-carbonylmethyl)methylamine (hydrochloride, m.p. 235—245°). Hydrogenation of 2-oximinoacetyldibenzfuran gives 64% of 2-aminoacetyldibenzfuran, decomp. from 171° [hydrochloride, m.p. 245—255° (decomp.)]. Hydrogenation of the keto-base or its hydrochloride affords - $\beta$ -dimethyl-, m.p. 88—89° (hydrochloride, m.p. 173—174°; O-benzoate, m.p. 99—100°), -diethyl-, m.p. 75—76° (hydrochloride, m.p. 157—159°), -piperidino-, m.p. 116.5—117.5° (hydrochloride, m.p. 250—251°; O-benzoate, m.p. 119°), and -ethyl-amino- $\alpha$ -hydroxyethylidibenzfuran, m.p. 99.5—101° (hydrochloride, m.p. 19—219.5°), and (I), m.p. 132° [hydrochloride, m.p. 261° (decomp.)]. (II) affords 2- $\alpha$ -hydroxyethylidibenzfuran, m.p. 63—64°. The Friedel-Crafts reaction in  $\text{PhNO}_2$  affords 2-propionylidibenzfuran, m.p. 101.5—102.5° (semicarbazone, m.p. 184—186°), oxidised to (II) by  $\text{NaOCl}$ . M.p. are corr. R. S. C.

**Constitution of calycopterin.** H. S. MAHAL and K. VENKATARAMAN (Current Sci., 1935, 4, 311—

312).—Calycopterin (cf. Ratnagiriswaran, A., 1935, 246) is shown to be 6:4'-dihydroxy-3:5:7:8-tetramethoxyflavone, since with  $\text{AlCl}_3$  it yields either 5:6:4'-trihydroxy-3:7:8-trimethoxy- or 3:5:6:4'-tetrahydroxy-7:8-dimethoxy-flavone. F. R. G.

**Saponins of the cyclopentanohydrophenanthrene group. III. Constitution of *Digitalis* saponins.** R. TSCHESCHE and A. HAGEDORN (Ber., 1935, 68, [B], 2247—2252; cf. A., 1935, 1126).—Reduction of cholestan-4-one with Na and boiling  $\text{EtOH}$  affords cholestan-4-ol, m.p. 189°,  $[\alpha]_D^{25} +3.9^\circ$  in  $\text{CHCl}_3$ , whereas hydrogenation (Adams-Shriner) yields epicholestan-4-ol, m.p. 132°,  $[\alpha]_D^{25} +29.0^\circ$  in  $\text{CHCl}_3$ . Neither substance is pptd by digitonin. It is therefore established that OH in tigogenin (I) is attached to C-3 and that its steric position is probably the same as in cholesterol. (I) has therefore

the structure shown. The acid  $\text{C}_{27}\text{H}_{42}\text{O}_5$  obtained by drastic oxidation of tigogenin acetate (*loc. cit.*) gives an *Et* ester, m.p. 134°, which contains 1 active H (Zerevitinov), does not yield an oxime or semicarbazone, and is not hydrogenated catalytically. It is formulated as in (II). H. W.

**Indigoid dyes.** S. K. GUHA (J. Indian Chem. Soc., 1935, 12, 659—664).—2-Hydroxy-4-methylthionaphthen, the appropriate aldehyde, and  $\text{HCl}$  in hot  $\text{EtOH}$  give 1-*p*-, m.p. 264°, and -*m*-nitro-, m.p. 233°, -*p*-chloro-, m.p. 178°, -*p*-methoxy-, m.p. 157°, -*p*-, m.p. 252°, and -*m*-hydroxy-, m.p. 200°, -4'-hydroxy-methoxy-, m.p. 194°, and -3':4'-dihydroxy-benzylidene-, m.p. 248°, 1-*p*-tolylidene-, m.p.

159°, 1-piperonylidene-, m.p. 231°, 1-cinnamylidene-, m.p. 184°, and 1-benzylidene-2-keto-1:2-dihydrothionaphthen, m.p. 147°, and the compound (I), m.p. >300°. Aceanthracenequinone affords the compound (II), m.p. >310°. R. S. C.

**Chemical investigation of the liana "Efiri."** IV.—See this vol., 259.

**Syntheses of 1:2-dimethyl- and 2-methylpyrrolidine-5-carboxylic acid.** K. WINTERFELD and H. E. RONSBERG (Arch. Pharm., 1936, 274, 40—47).— $\delta$ -Hexolactone (prep. from  $\text{CH}_2\text{I-CH}_2\text{-CO}_2\text{H}$ ) and  $\text{HBr}$  at 100° give  $\delta$ -bromohexic acid, which leads, by way of the chloride, to *Et*  $\alpha$ -dibromohexoate, b.p. 136°/11 mm. With 25%  $\text{NH}_3\text{-MeOH}$  at 110—

120° this gives 2-methylpyrrolidine-5-carboxylamide, m.p. 193°, hydrolysed by conc. HCl at 100° to the corresponding acid, m.p. 207° (Cu salt, +2H<sub>2</sub>O, m.p. 228°; reineckate, decomp. 159°; Et ester platnichloride, m.p. 130°; with PhNCO gives the anhydride, m.p. 130°, of the 1-NPh-CO-derivative). NH<sub>2</sub>Me affords similarly 1:2-dimethylpyrrolidine-5-carboxylic acid, m.p. about 123—125° (Cu salt, +2H<sub>2</sub>O; reineckate, decomp. 156°). Neither acid is identical with the product from dehydrosparteine methoacetate.

**Alkali bromo-salts and bromo-pyridine derivatives of rhodium.**—See this vol., 175.

**3-Aminopyridine. II. Methyl derivatives, and acetamido- and formamido-pyridine.** E. PEŁAZEK, A. MARCINKÓW, and C. STAMMER (Rocz. Chem., 1935, 15, 365—377).—3-Methylaminopyridine (I), b.p. 118—120°/12 mm. (picrate, m.p. 178°), yields with Ac<sub>2</sub>O the N-Ac derivative, b.p. 145°/11 mm., m.p. 64° (picrate, m.p. 150°; nitrate, m.p. 96°). (I) and excess of Br in AcOH afford 2:6-dibromo-3-methylaminopyridine, m.p. 69°. 3-Methylnitrosoaminopyridine, b.p. 135°/10 mm. (picrate, m.p. 136°), from (I) and HNO<sub>2</sub> at 0°, affords 3-pyridyl-methylhydrazine (II), b.p. 141°/11 mm. (picrate, m.p. 176°; compound with PhCHO, m.p. 96—97°), on reduction with Zn in AcOH. (I) in conc. H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub> at 0° yield 3-methylnitroaminopyridine, b.p. 124—125°/1.2 mm., m.p. 54—55° (picrate, m.p. 141°), reduced to (II) by Zn in AcOH, and converted by conc. H<sub>2</sub>SO<sub>4</sub> at 0—5° into 2-nitro-3-methylaminopyridine (III), m.p. 110°, together with 6-nitro-3-methylaminopyridine, m.p. 188°. 2-Amino-3-methylaminopyridine, m.p. 124° (picrate, m.p. 234°), is prepared by reduction of (III) with SnCl<sub>2</sub>, or from (I) and NaNH<sub>2</sub> in cymene (205—210°; 4—5 hr.), and 6-amino-3-methylaminopyridine, m.p. 70° (picrate, m.p. 228°), is obtained from 3-bromo-6-aminopyridine and NH<sub>2</sub>Me (110—115°; 20 hr.). Br and 3-dimethylaminopyridine in MeOH give a mixture of 2:6(?) dibromo-, b.p. 113—115°/0.5 mm., and (?) bromo-3-dimethylaminopyridine, m.p. 64—66° (picrate, m.p. 192—194°), whilst with HNO<sub>3</sub> in Ac<sub>2</sub>O trinitro-3-dimethylaminopyridine, m.p. 125—127°, is obtained. 3-Acetamidopyridine yields a nitrate, m.p. 165°, with HNO<sub>3</sub> in MeOH, and a Br<sub>2</sub> additive compound, m.p. 118°, with Br in AcOH, converted by conc. H<sub>2</sub>SO<sub>4</sub> into 2:4:6-tribromo-3-aminopyridine. 3-Aminopyridine and HCO<sub>2</sub>H at the b.p. (4 hr.) yield 3-formamido-pyridine, b.p. 200°/25 mm., m.p. 96° (nitrate, m.p. 158°; Br<sub>2</sub> additive compound, m.p. 92°). R. T.

**Pyridine series. II.** U. BASU and B. BANERJEE (J. Indian Chem. Soc., 1935, 12, 665—671).—The syntheses previously described (A., 1935, 1250) are generalised. NH<sub>2</sub>·CMe·CH·COMe with COPh·CH·CH·OH (I), p-C<sub>6</sub>H<sub>4</sub>·Me·CO·CH·CH·OH, or COEt·CMe·CH·OH in Et<sub>2</sub>O gives 3-acetyl-6-phenyl-, m.p. 90° (hydrochloride, m.p. 143—144°; picrate, m.p. 166°; semicarbazone, m.p. 212°; oxime, m.p. 106°), and p-tolyl-2-methylpyridine, m.p. 78° (hydrochloride, m.p. 150—151°; picrate, m.p. 163—164°; semicarbazone, m.p. 207°; oxime, m.p. 127°), and 3-acetyl-2:5-dimethyl-6-ethylpyridine, m.p. 60° (picrate, m.p. 118°; semicarbazone, m.p. 201°; oxime, m.p.

128°), respectively. NH<sub>2</sub>·CMe·CH·COPh affords similarly in EtOH or Et<sub>2</sub>O-EtOH 3-benzoyl-6-phenyl-, m.p. 77° (picrate, m.p. 196°; no semicarbazone), and p-tolyl-2-methylpyridine, m.p. 84°. NH<sub>2</sub>·CMe·CH·CO<sub>2</sub>Et with (I) in Et<sub>2</sub>O gives Et 2:5-dimethyl-6-ethylpyridine-3-carboxylate, b.p. 145°/10 mm. (picrate, m.p. 120°), hydrolysed by KOH to the corresponding acid, m.p. 193—194° (decomp.), which, when heated/vac. with soda-lime, affords 2:5-dimethyl-6-ethylpyridine, b.p. 181—182°/756 mm. (picrate, m.p. 127°). 6-Phenyl-, b.p. 285—287° (picrate, m.p. 180°), and 6-p-tolyl-2:5-dimethylpyridine, b.p. 291—292° (picrate, m.p. 146°), and 2:5:6-trimethylpyridine, b.p. 176—178°, are similarly obtained. R. S. C.

**Indole series. VI. Synthesis of [1:3-dimethylketo]tryptophan.** 3-Alkylation of oxindoles. P. L. JULIAN, J. PIKL, and F. E. WANTZ (J. Amer. Chem. Soc., 1935, 57, 2026—2029; cf. A., 1935, 765).—1:3-Dimethyloxindole, NaOEt, and CH<sub>2</sub>Br·CH(OEt)<sub>2</sub> in hot EtOH give a good yield of 1:3-dimethyl-3-β-dimethoxyethyloxindole, b.p. 182.5—183.5°/11 mm., hydrolysed by cold 5% HCl to 1:3-dimethyloxindolyl-3-acetaldehyde, b.p. 177—178°/12 mm., which by the Strecker synthesis affords the cyanohydrin, m.p. 142°, and β-1:3-dimethyloxindolyl-3-alanine (1:3-dimethylketotryptophan), m.p. 188° (decomp.), which above the m.p. in vac. loses CO<sub>2</sub> to give the base. Oxindole (2 active H) and 1-methyloxindole, however, with bromoacetals give only tars. CH<sub>2</sub>Cl·COCl and p-OEt·C<sub>6</sub>H<sub>4</sub>·NHMe yield 5-ethoxy-, m.p. 92°, and 1-hydroxy-5-methyl-oxindole. Oxindoles condense with esters in presence of NaOEt-EtOH. Thus are obtained 3-formyl-, -acetyl-, m.p. 109°, -carbethoxy-, m.p. 67°, and -dimethylaminoacetyl-1-methyloxindole, m.p. 219°, 3-acetyl-1:3-dimethyl- (I), m.p. 79°, and 3-dimethylaminoacetyl-5-ethoxy-1-methyl-oxindole, m.p. 196°, and 3-formyl-2-methoxy-1-methylindole; CH<sub>2</sub>(CO<sub>2</sub>Et)<sub>2</sub> gives also the bi-, m.p. 67°, and ter-mol., m.p. 225°, condensation products. Hydrogenation (PtO<sub>2</sub>; 1.5 atm.) of the acyl derivatives in EtOH at room temp. or, in some cases, AcOH at 50° gives the alkyl derivatives, viz.: 1:3-dimethyl-, 1-methyl-3-ethyl-, m.p. 169° (Br<sub>2</sub>-derivative), and 3-β-dimethylaminoethyloxindole, b.p. 185°/16 mm. (picrate, m.p. 168°), 5-ethoxy-1-methyl-3-β-dimethylaminoethyloxindole, b.p. 221°/17 mm. (picrate, m.p. 157°), β-1-methyloxindolyl-3-propionic acid, b.p. 160°/1 mm., and 2-methoxy-1-methylindolyl-3-carbinol, m.p. 62° (readily hydrolysed to 1-methyloxindolyl-3-carbinol). (I), which has no enolisable H, resists hydrogenation. R. S. C.

**Synthesis of derivatives of indole which contain sulphur.** H. WUYTS and (Mlle.) A. LACOURT (Bull. Soc. chim. Belg., 1935, 44, 587—592).—The S-Me derivative of β-phenylthioacet-α-phenyl-α-methylhydrazide (cf. A., 1933, 498) with warm MeOH-10% HCl (gas) gives 2-methylthiol-3-phenyl-N-methylindole, m.p. 96°, which loses 1 Me with HI at 120° and another at a high temp. The S-Me derivative of β-o-thiotolu-α-o-tolylhydrazine gives no indole because the hydrazine is substituted solely by aromatic groups. The S-Me derivative, m.p. 59°, of β-m-tolylthioacet-α-phenyl-α-methylhydrazide, m.p. 91°, with

MeOH-10% HCl affords 2-methylthiol-3-m-tolyl-N-methylindole, an oil (picrate, m.p. 84°), from which 2 Me are removed by energetic demethylation.  $\beta$ -Phenylthioacet- $\alpha$ -phenyl- $\alpha$ -methylhydrazide, m.p. 82°, affords 2-thion-3-phenyl-N-methyl-2:3-dihydroindole, m.p. 57° (picrate, m.p. 141°), insol. in alkali.  $\beta$ -Phenylthioacet- $\alpha$ -phenylhydrazide affords no indole, but is hydrolysed. J. L. D.

**Action of sodium methoxide on ethyl isatin-N-acetate.** N. I. PUTCHIN (J. Gen. Chem. Russ., 1935, 5, 1176—1184).—Et isatin-N-acetate and NaOMe in MeOH (75—80°; 2—3 hr.) give first the compound,  $\text{CO}_2\text{Et}\cdot\text{CH}_2\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{C}(\text{ONa})(\text{OMe})_2$ , decomp. 230°, and then either (8 hr.; 75—80°) 3:4-diketol-1:2:3:4-tetrahydroquinoline-2-carboxylic acid (I) (Na, Ag<sub>1</sub>, and Ag<sub>2</sub> salts; Et<sub>2</sub> derivative, m.p. 119—120°) or (80—100°) o-glycinobenzoylformic acid,  $\text{CO}_2\text{H}\cdot\text{CO}\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ . (I) is reduced (HI) to 1:2:3:4-tetrahydroquinoline-2-carboxylic acid. R. T.

**Reactions of mixed aromatic ketones with disubstituted thiocarbamides containing different aryl radicals.** K. DZIEWOŃSKI, L. GIZLER, and J. MOSZEW (Rocz. Chem., 1935, 15, 400—407).—Diarylthiocarbamides and substituted ketones yield quinoline derivatives when fused together; the reaction consists of three stages, viz., conversion of diarylthiocarbamide into amine and thiocarbimide, condensation of the former with the ketone to yield an anil, and condensation of the anil with the latter to yield a substituted quinoline. COPhMe (I) and *as*-phenyl-*p*-tolylthiocarbamide (5 hr. at 180—210°, then 30 min. at 270°), or acetophenone-*p*-tolil and PhNCS (2 hr. at 210—220°, then 30 min. at 270°) afford 4-anilino-2-phenyl-6-methylquinoline, m.p. 161° (hydrochloride, m.p. 171°; picrate, m.p. 210°; 4-N-NO-, m.p. 137—138°; 4-N-Ac-, m.p. 142°; 4-N-MeI-, m.p. 235°; 4-N-Me derivative, m.p. 167°), converted into 4-hydroxy-2-phenyl-6-methylquinoline by EtOH-KOH (200°; 4 hr.). *as*-Phenyl- $\beta$ -naphthylthiocarbamide (II) and (I) (4 hr. at 180°, then 30 min. at 280°) give 4- $\beta$ -naphthylamino-2-phenyl-5:6-benzoquinoline, m.p. 202—203° [hydrochloride, m.p. 286—287°; picrate, m.p. 260—261°; methiodide, m.p. 293—294°; 4-N-NO-, m.p. 250—251° (decomp.)]; 4-N-Ac derivative, m.p. 172—173°], yielding 4-hydroxy-2-phenyl-5:6-benzoquinoline with EtOH-KOH (200°; 4 hr.). (II) and *p*-tolyl Me ketone (5 hr. at 180—260°, then 30 min. at 290°) yield 4- $\beta$ -naphthylamino-2-*p*-tolyl-5:6-benzoquinoline, m.p. 226° [hydrochloride, m.p. 195°; picrate, m.p. 297° (decomp.)]; 4-N-NO-derivative, m.p. 195° (decomp.)], giving 4-hydroxy-2-*p*-tolyl-5:6-benzoquinoline, m.p. 314—315°, with EtOH-KOH (200°; 4 hr.). R. T.

**Fries-Rosenmund rearrangement of N-acetylcarbazole.** E. MEITZNER (J. Amer. Chem. Soc., 1935, 57, 2327—2328).—N-Acetylcarbazole with  $\text{AlCl}_3$  in  $\text{PhNO}_2$  gives 50—60% of 3- and some 1-acetylcarbazole, m.p. 136° (oxime, m.p. 179—180°; with molten KOH gives the 1-carboxylic acid), also obtained with tars from carbazole,  $\text{AcCl}$ , and  $\text{AlCl}_3$  in  $\text{PhNO}_2$ .  $\text{AlCl}_3$  alone is unsatisfactory. R. S. C.

**Some amino-alcohol esters of acridine-5-carboxylic acid.** B. SAMDAHL and C. F. WEIDER

(Bull. Soc. chim., 1935, [v], 2, 2008—2016).—The following esters of acridine-5-carboxylic acid (I) were prepared by heating the hydrochloride, m.p. 215—216° (decomp.), of the acid chloride of (I) with the appropriate alcohol in  $\text{C}_6\text{H}_6$ . They are feebly anaesthetic, but not antiseptic.  $\beta$ -Aminoethyl, m.p. 238—240° (decomp.) [monohydrochloride, m.p. 238—240° (decomp.)];  $\beta$ -dimethylaminoethyl [mono-, m.p. 189—190° (decomp.), and di-hydrochloride, m.p. 172—173° (decomp.)];  $\beta$ -diethylaminoethyl [mono-, m.p. 179—180° (decomp.), and di-hydrochloride, m.p. 179—180° (decomp.)];  $\beta$ -dipropylaminoethyl [mono-, m.p. 177—178° (decomp.), and di-hydrochloride, m.p. 177—178° (decomp.)];  $\beta$ -diisobutylaminoethyl [mono-, m.p. 178—180° (decomp.), and di-hydrochloride, m.p. 168—169° (decomp.)];  $\beta$ -diisooamylaminoethyl [mono-, m.p. 130—146°, and di-hydrochloride, m.p. 167—168° (decomp.)]. The following appear to be new:  $\beta$ -dipropyl-, b.p. 90—92°/22 mm.,  $\beta$ -diisobutyl-, b.p. 96—98°/15 mm., and  $\beta$ -diisooamyl-aminoethyl alcohol, b.p. 126—128°/15 mm. H. G. M.

**Optical crystallographic study of some derivatives of barbital and luminal.** M. E. HULTQUIST and C. F. POE (Ind. Eng. Chem. [Anal.], 1935, 7, 398—399).—The following derivatives of veronal are described: o-, m.p. 140°, m-, m.p. 91°,  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{CH}_2\cdot$ , m.p. 146°, o-, m.p. 127°, m-, m.p. 102°,  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{CH}_2\cdot$ , m.p. 142°,  $p\text{-C}_6\text{H}_4\text{I}\cdot\text{CH}_2\cdot$ , m.p. 122°, m-, m.p. 159°,  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot$ , m.p. 192°,  $\text{PhCO}\cdot\text{CH}_2\cdot$ , m.p. 191°,  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{CO}\cdot\text{CH}_2\cdot$ , m.p. 191.5°. The following derivatives of 5-phenyl-5-ethylbarbituric acid are described: o-, m.p. 116°, m-, m.p. 130°,  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{CH}_2\cdot$ , m.p. 117°, m-, m.p. 111°,  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{CH}_2\cdot$ , two forms, m.p. 111° and 113°,  $p\text{-C}_6\text{H}_4\text{I}\cdot\text{CH}_2\cdot$ , m.p. 127—128°, m-, m.p. 149.5°,  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot$ , m.p. 182.5°,  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{CO}\cdot\text{CH}_2\cdot$ , m.p. 164°.  $n_D$ ,  $n_A$ ,  $n_F$ , crystallographic data, and block m.p. are recorded. F. R. G.

**4(5)-Amino-5(4)-methylglyoxaline.** R. WEIDENHAGEN and R. HERRMANN (Ber., 1935, 68, [B], 2205—2209).—Reduction of 4(5)-nitro-5(4)-methylglyoxaline by cold  $\text{SnCl}_2$  and conc. HCl and evaporation of the Sn-free solution in vac. causes little fission of the glyoxaline ring and yields 4(5)-amino-5(4)-methylglyoxaline dihydrochloride (I), m.p. 186° (decomp.), in 67% yield. (I) is transformed by NaOAc and PhCHO into 4(5)-benzylideneamino-5(4)-methylglyoxaline, m.p. 216°, by NaOAc, EtOH, and  $\text{Ac}_2\text{O}$  into 4(5)-acetamido-5(4)-methylglyoxaline, m.p. 216°, by  $\text{BzCl}$  (1 and 2 mols., respectively) in  $\text{C}_6\text{H}_5\text{N}$  into 4(5)-benzamido-, m.p. 262°, and 4(5)-benzamido-1-benzoyl-, m.p. 170°, -5(4)-methylglyoxaline, and by KOAc and PhNCO in  $\text{H}_2\text{O}$  into phenyl-5(4)-methylglyoxalinylicarbamide, m.p. 283°. H. W.

**Glyoxalinecarboxylic esters.** W. JOHN (Ber., 1935, 68, [B], 2283—2291).—Contrary to Oddo et al. (A., 1928, 1381) the product of the action of Mg glyoxalyl bromide (I) on  $\text{ClCO}_2\text{Et}$  is Et glyoxaline-1-carboxylate (II), b.p. 100°/16 mm. (picrate, m.p. 124°), the constitution of which follows from its ready conversion by dil. acid into glyoxaline. Similarly Mg 5-methylglyoxalyl bromide and  $\text{ClCO}_2\text{Et}$  afford Et 5-methylglyoxaline-1-carboxylate (III), b.p.

118—119°/21 mm. (*picrate*, m.p. 148—149°; *nitrate*, m.p. 116—117°), readily hydrolysed to 5-methylglyoxaline. The discrepancy in the m.p. of the *picrates* obtained by Oddo and the author respectively suggests the possibility of an isomerisation of (I) or (II) during the experiments. (I) appears unchanged when heated at 200° and yields the same product with  $\text{ClCO}_2\text{Et}$  as under normal conditions. (II) is very rapidly transformed at 250—260° into 1-ethylglyoxaline, b.p. 110°/16 mm. (*picrate*, m.p. 170°), identical with the product derived from glyoxaline and  $\text{EtBr}$ . Similarly, but less smoothly, (III) is converted into 5-methyl-1-ethylglyoxaline (*picrate*, m.p. 140°) mixed with 5-methylglyoxaline. Gradual addition of  $\text{NH}_3$  to  $\text{AcCHO}$  and  $\text{CHPh}\cdot\text{CH}\cdot\text{CHO}$  in  $\text{EtOH}$  leads to 2-styryl-5-methylglyoxaline (V), m.p. 235° [*nitrate*, m.p. 168° (decomp.); *picrate*, m.p. 248° (decomp.)], and small amounts of 2-phenyl-5-methylglyoxaline. Oxidation of (V) by  $\text{KMnO}_4$  in  $\text{COMe}_2$  affords 5-methylglyoxaline-2-carboxylic acid, m.p. 175° (decomp.) (*Et* ester and its *nitrate*, m.p. 124°), decarboxylated when heated above its m.p. to 5-methylglyoxaline (*picrate*, m.p. 159—160°). Oxidation of (V) with  $\text{CrO}_3$  gives  $\text{CHPh}\cdot\text{CH}\cdot\text{CO}\cdot\text{NH}_2$ . H. W.

**Organic cupric tetrachlorides and tetrabromides.** J. AMIEL (Compt. rend., 1935, 201, 964—966; cf. A., 1935, 312).—The previous method was applied in preparing the compounds  $[\text{CuCl}_4](\text{NH}_3\text{Ph})_2$ ;  $[\text{CuCl}_4](\text{NH}_3\text{C}_6\text{H}_5)_2$ ;  $[\text{CuCl}_4](\text{C}_6\text{H}_5\text{NH})_2$ ;  $[\text{CuCl}_4](\text{NH}_2\text{C}_5\text{H}_9)_2$ ;  $[\text{CuCl}_4][(\text{NH}_2)_2\text{C}_4\text{H}_8]$ ;  $[\text{CuBr}_4](\text{C}_6\text{H}_7\text{NH})_2$ ;  $[\text{CuBr}_4](\text{C}_6\text{H}_5\text{NH})_2$ ;  $[\text{CuBr}_4](\text{NH}_2\text{C}_5\text{H}_9)_2$ ;  $[\text{CuBr}_4][(\text{NH}_2)_2\text{C}_4\text{H}_8]$ ;  $[\text{CuBr}_4](\text{C}_9\text{H}_7\text{NH})_2$ . The Cl and Br compounds were yellow and black, respectively. The piperazine (I) compounds formed dihydrates. With a large excess of halide of (I), or of Cu halide, respectively, the compounds  $\text{CuX}_2\cdot 2\text{X}\cdot[(\text{NH}_2)_2\text{C}_4\text{H}_8]\cdot 4\text{H}_2\text{O}$  and  $[\text{CuX}_3]_2[(\text{NH}_2)_2\text{C}_4\text{H}_8]$  were formed ( $\text{X}=\text{Cl}$  or  $\text{Br}$ ). H. J. E.

**Organic sulphur compounds. III. Action of hydrogen cyanide, ammonia, and hydrogen sulphide on  $\alpha\beta$ -unsaturated ketones.** K. ABE (Sci. Rep. Tokyo Bunrika Daigaku, 1935, 3, 17—27).—Treatment of mesityl oxide with  $\text{EtOH}\cdot\text{HCN}$  (from  $\text{KCN}$  and  $\text{AcOH}$ ) followed by  $\text{NH}_3$  and  $\text{H}_2\text{S}$  affords  $\alpha$ -amino- $\alpha$ -methylpyrrolerebic thionamide, m.p. 220°; similarly, benzylideneacetone (I) affords a mixture of  $\alpha$ -amino- $\beta$ -benzylidene- $\alpha$ -methylpropionic thionamide, m.p. 165—166°, and 2:5-dithioketo-3:6-distyryl-3:6-dimethylpiperazine, m.p. 172—173°. Under the same conditions furfurylideneacetone (II) gives  $\alpha$ -amino- $\beta$ -furfurylidene- $\alpha$ -methylpropionic thionamide, m.p. 190—191°. (I) with the same reagents but using  $\text{NaCN}+\text{NH}_4\text{Cl}$  as source of  $\text{HCN}$  affords duplo-benzylidenedithioacetaminine. Phenylacetonitrile was not obtained from (I) and  $\text{HCN}$ , and (II), under the same conditions, gave a substance, sinters at 210°, m.p. > 210°. P. G. C.

**Pyrimidines. CXLVIII. Action of chlorine on mercaptopyrimidines.** J. M. SPRAGUE and T. B. JOHNSON (J. Amer. Chem. Soc., 1935, 57, 2252—2255).—Four known 4-chloro-2-ethylthiopyrimidines are prepared from the corresponding 4-CO-compounds by  $\text{POCl}_3$ . The 4-Cl-

compounds and  $\text{NaOEt}\cdot\text{EtOH}$  at room temp. give 2-ethylthiol-4-ethoxy-, b.p. 123—124°/11 mm., and 4-ethoxy-5-methyl-, b.p. 135—136°/12 mm., and 5-bromo-2-ethylthiol-4-ethoxy-pyrimidine, b.p. 140°/6 mm. 4-Chloro-2-ethylthiol-5-carbethoxypyrimidine is unstable to  $\text{NaOEt}$  in  $\text{EtOH}$ , but in hot  $\text{C}_6\text{H}_6$  gives the 4-OEt-compound (I), b.p. 175°/18 mm. 2:4-Diethylthiol- (II), b.p. 135—137°/6 mm., and 2:4-diethylthiol-5-methyl-pyrimidine (III), b.p. 158—161°/11 mm., are obtained from the 2:4- $\text{Cl}_2$ -compounds and  $\text{NaEtS}$  in  $\text{PhMe}$ . 2-Ethylthiopyrimidines with  $\text{Cl}_2$  in  $\text{H}_2\text{O}$  at < 20° give 2-EtSO<sub>2</sub>-derivatives. Thus are obtained (a) 2-ethylsulphonyl-4-ethoxy-, b.p. 183—185°/4 mm., and 4-ethoxy-5-methyl-, m.p. 67—68°, (b) 4-chloro-2-ethylsulphonyl-5-methyl-, m.p. 67·5—68°, and 5-carbethoxy- (IV), m.p. 72·5—73·5°, (c) 4-chloro-, m.p. 57—58°, and 4-chloro-5-bromo-2-ethylsulphonyl-, m.p. 81—82°, (d) 5-bromo-2-ethylsulphonyl-4-ethoxy-, m.p. 89·5—90·5°, 4-amino-2-ethylsulphonyl-5-carbethoxy- (prepared in  $\text{HCl}$  at 0°), m.p. 143·5—144·5°, and 2:4-diethylsulphonyl-pyrimidine, m.p. 87—88°. At < 5° (I) gives 60% of (IV) and 15—20% of 2:4-dichloro-5-carbethoxypyrimidine (V), m.p. 36—37°, but at 30—40° 7% of (IV), 69—75% of (V), and 47—75% of  $\text{EtSO}_2\text{Cl}$ ; (V) is probably formed by way of the 2-sulphoxide. (II) and (III) give amorphous products. The structure of the  $\text{EtSO}_2$ -compounds is proved by hydrolysis by 20%  $\text{HCl}$  to the diketopyrimidines,  $\text{SO}_2$ , and a little  $\text{EtSO}_3\text{H}$  (probably formed from  $\text{EtSO}_2\text{H}$  produced as a primary product of hydrolysis). R. S. C.

**Complex dipyridyl salts of nickel and copper.**—See this vol., 175.

**3:3'-Dipyridyl derivatives.** W. BRYDOWNA and W. WISZNIIEWSKI (Rocz. Chem., 1935, 15, 378—382).—The Ag salt of 3:3'-dipyridyl-2:2'-dicarboxylic acid (I) and  $\text{EtI}$  or  $\text{MeI}$  in  $\text{C}_6\text{H}_6$  (at the b.p.; 2·5 hr.) yield the *EtI*, m.p. 82—84°, and *MeI*, m.p. 153—153·5°, esters of (I), which with  $\text{EtOH}\cdot\text{NH}_3$  (8 hr.; 135—145°) afford the diamide, m.p. 268·5—270° (decomp.) of (I), converted by the Hofmann reaction into 2:2'-diamino-3:3'-dipyridyl, m.p. 181—182·5°, together with some 2-amino-3:3'-dipyridyl-2'-carboxylic acid lactam, m.p. 366—368° (decomp.). The chloride, m.p. 147—150°, of (I) is prepared from (I) and  $\text{SO}_2\text{Cl}_2$ . R. T.

**Reactions between indoles and Schiff's bases.** M. PASSERINI and F. ALBANI (Gazzetta, 1935, 65, 933—938).—The product from indole and  $\text{NPh}\cdot\text{CHPh}$  (A., 1933, 615) is converted by boiling 20%  $\text{HCl}$  into a substance (I),  $\text{C}_{30}\text{H}_{22}\text{N}_2$ , m.p. > 350°, regarded as  $\text{C}_6\text{H}_4\cdot\text{C}\cdot\text{CHPh}\cdot\text{C}\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{C}\cdot\text{CHPh}\cdot\text{C}\cdot\text{NH}$ . Indole and  $\text{NPh}\cdot\text{CH}\cdot\text{C}_6\text{H}_4\cdot\text{OMe}$  yield anisylidi-indolylmethane, m.p. 180°, converted by boiling  $\text{HCl}$  into a substance,  $\text{C}_{32}\text{H}_{26}\text{O}_2\text{N}_2$ , m.p. > 350°, similar to (I). Phenylidi- $\alpha$ -methylindolylmethane is unchanged by  $\text{HCl}$ . E. W. W.

**Pyrrolidine derivatives. II. Ring enlargement from the indolizidine to the norlupinane series.** E. OCHIAI, K. TSUDA, and J. YOKOYAMA (Ber., 1935, 68, [B], 2291—2298; cf. A., 1934, 901).—Pyrrole is converted by the successive action of  $\text{K}$  and  $\text{Bu}^n\text{Br}$  in boiling  $\text{C}_6\text{H}_6$  into 1-n-butylpyrrole,

catalytically hydrogenated ( $\text{PtO}_2$  in  $\text{AcOH}$ ) to 1-n-butylpyrrolidine, b.p.  $88^\circ/63$  mm. (picrate, m.p.  $124.5^\circ$ ; methiodide, m.p.  $183^\circ$ ; platinichloride, m.p.  $122.5^\circ$ ). The corresponding bromocyanide, b.p.  $120^\circ/0.01$  mm., is converted by  $\text{KCN}$  in boiling  $\text{EtOH-H}_2\text{O}$  into  $\omega$ -cyanobutylbutylamine cyanide (I)  $\text{CN}[\text{CH}_2]_4\text{N}^+\text{Bu}^+\text{CN}$ , b.p.  $167^\circ/1$  mm., and  $\omega$ -butylamino-n-valeronitrile (II), b.p.  $125^\circ/9$  mm. (hydrochloride, m.p.  $211^\circ$ ). (I) or (II) with conc.  $\text{HCl}$  at  $150^\circ$  gives  $\omega$ -butylamino-n-valeric acid hydrochloride, m.p.  $124.5^\circ$ ; the corresponding acid, m.p.  $112.5^\circ$ , when heated at  $150^\circ$  gives 1-n-butylpiperid-2-one (III), b.p.  $120^\circ/5$  mm. (platinichloride, m.p.  $150-151^\circ$ ), also obtained by oxidising butylpyridinium bromide with  $\text{K}_3\text{Fe}(\text{CN})_6$  in alkaline solution and catalytic reduction ( $\text{PtO}_2$ ) of the pyridone.

2-Methylindolizidine bromocyanide (*loc. cit.*) is converted by  $\text{KCN}$  into 2- $\gamma$ -cyano- $\beta$ -methylpropylpiperidine cyanide, b.p.  $159^\circ/0.003$  mm., hydrolysed by conc.  $\text{HCl}$  to  $\gamma$ -2-piperidyl- $\beta$ -methylbutyric acid hydrochloride, m.p.  $145^\circ$ , converted by successive treatment with  $\text{Ag}_2\text{CO}_3$  and heating at  $150^\circ$  into 3-methyl- $\alpha$ -norlupinone (IV), b.p.  $107^\circ/2$  mm. (platinichloride, decomp.  $175^\circ$ ). Similarly, indolizidine is transformed successively into 2- $\gamma$ -cyanopropylpiperidine cyanide, b.p.  $175^\circ/0.12$  mm.,  $\gamma$ -2-piperidyl-butyric acid hydrochloride, m.p.  $188-189^\circ$ , and  $\alpha$ -norlupinone, b.p.  $105^\circ/3$  mm. (hydrochloride, m.p.  $146-147^\circ$ ). Reduction of (III) cannot be effected by  $\text{HCl}$  and  $\text{Zn-Hg}$ , electrolytically at a  $\text{Pb}$  cathode, or by  $\text{Na}$  and boiling  $\text{C}_5\text{H}_{11}\text{OH}$ ; with  $\text{MgMeI}$  it yields 1-n-butyl- $\alpha$ -pipecoline, b.p.  $85-90^\circ/11$  mm. (hydriodide, m.p.  $166.5^\circ$ ), hydrogenated ( $\text{PtO}_2$  in  $\text{AcOH}$ ) to 1-n-butyl- $\alpha$ -pipecoline, b.p.  $115-120^\circ/60$  mm. (hydrochloride, m.p.  $177.5^\circ$ ; picrate, m.p.  $116^\circ$ ; perchlorate, m.p.  $127.5^\circ$ ; aurichloride, m.p.  $114^\circ$ ; methiodide, m.p.  $224^\circ$ ; hydrobromide, m.p.  $203^\circ$ ; hydriodide, m.p.  $193^\circ$ ), also obtained from butylpecolinium bromide. Similar treatment of (IV) gives  $\Delta^1$ -1:3-dimethylnorlupinene, b.p.  $115^\circ/22$  mm. (hydriodide, decomp.  $237^\circ$ ), reduced ( $\text{PtO}_2$ ) to 1:3-dimethylnorlupinane, b.p.  $127^\circ/69$  mm., (hydrochloride, decomp.  $280^\circ$ ; perchlorate, decomp.  $228^\circ$ ; picrate, m.p.  $142.5^\circ$ ; methiodide, m.p.  $168^\circ$ ). H. W.

Reaction of  $\alpha\beta$ -diketonic acids with *o*-phenylenediamine. H. OHLE and W. GROSS (Ber., 1935, 68, [B], 2262-2269; cf. A., 1934, 634).— $\text{Et}_2$  mesoxalate (I) and  $o\text{-C}_6\text{H}_4(\text{NH}_2)_2$  in  $\text{EtOH}$  or  $\text{EtOH-H}_2\text{O}$  afford *Et* 2-hydroxyquinoxaline-3-carboxylate (II), m.p.  $175^\circ$ , hydrolysed to 2-hydroxyquinoxaline-3-carboxylic acid (III), m.p.  $265^\circ$  (decomp.). With a larger proportion of  $o\text{-C}_6\text{H}_4(\text{NH}_2)_2$  in boiling  $\text{AcOH-EtOH-H}_2\text{O}$  (I) gives 2-hydroxyquinoxaline-3-carboxy-2'-aminoanilide, m.p. about  $350^\circ$  after becoming yellow at  $250^\circ$  and subliming at about  $300^\circ$ , is obtained, which is not readily hydrolysed by boiling dil. acid or alkali, is not attacked by  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  at  $40^\circ$ , but is transformed by boiling  $\text{Ac}_2\text{O}$  into the  $\text{Ac}_2$  derivative, m.p.  $225^\circ$ , relatively readily hydrolysed to (III). Since it is indifferent towards  $\text{CH}_2\text{N}_2$ , it probably has a spiran structure at room temp., and the open form when heated. (II) reacts readily with  $\text{CH}_2\text{N}_2$  in  $\text{CHCl}_3$  giving *Et* 2-keto-1-methyl-1:2-dihydroquinoxaline-3-carboxylate, m.p.  $125-126^\circ$ , hydrolysed to the corre-

sponding acid, m.p.  $173^\circ$ , from which  $\text{Me}$  is not appreciably removed under the conditions of Zeisel's determination. Even with an excess of  $o\text{-C}_6\text{H}_4(\text{NH}_2)_2$ ,  $\alpha\beta$ -diketobutyric esters give 2-methylquinoxaline-3-carboxylic esters.  $\text{Me}_2$  dihydroxymaleate is transformed by the successive action of benzoquinone in boiling  $\text{MeOH}$  and  $o\text{-C}_6\text{H}_4(\text{NH}_2)_2$  into *Me*<sub>2</sub> quinoxaline-2:3-dicarboxylate, m.p.  $325^\circ$ . Hydroxytetronic acid acid when similarly treated yields the *o*-aminoanil of 2-hydroxy-1:2-dihydroquinoxaline 3-hydroxymethyl

ketone (IV),  $\text{NH}\cdot\text{CO}\cdot\text{C}_6\text{H}_4\cdot\text{N}\cdot\text{C}\cdot\text{C}(\text{CH}_2\cdot\text{OH})\cdot\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$ , m.p.

$167.5-168.5^\circ$ , in which the presence of  $\text{NH}_2$  is established by the formation of a monohydrochloride, by diazotisation and coupling with  $\beta\text{-C}_{10}\text{H}_7\text{OH}$ , by condensation with  $\text{COMe}$ , to the compound,

$\text{NH}\cdot\text{CO}\cdot\text{C}_6\text{H}_4\cdot\text{N}\cdot\text{C}\cdot\text{C}(\text{CH}_2\cdot\text{OH})\cdot\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{N}\cdot\text{COMe}_2$ , m.p.  $184.5-$

$186^\circ$ , and by the formation of a  $\text{Ac}_3$  derivative, m.p.  $182^\circ$  (with small amounts of a  $\text{Ac}_2$  compound, m.p.  $212-213^\circ$ ), converted by cautious hydrolysis into the  $\text{N-Ac}$  compound, m.p.  $233.5^\circ$ , and by  $\text{Ag}_2\text{O}$  and  $\text{MeI}$  into the substance

$\text{N}\cdot\text{C}(\text{OMe})\cdot\text{C}_6\text{H}_4\cdot\text{N}\cdot\text{C}\cdot\text{C}(\text{CH}_2\cdot\text{OMe})\cdot\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{NHAc}$ , m.p.

$136.5-137.5^\circ$ . In contrast to the derivative  $\text{C}_{18}\text{H}_{18}\text{O}_4\text{N}_4$  from isoascorbic acid (*loc. cit.*), (IV) does not yield  $o\text{-C}_6\text{H}_4(\text{NH}_2)_2$  when boiled with dil. acid, although extensive decomp. occurs. H. W.

Oxidation of uric acid.—See this vol., 233.

Reaction between aminoantipyrine and phenylhydrazine. M. PASSERINI and M. RINDI (Gazzetta, 1935, 65, 930-933; cf. A., 1935, 501).—Pyrimidone and  $\text{NHPh-NH}_2$  at  $180-190^\circ$  give 4-benzeneazo-1-phenyl-3-methyl-5-pyrazolone (I), with bis-(1-phenyl-3-methylpyrazol-5-on-4-yl), also obtained from (I) and  $\text{NHPh-NH}_2$ . Aminoantipyrine and *p*-tolylhydrazine yield 4-*p*-tolueneazo-1-*p*-tolyl-3-methyl-5-pyrazolone. E. W. W.

Occurrence of decomposition products of chlorophyll. III. Isolation of pyrroporphyrin from ox bile. P. ROTHMUND (J. Amer. Chem. Soc., 1935, 57, 2179-2180; cf. A., 1935, 110).—Fractional extraction of ox bile pigments from  $\text{Et}_2\text{O}$  by  $\text{HCl}$  gives a trace of coproporphyrin by 0.5%  $\text{HCl}$ , pyrroporphyrin by 3%  $\text{HCl}$ , phylloerythrin by 10%  $\text{HCl}$ , traces of other pigments by 15 and 20%  $\text{HCl}$ , but no phyllo- or rhodo-porphyrin. R. S. C.

Susceptibility of complex porphyrin-nickel salts. F. HAUROWITZ and W. KLEMM (Ber., 1935, 68, [B], 2312-2313).—Re-examination of the  $\text{Ni}$  salt of dimethylmesoporphyrin confirms its diamagnetic properties (Klemm, A., 1935, 1311), whereas the behaviour of  $\text{Ni}$ -tetramethylhaematoporphyrin ester (Haurowitz, A., 1935, 1384) varies, probably owing to non-uniformity. H. W.

Spectrophotometric studies. II—V.—See this vol., 221.

Alcoholic ammonia as a reagent in the nitrostilbene series. D. E. WORRALL (J. Amer. Chem. Soc., 1935, 57, 2299-2301).— $\alpha$ -Nitrostilbene (I) and  $\text{NH}_3\text{-EtOH}$  give  $\text{PhCHO}$ , much 3:4:5-triphenylisooxazoline oxide (II), and some dibenzoylphenyl-

methaneoxime ( $\alpha$ -oximino- $\gamma$ -keto- $\alpha\beta\gamma$ -triphenylpropane) (III), m.p. 152—153°; the same products are formed from (I) and  $\text{CH}_3\text{Ph}\cdot\text{NO}_2$  or from the latter and  $\text{PhCHO}$  with  $\text{NH}_3\text{-EtOH}$ . (III) gives (II) immediately with hot  $\text{HCl}$  or alkali and slowly above the m.p. The intermediate formation of some (III) in the prep. of (II) by more strongly alkaline reagents (cf. Heim, A., 1911, i, 717) is thus proved. In abs.  $\text{EtOH-NH}_3$  some  $\alpha$ -nitro- $\beta$ -benzylideneaminodibenzyl, m.p. 137—138°, is also formed. Similarly are obtained 3:5-diphenyl-4-p-bromophenyl-, m.p. 172—173°, 4-anisyl-, m.p. 145—146°, and 4-piperonyl-, m.p. 165—166°, 3:4-diphenyl-5-p-bromophenyl-, m.p. 213—215° (decomp.), 3-phenyl-4:5-di-p-bromophenyl-, m.p. 160—161°, and 5-p-bromophenyl-4-piperonyl-isooxazoline oxide, m.p. 192—193°; 3:5-diphenyl-4-p-bromophenyl-, m.p. 182—183°, 4-piperonyl-, m.p. 227—228°, 4-o-chlorophenyl-, m.p. 127—128°, 3-phenyl-4:5-di-p-bromophenyl-, m.p. 179—180°, 5-p-bromophenyl-4-anisyl-, m.p. 188—189°, and 5-p-bromophenyl-4-piperonyl-isooxazole, m.p. 204—205°;  $\alpha$ -nitro- $\beta$ -o-chlorobenzylideneamino- $\alpha$ -phenyl- $\beta$ -o-chlorophenylethane, m.p. 144—145°. R. S. C.

**Synthesis and pharmacological study of some derivatives of aminomethyl-dihydro-oxazine which exhibit an adrenaline-like action.** (MLLE.) G. BENOIT and D. BOVET (J. Pharm. Chim., 1935, [viii], 22, 544—548).— $o$ - $\text{NHAc}\cdot\text{C}_6\text{H}_4\cdot\text{OH}$  with  $\text{C}_3\text{H}_5\text{Br}$  in  $\text{COMe}_2$  containing  $\text{K}_2\text{CO}_3$  affords the  $O$ -allyl ether, the  $\text{Br}_2$ -derivative of which is hydrolysed ( $\text{HCl}$ ) to the  $\beta\gamma$ -dibromoallyl ether (hydrochloride, m.p. 171°) of  $o$ - $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$ . The latter is cyclised with  $\text{K}_2\text{CO}_3$  in  $\text{COMe}_2$  in  $\text{N}_2$  and then reacts with  $\text{NHEt}_2$  to give 3-diethylaminomethyl-2:3-dihydro-oxazine, m.p. 130° (dihydrochloride, m.p. 188°). 2-Diethylaminomethyl-, b.p. 195°/23 mm. (dihydrochloride, m.p. 190—192°), and 2-piperidinomethyl-2:3-dihydro-oxazine, b.p. 170—175°/1.5 mm., are prepared from  $o$ - $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$  with diethyl- $\beta\gamma$ -dibromopropylamine, b.p. 105—110°/769 mm. [from  $\text{C}_3\text{H}_5\text{Br}$  and  $\text{NHEt}_2$ , followed by bromination] and 1- $\beta\gamma$ -dibromopropylpiperidine, b.p. 147—152°/753 mm. [from  $\text{C}_3\text{H}_5\text{Br}$  and piperidine, followed by bromination], respectively. The pharmacological effects are described. J. L. D.

**Synthesis of phenylated benzoxazoles and [their] derivatives.** V. J. MIKESKA and M. T. BOGERT (J. Amer. Chem. Soc., 1935, 57, 2121—2124).—The prep. of  $o$ - and  $p$ - $\text{C}_6\text{H}_4\text{Ph}\cdot\text{OH}$  and  $\text{PhSO}_2$  from commercial  $\text{PhOH}$  residues is described. 3-Nitro-4-hydroxydiphenyl (I) ( $p$ -toluenesulphonate, m.p. 114.8°) with conc.  $\text{H}_2\text{SO}_4$  at 70° gives a sulphonic acid (Ba salt). 3-Amino-4-hydroxydiphenyl with  $\text{BzCl}$  gives 1:4-diphenyl-, m.p. 132.8°, and with  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{COCl}$  at 210° 4-phenyl-1-p-nitrophenyl-benzoxazole (II), m.p. 288.8° (with a little 3-p-nitrobenzamido-4-hydroxydiphenyl, m.p. 249.3°). (II) or the  $p$ -nitrobenzoate, m.p. 169°, of (I) with  $\text{SnCl}_4\text{-HCl-AcOH}$  gives 4-phenyl-1-p-aminophenylbenzoxazole, m.p. 174.2°, which with 60% oleum gives (?) 6-sulpho-4-phenyl-1-4'-amino-(?) 3'-sulphophenylbenzoxazole and with  $\text{NaNO}_2$ , in conc.  $\text{HCl}$  4-phenyl-1-( $p$ -benzenediazonium chloride)benzoxazole, m.p. 270°. The Na salt of 3:5-dinitro-2-hydroxydiphenyl and  $\text{BzCl}$  in  $\text{COMe}_2$  gives the benzoate, m.p. 119.5°, reduced to

4-amino-2:6-diphenylbenzoxazole, m.p. 220.8° (sulphonic acid,  $+\text{H}_2\text{O}$ , decomp.  $>375^\circ$ ). M.p. are corr. R. S. C.

**Crystalline by-product, obtained in the large-scale extraction of theelin and theelol.** A. W. DOX, W. G. BYWATER, and F. H. TENDICK (J. Biol. Chem., 1935, 112, 425—430).—Human pregnancy urine contains a non-œstrogenic, acidic substance,  $\text{C}_{21}\text{H}_{23}\text{O}_3\text{N}_4$ , decomp. 360° [3 active H; *Et* ester or ether m.p. 277—278° (decomp. from 275°)], stable to 25%  $\text{KOH}$  and hot conc. acid, oxidised by  $\text{CrO}_3\text{-AcOH}$  to an acid,  $\text{C}_{18}\text{H}_{19}\text{O}_7\text{N}_2$ , decomp. 253—269°, and giving a pyrrole pine-splinter reaction and a red solution in conc.  $\text{H}_2\text{SO}_4$  (green fluorescence when heated), but no protein,  $\text{NH}_2$ -acid, or purine reactions. R. S. C.

**Unsaturation and tautomeric mobility of heterocyclic compounds. VI. Mobility of 5-substituted 1-hydroxybenzthiazoles, and the ultra-violet absorption of mobile and static derivatives of 1-hydroxybenzthiazole.** R. F. HUNTER and E. R. PARKEN. VII. Selenazole derivatives. C. HASAN and R. F. HUNTER (J.C.S., 1935, 1755—1761, 1762—1766).—VI. 1-Hydroxy-5-methylbenzthiazole (I), m.p. 168—169° (*Ac* derivative, m.p. 109°; *Ag* salt; *Na* salt, decomp. 260—261°), obtained by hydrolysis of the 1-*OEt*-compound, m.p. 35—36°, which is prepared from  $p$ -tolylthiourethane, is methylated ( $\text{Me}_2\text{SO}_4$ ) to 1-keto-2:5-dimethyl-1:2-dihydrobenzthiazole, m.p. 76—77°, also obtained by heating the corresponding 1-nitrosoimino-compound, explodes 144° (from the methosulphate of 1-amino-5-methylbenzthiazole and  $\text{NaNO}_2$ ). 1-Methoxy-5-methylbenzthiazole, m.p. 32—33°, obtained from *Me p*-tolylthioncarbamate, m.p. 79—80°, is not present in the methylation product of (I). (I) is brominated to 4(or 6)-bromo-1-hydroxy-5-methylbenzthiazole, m.p. 239—240°, methylated to 4(or 6)-bromo-1-keto-2:5-dimethyl-1:2-dihydrobenzthiazole (II), m.p. 145°. *o*-Bromo- $p$ -tolylthiourethane, m.p. 32—33°, gives 3-bromo-1-ethoxy-5-methylbenzthiazole, m.p. 36—37°, hydrolysed to the 1-*OH*-compound, m.p. 209°, which is methylated to 3-bromo-1-keto-2:5-dimethyl-1:2-dihydrobenzthiazole, m.p. 116°, not identical with (II). 2-Bromo- $p$ -tolylthiocarbimide, m.p. 44—45°, forms 2-bromo- $p$ -tolylthiourethane, m.p. 106°, which yields 4(or 6)-bromo-1-ethoxy-5-methylbenzthiazole, m.p. 50—51°, hydrolysed to the 1-*OH*-compound.

A similar series of reactions leads to the following:  $p$ -phenetylthiourethane, m.p. 93—94°; 1:5-diethoxy-, m.p. 54°, 1-hydroxy-5-ethoxy-, m.p. 147°, and 1-keto-5-ethoxy-2-methyl-1:2-dihydro-benzthiazole, m.p. 85°; *Me p*-phenetylthioncarbamate, m.p. 68—69°, 1-methoxy-5-ethoxybenzthiazole, m.p. 75—76°,  $p$ -iodophenylthiourethane, m.p. 106—107°, *o*-iodo-1-ethoxy-, m.p. 76—77°, and -hydroxy-benzthiazole, m.p. 225—226°, 5-iodo-1-keto-, m.p. 135°, and 5-iodo-1-nitrosoimino-2-methyl-1:2-dihydrobenzthiazole, explodes 160°; *Me p*-bromophenylthioncarbamate, m.p. 99—100°, 5-bromo-1-methoxybenzthiazole, m.p. 82—83°; *Me* phenylthioncarbamate, m.p. 93°, oxidised to 1-methoxybenzthiazole, m.p. 88—89°; 5-bromo-1-hydroxybenzthiazole is methylated to 5-bromo-1-keto-2-methyl-1:2-dihydrobenzthiazole; 5-chloro-1-ethoxy-, m.p. 60—61°,

PLATZER (Ber., 1935, **68**, [B], 2221—2226).—Pyrrolidone and isatoic anhydride (I) at 120—180° afford  $\Delta^9$ -pegen-8-one, m.p. 110—111°, reduced at a Pb electrode to 1-o-aminobenzylpyrrolidine. Condensation of *o*-NO<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>-CH<sub>2</sub>Cl with Me  $\delta$ -aminovalerate [obtained from piperidone (II)] yields 1-o-nitrobenzylpiperidone, m.p. 117°, reduced by Zn dust and 20% AcOH to 1-o-aminobenzylpiperidone, m.p. 92.5—93.5°, which is dehydrated by POCl<sub>3</sub> to the base (III), *o*-C<sub>6</sub>H<sub>4</sub> $\begin{matrix} \text{CH}_2\cdot\text{N}\cdot\text{CH}_2\cdot\text{CH}_2 \\ \text{N}=\text{C}\cdot\text{CH}_2\cdot\text{CH}_2 \end{matrix}$  m.p. 82—83° (corresponding H<sub>2</sub>-derivative, m.p. 71—72°). Alternatively (I) is condensed with (II) to piperidino-4-ketodihydroquinazoline, C<sub>6</sub>H<sub>4</sub> $\begin{matrix} \text{CO}\cdot\text{N}\cdot\text{CH}_2\cdot\text{CH}_2 \\ \text{N}=\text{C}\cdot\text{CH}_2\cdot\text{CH}_2 \end{matrix}$  m.p. 99—100°, reduced by Zn and acid to (III). H. W.

**Lupin alkaloids. VIII.** G. R. CLEMO, W. MCG. MORGAN, and R. RAPER (J.C.S., 1935, 1743—1745).—*Et* pyridyl-2- $\beta$ -propionate, b.p. 95°/1 mm. (*picrolonate*, m.p. 141°, *picrate*, m.p. 84°), with CH<sub>2</sub>Br·CO<sub>2</sub>Et gives *Et* pyridinium-1-acetate-2- $\beta$ -propionate bromide, m.p. 159°, reduced to *Et* piperidyl-1-acetate-2- $\beta$ -propionate, b.p. 138—140°/1 mm. Ring-closure of this ester gives 3-keto-octahydropyridocoline, b.p. 74—76°/1 mm. (*picrate*, m.p. 185°), which with Zn-Hg-HCl yields octahydropyridocoline-A, identical with norlupinane, confirming the structure previously assigned. *Et* pyridyl-2-acetate, b.p. 134—135°/21 mm. (*picrate*, m.p. 136—137°), is reduced to the piperidyl ester, b.p. 105°/14 mm. (*picrate*, m.p. 125°), which with CHBrMe·CO<sub>2</sub>Et forms *Et* piperidyl-2-acetate-1- $\alpha$ -propionate, b.p. 135—140°/1 mm., cyclised to 3-keto-2-methyloctahydropyrrocoline, b.p. 67—69°/1 mm. (*picrate*, m.p. 162°). The ketone with Zn-Hg-HCl yields 3-hydroxy-2-methyloctahydropyrrocoline, b.p. 100—105°/16 mm. (*picrate*, m.p. 159°; *picrolonate*, m.p. 181°), and with N<sub>2</sub>H<sub>4</sub> followed by Na gives 2-methyloctahydropyrrocoline, b.p. 32—35°/1 mm. (*picrate*, m.p. 197°; *picrolonate*, m.p. 208°).

F. R. S.

**Lupin alkaloids. X.** Degradation of dehydrosparteine methoacetate by oxidation. K. WINTERFELD and H. E. RONSBERG (Arch. Pharm., 1935, **273**, 521—532).—The CrO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub> oxidation product of dehydrosparteine methoacetate (A., 1930, 1300) yields the platinumchloride, m.p. 250°, of a substance which is not C<sub>15</sub>H<sub>13</sub>O<sub>2</sub>N<sub>2</sub>, as thought by Winterfeld and Ipsen (*loc. cit.*), but the acid C<sub>15</sub>H<sub>26</sub>O<sub>4</sub>N<sub>2</sub> (I), [ $\alpha$ ]<sub>D</sub><sup>20</sup> -38.2° in H<sub>2</sub>O (*aurichloride*, m.p. 205°). (I) is decarboxylated to a resinous substance; with CH<sub>2</sub>N<sub>2</sub>, (I) loses H<sub>2</sub>O and forms the Me ester, C<sub>16</sub>H<sub>26</sub>O<sub>3</sub>N<sub>2</sub>, which with Pd-CaCO<sub>3</sub> absorbs 1 H<sub>2</sub>. A second CrO<sub>3</sub> oxidation product forms a Cu salt, and a reineckate, m.p. 186°; it is decarboxylated, and with MeOH-HCl yields two esters, b.p. 136°/15 mm. and 155—160°/1 mm., respectively. It consists of a mixture of the acid, C<sub>14</sub>H<sub>24</sub>O<sub>4</sub>N<sub>2</sub>, with a similar substance. Methylpyrrolidinedicarboxylic acid is absent. E. W. W.

**Lupin alkaloids. XI.** Oxidative degradation of  $\alpha$ -didehydrosparteine. K. WINTERFELD and H. E. RONSBERG (Arch. Pharm., 1936, **274**, 48—60).— $\alpha$ -Didehydrosparteine (I) with CrO<sub>3</sub> gives only NH<sub>2</sub>·[CH<sub>2</sub>]<sub>2</sub>·CO<sub>2</sub>H and CO<sub>2</sub> (8 mols.), indicating that one ethylenic linking is in position 4 : 5. (I) gives an

unstable Bz derivative, indicating that the second ethylenic linking is  $\alpha\beta$  to the second N and attached to a *tert*.-C. (I) and KMnO<sub>4</sub> in dil. H<sub>2</sub>SO<sub>4</sub> give (·CH<sub>2</sub>·CO<sub>2</sub>H)<sub>2</sub>, which must have come from ring IV and thus favours the symmetrical formula for sparteine. R. S. C.

**Solanidine t. I.** H. DIETERLE and H. ROCHELMEYER (Arch. Pharm., 1935, **273**, 532—539).—Solanidine (I) is hydrogenated in AcOH to dihydrosolanidine, m.p. 219—220°. Action of MeI on (I) for 24 hr. at 125° yields not solanidine methiodide (II) (cf. Schaffnit, Diss., Frankfurt, 1932), but solanthrine, C<sub>27</sub>H<sub>41</sub>N, also obtained by heating (II) at 325°. Se at 320° converts (I) into phenanthrene, chrysene, and another hydrocarbon, with pyridine and other bases. E. W. W.

**Solanthrine. II.** H. DIETERLE and H. ROCHELMEYER (Arch. Pharm., 1935, **273**, 539—540).—Dihydrosolanthrine (I) (A., 1933, 171) is identical with solanidine (*ibid.*, 290), but not with dihydrosolanidine (II) (*ibid.*, 1061); both (I) and (II) are, however, hydrogenated to tetrahydrosolanthrine (*ibid.*, 729). Thus (I) and (II) are isomerides differing in the position of a double linking. E. W. W.

[Attempted synthesis of] ergot alkaloids. **Synthesis of 4-carbolinedicarboxylic acids.** W. A. JACOBS and L. C. CRAIG (Science, 1935, **82**, 421—422).—Condensation of tryptophan with CH<sub>3</sub>O, MeCHO, paralalol, and PhCHO gives 3 : 4 : 5 : 6-tetrahydro-4-carboline-5-carboxylic acid, the 3-Me, m.p. 295° (decomp.), 3- $\beta$ -hydroxypropyl-, m.p. 261°, and 3-Ph derivative, m.p. 223—226°, respectively. Crotonaldehyde gives an amorphous substance. Using *N*-methyltryptophan instead of tryptophan in the condensations, PhCHO gives 3-phenyl-4-methyltetrahydro-4-carboline-5-carboxylic acid, m.p. 199—201° (decomp.). These substances, however, and those obtained by direct methylation, do not give the colour reaction with *p*-NMe<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>-CHO characteristic of lysergic acid and its derivatives. L. S. T.

**Strychnine and brucine. XXXV.** Hofmann degradation of dihydrobrucine. O. ACHMатович, (Miss) P. LEWIS, and R. ROBINSON (J.C.S., 1935, 1685—1694).—N(b)-Methyl-dihydrobrucidinum carbonate and N(a)N(b)-dimethyl-dihydrobrucidinum dicarbonate (+16H<sub>2</sub>O), m.p. 190—192° (decomp.), undergo thermal decomp., the dicarbonate giving more satisfactory results; the products are N(b)-methyl-dihydrobrucidine-a (I) (methyl- $\psi$ -dihydrobrucidine, m.p. 221—222°) and -b (II), dihydrobrucidine, and hydroxymethyltetrahydrobrucidine (III), m.p. 169°. (I) and MeI at low temp. yield N(b)-methyl-dihydrobrucidine-a dimethiodide (+4H<sub>2</sub>O), m.p. 284—286° (decomp.) [dimethochloride (+3H<sub>2</sub>O), decomp. 296—298°], and at high temp. form allo-N(b)-methyl-dihydrobrucidine-a dimethiodide (+3H<sub>2</sub>O), m.p. 245—246° [dimethochloride (+4H<sub>2</sub>O, 3MeOH), m.p. 202—204° (decomp.)]. The *allo*-dimethochloride and NaOMe give dimethyldebrucidine, m.p. 155—156°. (I) absorbs 2 H (Pd-C) to give (NaI) N(b)-methyl-dihydrobrucidinum-d (+2H<sub>2</sub>O), m.p. 317—318° (decomp.) [chloride (+3H<sub>2</sub>O), m.p. 304—306° (decomp.)], and -c iodide (+2.5H<sub>2</sub>O), m.p. 304—306° (decomp.) [chloride (+3H<sub>2</sub>O), m.p. 233—235°]. (III) with

$\text{Ac}_2\text{O}-\text{NaOAc}$  gives *acetoxymethyltetrahydrobrucidine*, m.p. 258—260° (decomp.), is methylated ( $\text{Me}_2\text{SO}_4-\text{NaI}$ ) to methoxymethyltetrahydrobrucidine methiodide, and with hot aq.  $\text{H}_2\text{SO}_4$  leads to methylidihydrobrucidinum H sulphate. (II) is isolated as the *methiodide* (+ $\text{CHCl}_3$ ), decomp. 242—244° (+2MeOH), m.p. 80—82°, decomp. 242—244°, converted into the *methochloride*, m.p. 165—170°, solidifies 175—180°, decomp. 245—248°, from which the base is obtained. The constitution of the compounds is discussed.

F. R. S.

**Strychnos alkaloids. LXXXVIII.** Transformation of dihydrobrucine into three isomerides and preparation of *isodihydrostrychnine*. H. LEUCHS and A. DORNOW (Ber., 1935, 68, [B], 2234—2241).—Treatment of dihydrobrucine with  $\text{NaOMe}$  affords a mixture of *isodihydrobrucine* III, m.p. 235—245°,  $[\alpha]_D^{20} +28.8^\circ$  in abs. EtOH, which gives a very sparingly sol. *perchlorate*,  $[\alpha]_D^{20} +13^\circ$  in  $\text{H}_2\text{O}$ , a *methiodide*, decomp. 310° after darkening at 280°,  $[\alpha]_D^{20} +41.7^\circ$  in 90% AcOH, and an *acetate* (*perchlorate*, softens at 240°,  $[\alpha]_D^{20} -18^\circ$  in  $\text{H}_2\text{O}$ ), and *isodihydrobrucine* I (I),  $\text{C}_{23}\text{H}_{28}\text{O}_5\text{N}_2$ , m.p. 225—235°,  $[\alpha]_D^{20} -165^\circ$  in abs. EtOH,  $-195^\circ$  in  $\text{CHCl}_3$  [identical with the so-called dihydrobrucine hydrate of Wieland *et al.* (A., 1930, 1455)], which affords a *sulphate*, m.p. > 290°,  $[\alpha]_D^{20} -223^\circ$  in  $\text{H}_2\text{O}$ , a *perchlorate*,  $[\alpha]_D^{20} -231^\circ$  in  $\text{H}_2\text{O}$ , a *methiodide*, decomp. 310° after softening at 280—300° (vac.), and an *acetate* [*perchlorate*, m.p. 240—260° (decomp.),  $[\alpha]_D^{20} -133^\circ$  in  $\text{H}_2\text{O}$ ]. In addition, small amounts of *isodihydrobrucine* II, m.p. 215—216° (vac.),  $[\alpha]_D^{20} -10.2^\circ$  in  $\text{CHCl}_3$ ,  $+4.3^\circ$  in abs. EtOH, are occasionally produced; this becomes the main product when less drastic conditions of isomerisation are used. It gives a *perchlorate*, m.p. 215—230°,  $[\alpha]_D^{20} +24^\circ$  in  $\text{H}_2\text{O}$ , *methiodide*, m.p. 208—218° (sealed tube),  $[\alpha]_D^{20} +17.2^\circ$  in 90% AcOH, and *acetate*, m.p. 103—105° (*perchlorate*, m.p. 138—143°,  $[\alpha]_D^{20} +12^\circ$  in  $\text{H}_2\text{O}$ ). It is not hydrogenated in presence of  $\text{PtO}_2$  and AcOH and is isomerised to (I) by  $\text{NaOMe}$ . The presence of the *isostrychnine* type is established for all isomerides, and isomerism is caused by new, asymmetric C atoms. Treatment of dihydrostrychnine with  $\text{NaOMe}$  leads to *isodihydrostrychnine* (II), m.p. 249—250°,  $[\alpha]_D^{20} +6.5^\circ$  in  $\text{CHCl}_3$ ,  $[\alpha]_D^{20} +23^\circ$  in abs. EtOH, but other isomerides do not appear to be formed. (II) gives a *perchlorate*, m.p. 258—260° (decomp.),  $[\alpha]_D^{20} +37^\circ$  in  $\text{H}_2\text{O}$ , *methiodide*, m.p. about 318° (decomp.), and an *acetate*, m.p. 202° [*perchlorate*, m.p. 260° (decomp.),  $[\alpha]_D^{20} +25^\circ$  in  $\text{H}_2\text{O}$ ]. It is hydrogenated ( $\text{PtO}_2$ -dil. AcOH) to the base  $\text{C}_{21}\text{H}_{26}\text{O}_2\text{N}_2$ , m.p. 228°,  $[\alpha]_D^{20} -4.02^\circ$  in  $\text{CHCl}_3$  [*perchlorate*, m.p. about 141° (decomp.),  $[\alpha]_D^{20} -14.3^\circ$  in  $\text{H}_2\text{O}$ ].

Dihydrobrucine methiodide separates from hot with 1 mol. of  $\text{H}_2\text{O}$  and has m.p. 245° or m.p. 255—258° (vac.). From MeOH it gives crystals  $+0.5\text{MeOH}$ , m.p. 290—295° (decomp.). The anhyd. salt has m.p. 290—295° (decomp.). H. W.

**Alkaloids of Papaver types. II. Alkaloids of . floribundum.** R. KONOVALOVA, S. YUNUSOV, and A. OREKHOV (Ber., 1935, 68, [B], 2277—2282; cf. this vol., 88).—The air-dried foliage of *P. floribundum* is moistened with 10%  $\text{NH}_3$  and percolated

with  $\text{C}_2\text{H}_4\text{Cl}_2$  and the mixture of alkaloids thus obtained (0.36% yield) is separated into phenolic (I) and non-phenolic (II) bases. Crystallisation of (I) from EtOH affords *floripavine* (III),  $\text{C}_{18}\text{H}_{21}\text{O}_4\text{N}$ , m.p. 200—201°,  $[\alpha]_D^{20} +90.5^\circ$  in  $\text{CHCl}_3$  (*hydrochloride*, m.p. 235—236°; *picrate*, m.p. 223—224°; *methiodide*, m.p. 220—221°), which contains 1 OH and 2 OMe. Treatment of the mother-liquors from (III) with  $\text{H}_2\text{C}_2\text{O}_4$  in EtOH gives *armepavine*. (II), when preserved, deposits crystals which are transformed into the corresponding hydrochlorides; these after repeated crystallisation from  $\text{H}_2\text{O}$  and subsequent treatment with  $\text{NH}_3$  yield *floripavidine* (IV),  $\text{C}_{21}\text{H}_{29}\text{O}_5\text{N}$ , m.p. 241—242°,  $[\alpha]_D^{20} -156.25^\circ$  in MeOH (*hydrochloride*, m.p. 209—210°; *hydriodide*; *methiodide*, m.p. 228—230°), which contains  $\text{CH}_2\text{O}_2$  but not  $\cdot\text{OH}$  (Zerevitinov). The mother-liquors from (IV) afford *floribundine* (V),  $\text{C}_{18}\text{H}_{19}\text{O}_3\text{N}$ , m.p. 193—195°,  $[\alpha]_D^{20} -204.28^\circ$  in  $\text{CHCl}_3$  (*tartrate*, m.p. 181—183°; *methiodide*, m.p. 178—180°), which contains  $\cdot\text{OH}$ ,  $\cdot\text{OMe}$ , and  $\cdot\text{NMe}$ . The mother-liquors from (V) give small amounts of "base V," m.p. 200—203°.

H. W.

**Deoxymorphine-C, deoxycodine-C, and their hydrogenated derivatives.**—See this vol., 107.

**Percaine.**—See this vol., 240.

**Alkaloids of Hanfangchi. II. Hanfangchin B.** C. F. HSU [with, in part, G. H. WANG and T. W. LU] (J. Chinese Chem. Soc., 1935, 3, 365—371; cf. A., 1935, 1257).—Hanfangchin B,  $\text{C}_{36}\text{H}_{40}\text{O}_6\text{N}_2$ , m.p. 241—242°,  $[\alpha]_D^{25} +272.4^\circ$  in  $\text{CHCl}_3$  (*COMe* compound, m.p. 134—136°; *picrate*, m.p. 186°; *aurichloride*, m.p. 172°; *methiodide*, m.p. 252°; *platinichloride*, m.p. 260°; *phosphate*, m.p. 215°; forms an Ac derivative with  $\text{Ac}_2\text{O}$  at 150—160°), was isolated by extracting the evaporated alcoholic mother-liquors from the prep. of hanfangchin A (*loc. cit.*) with  $\text{C}_6\text{H}_6$  and then crystallising from  $\text{COMe}_2$ . It contains 2 double linkings, 3 OMe, and 1 NMe, but no phenolic OH, N-NO, C=O,  $\text{O}_2\text{CH}_2$ , ester, or lactone groups. Intraperitoneal injection of the *hydrochloride* into the albino rat has no characteristic effect (minimal lethal dose, 250 mg. per kg. body-wt.). No alkaloids were found in Mofangchi or Kwangfangchi. H. G. M.

**Sulpharsphenamine. New method of preparation.** W. J. C. DYKE and H. KING (J.C.S., 1935, 1745—1747).— $\text{Na}_2$  3:3'-diamino-4:4'-dihydroxy-arsenobenzene-*NN'*-dimethylenesulphite, prepared from salvarsan and Na formaldehydebisulphite, with aq.  $\text{CH}_2\text{O}$  followed by  $\text{NaHSO}_3$  in  $\text{CO}_2$  gives sulpharsphenamine; it is not essential to isolate the  $\text{Na}_2$  salt. The mono-*N*-methylenesulphite of 4-nitro-2-aminophenol with  $\text{CH}_2\text{O}$  followed by  $\text{NaHSO}_3$  affords  $\text{Na}_2$  5-nitro-2-hydroxyanilino-*NN*-dimethylenesulphite.

F. R. S.

**Arsenicals containing the furan nucleus. II. Action of chlorine. Substituted furan arsenicals.** W. G. LOWE and C. S. HAMILTON (J. Amer. Chem. Soc., 1935, 57, 2314—2317; cf. A., 1935, 997).—Furyldichloroarsine, difurylchloroarsine (I), trifurylarsine, or 2-chlorofuran with  $\text{Cl}_2$  in  $\text{CHCl}_3$  give 2-chlorofuran tetrachloride, an oil, which loses HCl with  $\text{KOH}-\text{EtOH}$ , dil.  $\text{HNO}_3-\text{EtOH}$ , or  $\text{AgNO}_3-\text{HNO}_3-$

EtOH. Crude (I) and  $\text{Cl}_2\text{-CHCl}_3$  give also some *difurylarsinic acid*, m.p.  $138^\circ$ , and *trifurylarsine dichloride*, m.p.  $132^\circ$ . 5-Chloro-2-chloromercurifuran, m.p.  $181^\circ$ , and  $\text{AsCl}_3$  in  $\text{C}_6\text{H}_6$  give *tri-5-chlorofurylarsine*, m.p.  $63^\circ$ . *Tri-5-bromofurylarsine*, m.p.  $106^\circ$ , is similarly prepared. These compounds do not readily react with  $\text{HgCl}_2$ . R. S. C.

**Constitution of some additive compounds of tertiary phosphines.** W. C. DAVIES and (in part) W. P. WALTERS (J.C.S., 1935, 1786—1792).—The stability of  $\text{CS}_2$  compounds of phosphines is determined by measuring the total dissociation pressure of the compound; the stability of  $\text{PPhMe}_2\text{CS}_2$  is taken as 1 and that of any other compound obtained by comparing the temp. at which the dissociation pressure of the latter and of the standard become 50 mm. The m.p. of the additive compounds of  $\text{PRMe}_2$  and  $\text{PREt}_2$  run parallel, with one exception, to the stabilities in the two groups. The factors which affect stability are nuclear substituents in *p*- and *o*-positions and the change from aryl-dimethyl- to -diethyl-phosphine. The formulae of the compounds are discussed. The following have been prepared: *triethylphosphine-p-tolyl*, m.p.  $88\text{--}90^\circ$ , and *p-nitrophenyl-thiocarbimide*, m.p.  $97^\circ$ , *triethylphosphine-p-benzoquinone*, m.p. about  $180^\circ$ , *tri-n-butyl*, m.p.  $180\text{--}190^\circ$ , and *p-tolyl dimethyl-phosphine-p-benzoquinone*, m.p. above  $250^\circ$ . F. R. S.

**Derivatives of allyl ethers of phenols having mercury substituted in the nucleus.** A. N. NESMEJANOV and R. K. SCHATZKAJA (J. Gen. Chem. Russ., 1935, 5, 1268—1272).— $\text{o-OH}\cdot\text{C}_6\text{H}_4\cdot\text{HgCl}$  in boiling  $\text{COMe}_2$  and  $\text{RBr}$  ( $\text{R}=\text{CH}_2\cdot\text{CH}\cdot\text{CH}_2\cdot$ ) (7 hr.) yield the ether  $\text{o-OR}\cdot\text{C}_6\text{H}_4\cdot\text{HgCl}$  (I), m.p.  $89^\circ$ , whilst when  $\text{RCl}$  is taken in place of  $\text{RBr}$  the product is  $(\text{o-OR}\cdot\text{C}_6\text{H}_4)_2\text{Hg}$ , m.p.  $59\cdot5\text{--}60\cdot5^\circ$ , into which (I) is converted by the action of  $\text{Na}_2\text{SnO}_2$ . With  $\text{C}_5\text{H}_5\text{N}$  in place of  $\text{COMe}_2$  in the above reaction (at  $-10^\circ$ ) the sole product is  $2\text{C}_5\text{H}_5\text{N}\cdot 2\text{RBr}\cdot\text{HgBr}_2$ , m.p.  $120\cdot5\text{--}121\cdot5^\circ$ .  $\text{PhOR}$  in aq.  $\text{AcOH}$ ,  $\text{HgO}$ , and  $\text{NaCl}$  (at the b.p.) yield the *p-isomeride* of (I), m.p.  $101\text{--}101\cdot5^\circ$ , converted by  $\text{Na}_2\text{SnO}_2$  into  $(\text{p-OR}\cdot\text{C}_6\text{H}_4)_2\text{Hg}$ , m.p.  $108\cdot5\text{--}110^\circ$ . The compound  $\text{OR}\cdot\text{C}_{10}\text{H}_6\cdot\text{HgCl}$ , m.p.  $161\text{--}162^\circ$ , is obtained from  $\beta\text{-C}_{10}\text{H}_7\cdot\text{OH}$  in  $\text{AcOH}$ ,  $\text{HgO}$ , and  $\text{NaCl}$ , as above. R. T.

**Arylation of mercuri-organic hydroxides by means of organic derivatives of tin, antimony, and boron.** R. C. FREIDLIN, A. A. KOTSCHESKOV, and A. N. NESMEJANOV (J. Gen. Chem. Russ., 1935, 5, 1171—1175).—The following compounds of the type  $\text{HgRR}'$  have been prepared by the general reaction  $\text{RHgX} + \text{R}'_m\text{MX}_n \rightarrow \text{HgRR}' + \text{R}'_m\text{MX}_{n+1}$  ( $\text{M}=\text{Sn}$ ,  $\text{Sb}$ , or  $\text{B}$ ;  $\text{X}=\text{halogen}$  or  $\text{OH}$ ):  $\text{R}=\text{Me}$ ,  $\text{R}'=\alpha\text{-C}_{10}\text{H}_7$ , m.p.  $80\text{--}82^\circ$ , from  $\text{RHgI}$  and  $\text{R}'_2\text{SnCl}_2$ , in  $\text{EtOH-NaOH}$  at the b.p.;  $\text{R}=\text{Ph}$ ,  $\text{R}'=\text{m-}$ , m.p.  $113\text{--}116^\circ$ , or  $\text{p-C}_6\text{H}_4\cdot\text{NO}_2$ , sintering at  $144\text{--}145^\circ$ , from *m-* or *p-R'HgCl* and  $\text{R}_2\text{SnCl}_2$ , as above;  $\text{R}=\text{p-C}_6\text{H}_4\text{Cl}$ ,  $\text{R}'=\text{CH}_2\text{Ph}$ , m.p.  $104\text{--}108^\circ$ , from  $\text{R'HgCl}$  and  $\text{RSbO}$ . R. T.

***o*- and *p*-Tolylstannic acids.** K. A. KOTSCHESKOV and M. M. NADJ (J. Gen. Chem. Russ., 1935, 5, 1158—1167).— $\text{R}_4\text{SnCl}_2$  (I) ( $\text{R}'=\text{o-}$ ,  $\text{R}=\text{p-C}_6\text{H}_4\text{Me}$ ) and  $\text{HgCl}_2$  in  $\text{EtOH}$  yield  $\text{RHgCl}$ , whilst in presence

of alkali the product is  $\text{HgR}_2$ .  $\text{RSnCl}_3$ , b.p.  $157^\circ/23\text{ mm.}$  (1 : 2 compound with  $\text{C}_6\text{H}_5\text{N}$ ), prepared from  $\text{SnCl}_4$  and  $\text{SnR}_4$ , or from (I) and  $\text{SnCl}_4$ , is converted into *p-tolylstannic acid*, decomp. at  $295^\circ$ , by aq.  $\text{KOH}$  at room temp.  $\text{R}'_2\text{SnCl}_2$ , m.p.  $49\text{--}50^\circ$ , obtained from  $\text{SnCl}_4$  and  $\text{SnR}'_4$ , yields  $\text{R}'\text{SnCl}_3$ , b.p.  $157\text{--}158^\circ/20\text{ mm.}$ , with  $\text{SnCl}_4$ , and is converted into  $(\text{R}'\text{SnS})_2\text{S}$  by  $\text{H}_2\text{S}$ , and into *o-tolylstannic acid* (II) by  $\text{KOH}$ . (II) is oxidised by  $\text{K}_3\text{Fe}(\text{CN})_6$  at room temp. to yield  $\text{PhMe}$ ,  $\text{R}'\text{CN}$ , and  $\text{H}_2\text{SnO}_3$ . R. T.

**Separation of diketopiperazines and amino-acids in protein hydrolysates by ionophoresis.** II. V. S. BALABUCHA-POPOVA, N. I. GAVRILOV, and A. M. RIKALEVA (Biochem. Z., 1935, 283, 62—70).—Mixtures of anhydrides and  $\text{NH}_2$ -acids are quantitatively separated by electrophoresis of the cathode fluid 3 or 4 times. In protein hydrolysates, the anhydride fraction can also be removed by electrophoresis, the cathodic fluid only retaining traces of anhydride.  $\text{Hg}$ ,  $\text{Ag}$ , or  $\text{Pb}$  but not  $\text{Ni}$  is usable as cathode; the c.d. at the cathode should be  $>10\text{--}13$  milliamp. per sq. cm. cathode surface and the liquid in cathode and anode chambers should be feebly acidified with  $0\cdot1\text{N-H}_2\text{SO}_4$  beforehand. With protracted electrophoresis, loss of N occurs. P. W. C.

**Derivatives of keratin.** D. R. GODDARD and L. MICHAELIS (J. Biol. Chem., 1935, 112, 361—371).—Keratin (I) (keratin reduced by  $\text{SNa}\cdot\text{CH}_2\cdot\text{CO}_2\text{Na}$ ) with  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{Et}$ ,  $\text{CHMeBr}\cdot\text{CO}_2\text{Et}$ ,  $\text{CH}_2\text{I}\cdot\text{CO}\cdot\text{NH}_2$ , and  $\text{CH}_2\text{I}\cdot\text{CH}_2\cdot\text{OH}$  gives *S-derivatives*, differing from (I) in solubility and isoelectric point, and digestible by pepsin or trypsin. The product from  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{Et}$  is fractionally pptd. by  $(\text{NH}_4)_2\text{SO}_4$ , indicating non-homogeneity of (I). The substance formed by re-oxidation of (I) is called metakeratin. *N-Derivatives* are not formed by the above procedure. R. S. C.

**Formation of thio-derivatives of proteins using carbon disulphide.** M. LOISELEUR (Compt. rend., 1935, 201, 966—968).— $\text{CS}_2$  and casein in  $0\cdot1\text{N-NaOH}$  at  $40\text{--}45^\circ$  give after pptn. by acid a red-orange product, which decomposes on drying and probably has  $\text{CS}_2\text{K}$  groups attached to protein- $\text{NH}_2$ . F. A. A.

**Acid autoclaving of blood-albumin.**—See this vol., 222.

**Direct simultaneous micro-determination of carbon, hydrogen, and oxygen.** II. Analysis of pure compounds containing carbon, hydrogen, oxygen, and sulphur. III. Analysis of pure compounds containing carbon, hydrogen, oxygen, and nitrogen. W. R. KIRNER (Ind. Eng. Chem. [Anal.], 1935, 7, 363—365, 366—368; cf. A., 1934, 1239).—II.  $\text{Ph}_2\text{SO}_2$  and  $\text{p-C}_6\text{H}_4\text{Me}\cdot\text{SO}_3\text{Ph}$  analysed by the method previously described give vals. for S accurate to  $0\cdot4\pm0\cdot1\%$ .

III. The ratio of  $\text{NO}_2$  and  $\text{N}_2$  is determined in micro-combustions by the same method for various compounds containing N. F. R. G.

**[Determination of] chlorine in organic compounds.** I. Rapid lamp method. W. N. MALISOFF (Ind. Eng. Chem. [Anal.], 1935, 7, 428).—Cl can be determined accurately by the lamp method (cf. Kennedy, B., 1928, 559). F. R. G.

Action of perchloric acid on iodine and iodine derivatives.—See this vol., 177.

Semi-micro-Kjeldahl determination of nitro- and azo-nitrogen. R. A. HARTE (Ind. Eng. Chem. [Anal.], 1935, 7, 432—433).—A modification of the method of Elek *et al.* (A., 1926, 632). F. R. G.

Micro-determination of protein-nitrogen in the presence of ammonium salts. A. ROCHE and F. MARQUET (Bull. Soc. Chim. biol., 1935, 17, 1630—1632).—The protein is pptd. with tannin in aq. AcOH and N determined in the ppt. A. L.

Determination of protein-nitrogen. H. W. GERRITZ and J. L. ST. JOHN (Ind. Eng. Chem. [Anal.], 1935, 7, 380—383).—0.8 of the sulphates in the Kjeldahl-Gunning-Arnold method are replaced by phosphate, giving a reduction of digestion time to 10—25 min. F. R. G.

Determination of selenium in organic matter. K. T. WILLIAMS and H. W. LAKIN (Ind. Eng. Chem. [Anal.], 1935, 7, 409—410).—Modification of the method of Robinson *et al.* (B., 1934, 798) results in a saving of 4—6 hr. in the time of digestion. F. R. G.

Determination of the nitrogen of the nitro-groups of cyclotrimethylenetrinitroamine (T.). E. VERNAZZA (Chim. e l'Ind., 1935, 17, 685—687).—0.02—0.05 g. of the substance is treated with 10 c.c. of  $H_2SO_4$  and 0.3—0.4 g. of  $KMnO_4$  for 10 min. at room temp. and then at  $100^\circ$  until no more gas is evolved (about 20 min.). When cool, 1—3 drops of a saturated solution of I in  $H_2SO_4$ , followed by 0.1—0.2 c.c. of glacial  $HCO_2H$ , are added and the mixture is heated at  $100^\circ$  until colourless (1 min.). The excess of  $KMnO_4$  is thus reduced to  $Mn^{++}$  and the of the  $NO_2$  groups is converted quantitatively into  $NO_2 \cdot SO_3H$ , which is determined by adding an excess of standard  $KMnO_4$ , followed by an excess of standard  $FeSO_4$ , and titrating with  $KMnO_4$ . D. R. D.

"Glacial acetic acid" method of determination of amino- or other basic groups in amino-acids etc. L. J. HARRIS (Biochem. J., 1935, 29, 2820—2829).—The considerable "blank" correction in the aq. titration of basic groups in  $NH_2$ -acids, polypeptides, etc. is obviated by using glacial AcOH solvent,  $HClO_4$  in glacial AcOH as titrant, and brilliant-cresyl-blue as indicator. With 2 ml. of 0.1N solution (micro-method, 0.05 ml. of 0.025N) and in absence of  $H_2O$ , the error is  $< 2\%$ . Examples are given. F. O. H.

Colorations given by phenols with nitrous acid. S. MALINOVSKI (J. Gen. Chem. Russ., 1935, 5, 97—1298).—PhOH, cresol, and thymol do not give any coloration with aq.  $HNO_2$ , pyrocatechol gives a brown coloration with  $< 0.002\%$   $HNO_2$ , resorcinol a grey ppt. with 1% and a yellow coloration with 0.005—0.1%  $HNO_2$ , quinol gives a yellow coloration 0.1%, pyrogallol with 0.001—1%, and phloroglucinol with 0.1—1%  $HNO_2$  (pink with 0.002—0.005%  $HNO_2$ ). R. T.

Volumetric extraction analysis. A. BOLLIGER (J. Proc. Austral. Chem. Inst., 1935, 2, 312—317).—o-polytropenols (I), e.g., picric or styphnic acid, are titrated with aq. methylene-blue hydrochloride

(II). The insol. salt formed is extracted with  $CHCl_3$ , and titration continued until (I) is completely removed from the  $H_2O$  layer. Cations forming insol. picrates or picrolonates may be so pptd., the ppt. being subsequently titrated as indicated. Other acids forming with (II) or other coloured bases salts insol. in  $H_2O$  but sol. in org. solvents may be titrated similarly. The method is suitable for about 1 mg. of material. J. S. A.

Determination of cholesterol. II. I. LIFSCHUTZ (Biochem. Z., 1935, 282, 441—443; cf. A., 1918, ii, 179; 1935, 1363).—Cholesterol is recovered quantitatively from its compound (I) with digitonin (II) by grinding (I) with NaOAc, boiling the mixture for 30 min. with 95% EtOH, and adding excess of  $Et_2O$ . (II) and NaOAc are pptd. W. McC.

Microchemical determination [detection] of cholesterol, carbamide, glycerol, etc., based on the formation of liquid crystals. P. GAUBERT (Compt. rend., 1935, 201, 1202—1204).—A very small quantity of cholesterol (I) may be detected by melting it on a heated microscope slide together with a fragment of  $CO(NH_2)_2$ , or other substance which when mixed with (I) forms liquid crystals (cf. A., 1913, i, 264); the latter show the presence of (I). Similarly urine, or glycerol in wine, may be detected by adding fragments of (I) to a drop evaporated on a slide, and heating; if necessary the liquid crystals are made visible by pressure on the cover-slip. Lemon juice is similarly detected; in this case the liquid crystals, due to citric acid, persist at room temp. E. W. W.

Application of "Original Hanau" artificial sunlight lamp in qualitative analysis. I. Photoanalysis in pyridine and indole series. H. FREYTAG (Z. anal. Chem., 1935, 103, 334—340).—A drop of solution containing  $C_5H_5N$ , applied to filter-paper impregnated with 0.2% alcoholic 1-phenyl-3-methylpyrazolone, gives on irradiation with ultraviolet light a blue spot, due to formation of a pyridine dye from the products of photochemical oxidation. 4-Methyl- but no other methylated pyridine similarly gives a violet colour. Limit,  $10^{-5}$  g. for each. Indole, and 2-, 5-, and 7-methylindole, irradiated as drops on filter-paper, give oxidation products possessing a strong yellow-green fluorescence. With skatole a sp. bluish fluorescence is obtained.  $2 \times 10^{-6}$  g. of indole may be detected by the formation of a pink colour on irradiation of a drop of liquid on filter-paper soaked in  $H_2SO_4$ . 2-, 5-, and 4-Methylindole (sp. blue colour) may be similarly detected. J. S. A.

Specific reaction for yohimbine. L. ROSSI, A. DEL BOCA, and R. LOBO (J. Pharm. Chim., 1935, [viii], 22, 566).—The authors claim priority (cf. Anal. Farm. Bioquim., 1932, 3, 51; A., 1935, 1260). J. L. D.

Aminometry of alkaloids. I. Aminometric determination in anhydrous chloroform solution. R. DIETZEL and W. PAUL (Arch. Pharm., 1935, 273, 507—515).—Alkaloids are determined by a modification of Vorlander's "aminometric" method (A., 1934, 198, 314). The amine groups are titrated in anhyd.  $CHCl_3$  with  $p-C_6H_4Me \cdot SO_3H$  in  $CHCl_3$  [standardised against  $N(CH_2Ph)_3$ ], using

$\text{NMe}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{N} \cdot \text{Ph}$  in  $\text{CHCl}_3$  as indicator. Accurate results are obtained with brucine, strychnine, hyoscyamine, veratrine, atropine, papaverine, quinine, aconitine, cocaine, codeine, narcotine, and cinchonine. The method is applied to the determination of alkaloids in drugs and pharmaceutical preps. The drug is (if necessary) digested with aq.  $\text{HCl}$  or aq.  $\text{H}_2\text{SO}_4$  and extracted with  $\text{CHCl}_3$ . In general the alkaloid is then set free by  $\text{NaOH}$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{MgO}$ , or aq.  $\text{NH}_3$ , and extracted with  $\text{CHCl}_3$  (mixed, if necessary, with  $\text{Et}_2\text{O}$ ); the dried solution is then titrated as above. Details are given of the method as applied to cortex chinæ (and other quinine preps.), cortex granati, radix and tinctura ipecacuanhæ, extractum and tinctura strychni, extractum belladonnæ and hyoscyami, and secale cornutum (which requires special treatment). Application to semen strychni and to folia belladonnæ or hyoscyami is difficult. For semen and tinctura colchici, and for caffeine and theobromine, no suitable indicator is found. E. W. W.

**Extraction of lead by means of diphenylthiocarbazone.**—See this vol., 179.

**Glucoproteins. I. Determination of glucosamine.** R. BOYER and O. FÜRTH (Biochem. Z., 1935, 282, 242—256).—The colorimetric method of Elson and Morgan (A., 1934, 910) for determination of glucosamine (I) is adapted, with modifications, for use with the step photometer. Addition of carbohydrates or  $\text{NH}_2$ -acids to solutions of (I) causes errors; that of protein hydrolysates renders the method useless. Separation of (I) from the hydrolysates by pptn. by the  $\text{Cu-CaO}$  method is not possible, since considerable destruction of (I) occurs. For determinations of (I) in protein hydrolysates the more tedious method of Zuckerkandl *et al.* (A., 1931, 1081) must still be employed, since it is less sensitive to these errors. The structure of the pigment and its precursor is discussed. P. W. C.

**Determination of tryptophan in proteins by means of the Pulfrich photometer.** F. BÖHM and G. GRÜNER (Biochem. Z., 1935, 282, 230—234).—A method is described and tables summarise the tryptophan contents of caseinogen and serum when determined both by the colorimetric and photometric methods. P. W. C.

## Biochemistry.

**Carbonic acid and respiratory activity.** A. RISI (Z. Biol., 1935, 96, 615—633).—Inhalation of  $\text{CO}_2$ -rich (5—15%) air by cats and dogs markedly stimulates the respiration in both frequency and depth. The effect is increased by admixture with  $\text{O}_2$ , and occurs, although to some extent modified, after administration of certain alkaloids etc.

F. O. H.

**Equilibrium time of the gaseous nitrogen in the dog's body following changes of nitrogen tension in the lungs.** L. A. SHAW, A. R. BEHNKE, A. C. MESSER, R. M. THOMSON, and E. P. MOTLEY (Amer. J. Physiol., 1935, 112, 545—553).—The  $\text{N}_2$  content of the body  $\propto$  the partial pressure of  $\text{N}_2$  in the lungs under conditions of equilibrium at pressures up to 4 atm. The rates of  $\text{N}_2$  elimination from the completely and partly saturated body are equal, as are the saturation and desaturation times.  $\text{N}_2$  is held by the blood and tissue-fluids in a high state of supersaturation. R. N. C.

**Intravenous injection of oxygen with the animal under ordinary and increased atmospheric pressure.** I. SINGH (J. Physiol., 1935, 84, 315—322).—Cats absorb about 5 c.c. of  $\text{O}_2$  injected intravenously in 10 min. With animals of different species the vol. absorbed per kg.  $\propto$  the size of the animal. Increase of atm. pressure increases the amount of  $\text{O}_2$  that can be absorbed. R. N. C.

**Influence of hyperpnœa and of variations of oxygen and carbon dioxide tension in the inspired air on hearing, after images, and nystagmus.** E. GELLHORN and I. G. SPIESSMAN (Amer. J. Physiol., 1935, 112, 519—527, 620—626, 662—668).

R. N. C.

**Excitability of the respiratory centre in dependence on the thyroid and spleen.** J. FELDER

(Z. ges. exp. Med., 1934, 94, 384—388; Chem. Zentr., 1935, i, 2691). R. N. C.

**Dependence of the excitability of the respiratory centre on the thyroid.** R. SPIELMANN (Z. ges. exp. Med., 1934, 94, 378—383; Chem. Zentr., 1935, i, 2691).—The excitability of the respiratory centre of the rabbit is determined by measurement of the gross respiration in a special apparatus. Injection of thyroxine or thyrotropic hormone increases the excitability. Thyroid preps. can be evaluated biologically by the method. R. N. C.

**Effects of suppression of the mesotergal organ on the gaseous exchange of *Lepidoptera*.** A. RAFFY and G. GUIGNON (Compt. rend. Soc. Biol., 1935, 120, 765—766).—Gaseous exchange is depressed by destruction of the mesotergal organ, and the increases produced by nicotine are  $<$  normal. R. N. C.

**Neuro-central regulation of hæmatic nitrogen.** P. JEDŁOWSKI (Boll. Soc. ital. Biol. sperim., 1935, 10, 225—227).—Hæmatic N is increased by destruction of one or both of the hemispherical cortices in the rabbit, and to a small extent by lesions of different parts of the encephalic base. R. N. C.

**Evidence for a potassium shift from plasma to muscles in response to an increased carbon dioxide tension.** W. O. FENN and D. M. COBB (Amer. J. Physiol., 1935, 112, 41—55).—Experiments described indicate that increased  $\text{CO}_2$  tension tends to cause K shift from plasma to muscles, but the same increase would shift K from the muscle to Ringer's solution, because the muscle is intermediate between Ringer's solution and blood in its buffering capacity.

**Kinetics of the elimination of the dye water-blue from dog plasma after intravenous injection.** A. HEMINGWAY, F. H. SCOTT, and H. N. WRIGHT (Amer. J. Physiol., 1935, 112, 56—64).—The concn. of water-blue falls rapidly in the first 2 hr. after injection, following an exponential curve; it follows a slower exponential curve during the next 48—72 hr., and proceeds at an approx. const. rate during the last 7—8 days. The equation for time and concn. is given. R. N. C.

**Erythrocyte and hæmoglobin increase in human blood during and after exercise.** E. C. SCHNEIDER and C. B. CRAMPTON (Amer. J. Physiol., 1935, 112, 202—206). R. N. C.

**Adsorption of creatine and creatinine by erythrocytes.** K. KACL (Compt. rend. Soc. Biol., 1935, 120, 916—917).—Creatine is not adsorbed by erythrocytes of cattle, and only by those of adult horses. Creatinine (I) is adsorbed by the cells of both species to the extent of 10—50%. Equilibrium is established rapidly. The abs. quantity of (I) adsorbed increases, whilst the relative quantity decreases, with rise of concn.; the phenomenon is reversible. R. N. C.

**Effect of  $p_H$  on the adsorption of creatinine by erythrocytes.** K. KACL (Compt. rend. Soc. Biol., 1935, 120, 918—920).—The optimum  $p_H$  for the adsorption is 7.3. The amount of adsorption increases with rise of temp. In presence of acids or alkalis,  $p_H$  tends to revert to its natural val. during adsorption. R. N. C.

**Permeability of erythrocytes for malonamide.** F. SCHONHEYDER (Skand. Arch. Physiol., 1934, 71, 39—60; Chem. Zentr., 1935, i, 2837—2838).—The permeability in buffered NaCl solution is independent of the treatment of the blood, of the composition of the outer fluid [addition of  $\text{Na}_2\text{CO}_3$  or  $\text{Hg}(\text{CN})_2$ ], or the amount of swelling, but rises with decreasing  $p_H$ . J. S. A.

**Glutathione of the erythrocytes in hyper- and hypo-thyroidism.** A. R. BEAUX (Compt. rend. Soc. Biol., 1935, 120, 822—823).—Glutathione in red corpuscles of dogs is decreased by feeding with thyroid, and increased by thyroidectomy. R. N. C.

**Alleged effect of electrical stimulation on the metabolism of red cell suspensions.** E. PONDER and J. MACLEOD (J. Gen. Physiol., 1935, 19, 265—281).—Electrical stimuli applied to red cell suspensions lead to a permanent vol. decrease (0.1%) in the system, and not to an increase in  $\text{O}_2$  consumption (cf. von Hattingberg, A., 1934, 541). The effect, which may occur in absence of red cells, disappears when platinised Pt electrodes are substituted for bright Pt. Using serum, a vol. increase occurs with platinised, not with bright, Pt electrodes. F. A. A.

**Electrokinetic potential of thrombocytes.** H. D. REMIER (Biochem. Z., 1935, 281, 345—348).—The potential is 20—42 mv. The val. varies during the day, but no certain relationship between potential and time of day, absorption of food, amount of protein, serum-albumin-globulin ratio, or plasma viscosity was detectable. P. W. C.

**Optical activity of horse's globinhæmochromogen and of hæmoglobin dissolved in 0.25N-sodium hydroxide (globin+hæmatin), with special reference to the sulphur contents.** S. SIMONOVITS and G. BALASSA (Biochem. Z., 1935, 281, 333—338).—A 0.16% solution of horse-globinhæmochromogen in 0.25N-NaOH after keeping 24 hr. has  $[\alpha]_{D^{20}}^{20} -45.2^\circ$ ; globin+hæmatin under the same conditions has  $[\alpha]_{D^{20}}^{20} -45.7^\circ$ . The vals. are dependent on the S content of the prep., but are independent of the concn. (0.20—0.92%) and of the methods of crystallisation. It is suggested that in globinhæmochromogen the reduced prosthetic group is coupled not with the whole globin mol., but only with the N bases of globin which are split off by NaOH. P. W. C.

**Spectrophotometric studies. II. Preparations from washed blood cells; nitric oxide-hæmoglobin and sulphæmoglobin.** D. L. DRABKIN and J. H. AUSTIN. III. Methæmoglobin. J. H. AUSTIN and D. L. DRABKIN. IV. Hæmochromogens. V. Technique for analysis of undiluted blood and concentrated hæmoglobin solutions. D. L. DRABKIN and J. H. AUSTIN (J. Biol. Chem., 1935, 112, 51—65, 67—88, 89—104, 105—114; cf. A., 1933, 81).—II. Solutions prepared from washed erythrocytes are preferable to hæmolysed whole blood, and absorption spectra of oxyhæmoglobin (I), hæmoglobin (II), CO-(II), cyanomethæmoglobin (III) are presented. NO-hæmoglobin (IV) solutions are prepared from reduced (II) and NO in the absence of  $\text{O}_2$ , and are converted into methæmoglobin (V) by  $\text{K}_3\text{Fe}(\text{CN})_6$ , and further into (III) by KCN. (IV) appears to be analogous to (I), but is less readily converted into (II). (I) treated with  $\text{H}_2\text{S}$  gives mixtures of (II) and sulphæmoglobin (VI). A curve for pure (VI) is deduced; from this a quant. estimate of (VI) in the blood of a patient with clinical sulphæmoglobinæmia is obtained. (VI) is formed from (II) only in the presence of  $\text{O}_2$ . It is convertible into hæmochromogens, but not into (II) or (III). Sulph-methæmoglobin is produced when (V) or (III) is treated with  $\text{H}_2\text{S}$ .

III. Absorption data are given for (V) between  $p_H$  6.0 and 9.4. Between  $p_H$  7.0 and 9.2 the change is reversible; at about  $p_H$  9.4 a reaction apparently leading to hæmatin occurs. (I) is converted into (V) in 20 min. at  $p_H$  6.0 by an equiv. amount of  $\text{K}_3\text{Fe}(\text{CN})_6$  in air. At higher  $p_H$  excess of  $\text{K}_3\text{Fe}(\text{CN})_6$  is required to complete the reaction.  $\text{NaNO}_2$ , above a crit. amount, reacts with (I) giving (V). This reaction is faster at lower  $p_H$  vals. Benzoquinone reacts slowly with (I) giving (V), and (I) in very dil. solution is partly converted into (V) in 84 hr.

IV. Spectra are given of oxidised and reduced hæmins, and of various hæmochromogens. (II) reacts slowly with NaOH, giving one of these. Another is produced when  $\text{C}_5\text{H}_5\text{N}$  is added to reduced hæmins; the reaction is complete only when excess of  $\text{C}_5\text{H}_5\text{N}$  is used. (II) and  $\text{C}_5\text{H}_5\text{N}$  yields a hæmochromogen; the reduced form of this reacts reversibly with CO, the oxidised form with KCN.

V. A spectroscopic cell, 0.07 mm. in depth, allows direct measurements to be made on undiluted blood

and solutions of (II) up to 42.7 g. per 100 c.c. Beer's law holds, no significant change in the spectrum of (II) being observed down to  $10^{-4}$  of this concn.

F. A. A.

**Physiological degradation of blood-pigments.** III. Derivation of urinary pigments from hæmoglobin. R. NOTTHAAS (Klin. Woch., 1935, 12, 1438—1441; Chem. Zentr., 1935, i, 2837).—By oxidation of hæmoglobin with  $\text{H}_2\text{O}_2$ , a pigment identical in absorption spectrum, adsorptive properties, and solubility with urochrome B was obtained.

J. S. A.

**Acid autoclaving of blood-albumin at 220°.** V. S. SADIKOV and E. V. LINDQUIST-RISAKOVA (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 271—272).—The ppt. (54 g.) obtained by acting on blood-albumin (6 kg.) with 4%  $\text{H}_2\text{SO}_4$  at 220° for 10 min. is purified by washing with  $\text{Et}_2\text{O}$  and 20 recrystallisations from hot  $\text{EtOH}$ ; the product (I) (3.4 g.) begins to sublime at 230° and to decompose at 250°; m.p. 275—276°, mol. wt. 209, 210. Analysis indicates the formula  $\text{C}_{11}\text{H}_{20}\text{O}_2\text{N}_2$ . The results of hydrolysis with 25%  $\text{HCl}$  suggest that (I) is a cyclic leucylisovaline,

P G C

**Genesis of the proteins of the blood-plasma.** I. Variations in albumin and globulin in course of plasmaphoresis. II. Restoration of the serum-proteins after repeated plasmaphoresis. III. Importance of the bone-marrow in the synthesis of serum-albumin. A. DALLA VOLTA (Boll. Soc. ital. Biol. sperim., 1935, 10, 163—166, 167—171, 342—346).—I. Repeated plasmaphoresis at 3—5-day intervals in the dog causes an initial rise followed by a fall in total serum-proteins, serum-albumin, the albumin/globulin ratio, and the vol. of circulating plasma, immediately before withdrawal of the blood, whilst the serum-proteins fall steadily for 24 hr. after replacement of the withdrawn corpuscles. Serum-globulins remain unchanged.

II. Protein and plasma regeneration takes place rapidly after repeated plasmaphoresis; albumins and globulins increase independently of each other.

III. X-Irradiation of the bone-marrow of plasma-phorised dogs induces a rapid increase of serum-albumin, whilst globulins decrease. Destructive X-irradiation of the whole body induces small variations of total serum-proteins, with a slight increase during cachexia; globulins rise whilst albumins fall. The bone-marrow is hence a place of origin of serum-albumins.

R. N. C.

**Behaviour of serum-proteins under various metabolic conditions.** H. KEILHACK (Arch. exp. Path. Pharm., 1935, 180, 1—11).—Transfer of precipitin blood from rabbits to rabbits inhibits the pptn., due probably to the presence of a non-sp., heat-stable but  $\text{O}_2$ -sensitive factor. Transfer of hæmagglutinin blood to normal, fed animals results in the detection of serum-proteins (I) in the blood after 3—4 weeks. In starved, febrile, or growing animals (I) disappear more rapidly from the blood. The difference between normal and other animals indicates that (I) can be used in an emergency to replace N loss, or consumed directly.

J. N. A.

**Determination of the isoelectric point of blood-serum.** N. I. JOUKOVSKY and W. A. L. DEKKER (Compt. rend. Soc. Biol., 1935, 120, 805—808).—The isoelectric point of cattle serum is determined by measurement of the velocity of cataphoresis of colloidal particles in the serum. Colloidal Pt, Au,  $\text{Fe}_2\text{O}_3$ , Se, and  $\text{TiO}_2$  suspension all have the same velocity in serum, although their velocities in  $\text{H}_2\text{O}$  differ; specificity of adsorption does not interfere. The isoelectric point obtained is identical with that found by the turbidity method.

R. N. C.

**Lipins of human blood.** E. M. BOYD and J. H. TWEDDELL (Trans. Roy. Soc. Canada., 1935, [iii], 29, V, 113—121).—The free cholesterol and phospholipin of whole blood remain approx. const. during the 24 hr. Cholesteryl esters are max. at 4 a.m. and lowest in the early afternoon, whilst neutral fats are highest during the day and lowest about 4 a.m.

W. O. K.

**Relation between blood-lipin level and fat content of milk in cows.** P. SCHROORL (Landbouw. Tijdschr., 1935, 47, June).—The lipin content of the blood of calves 1 week to 14 months old is 0.63—0.85%. In two herds there seemed to be a correlation between the mean fat production of the cows and the lipin content of the blood of their calves.

NUTR. ABS. (m)

**Physico-chemical state of acetylcholine in the blood.** D. BROWN and H. SCHEINER (Compt. rend., 1935, 201, 1046—1048).—When acetylcholine is added to blood-serum, the greater part is destroyed by the choline-esterase, but a small portion is inactivated by forming a complex with the serum constituents, from which it may be liberated in an active form by the addition of alkali.

W. O. K.

**Reflex influence of the content of acetylcholine in the blood of the coronary veins.** O. KRAYER and E. B. VERNEY (Arch. exp. Path. Pharm., 1935, 180, 75—92).—Electrical stimulation of the carotid sinus increases the acetylcholine (I) content of the coronary venous blood (dog) when physostigmine is previously administered. Increase of blood pressure in the isolated sinus does not increase (I), an effect achieved by adrenaline (which is inactive unless producing an arterial pressor action) in heart-lung preps. with intact vagi.

J. N. A.

**Creatine compounds.** III. Phosphocreatine of the blood. I. CIACCIO (Boll. Soc. ital. Biol. sperim., 1935, 10, 308—310).—Blood contains 0.40—0.80 mg.-% of phosphocreatine as determined by the method of Dulière; it occurs in the erythrocyte fraction.

R. N. C.

**Some recently-proposed methods for determination of glyoxaline derivatives in serum.** E. TRABUCCHI (Boll. Soc. ital. Biol. sperim., 1935, 10, 264—267).—A criticism of the method of Loeper *et al.* (cf. A., 1935, 422). The Pauly reaction in serum is considered to be due to histidine or ergothioneine, rather than to histamine, which is pptd. by phosphotungstic acid.

R. N. C.

**Alimentary post-hyperglycæmic hypoglycæmia in the normal dog.** R. SARIC, A. LACOSTE, and E. AUBERTIN (Compt. rend. Soc. Biol., 1935, 120, 1104—

1107).—The fall of blood-sugar (I) after alimentary hyperglycæmia is of regular occurrence. It may take place in one or two stages, and in some cases a second fall occurs after partial recovery; the type of curve varies with the animal. There is no correlation between the max. rises and falls of (I) or the two sections of the (I) curve. Initial hypoglycæmia never occurs before hyperglycæmia. R. N. C.

**Variations of the blood-sugar and the influence of adrenaline and insulin.** H. HOLMGREN (Acta med. Scand. Suppl., 1934, 59, 104—115).—The daily blood-sugar (I) picture of the rabbit shows regular fluctuations associated with the rhythmic changes of the liver function. Liver-glycogen (II) reaches its max. between the successive (I) max. The action of adrenaline at the (I) max. is < at the (I) min., but that of insulin is greater. The effects are associated with (II). R. N. C.

**Behaviour of blood-sugar in poisoning by potassium atractylate.** A. MARRAS (Boll. Soc. ital. Biol. sperim., 1935, 10, 355—357).—K atractylate increases blood-sugar in rabbits and pigeons when given in sublethal doses, and decreases it in lethal doses. The increase in rabbits is > in pigeons, and is reduced by atropine and ergotamine. R. N. C.

**Blood-alcohol curve after ingestion of malt beer and sugar solutions.** A. BICKEL (Arch. Verdauungskr., 1935, 57, 239—243).—After taking 400 ml. of malt beer by mouth, the blood-EtOH (Widmark's method) reached only 0.067—0.100 g. per litre. After sugar by mouth no EtOH appeared in the blood. NUTR. ABS. (m)

**General theory of the solubility of volatile acids in blood.** F. LUCE (Biochem. Z., 1935, 281, 383—394).—A theory of the solubility of foreign substances (particularly volatile acids) is developed from the physico-chemistry of hæmoglobin and from the acid-base equilibrium in blood. The difficulties due to inadequate knowledge of the influence of high concns. of protein and hæmoglobin on the individual activities of acid anions are discussed. P. W. C.

**Effect of pyruvic acid on blood-oxalic acid.** S. SUZUKI (Japan. J. Med. Sci., 1935, II, 3, 91—94).—Intravenous (but not oral) administration of  $\text{AcCO}_2\text{H}$  (< 0.05 g. per kg.) lowers the blood- $\text{H}_2\text{C}_2\text{O}_4$  in rabbits and men (cf. A., 1934, 1122). Lactic acid is ineffective. F. O. H.

**Determination of lactic acid in blood.** J. RNST and J. TRUKA (Magyar orvosi Arch., 1934, 35, 386—391; Chem. Zentr., 1935, i, 2417).—Blood is diluted with aq. NaCl and centrifuged. The plasma is pptd. successively with  $\text{Ca(OH)}_2$  and  $\text{ZnSO}_4$ , and lactic acid in the clear filtrate is determined colorimetrically with  $\text{FeCl}_3$ . J. S. A.

**Lactic acid content of the blood in pregnancy and in puerperium.** T. J. TRUKA (Magyar orvosi Arch., 1934, 35, 482—486; Chem. Zentr., 1935, i, 2400).—The normal lactic acid content of the blood varies with the season of the year. It is increased by 40—50% in the ninth month of pregnancy and returns to normal after several days of puerperium. R. N. C.

**Oxalic acid content of blood.** A. THOMSEN (Z. physiol. Chem., 1935, 237, 199—213).—The method of Merz *et al.* (A., 1931, 1440) for the determination of  $\text{H}_2\text{C}_2\text{O}_4$  in blood and serum involves a series of indifferent compounds, and the high vals. observed are due largely if not exclusively to these impurities. The content of ox serum, determined by the  $\text{Et}_2\text{O}$  extraction method, is > 0.001%. After administration of spinach to a rabbit, the max. content of  $\text{H}_2\text{C}_2\text{O}_4$  in the serum is 0.0011%. Small amounts of  $\text{H}_2\text{C}_2\text{O}_4$  are detected in the kidneys and liver. Izumi's method (A., 1934, 201) and Suzuki's modification thereof (*ibid.*, 1122) are untrustworthy. H. W.

**Acid-base balance of blood. IV. Characterisation and interpretation of displacement of the acid-base balance.** N. W. SMOCK and A. B. HASTINGS (J. Biol. Chem., 1935, 112, 239—262; cf. A., 1934, 542).—The results produced by varying the factors which control the acid-base balance in human blood indicate that individuals may be characterised in terms of the rate at which the balance is restored to normal after experimental displacement and that abnormal acid-base conditions may be characterised in terms of the physiological factors involved. W. McC.

**Blood of salmon during the spawning season.** H. OKAMURA (Japan. J. Med. Sci., 1935, II, 3, 85—89).—Analytical data are given. F. O. H.

**Changes in blood [produced] by experimental ammonia poisoning.** I. G. FAZEKAS (Arch. exp. Path. Pharm., 1935, 180, 93—104).—In rabbits there is marked hyperglycæmia, increase of serum-inorg. P, decrease of serum-Ca, pronounced acidosis, and lipæmia. J. N. A.

**Apparatus for the micro-determination of certain volatile substances. IV. Blood-ammonia, with observations on normal human blood.** E. J. CONWAY (Biochem. J., 1935, 29, 2755—2772).—Refinements in the method of determination of  $\text{NH}_3$  (A., 1933, 654) have been made. In venous blood, collected directly into the absorption vessel through a paraffined tube in an atm. of alveolar air or pure  $\text{CO}_2$ , there is practically no free  $\text{NH}_3$  for approx. 12 min.; after this time a slow rise occurs. In blood collected in an open vessel a rapid rise in  $\text{NH}_3$  content occurs, followed by a slower one; extrapolation of the curves corresponding with these rises to zero time gives in the first case a zero val. for blood- $\text{NH}_3$  and in the second 0.038 mg. of  $\text{NH}_3$ -N per 100 ml. It is concluded that there is no free  $\text{NH}_3$  in normal blood, and that that produced on shedding is due to the decomp. of a carbamino-compound. H. D.

**Blood-bromine. I. Determination. II. Control of the method and values for normal subjects.** R. INDOVINA (Boll. Soc. ital. Biol. sperim., 1935, 10, 189—191, 191—192).—I. See A., 1935, 375.

II. The sensitivity of the method (*loc. cit.*) is double that of the gravimetric or Volhard's method. The time of heating required for the destruction of org. matter does not affect the result. Vals. found for

dibromothyroxine agree with the calc. val. Vals. are given for Br in ox blood and human blood.

R. N. C.

**Detection of lead in blood.** K. HOLL (Pharm. Ztg., 1935, 80, 1342—1343).—Various methods are discussed.

F. O. H.

**Diffusion of potassium from resting skeletal muscle following a reduction in the blood supply.** A. M. BAETJER (Amer. J. Physiol., 1935, 112, 139—146).—Blood-K in the femoral vein of the cat is not affected by reduction of the blood supply to the leg muscles to vals.  $\leq 80\%$  of the normal val., below which level it increases rapidly through loss of K from the muscles. Sympathetic stimulation increases venous plasma-K owing to reduction in the blood flow by vaso-constriction.

R. N. C.

**Inflammation and hydrogen-ion concentration of the blood.** F. LAMMERHIRT (Arch. exp. Path. Pharm., 1935, 180, 52—68).—Inflammation on the backs of rabbits, produced by mustard oil, is inhibited by intravenous injection of isotonic  $\text{Na}_2\text{CO}_3\text{--NaHCO}_3$  buffer. These solutions have no appreciable effect on  $[\text{H}^+]$  of the blood.  $\text{NH}_4\text{Cl}$  and Na atophan solutions both lower the  $p_{\text{H}}$ ; the latter, however, produces alkalosis within a few hr.

J. N. A.

**Action of zinc salts on blood.** G. PIOTROWSKI (Compt. rend. Soc. Biol., 1935, 120, 830—832).—Zn salts increase the time of coagulation of blood *in vitro* but not *in vivo*. Leucocytes and the polynuclear/lymphocyte ratio are temporarily increased.

**Chemical examination of moranylised or liquoidised blood.** R. NATTAN-LARRIER and P. TCHERNIAKOVSKY (Compt. rend. Soc. Biol., 1935, 120, 857—859).—Moranyl and liquoid used as anticoagulants do not affect the composition of blood except to raise the Na content.

R. N. C.

**Immunological specificity of the euglobulin and pseudoglobulin fractions of horse and human serum.** T. HARRIS and H. EAGLE (J. Gen. Physiol., 1935, 19, 383—396).—The sera of rabbits injected with either euglobulin or pseudoglobulin fractions from human and horse sera give ppts. with both, but two distinct antibodies are present. Neither fraction, as usually prepared, is free from the other. Lipins associated with the proteins do not determine the immunological specificity of the fractions.

F. A. A.

**Properties of the dried diphtheria toxin-aluminium hydroxide complex.** S. SCHMIDT (Compt. rend. Soc. Biol., 1935, 120, 1148—1150).—The complex loses its dissociability and its toxicity when dried.

R. N. C.

**Preparation of aluminium hydroxide for adsorption of toxins (anatoxins) and ultraviruses.** A. HANSEN and S. SCHMIDT (Compt. rend. Soc. Biol., 1935, 120, 1150—1152).— $\text{Al}(\text{OH})_3$  prepared by Willstatter's method does not lose its adsorbing power or gelatinous appearance if autoclaved immediately when prepared.

R. N. C.

**Adsorption of the antibodies from syphilitic and tuberculous sera.** G. D'ALESSANDRO and F. SOFIA (Boll. Soc. ital. Biol. sperim., 1935, 10,

193—195).—The antibodies are adsorbed by kaolin or animal C in presence of the corresponding antigens.

R. N. C.

**Nature of diphtheria toxin: pulverulent purified anatoxin.** S. HOSOYA, K. KAGABE, T. TANAKA, and A. MOMMA (Compt. rend. Soc. Biol., 1935, 120, 1030—1032).—The purified anatoxin does not produce flocculation with horse-serum as does the crude anatoxin, and is not an anaphylactic antigen. It does not reduce Fehling's solution except after hydrolysis with 5% HCl at 80°. An osazone, m.p. 189—191°, can be prepared from the hydrolysate after pptn. of proteins with Pb salts.

R. N. C.

**Aninsulin.** P. BARRAL (Compt. rend. Soc. Biol., 1935, 120, 993—995).—*Aninsulin*, prepared by heating insulin with  $\text{CH}_2\text{O}$ , does not produce hypoglycæmia, but is antigenic. These properties are unstable at most temp., the optimum temp. for storage being 60°.

R. N. C.

**Complement deviation reaction of aninsulin.** P. BARRAL (Compt. rend. Soc. Biol., 1935, 120, 995—998).

R. N. C.

**Nature of tubercle antibodies.** K. MEYER and A. PIC (Compt. rend. Soc. Biol., 1935, 120, 946—949).—Sera of animals prepared with tubercle bacilli contain antibodies to the proteins and fats of the bacilli, but no antibodies capable of reacting with both at once.

R. N. C.

**Precipitin titration of types I and II anti-pneumococcus sera.** L. K. VIKTOROV, L. A. GUINTZE-VERNER, and M. V. DEMIDOVA (Ann. Inst. Pasteur, 1936, 56, 52—67).—An *in-vitro* technique, using a precipitin titration with the sp. polysaccharide fraction prepared from cultures deproteinised by  $\text{CCl}_3\cdot\text{CO}_2\text{H}$  and pptd. by 60% EtOH, is described.

F. O. H.

**Immunising power of certain soluble metallo-protein complexes, formed from anti-swine fever serum.** H. DIACONO (Compt. rend. Soc. Biol., 1935, 120, 699—701).—Cu and Hg complexes with the antiserum retain a considerable part of the immunising power.

R. N. C.

**Analysis of type I pneumococcus specific precipitate.** H. O. CALVERY (J. Biol. Chem., 1935, 112, 167—169).—Analytical data for the ppt. obtained from type I pneumococcus haptene and antisera are given. The cystine and tryptophan vals. are  $>$ , and the tyrosine val. is  $<$ , those for diphtheria toxin-antitoxin flocculates.

J. N. A.

**Nature of tuberculous antibodies.** K. MEYER and A. PIC (Compt. rend. Soc. Biol., 1935, 120, 772—774).—The antibodies of antiprotein and antilipin sera are fixed by their sp. antigens, and when liberated, remain sp.

R. N. C.

**Serological flocculation rate in the region of considerable antibody excess.** S. B. HOOKER and W. C. BOYD (J. Gen. Physiol., 1935, 19, 373—378).—Mainly theoretical. When antibody concn. is  $> 3$  times the equiv. amount, the velocity of flocculation approx.  $\propto$  antigen dilution.

F. A. A.

**Microscopy of powdered desiccated endocrine organs.** H. W. YOUNGKEN (Amer. J. Pharm., 1935,

107, 463—471).—Examination and identification of thyroid, adrenal, pituitary, ovary, and corpus luteum of cattle, sheep, and hogs are described. W. McC.

**Cerium in the organs and excreta.** C. PROVINCIALI (Arch. ital. Sci. farmacol., 1932, 1, 101—119).—Ce cannot be detected in the organs with  $\text{H}_2\text{O}_2$ - $\text{NH}_3$  owing to the interference of Fe. A solution of strychnine in  $\text{H}_2\text{SO}_4$  or of benzidine in AcOH is used under determined conditions. Ce injected intravenously remains in the blood stream for 8 hr., but later appears in most of the organs. In chronic Ce poisoning *per os*, Ce appears in the liver and kidneys, and also in the gall-bladder if administered as a double salt. It is excreted exclusively by the intestine. Resorption on oral administration is small. R. N. C.

**Distribution of chlorine in the tissues of the rabbit, after intravenous injection of sodium chloride.** F. SCICLOUNOFF and R. S. MACH (Compt. rend. Soc. Biol., 1935, 120, 941—942).—Max. increase of Cl in all organs appears rapidly after injection. The Cl is largely taken up by the organs that normally show high Cl contents. R. N. C.

**Occurrence of lead in the organs and bones of healthy domestic animals.** P. W. DANCKWORTT and K. HOLL (Deut. tierarztl. Woch., 1934, 42, 586—589).—Liver, spleen, kidneys, and brains, or mixed samples of these were analysed. The average Pb content of organs (200 g.) of cows and horses was 0.051 mg., and of pigs 0.33 mg. For the bones (200 g.) of cows the mean val. was 0.66 mg. and of pigs 1.15 mg. NUTR. ABS. (m)

**Silica in silicoderms.** E. KAHANE (Bull. Soc. Chim. biol., 1935, 17, 1554—1558).—Digestion by  $\text{HNO}_3$ - $\text{HClO}_4$  of silicoderms (*Oncidium*, *Paraperonia*, *Oncidiella*) yields cryst. residues containing 55—85% of  $\text{SiO}_2$ . A. L.

**Effects of magnesium deficiency on the teeth and their supporting structures in rats.** H. KLEIN, E. R. ORENT, and E. V. MCCOLLUM (Amer. J. Physiol., 1935, 112, 256—262). R. N. C.

**Chemical composition of teeth. II. Composition of human enamel and dentine.** J. H. BOWES and M. M. MURRAY (Biochem. J., 1935, 29, 2721—2727; cf. A., 1935, 234).—N, Ca, Mg, Na, K, P,  $\text{CO}_2$ , Cl, and F were determined in the enamel and dentine from sound teeth with only a slight degree of hypoplasia. It is concluded that the enamel consists chiefly of hydroxyapatite, and that dentine contains less apatite than enamel, but more  $\text{CO}_3$ ;  $\text{CaHPO}_4$  is probably also a constituent of dentine. Only small quantities of Si and F were found in teeth. H. D.

**Early stages in the formation of the enamel organ.** E. DELORENZI (Boll. Soc. ital. Biol. sperim., 1935, 10, 279—280).—Glycogen is present in considerable quantities in early stages of formation of the organ in the guinea-pig, rabbit, and calf, but disappears with the metamorphosis into the stellate form of the cells of the central mass. R. N. C.

**Human epidermis. II. Isoelectric points of the stratum corneum, hair, and nails as determined by electrophoresis.** V. A. WILKERSON

(J. Biol. Chem., 1936, 112, 329—335; cf. A., 1934, 1381).— $p_{\text{H}}$ -electrophoretic mobility curves are plotted for the stratum corneum of human skin, hair, and nails, giving isoelectric points of  $p_{\text{H}}$  3.70, 3.67, and 3.78, respectively. H. D.

**Oxidation-reduction potential of the tissues of the ovary: effect of urine on this potential.** M. MAGARA (Compt. rend. Soc. Biol., 1935, 120, 1015—1018).—The initial  $E_h$  of the tissues of the rabbit ovary is approx. +0.3 mv., and falls in 2—3 hr. to a steady val. of +0.1 mv. In presence of urine it falls to -0.2 mv.; urine shows the same effect to a smaller degree on  $E_h$  of other tissues. R. N. C.

**Chemical composition of the muscle of marine animals. II. Nitrogenous extractives in muscle of *Mugil cephalus*.** A. CARTENI and A. MORELLI (Quad. Nutrizione, 1934—1935, 1, 433—449).—In the aq. extract of the muscle total extractive N constitutes 0.40% of the fresh tissue, the composition being:  $\text{NH}_3$ -N 4.30; purine-N 4.03; albumin-N 20.73; creatine- and creatinine-N 24.74; N of other bases 23.02;  $(\text{NH}_2)_1$ -acid-N 15.16; polypeptide-N 2.05; urea-N 2.55; undetermined N 3.43%. NUTR. ABS. (m)

**Glycogen content of tape worms (cestoids).** I. A. SMORODINCEV and K. V. BEBESHIN (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 413—414).—The glycogen content of *Taenia saginata* (60% of the dry solids) is 3—4 times that of *T. solium* or *Diphyllobotrium latum*. H. G. R.

**Growth and glycogen content of the foetal liver and placenta.** E. L. COREY (Amer. J. Physiol., 1935, 112, 263—267).—The foetal liver of the rat is progressively hydrated during the last third of the gestation period, placental  $\text{H}_2\text{O}$  remaining const. At foetal wt. of 0.3 g., foetal liver-glycogen (I) is > placental glycogen, which falls relatively steadily until birth, although maternal (I) varies widely, showing that the two are independent. R. N. C.

**Size, fat, and vitamin-A content of the liver of some cartilaginous fishes.** S. SCHMIDT-NIELSEN, A. FLOOD, and J. STENE (Kong. Norske Vidensk. Selsk. Forhandl., 1934, 7, 47—50; Chem. Zentr., 1935, i, 2913; cf. B., 1934, 970).—The fat content of the liver is up to 80—90% and generally  $\propto$  liver-wt. Large variations in fat and vitamin-A (I) contents occur, even in the same species. Fat melted out from the liver is poorer in (I) than the extracted liver-oil. The total (I) content is  $\leq 14$  units, sometimes >5000; in *Galens vulgaris* and *Lamna cornubia* it is >10,000—40,000, i.e., as great as in halibut etc. The (I) content of rays is < that of sharks. H. N. R.

**Separation of physeteric acid from sardine and pilot-whale oils.**—See this vol., 189.

**Effect of sex on the lipins of some marine molluscs.** J. TIMON-DAVID and G. CERESOLA (Compt. rend., 1935, 201, 853—854).—The lipin contents of the female *Eledone moschata*, *Murex brandaris*, and *Mytilus galloprovincialis* are > those of the corresponding males. R. N. C.

**Separation of selacholeic acid from cod-liver, "sukesso-dara" liver, sei-whale, and pilot-**

**whale oils.** Y. TOYAMA and T. TSUCHIYA (J. Soc. Chem. Ind. Japan, 1935, 38, 684—687B).—Selacholeic ( $\Delta^8$ -tetracosic) acid has been isolated as a minor component of the fatty acids from the liver oils of cod and *Theragra chalcogramma*, and from sei- and pilot-whale oils; some impure *n*-tetracosic acid was also isolated from the whale oils. H. G. M.

**Unsaponifiable matter of sei-whale oil.** Y. TOYAMA and T. TSUCHIYA (J. Soc. Chem. Ind. Japan, 1935, 38, 687—690B).—The unsaponifiable matter contains oleyl and a little cetyl alcohol and cholesterol. Hexadecanol, octadecanol, and some highly unsaturated alcohols are possibly also present. H. G. M.

**Fatty oil of *Chanoschanos* (Forsk.)**. K. KAFUKU and C. HATA (J. Soc. Chem. Ind. Japan, 1935, 38, 650B).—Analytical data for the oils from the body, liver, and intestines of this tropical fish are recorded. Only the liver oil gives a strong colour reaction for vitamin-A. J. S. A.

**Visual purple system in marine fishes.** G. WALD (Nature, 1935, 136, 913).—The visual purple system in the eye tissues of *Prionotus carolinus*, *Centropomus striatus*, and *Stenotomus chrysops* is identical chemically with that in frogs (this vol., 96). L. S. T.

**Carotenoids and the visual cycle.** G. WALD (J. Gen. Physiol., 1935, 19, 351—371).—Fuller details of work already reported (A., 1934, 913; this vol., 96) are given. The xanthophyll content of the epithelium and choroid layer of frogs' eyes falls 10—20% during light-adaptation. Light-adapted retinas contain  $0.2\text{--}0.3 \times 10^{-6}$  g. of vitamin-A. F. A. A.

**Dissociation between intestinal and glandular permeability to carotenoids in the descendance of some crossings between different species of silkworm.** C. JUCCI (Boll. Soc. ital. Biol. sperim., 1935, 10, 218—219). R. N. C.

**New phosphorus fraction in blood and tissues.** T. KALAJA (Suomen Kem., 1935, 8, B, 41—42).—The filtrate obtained from the addition of blood (but not of serum) (man, cow, rabbit, rat) and liver and muscle (rabbit, rat) to  $\text{CCl}_3\text{CO}_2\text{H}$  gives a lower % of inorg. P by the Fiske-Subbarow method in the freshly prepared filtrate than after some hr. It is inferred that blood etc., but not serum, contains a thermo-labile compound which hydrolyses in acid or alkaline (but not neutral) protein-free filtrate. In the usual colorimetric method inorg. P must be determined immediately after filtering in the case of blood, whereas serum filtrates may be kept. The nature of the P compound is discussed. R. S. B.

**Dielectric properties and chemical constitution of phosphatides.** R. KUHN, I. HAUSSER, and W. BRYDOWNA (Ber., 1935, 68, [B], 2386—2388).—Sphingomyelin and lecithin (I) in EtOH have a dielectric const. > that of the solvent and therefore exist as zwitterions. In  $\text{C}_6\text{H}_6$  (I) and cephalin are dielectrically inactive. The inactivity of (I) is due to association. H. W.

**Lignoceryl sphingosin in ox lung.** C. TROPP (Z. physiol. Chem., 1935, 237, 178—180; cf. A., 1934, 97).

—Dried ox lung contains 0.06% of lignoceryl-sphingosin (I) together with a phosphatide of the sphingomyelin series. (I) probably exists preformed in the spleen, the content of which is not subject to seasonal variations. (I) does not occur in the heart, kidney, lymph glands, testes, or white and red bone marrow of the ox. W. McC.

**Determination of molecule size of nucleic acids and mononucleotides by the free diffusion method.** Size of the molecule of pancreatic pentosepolynucleotide and of cozymase. K. MYRBACK and E. JORPES (Z. physiol. Chem., 1935, 237, 159—164; cf. A., 1935, 232).—The diffusion of nucleic acids (I) [yeast-nucleic acid (II), pentosepolynucleotide (III)] is not affected by  $[\text{H}^+]$ , but is greatly affected by their electric charge and by presence of salts (e.g., NaCl) which restrict the diffusion to an extent  $\propto$  the mol. size of (I). In the determination of approx. mol. wt. of (I) by the free diffusion method, comparison must be made with known substances of similar structure and tendency to ionise. The method gives a mol. wt. of about 3000 for (III), and proves that it is not a mixture of (II) with guanylic acids. The mol. wt. of cozymase is approx. 500. W. McC.

**Isolation of cystine from wool hydrolysates.** G. TOENNIES and M. A. BENNETT (J. Biol. Chem., 1935, 112, 39—50).—Yields of *l*-cystine (I) up to 44% of theoretical calc. on total S are obtained by hydrolysis of wool with 50%  $\text{H}_2\text{SO}_4$ , addition of  $\text{Na}_2\text{SO}_4$  (to salt out humins), pptn. of (I) with  $\text{Cu}^{++}$ , and its conversion into hydrochloride. Negative biuret tests, or cyanide-nitroprusside tests corresponding with the total S content of the wool, do not prove complete hydrolysis. Max. yields of (I) are obtained at stages before complete hydrolysis, owing to loss of (I) by racemisation. F. A. A.

**Distribution of cystine and cysteine in the body.** K. INATOMI (Japan. J. Med. Sci., 1935, II, 3, 115—157).—Data for the cystine-cysteine (I) content of blood and other tissues (rabbit, dog, ox, man) are tabulated. The level increases in the blood during anæmia and in the spleen (but decreases in the liver) during hunger. Splenectomy produces first a fall, then a rise (to subnormal vals.), in the content of the corpuscles, a rise in that of liver and bone-marrow (a gradual decrease commences in the latter after 1 week), and a fall in that of kidney and muscle. The origin and storage of (I) are discussed. F. O. H.

**Acetylcholine equivalent of nervous tissues.** G. S. BARSOUM (J. Physiol., 1935, 84, 259—262).—The splanchnic and vagal nerve trunks in the dog show the highest acetylcholine (I) contents of all the tissues. EtOH extracts of tissues lose their (I) activity when kept at room temp.; the activity is largely restored by addition of  $\text{CCl}_3\text{CO}_2\text{H}$ . R. N. C.

**Carbon monoxide-ferroglutathione.**—See this vol., 194.

**Heparin.** F. LIPMANN and A. FISCHER (Z. physiol. Chem., 1935, 237, 273—274).—In agreement with Schmitz (A., 1935, 1394) highly purified hepa-

rin (I) is free from S. (I) prepared from ox lung by the method of Charles and Scott (A., 1933, 1317) gives a Ba salt which, after fractionation from neutral solution, contains Ba and org. S in the approx. ratio 2 : 3 in agreement with Jorpes' results (A., 1935, 1144), but % C and N are too high for a chondroitin-sulphuric acid. The preps. are about 30% more active than those of Jorpes. Under the action of 0.1N-HCl at 100° loss of physiological activity is much more rapid than elimination of H<sub>2</sub>SO<sub>4</sub>.

H. W.

**Potentiometric study of hepatoflavin.** F. J. STARE (J. Biol. Chem., 1935, 112, 223—229; cf. Stern, A., 1934, 846).—The redox potentials of hepatoflavin (from horse liver) at  $p_H$  0.32—13.38 have been determined by titration with reducing agents [Ti<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>]. The titration curves branch in the more acid region. There are ionisation consts. at  $p_H$  about 6.8 (reduction) and 9.6 (oxidation). The normal potential is 0.188 volt.

W. McC.

**Dietary requirements for lactation. IV. Nature of factor-L.** W. NAKAHARA, F. INUKAI, and S. UGAMI (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1935, 28, 152—160).—Factor-L is pptd. from aq. EtOH extracts (previously treated with "acid earth"; A., 1934, 930) of liver by Ba(OH)<sub>2</sub>-MeOH. Dissolution of this ppt. by removal of Ba etc. and treatment with WO<sub>3</sub>.2H<sub>3</sub>PO<sub>4</sub> gives an active ppt. (0.176% of the liver used). The factor is not identical with glutamic acid.

F. O. H.

**Isolation of nicotinamide from heart muscle.** R. KUHN and H. VETTER (Ber., 1935, 68, [B], 2374—2375).—Protracted extraction with CHCl<sub>3</sub> of concentrates of a vitamin-B component (free from -B<sub>1</sub> and -B<sub>2</sub>) in feebly alkaline and neutral condition and heating of the residue at 150—160°/5 × 10<sup>-4</sup> mm. gives a waxy distillate from which nicotinamide is isolated.

H. W.

**Probable occurrence of tunicin in the dorsal sac of Sepia.** S. MÜLLER (Magyar chem. Foly., 1934, 40, 112—114; Chem. Zentr., 1935, i, 2551).—The product prepared by Ambronn from the dorsal sac of Sepia contains no tunicin, but a mixture of decomp. products of albumin, with a high N content.

R. N. C.

**Amide-nitrogen of ovalbumin.** A. SHORE, H. WILSON, and G. STUECK (J. Biol. Chem., 1936, 112, 407—413).—The NH<sub>3</sub> produced by the hydrolysis of ovalbumin (I) in 5, 1, and 0.2M-HCl is plotted against time and the probable amide content of (I) deduced by extrapolation to be 24 equivs. per mol.

H. D.

**Crystalline ovalbumin. II. Fractionation of peptic hydrolysis products.** H. O. CALVERY (J. Biol. Chem., 1935, 112, 171—174).—Pepsin hydrolysed one third of the peptide linkings of ovalbumin. Five distinct fractions were obtained, one of which contains free NH<sub>2</sub>-acids. Hydrolysis was also effected by erepsin, aminopolypeptidase, protaminase, and dipeptidase, the last yielding dipeptides.

J. N. A.

**Denaturation of ovalbumin by ultra-violet radiation.** J. H. CLARK (J. Gen. Physiol., 1935, 19, 199—210).—Three processes are involved, (a) a light-

denaturation, (b) a reaction between the product of (a) and H<sub>2</sub>O, (c) formation of a coagulum. (a) is unimol., independent of temp. and (largely) of  $p_H$ ; (b) has a temp. coeff. > 10, and occurs at lower temp. than does heat-denaturation.

F. A. A.

**Composition of the gelatinous mass from Rhizostoma Cuvieri.** R. ZEYNEK and A. DIMTER (Z. physiol. Chem., 1935, 237, 247—253).—The jelly is regarded as a gelatin-giving tissue differing from that of the higher animals in its ready decomp., low content of glycine (which is replaced by other NH<sub>2</sub>-acids), and high S content. It is undecided whether the L-aminobutyric acid present is to be regarded as a structural component.

H. W.

**Structure of silk fibroin.** H. MÜNCH (Angew. Chem., 1935, 48, 797—799).—A discussion of the effects of enzyme action.

E. S. H.

**Cryolysis and its relation to cell physiology.** F. F. NORD (Protoplasma, 1934, 21, 116—128).—Cryolysis of colloidal solutions followed by determination of physico-chemical vals. indicates that lyophilic colloids and their emulsions undergo irreversible changes consisting of aggregation or disaggregation according to their concns.

R. N. C.

**Physico-chemical researches on the proteins.**—See this vol., 158.

**Affinities between proteins and fatty acids, fats, and lipins.**—See this vol., 155.

**Colloid chemistry of edestin. II.**—See this vol., 158.

**Diphasic aspect of the curdling of milk by rennin.** A. G. SMITH and H. C. BRADLEY (Science, 1935, 82, 467).—A method for separating the enzymic and the aggregation phase is described. The former occupies < 60% of the time required for the appearance of the curd. Addition of CaCl<sub>2</sub> accelerates curdling by shortening the aggregation time; the enzymic activity of the rennin is unaffected. An increase in [H<sup>+</sup>] accelerates both phases.

L. S. T.

**Carotenoids of butter.** A. E. GILLAM and I. M. HEILBRON (Biochem. J., 1935, 29, 834—836).—The carotenes of various butters examined consisted of mixtures of  $\alpha$ - and  $\beta$ -forms. Lycopene and kryptoxanthin occurred in some highly coloured butters.

H. D.

**Adsorption of grass and butter carotenes on alumina.**—See this vol., 155.

**Carbon dioxide content and combining power and  $p_H$  of cervical lymph.** J. W. HEIM and O. C. LEIGH (Amer. J. Physiol., 1935, 112, 699—703).—The CO<sub>2</sub> dissociation curve of the cervical lymph of the dog is logarithmic. For a given CO<sub>2</sub> tension the combining power of the lymph is slightly > that of plasma. The average difference between the CO<sub>2</sub> contents of lymph saturated at 30 and 60 mm. of CO<sub>2</sub> tension is < the corresponding difference for separated plasma. The lymph contains about 58.8 vols. of CO<sub>2</sub> per 100 c.c. and its  $p_H$  is about 7.41 (plasma 7.34).

R.

**Substance in human seminal fluid affecting uterine muscle.** J. R. COCKRILL, E. G. MILLER, jun., and R. KURZROK (Amer. J. Physiol., 1935,

112, 579—580).—Human semen contains acetylcholine or some similar substance that in large amounts causes contraction, and is probably also responsible for the normal relaxation, of uterine muscle.

R. N. C.

**Identification of sperm in medico-legal investigations.** V. PRÉREZ (Crónica med. Valencia, 1934, 38, No. 810).—Solutions of  $\text{AuI}_3$  give characteristic crystals with dil. sperm.

CH. ABS. (e)

**Effect of intravenous injection of sucrose and glucose on the reducing power of cerebrospinal fluid, before and after hydrolysis.** M. I. GREGERSEN and L. WRIGHT (Amer. J. Physiol., 1935, 112, 97—108).—The average glucose (I) concn. of the spinal fluids of normal dogs is 77.5 mg. per 100 c.c. No hydrolysable reducing material is present; the apparent increase in reducing power on acid hydrolysis can be imitated in known (I) solutions by addition of  $\text{NaCl}$ ,  $\text{Na}_2\text{SO}_4$ , or neutralised  $\text{HCl}$ . Injection of (I) causes an increase in cerebrospinal fluid-(I), but sucrose (II) does not increase hydrolysable reducing material, indicating that (I), but not (II), passes the blood-spinal fluid barrier. Spectrophotometric analysis is recommended in (I) determination by Folin's micro-method.

R. N. C.

**Use of hypertonic sucrose solutions intravenously to reduce cerebrospinal fluid pressure without a secondary rise.** L. T. BULLOCK, M. I. GREGERSEN, and R. KINNEY (Amer. J. Physiol., 1935, 112, 82—96).—Hypertonic glucose or  $\text{NaCl}$  solution reduces cerebrospinal fluid pressure in the dog, but the fall is followed by a secondary rise to vals. > the initial pressure. Sucrose causes the reduction without the secondary rise.

R. N. C.

**Calcium excretion by the pancreas.** G. ÅGREN (Biochem. Z., 1935, 281, 358—362).—The  $[\text{Ca}]$  in pancreatic juice is dependent on the rate of secretion and is always > that in blood. The serum- $\text{Ca}$  curves after injection of 5—10 mg. of  $\text{CaCl}_2$  per kg. body-wt. are very different for cats before and after injection of secretin. The difference may be utilised as a test for pancreatic function.

P. W. C.

**Excretion of uric acid and urea by the pancreas and the liver under the action of secretin.** G. ÅGREN (Biochem. Z., 1935, 281, 363—366).—The uric acid and residual N contents of pancreatic juice and of bile varied from the blood concn. down to 1/15 this amount. Intravenous injection of uric acid and urea, in amounts sufficient to increase the blood concn. considerably, led to a considerable increase also in the concns. of these substances in the pancreatic juice and in bile.

P. W. C.

**Stable histochemical reaction for detection of bilirubin.** J. STEIN (Compt. rend. Soc. Biol., 1935, 120, 1136—1138).—Bilirubin in fixed sections of tissue is coloured green by I, no other oxidiser showing this reaction except  $\text{FeCl}_3$ , with which it is very feeble.

R. N. C.

**Pyrroporphyrin from ox bile.**—See this vol., 213.

**Determination of the chloride index.** A. E. LEWIN and O. B. MAKAREVIĆ (Arch. Verdauungskr., 1935, 57, 263—268).—The chloride index of a gastric juice is defined as neutral  $\text{Cl} \times 100 / \text{total Cl}$ . Hist-

amine,  $\text{EtOH}$ , or any  $\text{Cl}'$ -free test meal may be used to promote the flow of juice. The  $\text{HCl}$  of the juice and the total  $\text{Cl}'$  are determined by titration with  $\text{NaOH}$  and  $\text{AgNO}_3$ , respectively, neutral  $\text{Cl}'$  being obtained by difference. Bile-stained juice must not be used. The index remained relatively const. in the same person, in spite of wide fluctuations in  $\text{HCl}$  and total  $\text{Cl}'$ .

NUTR. ABS. (m)

**Origin and significance of neutral chloride in the secretions of the stomach and duodenum.** C. M. WILHELMJ, L. C. HENRICH, I. NEIGUS, and F. C. HILL (Amer. J. Physiol., 1935, 112, 15—20).—Neutral  $\text{Cl}'$  in the non-acid secretions of the stomach and the mixed duodenal secretions are approx. the same. When 0.1N- $\text{HCl}$  is added to the secretions, only about one third of the neutral  $\text{Cl}'$  represents neutralised  $\text{HCl}$ .

R. N. C.

**Action of gastric and duodenal juice and of bile on ascorbic acid.** A. CARTENI and A. MORELLI (Boll. Soc. ital. Biol. sperim., 1935, 10, 327—329).—Ascorbic acid is destroyed by gastric and duodenal juice and by bile, the % reduction generally  $\propto p_{\text{H}}$ .

R. N. C.

**Acidic components of wool grease.**—See B., 1936, 66.

**Formation of wax within the organism of bees.** G. BUCHNER (Fettchem. Umschau, 1935, 42, 208—209).—Shortly before the wax is discharged by the bees (i.e., during its formation) the temp. of the hive rises markedly, indicating an energetic oxidation due to the  $\text{O}_2$  derived from the conversion of sugar into wax. Possible reactions are discussed.

E. L.

**Urinary modifications in the dog and rabbit following vagotomy.** E. TRIA and A. NICOLAZZO (Boll. Soc. ital. Biol. sperim., 1935, 10, 329—331).—Vagotomy induces aciduria in the rabbit and alkaluria in the dog, irrespective of the normal effect of the diet on urinary  $p_{\text{H}}$ .

R. N. C.

**Physico-chemical characters of the urine of rats on a diet of fibrin and kept in glass cages.** F. M. CHIANCONE (Boll. Soc. ital. Biol. sperim., 1935, 10, 292—294).—The urine shows decreases in  $\eta$ ,  $\sigma$ , and f.p., and increases in  $\kappa$  and the f.p./ $\kappa$  ratio, which are > those obtained when the animals are kept in metal cages. The fluorescence spectrum and spectrophotometric curve are normal.

R. N. C.

**Elimination of organic acids in urine during childhood and relation of acids to basal metabolism in adults.** S. A. SIVÉ (Svenska Lak. sällsk. Hand., Stockholm, 1934, 60, 157).—Elimination of org. acids, both in the total amount and in the  $\text{Et}_2\text{O}$ -sol. fraction, often varies considerably from case to case and in the same person from day to day. In premature and weak infants, in rickets, and in nutritional disturbances the vals. are high. In diabetes establishment of the org. acids in the urine presents an improved method for determining acidosis. In children elimination of org. acids seems to diminish with age and daily variations become less. There is a relatively const. ratio of 3 : 2 between the org. acids eliminated during the day and during the night. In adults there is no relation between basal metabolism and org. acid elimination.

NUTR. ABS. (m)

**Excretion of oxalic acid by guinea-pigs.** S. BORGSTROM (Biochem. Z., 1935, 281, 377—382).— $\text{H}_2\text{C}_2\text{O}_4$  is excreted even when the diet is devoid of it.  $\text{H}_2\text{C}_2\text{O}_4$  given by mouth is to a large extent decomposed in the body, but injected subcutaneously is mainly excreted in the urine. P. W. C.

**Butyric acid content of normal urine.** L. KLINC (Bull. Soc. Chim. biol., 1935, 17, 1540—1545).—In normal urine 4—8 mg. of  $\text{Pr}^n\text{CO}_2\text{H}$  (determined by oxidation to  $\text{COMe}_2$  followed by iodometric titration) are excreted daily.  $\text{Pr}^n\text{CO}_2\text{H}$  is absent. A. L.

**Water and chloride excretion of decerebrate cats.** M. SUMWALT, W. H. ERB, and H. C. BAZETT (Amer. J. Physiol., 1935, 112, 386—396).

R. N. C.

**Bromine index of the urine as an indication of the normal physiological state.** N. BEZSSONOFF, A. VALLETTE, and R. SACREZ (Bull. Soc. Chim. biol., 1935, 17, 1573—1598).—The Br index of urine (mg. of Br taken up by 1 ml.) is not dependent on the concn. of mineral or org. substances, but on the presence of phenolic, indole, and glyoxaline derivatives, i.e. on the protein metabolism. The index increases with age, and reflects pathological conditions. Fever and rickets increases, and administration of vitamin-C decreases, the val. A. L.

**Renal excretion of urea.** R. DOMINGUEZ (Amer. J. Physiol., 1935, 112, 529—544).—Theoretical.

R. N. C.

**Application to urine of Tollens' naphthoresorcinol test for conjugated glycuronides.** H. B. SALT (Biochem. J., 1935, 29, 2705—2709).—An improved technique is described. It is sensitive to 0.5 mg. of glycuronic acid in 5 c.c. of urine. Interfering substances are first pptd. by  $\text{Pb}(\text{OAc})_2$ , and then the glycuronide by basic Pb acetate; the test is done on this ppt. Using aspirin as a glycurogenic drug, a method of testing the detoxicatory efficiency of the liver is described. J. N. A.

**Factors affecting appearance and duration of glycosuria.** C. S. ROBINSON, R. C. DERIVAUX, and B. HEWELL (Amer. J. Med. Sci., 1935, 189, 795—803).—In female patients without disturbance of carbohydrate metabolism and with normal fasting blood-sugar (I), after intravenous injection of 10 g. of glucose the peak (I) vals. were 0.131—0.304%. When urine excretion was small in vol., glycosuria persisted longer. The (I) level at which glycosuria ceased was usually < that at which it commenced.

NUTR. ABS. (m)

**Excretion of vitamin-C in human urine.** B. AHMAD (Biochem. J., 1936, 30, 11—15).—The reducing capacity of urine excreted under diets with (a) low vitamin-C (I), (b) low protein, (c) high protein, and (d) purine-free high protein contents has been determined. Meat diets favour excretion of (I), which possibly forms most of the reducing substance of urine. J. N. A.

**Detection of small quantities of gonadotropic hormone in the urine of normal subjects.** O. THOMSEN and K. PEDERSEN-BJERGAARD (Compt. rend. Soc. Biol., 1935, 120, 1143—1147).

R. N. C.

**Tungstic acid precipitation method for extraction of oestrogenic substance from urine.** S. C. FREED, I. A. MIRSKY, and S. SOSKIN (J. Biol. Chem., 1935, 112, 143—147).—Oestrogenic substances are extracted, without loss of activity, by treating urine with  $\text{Na}_2\text{WO}_4$ , acidifying with  $\text{H}_2\text{SO}_4$ , and extracting the ppt. with  $\text{EtOH-Et}_2\text{O}$ . J. N. A.

**Determination of urinary oestrin.** G. VAN S. SMITH and O. W. SMITH (Amer. J. Physiol., 1935, 112, 340—350).—Oestrin (I) cannot be recovered completely from untreated pregnancy urines by  $\text{CHCl}_3$ , olive oil,  $\text{EtOAc}$ , or  $\text{C}_6\text{H}_6$ ; the largest quantity is extracted by  $\text{C}_6\text{H}_6$ . In some cases  $\text{C}_6\text{H}_6$  extracts more (I) than can be demonstrated in the untreated urines. Pregnancy urines boiled with HCl increase in their (I) content. Total (I) after boiling with HCl can be extracted completely by  $\text{C}_6\text{H}_6$ ; none is destroyed by boiling with 15% HCl. Pure "theelin" is fixed in the alkaline solution in which it is supplied, and is less potent when first diluted than if kept for 10 days; acid treatment does not increase the potency further. The action of the HCl is therefore considered to be a liberation of "bound" (I). There is no apparent relation between the "free" (I) content of the urine and its  $p_H$ . The "free" (I) of the urine of a pregnant woman varies widely daily, but total (I) increases uniformly. The procedure adopted for the assay of (I) is outlined.

R. N. C.

**The Donaggio reaction. [Protective colloid in pathological urine.]** G. SOILLAZZO and V. CORTESE (Boll. Chim. farm., 1935, 74, 625—628, 631—634, 637).—The property of urine of febrile patients of inhibiting pptn. of a lake from thionine by  $(\text{NH}_4)_2\text{MoO}_4$  is due to a protective colloid, and can be imitated by gum arabic, and counteracted by addition of mannitol. The protective action is destroyed by pepsin or by dil.  $\text{AcOH}$ . Properties of the colloidal substance are discussed. E. W. W.

**Butyric acid content of faeces.** K. KLINC (Bull. Soc. Chim. biol., 1935, 17, 1546—1548).—The meconium does not contain  $\text{PrCO}_2\text{H}$ , which, however, is present in the faeces of suckling infants for a short time (until lactic acid fermentation predominates). In the adult, 40—130 mg. of  $\text{PrCO}_2\text{H}$  are present per 100 g. of faeces. A. L.

**Secreted nitrogen in the faeces and dietary protein utilisation.** W. HEUPKE and F. BELZ (Arch. Hyg. Bakteriol., 1935, 114, 56—62).—In man ingestion of various N-poor foodstuffs for 3—4-day periods indicated that faecal N (which was in all cases > the intake) tended to vary with the dry wt. of the faeces, suggesting that part of this N must be derived from intestinal secretion and that the utilisability of a foodstuff can be assessed only if the amount of the secreted N is known. About 1.5—2 g. of N are secreted per day for every 50 g. of dry wt. of faeces.

NUTR. ABS. (m)

**Variation in water content of the faecal material along the colon.** F. R. STEGGERDA (Amer. J. Physiol., 1935, 112, 559—564).

R. N. C.

**Disease of metabolism in sheep.** J. G. WRIGHT (Vet. Rec., 1935, 15, 1253—1255).

R. N. C.

**Uric acid excretion following administration of creatinine in man under normal and pathological conditions with special reference to renal insufficiency.** R. GARDSTAM (*Acta med. Scand.*, 1935, Suppl. 67, 296 pp.).—In toxic and orthostatic albuminuria and in the residual condition which follows acute nephritis, in essential hypertonia and gout, and to a certain extent in congestive cardiac conditions with albuminuria the ratios *concn. index of uric acid (I) : concn. index of creatinine (II)* and *(I) content of urine : concn. index of (II)* were within normal limits. Raised vals. were found in acute and chronic nephritis, pyelonephritis, and advancing arteriosclerosis of renal origin. NUTR. ABS. (m)

**Role of the pituitary in experimental chronic adrenal insufficiency.** A. GROLLMAN and W. M. FIROR (*Amer. J. Physiol.*, 1935, 112, 310—319).

R. N. C.

**Correlation between adrenals and thyroid.** I. ABELIN (*Z. ges. exp. Med.*, 1934, 94, 353—358; *Chem. Zentr.*, 1935, i, 2690).—Adrenalectomy and hyperfunction of the thyroid result in a similar series of effects. In both cases glycogen (I) falls in muscle and disappears from the liver, which undergoes fatty degeneration. A diet known to maintain liver-(I) in hyperthyroid rats has the same effect in adrenalectomised animals; di-iodotyrosine also maintains liver-(I). R. N. C.

**Gastric secretion in anaemia.** J. W. OGILVIE (*Arch. Dis. Childhood*, 1935, 10, 143—148).—A marked diminution in the secretion of free HCl and total acidity was found in 13 out of 34 anæmic children, but there was no significant variation in the other constituents of the juice. No type of anaemia showed any const. change in secretion of free acid. NUTR. ABS. (m)

**Effect of acute anoxaemia on hunger, digestive contractions, and the secretion of hydrochloric acid in man.** F. A. HELLEBRANDT, E. BROGDON, and S. L. HOOPES (*Amer. J. Physiol.*, 1935, 112, 451—460).—Acute anoxaemia of the pre-coma type has relatively little inhibitory effect on gastric motility or HCl secretion. R. N. C.

**Human anthrax in Barotseland treated with novarsenobenzene.** F. W. GILBERT (*Lancet*, 1935, 229, 1283—1285). L. S. T.

**Alimentary azotæmia in rats.** F. FUCHS (*Wien. klin. Woch.*, 1935, 48, 582—584).—In rats, a diet of green food with  $\text{NaHCO}_3$  in the drinking  $\text{H}_2\text{O}$  resulted in sickness and death in >14 days (high blood-N, very alkaline urine). NUTR. ABS. (m)

**Hyperglycæmia and glycosuria associated with disease of the biliary tract.** H. LANDE and H. POLLACK (*Arch. Int. Med.*, 1935, 56, 1097—1108).—A direct correlation was obtained between the disturbance of carbohydrate metabolism and the impairment of hepatic function. Disease of the gall bladder is accompanied by diabetes, which disappears on normal functioning of the liver and adequate biliary drainage. H. G. R.

**Cancer as a problem in metabolism.** H. H. BEARD (*Arch. Int. Med.*, 1935, 56, 1143—1170).—A review. H. G. R.

**Blood modifications in cancer.** J. LOISELEUR (*Compt. rend. Soc. Biol.*, 1935, 120, 1038—1042).—Blood- $\text{NH}_2$ -acids and -residual N in patients with cancerous lesions are increased, whilst urea falls. The corpuscle-/plasma-Cl ratio is lowered, and is inversely  $\propto$  total Cl. The alkaline reserve approaches the lower limit of its normal vals., whilst plasma- $\text{pH}$  approaches the upper limit. During radiological treatment residual N is increased, whilst urea, Cl, hydræmia, and alkalosis fall. R. N. C.

**Induction of cancer by cracked mineral oils.** C. C. TWORT and J. M. TWORT (*Lancet*, 1935, 229, 1226—1228).—Mice exposed to fumes from a mineral oil cracked on a heated plate showed no definite increase in the incidence of lung tumours, but the polynuclear count is increased. Heavier Diesel oils, but not light-grade oils, are carcinogenic for the skins of mice. Lubricating oils recovered from the sump of motor cars are more carcinogenic than the original oils. The carcinogenicity of crude shale oils decreases as the cracking temp. is lowered, but oil cracked at  $385^\circ$  is still carcinogenic. L. S. T.

**Growth-promoting and growth-inhibiting substances of normal organs.** J. MAISIN and Y. POURBAIX (*Amer. J. Cancer*, 1935, 24, 357—385).—Addition of liver, pancreas, and intestinal mucosa to the diet of tarred mice promoted growth of tar tumours. Brain, thymus, bone marrow, dried gastric mucosa, and lymph-tissue inhibited growth. The growth-promoting substances are mostly  $\text{H}_2\text{O}$ -sol. and relatively insol. in  $\text{Et}_2\text{O}$ , whilst the growth-inhibiting substances are sol. in  $\text{Et}_2\text{O}$  and relatively insol. in  $\text{COMe}_2$ . NUTR. ABS. (m)

**Anterior pituitary hormones and formation of experimental tar carcinoma.** J. ZELDENRUST (*Acta Brev. Neerl. Physiol.*, 1934, 4, 182—184).—Prolan stimulates growth of tumours produced in mice by tar, but the Evans alkaline pituitary extract prevents tumour formation. R. N. C.

**Phosphoric esters in normal and malignant tissues.** E. L. OUTHOUSE (*Trans. Roy. Soc. Canada*, 1935, [iii], 29, V, 77—84).—From lymphosarcoma was isolated  $\text{C}_6\text{H}_{13}\text{O}_8\text{NPBa}(\text{?})$ ,  $[\alpha]_{\text{D}}^{25} +2.86^\circ$ , probably the Ba salt of an aminohexahydric alcohol phosphoric acid (or possibly hexosaminephosphoric acid). From tumours other than lymphosarcomata, ethanolaminephosphoric acid has been isolated. Both these acids form insol. Pb salts. Phosphoric esters forming sol. Pb salts are present to the greatest extent in tumour tissue and least in skeletal muscle. Hexose phosphates are absent from the acid-sol. phosphates of tumour. W. O. K.

**Copper metabolism and experimental rat cancer.** S. SUMEGI (*Frankfurter Z. Path.*, 1935, 48, 35—42).—During implantation of Ehrlich-Putnoky rat cancer the Cu content of the tumour formed rises steeply until the 10th day and remains at the same level until death occurs. A disturbance of assimilation takes place in which the Cu content of

the liver rises from 34.2 to 40.8 mg. per 100 g., whilst that of the stomach falls from 38.9 to 23.2 mg. Withdrawal of Cu from normal function is advanced as a cause of cancer anæmia. When loss of Cu was compensated by injections of  $\text{CuSO}_4$  the Cu content of the stomach of tumour rats was raised to 59% > that of controls, and 11.3% < that of Cu-treated non-implanted rats. The treatment decreased the loss of red blood corpuscles and hæmoglobin and increased the no. of reticulocytes in tumour animals.

NUTR. ABS. (m)

**Determination of blood-oxalic acid in cancer.** E. AUJALEV, F. H. COLOMBIES, and A. MONTARIOL (Compt. rend. Soc. Biol., 1935, 120, 954—955).— $\text{H}_2\text{C}_2\text{O}_4$  is determined by the method of Maugeri. In cases of hyperoxalæmia, blood-sugar and cholesterol are generally increased, but not  $\propto \text{H}_2\text{C}_2\text{O}_4$ ; urea remains normal.

R. N. C.

**Intimate mechanism of diabetes from superabundance.** M. WIERZUCHOWSKI, Z. BORKOWSKI, and A. GOSTYNSKA (Compt. rend. Soc. Biol., 1935, 120, 1133—1135).—Absorption by the organs from the blood-stream of continuously-injected glucose in the dog increases with the rate of injection up to the extreme limit of tolerance.

R. N. C.

**Effect of total thyroidectomy on experimental diabetes insipidus in dogs.** W. MAHONEY and D. SHEEHAN (Amer. J. Physiol., 1935, 112, 250—255).

R. N. C.

**Calorigenic action of fat and carbohydrate in pancreatic diabetes.** G. C. RING (Amer. J. Physiol., 1935, 112, 124—129).

R. N. C.

**Effect of equivalent amounts of glucose and starch on glycæmia and glycosuria in diabetics.** M. WISHNOFSKY and A. P. KANE (Amer. J. Med. Sci., 1935, 189, 545—550).—No significant difference was observed.

NUTR. ABS. (m)

**Lipase content of the normal liver and the liver in fatty degeneration.** N. FIESSINGER and A. GAJDOS (Compt. rend. Soc. Biol., 1935, 120, 666—668).—The lipase content of the human liver decreases considerably in fatty degeneration.

R. N. C.

**Pathogenic mechanism of the green diarrhoea of pigeons in avitaminosis.** G. RENOSTO (Boll. Soc. ital. Biol. sperim., 1935, 10, 297—299).—The capacity of strains of *B. coli*, isolated from the intestines of pigeons in avitaminosis-B, to ferment carbohydrates, liberate  $\text{H}_2\text{S}$ , and cause hæmolysis is equal to that of strains from normal pigeons.

R. N. C.

**Structure of the striated muscular fibres in normal and pathological conditions. I. Lipidosis of the striated muscular fibres and localisation of the lipin material in some toxic actions.** A. BASILE (Boll. Soc. ital. Biol. sperim., 1935, 10, 302—304).—Intoxication of guinea-pigs by diphtheria toxin, *B. typhosus*, P, or As provokes a rise of lipins in the striated muscular fibres.

R. N. C.

**Influence of progressive toxæmic liver damage on the glucose tolerance curve.** S. SOSKIN and A. MIRSKY (Amer. J. Physiol., 1935, 112, 649—

656).—The curves obtained in dogs after administration of diphtheria toxin do not show the normal increase in tolerance. The cycle of events following the onset of toxæmia depends on the amount of sugar used; the curve becomes alternately normal and "diabetic" in type.

R. N. C.

**Infantile allergic eczema. II. Serum-lipins; saturation of the fatty acids.** H. K. FABER and D. B. ROBERTS (J. Paediat., 1935, 6, 490—493).—In eczema, serum-fatty acids tend to be less unsaturated than normally.

NUTR. ABS. (m)

**Hyperoxalæmia in acute eczema and dermatitis.** S. SUZUKI (Japan. J. Med. Sci., 1935, 11, 3, 95—97).—A slight hyperoxalæmia occurs.

F. O. H.

**Treatment of hæmorrhagic disorders with vitamin-C.** H. ENGELKES (Lancet, 1935, 229, 1285—1287).—Capillary hæmorrhages are successfully treated.

L. S. T.

**Pathological physiology of infarct. III. Ammonia and lactic acid during necrosis and autolysis.** G. BORGER, H. BAYERLE, T. MAYR, and E. PETERS (Z. physiol. Chem., 1935, 237, 113—120; cf. A., 1935, 1269).—The  $\text{NH}_3$  content of normal and infarct kidney remains fairly const. for 50 hr., whilst that of autolysing kidney steadily increases. The lactic acid levels vary, both that of autolysing and infarct kidney being > normal for the first 2 hr., after which (2—96 hr.) the infarct content alone decreases to normal levels.

F. O. H.

**Non-diabetic ketosis with acidosis.** D. C. DARROW and M. K. CARY (J. Paediat., 1935, 6, 676—694).

NUTR. ABS.

**Ketosis in cows.** G. F. BODDIE (Vet. Rec., 1935, 15, 1539—1546).—Blood-sugar in a normal cow is not increased after parturition; it falls in severe cases of post-parturient dyspepsia. Blood-ketones are slightly increased after parturition; in severe post-parturient dyspepsia there is a considerable increase due to formation of  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{H}$ , which is low in normal animals.

R. N. C.

**Flocculation of sera in distilled water and Henry reaction.** R. O. PRUDHOMME (Compt. rend. Soc. Biol., 1935, 120, 944—946).—Malaria sera contain a substance that is pptd. by  $\text{H}_2\text{O}$ ; it is present in normal serum in smaller quantities, demonstrable by melanin.

R. N. C.

**Pathology of infantile marasmus.** Z. VON GUTACSY (Arch. Kinderheilk., 1935, 105, 43—53).

NUTR. ABS.

**Blood- and cerebrospinal fluid-sugar. Permeability to sugar of the brain-membranes in meningitis.** A. V. TSHERKASSOV and E. E. JOLKVER (Rev. franc. Pediat., 1935, 11, 350—364).

NUTR. ABS.

**Renal elimination of vitamin-C in experimental nephritis.** F. PINOTTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 314—317).—Vitamin-C elimination by the kidneys is increased by intoxication with  $\text{UO}_2(\text{OAc})_2$  or  $\text{HgCl}_2$ , the increase from  $\text{HgCl}_2$  persisting longer.

N. C.

**Uric acid crystals in the blood plasma of a fowl suffering from pyo-nephrosis consequent**

on vitamin-A deficiency. G. SANKARAN (Current Sci., 1935, 4, 314).—A fowl fed during 12 weeks on a diet deficient in vitamin-A had 375 mg. of uric acid per 100 c.c. of plasma (control 8.34 mg.).

F. R. G.

Cerebrospinal fluid in periodic paralysis. G. GUILLAIN, L. ROQUES, and C. RIBADEAU-DUMAS (Compt. rend. Soc. Biol., 1935, 120, 841—842).—The cerebrospinal fluid shows hyperalbuminosis, a slightly positive Pandy reaction, and a broadening of the colloidal benzoin pptn. curve.

R. N. C.

Specific value of crude iron compounds in the treatment of "pine" in cattle and sheep. J. BROWN (Vet. Rec., 1935, 15, 1233—1234).

R. N. C.

Rheumatic disease (osteo-arthritis and allied conditions) in the horse. W. M. MITCHELL (Vet. Rec., 1935, 15, 1501—1507).—A lecture. Vitamin deficiency is the probable cause.

R. N. C.

Rickets due to strontium. (A) Nature of injury to calcifying mechanism. (B) Phosphatase activity and calcification. A. E. SOBEL, J. COHEN, and B. KRAMER (Biochem. J., 1935, 29, 2640—2645, 2646—2650).—(A) With Sr rickets in rats, a marked diminution occurs in *in-vitro* calcifying power of the bones, an injury removed both *in vivo* and *in vitro* by bathing the bone cells in Sr-free fluids. Sr<sup>++</sup> directly inhibits calcification, apparently combining with a factor involved in this process.

(b) No significant difference occurs in the phosphatase activities of bones from rats with Sr- or Ca-rickets, whilst Sr<sup>++</sup> (up to 0.08%) does not influence the hydrolysis by bone-phosphatase preps.; hence the loss of *in-vitro* calcifying power due to Sr<sup>++</sup> is not related to the phosphatase activity.

F. O. H.

Activity of *p*-aminophenylsulphonamide on experimental streptococcal infections in the mouse and rabbit. J. TREFOUEL, (MME.) J. TREFOUEL, F. NITTI, and D. BOVET (Compt. rend. Soc. Biol., 1935, 120, 756—758).—Resistance to hæmolytic streptococci is increased.

R. N. C.

Bordet-Wassermann reaction: inhibiting power of the fraction of the serum precipitated by hydrochloric acid. C. AUGUSTE (Compt. rend. Soc. Biol., 1935, 120, 885—886).—Complement-fixation by syphilitic sera is increased considerably by pptn. with HCl; it is reduced to normal by the return of the pptd. fraction.

R. N. C.

Relation of diet and serum-calcium to tetany in the parathyroidectomised rat. M. M. HOSKINS (Endocrinol., 1935, 19, 453—460).—Rats are protected from tetany by diets with high Ca/P ratios, which keep serum-Ca (I) high. In cases where (I) is low, tetany cannot be correlated closely with the blood-Ca level, and apparently depends on some endogenous factor.

R. N. C.

Thrombo-angiitis obliterans (Buerger) X. Reduction in blood volume following bilateral oophorectomy. M. FRIEDLANDER, N. LASKEY, and S. SILBERT (Endocrinol., 1935, 19, 461—465).—Cholesterol, fibrinogen, and  $\gamma$  are increased.

R. N. C.

Metabolism of tonic and non-tonic muscle. H. SCHONFELDER (Arch. exp. Path. Pharm., 1935,

180, 24—27).—Under anaerobic conditions the lactic acid (I) produced by finely minced muscle from newborn rabbits is increased by 28% by addition of glucose (II), but by only 5% by glycogen (III). With mature muscle, (II) increases (I) by only 7%, whilst (III) increases it by 116%; if the same muscles have been paralysed by section of the nerves 3—4 weeks before, the yield of (I) is increased by 30% by (II), and only by 1% by (III).

J. N. A.

Role of tissue metabolism in the radio-sensitivity of the thymus of the guinea-pig. M. CHEVRE-MONT (Arch. Biol., 1935, 46, 507—598).

Chemical mediation of sympathetic vasodilator nerve impulses. A. ROSENBLUETH and W. B. CANNON (Amer. J. Physiol., 1935, 112, 33—40).

R. N. C.

Water metabolism in normal and hypophysectomised frogs. M. E. JONES and F. R. STEGGERDA (Amer. J. Physiol., 1935, 112, 397—400).

R. N. C.

Colloid model for illustration of biological processes. I. Triple salt effect in the germination of crustacean eggs and with phosphatides. H. G. B. DE JONG, J. VAN DER MEER, and L. G. M. B. BECKING (Kolloid-Beih., 1935, 42, 384—407).—The concn. region of the system KCl-MgCl<sub>2</sub>-NaCl-H<sub>2</sub>O in which the germination of crustacean eggs is possible has been determined. Analogous regularities have been found in the behaviour of a desensitised, EtOH-insol. plant phosphatide as regards stability and reversal of change in these solutions. The biological significance of the results is discussed.

E. S. H.

Role of phosphatides in nutrition. A. K. PICKAT, O. J. KURTSINA, and N. S. ZENIN (Problems of Nutrition, Moscow, 1935, 4, No. 2, 30—37).—Small doses of lecithin (I) had no beneficial effect on the growth of rats receiving also all vitamins. (I) is probably not essential to the diet.

NUTR. ABS. (m)

Nutrient value of cow's milk and of modified milk for various mammals. R. JACQUOT and H. TRIMBACH (Bull. Soc. Sci. aliment., 1934, 22, 134—156; Chem. Zentr., 1935, i, 2553—2554).—Varying levels of utilisation of milk by animals receiving an all-milk diet are discussed. For smaller and more rapidly growing animals cow's milk is deficient in Ca, P, Fe, and lactalbumin (lysine). Lactose is relatively poorly utilised even by calves. Isoenergetic replacement of milk-fat by starch improves growth and increases N retention.

Digestibility of foodstuffs. H. STEUDEL (Z. ges. exp. Med., 1935, 95, 580—588; Chem. Zentr., 1935, i, 2553).—A discussion.

A. G. P.

Influence of rations low in minerals on the composition of the blood and milk of cows, and on the blood of their progeny. J. W. GROENEWALD (Onderstepoort J. Vet. Sci., 1935, 4, 93—165).—The only mineral element, a shortage of which in the ration was reflected in the composition of the blood of the heifers, was P, the blood-inorg. P decreasing from 7.2 to 3.4 mg. per 100 ml. The average composition of the blood-minerals of all the cows except those on low P intake was: Ca 8.4, P

Mg 2.7, K 58.7, Na 302, Cl 314 mg. per 100 ml. Slight depressions occurred in these levels during lactation. The variations in the composition of the rations had no effect on the mineral composition of the milk. In the calves, the blood-Ca was > that of the dam during the first month, and the inorg. P higher during the first 3 months. The K, which was very high in calf's blood at birth, declined rapidly and steadily, reaching the adult level at 10 weeks, whereas for Na the reverse was true.

NUTR. ABS. (m)

Effects of a diet poor in salts on the growth and composition of the incisors of the rat. M. F. CLARKE and A. H. SMITH (Amer. J. Physiol., 1935, 112, 286—293). R. N. C.

Relation between the motor and secretory functions of the human fasting stomach. F. A. HELLEBRANDT (Amer. J. Physiol., 1935, 112, 162—165). R. N. C.

Reserve store of hæmoglobin-producing substances in growing dogs as influenced by diet. F. S. ROBSCHT-ROBBINS and G. H. WHIPPLE (Amer. J. Physiol., 1935, 112, 27—32).—Growing dogs can store hæmoglobin-producing substances on a diet of liver or ox skeletal muscle. R. N. C.

Phytin in human nutrition. R. A. McCANCE and E. M. WIDDOWSON (Biochem. J., 1935, 29, 2694—2699).—Small amounts of phytin (I) can be determined by extraction with HCl, pptn. as the  $\text{Fe}^{\text{III}}$  salt, and determination of the P in the latter after  $\text{H}_2\text{SO}_4\text{-HClO}_4$  incineration. The (I) content of 64 foodstuffs has been determined, in many cases 40—50% of the total P being in the form of (I). Green leaf and stem vegetables and the pulp of fresh and dried fruits contain no (I). When (I) is ingested, 40—60% is excreted unchanged in the faeces. (I)-P constitutes < 5% of the total P of the average diet in this country. J. N. A.

Permeability of frog capillaries to protein. R. E. CONKLIN (Amer. J. Physiol., 1935, 112, 401—411).—The skin capillaries are highly permeable to protein, but normally do not admit protein mols. from the lymph spaces. R. N. C.

Deaminating and urea-forming power of the liver in normal pregnancy; intermediary metabolism. L. HEROLD (Arch. Gynakol., 1935, 159, 166—171).—Compared with normal women, normal pregnant women exhibit a delay in the decline of the free  $\text{NH}_2\text{-N}$  of the blood and a delayed rise in the bound  $\text{NH}_2\text{-N}$  following intravenous injection of 1 g. of glycine. NUTR. ABS. (m)

Effect of restricted diet on deamination in the organism. I. Effect of high-carbohydrate diet. AGNOLI and L. UNTERSTEINER (Arch. Sci. biol., 1934, 20, 474).—Deaminative power is reduced. NUTR. ABS. (m)

Nitrogen metabolism in protein starvation. OUBOT (Compt. rend., 1935, 201, 1044—1046).—In N<sup>o</sup> starvation the relative amount of the various actions excreted is a function of the total N excreted per kg. body-wt. per 24 hr. (i). Thus, as i increases, the proportion of urea also increases at

first rapidly, then more slowly, becoming const. at about 80% of the total N, when i is 400 mg. Conversely the amount of undetermined N falls with increasing i and becomes insignificant at the above val. of i. The nature of the N products excreted is thus determined primarily by the intensity of the oxidation process in the tissues. W. O. K.

Tyrosine metabolism of *Bombyx mori* (silkworm). J. HOLTZMANN (Biochem. J., 1936, 30, 28—30).—There is no need to assume synthesis of tyrosine (I) by the grubs, as the (I) intake in the ingested mulberry leaves exceeds the amount of (I) in the cocoon and contained grub. J. N. A.

Effect of an alkaline reaction and of the physico-chemical environment on the oxidation of uric acid. J. SULA (Compt. rend. Soc. Biol., 1935, 120, 911—915).—Uric acid (I) is oxidised by  $\text{O}_2$  in pure solutions at  $p_{\text{H}} > 7.6$ , the extent of oxidation increasing with  $p_{\text{H}}$ . Oxidation takes place in human serum at  $p_{\text{H}} > 7.6$  only if the (I) concn. is > 3 mg. per litre; otherwise it begins at  $p_{\text{H}}$  8.0. The inhibition is not due to the sp. proteins, since serum-globulins and -albumins and ovalbumin in pure solutions permit oxidation at  $p_{\text{H}}$  7.6. R. N. C.

Absorption of gluten peptone and of glutamic acid introduced into a Vella intestinal loop. G. SARZANA (Boll. Soc. ital. Biol. sperim., 1935, 10, 173—175).—The rate of absorption of gluten peptone in the dog is < that of Witte's peptone, but > that of glutamic acid. R. N. C.

Feeding experiments with mixtures of highly purified amino-acids. VII. Dual nature of the "unknown growth essential." M. WOMACK and W. C. ROSE. VIII. Isolation and identification of an essential amino-acid. R. H. MCCOY, C. E. MEYER, and W. C. ROSE (J. Biol. Chem., 1935, 112, 275—282, 283—302; cf. A., 1935, 113).—VII. The unknown substance essential for growth is a mixture of isoleucine (I) and a substance (II) less sol. in  $\text{Bu}^{\text{O}}\text{H}$  than is (I).

VIII. The isolation of pure (II) from blood-fibrin is described. (II) is  $\alpha$ -amino- $\beta$ -hydroxybutyric acid, m.p. 255—257° (decomp.) (N-benzoate, m.p. 151°, picrate m.p. 139.5—141°), which with red P and HI gives  $d$ - $\alpha$ -aminobutyric acid. An otherwise adequate diet must contain < 0.6% of (II) for max. growth. Bromination of methoxyethylmalonic acid (Palomaa *et al.*, A., 1931, 710) followed by heating at 150° gives  $\alpha$ -bromo- $\gamma$ -methoxybutyric acid, b.p. 145—148°/5 mm., which, with conc. aq.  $\text{NH}_3$  gives  $\alpha$ -amino- $\gamma$ -methoxybutyric acid (III), m.p. 224—225° (decomp.). (III) boiled for 3 hr. with 48% HBr gives  $\alpha$ -amino- $\gamma$ -hydroxybutyric acid, which has no growth-promoting effect. Hydroxyglutamic acid and citrulline are not essential constituents of food. W. McC.

Amino-acid metabolism. I. Fate of glycine,  $dl$ - and  $d$ -alanine in the normal animal. J. S. BUTTS, M. S. DUNN, and L. F. HALLMAN (J. Biol. Chem., 1935, 112, 263—274; cf. Wilson *et al.*, A., 1930, 367).—Those  $\text{NH}_2$ -acids, fed to male rats, favour the production of glycogen,  $d$ - being twice as effective as  $dl$ -alanine (I), which is much more effective than is glycine. The ketone-suppressing activities

of the acids are in the same order. Probably the *l*-component of (I) has no effect on glycogen production.

W. McC.

**Model experiment in respiration using croton oil in the presence and absence of carotenoids.** R. RETOVSKY (Bull. Soc. Chim. biol., 1935, 17, 1614—1628).—A study is made of the autoxidation of croton oil in the presence and absence of carotenoids (I). The length of the period of incubation  $\propto$  the intensity of the light, and is shorter in absence of (I). With daylight the course of the autoxidation in absence of (I) eventually follows that in presence of (I).

A. L.

**Behaviour in the body of peat extracts (humic substances) after oral or intravenous administration.** R. SCHMID (Biochem. Z., 1935, 281, 329—332).—Humic substances, orally administered to man, were absorbed to a small extent and led to an increase in the normal urinary excretion of humic substances. 1% aq. solutions injected intravenously into rabbits were lethal but smaller concns. were tolerated.

P. W. C.

**Action of choline and other substances in the prevention and cure of fatty livers.** C. H. BEST and H. J. CHANNON (Biochem. J., 1935, 29, 2651—2658).—The influence of dietary constituents (*e.g.*, protein) on the fat content of the liver and the correlation and significance of available data are discussed (cf. A., 1935, 244, 524, 890).

F. O. H.

**Influence of caseinogen content of diets on the nature of "cholesterol" fatty liver.** A. W. BEESTON, H. J. CHANNON, and H. WILKINSON (Biochem. J., 1935, 29, 2659—2667).—In rats fed on a diet containing 20% of fat, 2% of cholesterol, and only small amounts of choline (I), variations in the protein (II) content cause marked changes in the contents of the various lipins in the resulting fatty livers. Dosage with (I) (80 mg. per day per rat) largely prevents deposition of glycerides, but not that of cholesteryl esters. (II), but not (I), increases liver-phosphatides.

F. O. H.

**Metabolism of polycyclic compounds. I. Production of dihydroxydihydroanthracene from anthracene.** E. BOYLAND and A. A. LEVI (Biochem. J., 1935, 29, 2679—2683).—Rats fed on a diet containing anthracene excrete 1:1:2-dihydroxy-1:2-dihydroanthracene (I),  $C_{14}H_{12}O_2$ , m.p. 160—161°,  $[\alpha]_D^{20}$  —154° in  $COMe_2$ , —100° in dioxan (diacetate,  $C_{18}H_{16}O_4$ , m.p. 149°,  $[\alpha]_D^{20}$  —375.5° in  $C_6H_6$ , —362° in dioxan; dibenzoate,  $C_{28}H_{20}O_4$ , m.p. 138°,  $[\alpha]_D^{20}$  —452°), yielding  $\alpha$ -anthrol on boiling with dil. acid. Hydrogenation of (I) yielded dihydroxytetrahydroanthracene (II), m.p. 149°,  $[\alpha]_D^{20}$  +99° in dioxan (diacetate, m.p. 91°,  $[\alpha]_D^{20}$  —74° in dioxan). Oxidation of (II) gave 3- $\beta$ -carboxyethyl-2-naphthoic acid (III), m.p. 210° (decomp.). On boiling with dil. acid, (II) affords 2-ketotetrahydroanthracene. Rabbits fed on the same diet excreted a *d*-form of (I), m.p. 184°,  $[\alpha]_D^{20}$  +16° in dioxan (diacetate, m.p. 184°,  $[\alpha]_D^{20}$  +309° in dioxan). Hydrogenation yielded a dihydroxytetrahydroanthracene, m.p. 162°,  $[\alpha]_D^{20}$  —1° (diacetate, m.p. 84°,  $[\alpha]_D^{20}$  —3°), which on oxidation yielded (III). Rats probably excrete 1(or 2)-hydroxy-1:2-dihydroanthracene in addition to (I).

J. N. A.

**Comparison of the actions of certain dietary lipins in producing acetonaemia.** R. LECOQ and R. CAREL (Compt. rend., 1935, 201, 1154—1156).—Ingestion of castor oil in man, dog, rabbit, and rat is followed by a rise of the total ketones in the blood and especially of  $\beta$ -hydroxybutyric acid, similar to that following administration of butter-fat or olive oil.

W. O. K.

**Effect of ingested fat on the sterol metabolism of the white rat.** H. C. ECKSTEIN and C. R. TREADWELL (J. Biol. Chem., 1936, 112, 373—378).—Rats on diets supplemented with soya-bean or maize oils showed increased concns. of sterols in their livers which were not due to mobilisation from the tissues. The supplements appear to increase the difference between faecal and ingested sterols.

H. D.

**Fat metabolism in fishes. VIII. Changes in the fat of ripening salmon eggs.** J. A. LOVERN (Biochem. J., 1936, 30, 20—24).—At all stages of the ripening the degrees of unsaturation of the  $C_{20}$  and  $C_{22}$  acids are higher than in the depot fat, and two possible explanations are discussed. During ripening there is a marked rise in the amount of  $C_{18}$  acids together with a fall in the mean unsaturation of this group.

J. N. A.

**Dicarboxylic acids as intermediates in the biological degradation of normal saturated fatty acids and their derivatives.** P. E. VERKADE and J. VAN DER LEE (Rec. trav. chim., 1935, 54, 893—898).—Mainly a priority claim against Flaschen-träger *et al.* (A., 1935, 1151) and a recapitulation of the authors' views on biological oxidation of fatty acids (cf. A., 1933, 417; 1935, 1273, etc.).

J. W. B.

**Fat metabolism. VII.  $\beta$ -Oxidation of normal saturated dicarboxylic acids administered *per os*.** P. E. VERKADE, J. VAN DER LEE, and A. J. S. VAN ALPHEN (Z. physiol. Chem., 1935, 237, 186—190; cf. A., 1934, 1393).—Suberic and adipic acid were detected in the urine of a dog to which Na sebacate had been administered; similarly azelaic and pimelic acids were found after administration of Na undecanedicarboxylate. The incidence of  $\beta$ -oxidation is thus established.

H. W.

**Absorption in phloridzinised animals. I. Absorption of fats.** G. SARZANA (Boll. Soc. ital. Biol. sperim., 1935, 10, 197—198).—Fat excretion in the faeces of pigeons given high doses of phloridzin increases, but the % of fat absorbed is not displaced considerably.

R. N. C.

**Spontaneous ketonuria and ketonuria from administration of stearic acid in normal subjects and hepatic patients.** L. CANNAVÒ (Boll. Soc. ital. Biol. sperim., 1935, 10, 180—182).—Ketonuria is min. in normal subjects on a mixed diet, but is increased to non-pathological vals. by ingestion of Na stearate (I). It is increased in patients with hepatic parenchymatic trouble and after carbohydrate-rich food. (I) acts according to the type of hepatic lesion; ketonuria appears in local lesions where large parts of the parenchyma are functioning normally, and in more extensive lesions associated with cellular degeneration. The keto-acids are mostly eliminated as  $\beta$ -hydroxybutyric acid. (I) provokes in

most cases an increase in total org. acids in the urine, but there is no relation existing between ketonuria and aciduria.

R. N. C.

**Fat and calcium metabolism. III. Influence of butter and margarine on the faecal output of calcium in full-grown rats.** A. WESTERLUND (Lantbrukshögsk. Ann., 1935, 2, 51—70).—In rats on low or moderate Ca diets the faecal but not the urinary Ca excretion was much greater in those receiving margarine as sole source of fat than in those receiving butter.

NUTR. ABS. (m)

**Glycogen formation from lower fatty acids with an even number of carbon atoms. III. Fate of acetoacetic acid in the animal organism.** R. STÖHR (Z. physiol. Chem., 1935, 237, 165—170; cf. A., 1933, 1193; Snapper *et al.*, A., 1929, 94).—The respiration of surviving rat's liver and kidney is restricted and that of diaphragm is increased by addition of  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{H}$ . The glycogen content of the livers of fasting rats is not increased by feeding  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{Na}$  and  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{Et} + \text{glucose}$ .

W. McC.

**Ketosis. VII. Quantitative studies on  $\beta$ -oxidation. Glycogen formation from various fatty acids.** H. J. DEVEL, jun., J. S. BUTTS, L. F. HALLMAN, and C. H. CUTLER (J. Biol. Chem., 1935, 112, 15—23).—Liver-glycogen (I) of fasting male rats rises approx. 100% following the ingestion of the Na salts of fatty acids with an odd no. of C. No such rise follows the ingestion of the Na salts of the even acids. Trivalerin causes an increase in (I) > that caused by tributyrin; Wesson oil causes no increase. Oleic acid does not cause an increased (I) formation, but nonoic acid does, indicating that fissure of the double linking is not a primary change in the metabolism of oleic acid.

F. A. A.

**Effect of administration of fat on blood-sugar.** H. SCHONFELD (Monatsschr. Kinderheilk., 1935, 61, 432—435).—Olive oil caused a fall in blood-sugar in fasted children and rabbits, but when fasted for 24—48 hr. after the administration, hyperglycaemia occurred.

NUTR. ABS. (m).

**Conversion of fat into sugar.** W. HAARMANN (Biochem. Z., 1935, 282, 406—418; cf. A., 1933, 1193). The production of lactic acid (I) by surviving organs (skeletal and heart muscle, liver, brain of rabbit, dog, pig) is increased (optimal with 0.005—0.01M solutions) by addition of  $\text{Pr}^n\text{CO}_2\text{Na}$  and a  $\beta$ -hydroxybutyrate (II), the increases being > equiv. to the corresponding decrease in the degradation of carbohydrate. When glucose is added this degradation is increased by addition of  $\text{Pr}^n\text{CO}_2\text{Na}$  and to a lesser extent by that of (II) but the production of (I) from carbohydrate is usually decreased.

W. McC.

**Fat metabolism. IV. Acetoacetic acid breakdown in the kidney.** J. H. QUASTEL and A. H. M. HEATLEY (Biochem. J., 1935, 29, 2773—2786).—The rate of  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{H}$  (I) by the kidney cortex *in vitro* under the conditions previously described (1935, 1408) is investigated. The anaerobic breakdown of (I) is similar to the aerobic breakdown in the presence of  $\text{CN}^-$  or glucose, and is

accelerated by glutathione but not by ascorbic acid. The aerobic breakdown of (I) is inhibited by salts of  $\text{AcOH}$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{PrCO}_2\text{H}$ , and malonic acid (II). The inhibition by (II) may be neutralised by Na fumarate and lactate and by alanine. The aerobic inhibition by  $\text{BzOH}$  with guinea-pig kidney is much > that with rat kidney.  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{H}$  and  $\text{H}_3\text{AsO}_3$  inhibit strongly under aerobic conditions. Mincing the kidney decreases the breakdown of (I). Production of  $\beta$ -hydroxybutyric acid accounts chiefly for the anaerobic decomp. of (I) and for about 1/3 to 1/4 of the aerobic decomp.

H. D.

**Relation of the spleen to formation of glycogen in the liver; rate of absorption of glucose and lactic acid.** M. KERLY and C. REID (J. Physiol., 1935, 84, 302—314).—Glycogen (I) formation in the liver in normal or splenectomised cats under chloralose takes place with equal readiness when glucose (II) or lactic acid (III) is injected into a vein or absorbed from the intestine. Unanæsthetised normal and splenectomised rats form (I) in the liver after administration of (II) or (III) by stomach tube. Anæmia after splenectomy reduces (I) formation. (I) formation after feeding with (III) is < that after (II) and less regular. Acetylcholine and choline chloride do not increase (I) formation. Cats absorb 1.1N-(II) and -(III) from the intestine at the same mol. rate, but rats absorb 50—60% (II) from the stomach 6—7 times as fast as 10—17% (III); the rate of (III) absorption is not increased by the use of more conc. solutions, and the unabsorbed fraction is mostly found in the stomach, suggesting that control by this organ is responsible for the different rates of absorption in cats and rats.

R. N. C.

**Cyclic changes in liver-glycogen of rats after removal of the adrenals.** G. ÅGREN (Biochem. Z., 1935, 281, 367—369).—The periodic changes in the liver-glycogen level normally observed in rats are not obtained after adrenalectomy.

P. W. C.

**Functional and anatomical state of the endocrine pancreas, and its insulin content, in dogs subjected to prolonged fasting.** E. AUBERTIN, A. LACOSTE, R. SARIC, and E. CASTAGNOU (Compt. rend. Soc. Biol., 1935, 120, 1107—1110).—The alimentary blood-sugar curve in dogs subjected to prolonged fasting resembles that of diabetic dogs, but a subsequent hypoglycaemia is observed. The insulin (I) of the pancreas is > in normal animals.

R. N. C.

**Comparison of the influence of fasting on the tolerance to glucose and galactose.** E. M. MACKAY, H. C. BERGMAN, and R. H. BARNES (Amer. J. Physiol., 1935, 112, 591—594).—The blood-sugar curve in the rabbit following administration of galactose (I) is not influenced by fasting, whereas that after glucose (II) is lower. The alimentary hyperglycaemia produced by (I) is not affected by previous administration of (II), nor is the blood-sugar curve of a second dose of (I) essentially different from that of the first. The data support the theory that metabolism of (I) and (II) is fundamentally different.

**Rate of absorption of glucose from the intestinal tract of the rabbit.** E. M. MACKAY, H. C.

BERGMAN, and R. H. BARNES (Proc. Soc. Exp. Biol. Med., 1934, 32, 323—326).—The rate of absorption decreases with time after the glucose is administered, and is related to the amount of glucose available for absorption.  
R. N. C.

Origin of the specific dynamic action of intravenous fructose at the three levels of assimilation in a normal dog. M. WIERZUCHOWSKI (Compt. rend. Soc. Biol., 1935, 120, 1127—1130).—Fructose (I) assimilation, fructolysis, and fat formation are dependent on the levels of assimilation, whilst the sp. dynamic action and oxidation quotient of (I) are independent of these and hardly variable. The sp. dynamic action hence originates from none of the above factors.  
R. N. C.

Utilisation of carbohydrate during aerobic activity in isolated frogs' muscle. C. L. GEMMILL (Amer. J. Physiol., 1935, 112, 294—300).—The average utilisation of carbohydrate by muscles stimulated at regular short intervals for long periods in oxygenated Ringer's solution accounts for only 42% of the total energy exchange as calc. from the  $O_2$  consumption, so that other material besides carbohydrate is oxidised to supply the energy for aerobic contraction of muscle.  
R. N. C.

Carbohydrate changes following recovery from muscular contraction. J. SACKS and W. C. SACKS (Amer. J. Physiol., 1935, 112, 565—572).—The lactic acid (I) formed during anaerobic activity in the muscle diffuses into the blood during recovery, no glycogen (II) being formed. The "Meyerhof cycle" is of no significance in recovering mammalian muscle. Hexose phosphate formed during contraction is resynthesised directly to (II) during recovery, at a practically const. rate. Further evidence is shown that the sole function of phosphocreatine hydrolysis is the maintenance of const.  $p_H$  in the fibre. The data confirm the theory that the energy of muscular activity is derived primarily from oxidative reactions.  
R. N. C.

Hypothalamic nuclei in the regulation of chloride and sugar metabolism. F. H. LEWY and F. K. GASSMAN (Amer. J. Physiol., 1935, 112, 504—510).  
R. N. C.

Hexose monophosphate changes in muscle in relation to rate of stimulation and work performed. R. E. FISHER and G. T. CORI (Amer. J. Physiol., 1935, 112, 5—14).—The work output and lactic acid (I) formation by rapidly-stimulated, isolated frogs' gastrocnemii are the same as by slowly-stimulated muscle, but hexose monophosphate (II) formation is increased, indicating an increased breakdown of glycogen (III); a short tetanus causes an even greater increase. (I) and (II) formation in unloaded muscle is < in muscles attached to a tension spring. (II) formation is not directly related to the work performed. The increase per mg. of (I) formed is greatest in contractions without load, and decreases as the work output increases; it is concluded that a muscle exhibits max. working efficiency with reference to (III) expenditure if it is producing max. tension at a slow rate of stimulation. Short tetani against a spring permitting considerable con-

traction do not produce delayed (I) or (II) formation, but after-formation of (I) is observed.  
R. N. C.

Aerobic and anaerobic production of lactic acid and degradation of carbohydrate in tissues. W. HAARMANN and H. BRINK (Biochem. Z., 1935, 282, 419—433).—Production of lactic acid (I) and degradation of carbohydrate in organs (heart and skeletal muscle, brain of ox, dog, rabbit) are differently affected by  $O_2$ , being restricted in some cases and unaffected or increased in others. In some case the production of (I) after addition of glucose (II) and glycogen (III) is decreased in presence of  $O_2$ . Usually the degradation of carbohydrate in absence of  $O_2$  is more than equiv. to the amount of (I) produced. Oxidation of (II) and (III) in some organs is decreased by  $O_2$ , but is unaffected in others. Production by the organs of (I) from  $AcCO_2H$  and  $AcCHO$  is not prevented by  $O_2$  and that from fumaric and succinic acid (IV) is increased by  $O_2$  [no (I) is produced anaerobically from (IV)].  
W. McC.

Aerobic and anaerobic disappearance of lactic acid in tissues. W. HAARMANN and H. BRINK (Biochem. Z., 1935, 282, 434—440).—The amount of added lactate which disappears from pulped tissues in 3 hr. is the same whether or not  $O_2$  is present.  
W. McC.

Vascular balance of lactic acid in the organs of the dog, after saturation of the organism with glucose. M. WIERZUCHOWSKI and T. CHMIELEWSKI (Compt. rend. Soc. Biol., 1935, 120, 1131—1133).—Lactic acid is discharged into the blood-stream from the motor apparatus, head organs, and portal vein system, and is absorbed in small quantities by the liver.  
R. N. C.

Resynthesis of phosphocreatine after muscular contraction. J. SACKS and W. C. SACKS (Amer. J. Physiol., 1935, 112, 116—123).—Removal of lactic acid (I) and resynthesis of phosphocreatine (II) proceed *pari passu* in the early stages of recovery of the muscle of the cat and the rabbit after contraction. The amounts of (I) removed and (II) synthesised in a given time are equiv. (II) resynthesis from its hydrolysis products after contraction takes place at a rate much < that required by Lundsgaard's hypothesis. Reconversion of hexose phosphate-P into (II)-P is slow in the early stages of recovery.  
R. N. C.

Liver-ketogenesis and its auto-regulation. S. LEITES and A. I. ODINOV (Biochem. Z., 1935, 282, 345—361).—In rabbit's liver pulp kept at 37—38° for 24 hr. autoxidation produces  $CH_3Ac\cdot CO\cdot H$  (I) and  $\beta$ -hydroxybutyric acid (II). Ketogenesis is more pronounced in the liver pulp of fasting than in that of non-fasting rabbits. With non-fasting rabbits production of (I) is optimal at  $p_H$  5.6 and of (II) at 7.0, whilst with fasting rabbits the val. for (I) and (II) is 5.6. When the amount of preformed ketone in the pulp is low, ketogenesis is > when it is high.  $Pr^oCO_2H$  added to the pulp produces (II) if ketogenesis was previously slight. Addition of  $NaOAc$  and  $AcCO_2Na$  has no effect on ketogenesis. These results indicate that the intermediate products of fat metabolism directly control ketogenesis in the liver to an extent dependent on that of previous

ketogenesis. The auto-regulation also depends on the glycogen content.

W. McC.

**$\alpha$ -Glycerophosphoric acid and brain metabolism.** R. E. JOHNSON (Biochem. J., 1936, 30, 33—42).—In the presence of  $\text{Na}_4\text{P}_2\text{O}_7$  (I) the extra  $\text{O}_2$  uptake by pigeon's brain tissue *in vitro* due to the addition of  $\alpha$ -glycerophosphate (II) is additive to that due to lactate (III). (I) increases the rate of disappearance of (II); (III) has little effect. There is no interaction between  $\text{AcCO}_2\text{H}$  and (II) with or without added (I), so it is concluded that the Embden-Meyerhof scheme does not apply to pigeon's brain tissue. The 2:4-dinitrophenylhydrazones of  $\text{AcCHO}$  and of a compound containing probably 6 C were isolated from the reaction products of brain with (II).

H. D.

**Role of glutathione in anaerobic tissue glycolysis.** A. GEIGER (Biochem. J., 1935, 29, 811—823).—Aq. KCl extracts and suspensions of muscle, brain, liver, and heart of rats, dialysed free from glutathione (I), produced no lactic acid (II) from glucose (III) or  $\text{AcCHO}$ , but did so if glycogen (IV) was the substrate. Addition of reduced (I) caused (II) formation from (III) and  $\text{AcCHO}$ , but slightly inhibited that from (IV). Oxidised (I) inhibited (II) formation from (III),  $\text{AcCHO}$ , and (IV). Inhibition of glycolysis by oxidising agents is probably due to the formation of oxidised (I). Borate inhibits glycolysis by brain, the effect being counteracted by  $\text{CaCl}_2$ . Probably inorg. P is not essential for glycolysis.

H. D.

**Intermediate metabolism of internal secretory glands. IV. Proteolysis and ammonia formation.** S. EPSTEIN and E. MIMA (Biochem. Z., 1935, 281, 339—344).—The proteolytic activity and  $\text{NH}_3$  formation in the thyroid, thymus, adrenal, and pancreatic glands were investigated. Proteolysis was very feeble (except with the pancreas), but was more marked at acid reactions.

P. W. C.

**Nitrogen metabolism of pre-school children.** L. C. KUNG and W. Y. FANG (Chinese J. Physiol., 1935, 9, 375—381).—In children on a controlled diet supplemented with soya-bean milk or cow's milk, the N intake and retention were 0.47—0.53 and 0.046—0.140 g. per kg., respectively; with a freely chosen diet the vals. were 0.39—0.56 and 0.030—0.064.

H. G. R.

**Chemical changes in metabolism in severe malnutrition in infants. V. Nitrogen metabolism.** L. GAROT, R. VIVARIO, and (Mlle.) COMHAIRE (Rev. franç. Pédiat., 1935, 11, 1—36).—Absorption of protein in malnutrition is little altered, the recovery of N from the faeces being < 20% of the intake. N retention is often increased in spite of stationary body-wt. Excretion in the early stages is normal, but in more severe cases the partition of urinary N is altered. Urea-N falls below 60% of the total,  $\text{NH}_3$ -N is almost absent, and  $\text{NH}_2$ -acid and residual N are greatly increased. Possibly intermediary metabolism is deranged.

NUTR. ABS. (m)

**Phosphorus metabolism of invertebrate nerve.** G. L. ENGEL and R. W. GERARD (J. Biol. Chem., 1936, 112, 379—392).—The P of the nerves of

*Homarus americanus* was determined as inorg., arginine (I), adenylypyrophosphate (II), and stable (resistant to 7 min. acid hydrolysis) fractions. The changes in these fractions during recovery in  $\text{O}_2$  after dissection are interpreted as being due to the reaction:  $(\text{II}) + 2 (\text{I}) \rightarrow 2 (\text{I}) \text{ phosphate} + \text{adenylic acid}$ . If the time of dissection was long the synthesis of (I) phosphate was > the apparent breakdown of (II), due probably to the re-synthesis of (II) at a later stage. During anoxia extensive hydrolysis of (II) and (I) phosphate occurs; on aerobic recovery from anoxia all the (I) phosphate is re-formed in 5 hr. and 2/3 of the (II) in 1 hr.

H. D.

**Minimum endogenous sulphur metabolism: magnitude, origin, character.** R. RAZAFIMAHERY (Ann. Physiol. Physicochim. biol., 1935, 11, 261—300).—Administration to pigs, rats, rabbits, and dogs of a carbohydrate diet sufficient for energy requirements but deficient in N and S led to a continual loss of N and S from the body. The N:S ratio of the negative balance was always different from that found in the tissues, being higher in the dog and rabbit and lower in the rat and pig. When the total energy expenditure was lowered the loss of both N and S per unit of body-wt. was also lowered. The partition of S between faeces and urine differed from that of N, the gut excreting a higher proportion of S than N. In the dog the faecal S was 66% of the total output, in the rat 50, in the rabbit 33, and in the pig 20%. 30—50% of urinary S was neutral S. In all species observed about 15% of the total acid S consisted of conjugated S; it persisted in the urine even with a protein-free diet.

NUTR. ABS. (m)

**Sulphur metabolism. I. Absorption and excretion of flowers of sulphur.** J. H. KELLER-MANN (Onderstepoort J. Vet. Sci., 1935, 4, 199—228).—The rates of absorption and excretion of S flowers, when fed to rats or sheep, were relatively low. When the S was removed from the ration there was a very marked lag before the urinary inorg.  $\text{SO}_4$  returned to its normal level, and also a long retention of S in the digestive tract. When the basal ration was relatively high in easily available S the absorption of the S flowers was low and vice versa, and thus the level of the food-S may control the toxic level of S flowers when added to the ration.

NUTR. ABS. (m)

**Continuous nitrogen and mineral balances during pregnancy, puerperium, and lactation.** H. A. HUNSCHER, F. COPE, H. R. STERNBERGER, B. N. ERICKSON, and I. G. MACY (Proc. Amer. Inst. Nutrition, J. Nutrition, 1935, 9, No. 6, Suppl., 13—14).—During the latter half of pregnancy in a healthy woman the mean daily intakes were: Ca 3.1, Mg 0.6, Na 5.0, K 6.6, N 19.0, P 2.7, Cl 7.7, S 1.5 g., and the corresponding daily retentions: 0.37, 0.11, 0.56, 1.40, 3.06, 0.26, 0.60, and 0.34 g. During the first 53 days of lactation the daily balances were often negative; the averages were: Ca -0.48, Mg -0.03, Na +0.47, K +0.87, N -0.56, P -0.37, Cl +0.30, S -0.22 g.

NUTR. ABS. (m)

**Calcium, phosphorus, and nitrogen retention of rats on soya bean-egg powder and whole milk powder diets.** E. REID (Chinese J. Physiol., 1935,

9, 307—313).—Soya bean-egg powder promotes Ca and P retention equal to, and N retention and digestibility >, that of whole milk powder. H. G. R.

**Composition and action on calcium metabolism of Ah-Chiao (donkey-skin) glue and commercial gelatin.** T. G. NI (Chinese J. Physiol., 1935, 9, 329—338).—Donkey-skin glue contains N 16.49, ash 0.92, Ca 0.099, lysine 6.2—7.0, arginine 7, lysine 0.41—2.19, and cystine 0.15%. Donkey-skin glue, pure gelatin, and glycine all increase the absorption and retention of Ca. H. G. R.

**Serum-calcium response to ingested calcium.** S. FREEMAN, E. R. KANT, and A. C. IVY (J. Biol. Chem., 1935, 112, 1—7).—The serum-Ca of fasting adults is raised 5—6% 2 hr. after ingestion of 2.3 g. of  $\text{CaCl}_2$  or 10 g. of Ca gluconate (I). Daily ingestion of  $\text{CaCl}_2$  for one month before the experiment does not affect this response. In dogs the serum-Ca response increases with Ca dosage, and  $\text{CaCl}_2$  produces a greater max. response than (I), but the increase produced by (I) persists longer. F. A. A.

**Magnesium deficiency in animals. VII. Effects of magnesium deprivation, with a superimposed calcium deficiency, on the animal body, as revealed by symptomatology and blood changes.** H. G. DAY, H. D. KRUSE, and E. V. MCCOLLUM (J. Biol. Chem., 1936, 112, 337—359; cf. A., 1934, 1253).—Dogs on a diet deficient in Mg and Ca show decreases in serum-Ca, -Mg, -alkali reserve, - $p_{\text{H}}$ , and -inorg. P, and erythrocyte vol. and increases in blood-Cl, -fibrinogen, and -non-protein-N, and no changes in serum-Na, -K, -lipins, -bile pigments, -albumin, and -globulin. H. D.

**Metabolism of inorganic substances in the liver of calves during foetal development. I. Iron, phosphorus, and calcium.** Z. GRUZEWSKA and M. G. ROUSSEL (Ann. Physiol. Physicochim. biol., 1935, 11, 176—198).—There appears to be a local reserve of Fe in the foetal liver; the content is at a min. at 6—7 months, rising suddenly at 8½—9 months. The P content (chiefly org.) at about the 4th month is approx. 0.9%; it then decreases throughout gestation, at first rapidly, then more slowly. The Ca content showed only small variations throughout development. NUTR. ABS. (m)

**Disappearance of digestive inhibition with the repetition of exercise.** F. A. HELLEBRANDT, E. BROGDON, and S. L. HOOPES (Amer. J. Physiol., 1935, 112, 442—450).—The inhibition of HCl secretion disappears with the repetition of all but extreme grades of work. It disappears also in extremely severe work when the response has been conditioned. R. N. C.

**Some immediate physiological effects of reduced cooling powers on human subjects.** D. H. K. LEE and A. G. MULDER (J. Physiol., 1935, 84, 279—295).—Exposure in the post-absorptive state to high temp. in dry or humid atm. causes similar responses. Respiratory changes become marked after 3 hr. Alveolar  $\text{CO}_2$  tension falls only after the respiratory vol. has increased. Urinary acid excretion is lowered from the 3rd to the 6th hr.  $\text{CO}_2$  in cutaneous venous blood from the forearm

falls before alveolar  $\text{CO}_2$  tension, probably due to increased  $\text{CO}_2$  excretion through the skin; the fall may be increased when the tension falls. The evidence for a true arterial alkalemia is not conclusive. Blood-lactate is not increased. After ingestion of food the response in dry atm. is > that in humid atm. R. N. C.

**Nervous system and remote action of ultra-violet rays.** G. VIALE and E. RONCALLO (Boll. Soc. ital. Biol. sperim., 1935, 10, 311—314).—Irradiation of the normal rabbit's foot depresses blood-sugar, but scarcely affects it in the denervated foot. R. N. C.

**Diuresis associated with direct stimulation of the pituitary.** W. R. INGRAM and R. W. BARRIS (Endocrinol., 1935, 19, 432—440). R. N. C.

**Comparative study of sodium chloride and blood pressure changes induced by adrenal insufficiency, trauma, and intraperitoneal administration of glucose.** W. M. PARKINS, A. R. TAYLOR, and W. W. SWINGLE (Amer. J. Physiol., 1935, 112, 581—590; cf. A., 1935, 1422). R. N. C.

**Comparative values of butter and margarine in medical nutrition.** S. BADILKES, E. EINHORN, V. KUDASCHEVITSCH, and V. SIKOV (Arch. Verdauungskrankh., 1934, 56, 293—306; Chem. Zentr., 1935, i, 2694). R. N. C.

**Physiological action of silage on the digestive process of farm animals.** A. KRATINOV (Probl. Tierzucht, 1933, 5, 18—25; Bied. Zentr., 1935, A, 5, 615).—Silage stimulates the gastric and salivary glands of cows, sheep, and pigs and induces changes in the composition of digestive juices, whereby digestion is improved. A. G. P.

**Influence of ingestion of raw pancreas on the blood-lipins of completely depancreatized dogs maintained with insulin.** I. L. CHAIKOFF and A. KAPLAN (J. Biol. Chem., 1935, 112, 155—165).—The blood-lipin level is lowered soon after pancreatectomy, but addition of raw pancreas to the diet increases it to a val. > the normal, which is maintained as long as the tissue is supplied. Ingestion of raw pancreas after a low lipin level has been established causes a rapid and pronounced rise in all lipin constituents and fatty acids, particularly the cholesteryl esters. J. N. A.

**State of bismuth in body-fluids and tissues.** P. J. HANZLIK and A. P. RICHARDSON (J. Pharm. Exp. Ther., 1935, 55, 447—463).—Electromigration experiments show that the Bi of  $\text{NaBiO}_3$ ,  $\text{Na}_2\text{BiI}_5$ , and Na Bi tartrate and thioglycollate (I) exists in the electronegative state in aq., glycol, or sucrose solutions, in the presence of salt and of acidity or alkalinity according to the Bi compound, in urine, blood, and liver-tissue *in vitro*, and in the urine, plasma, and liver of rabbits after intramuscular injection of toxic and fatal doses. The  $\text{BiI}_5$  ion exists as such in both solutions and body-fluids. Bi of  $\text{BiOCl}$  and Bi hydroxysalicylate in aq. suspension migrates electropositively in traces only, but in the presence of salt and the above body-fluids and tissues *in vitro*, and after intramuscular injection, the Bi is strongly electronegative. Bi always exists in the

electronegative state in the body, the originally electro-positive ions being transformed slowly into electro-negative complexes by the action of salts. Blood-Bi is mostly in plasma solution, only traces occurring in the corpuscles; the highest concn. of plasma-Bi is obtained after administration of (I). R. N. C.

**Incidents and toxic accidents of calcium intravenotherapy.** L. TOCCO (Boll. Soc. ital. Biol. sperim., 1935, 10, 348—350).—The disturbances produced during Ca therapy, or immediately after, are the result of rapid reaction or saturation of the blood with Ca, and have no connexion with the toxic effects sometimes encountered, which are probably due to micro-crystals present in the Ca solution, or produced by contact with the blood. R. N. C.

**Effect of potassium and calcium on the contractions of mammalian skeletal muscle.** A. M. BAETJER (Amer. J. Physiol., 1935, 112, 147—151). R. N. C.

**Effect of potassium and calcium ions on the blood-sugar.** K. KIYOHARA, M. MORITA, and S. MUTA (Compt. rend. Soc. Biol., 1935, 120, 1011—1014).—Perfusion of the isolated pancreas of the dog with blood containing KCl or CaCl<sub>2</sub> does not affect blood-sugar (I). Both increase (I) in rabbits when injected intravenously; the increase is not affected by atropine, and is not reduced after double adrenalectomy. R. N. C.

**Biochemistry of copper. XI. Pigmentation of skin and hair.** U. SARATA. XII. Beneficial effect on blood-transfusion. M. ITIZYO (Japan. J. Med. Sci., 1935, II, 3, 79—84, 99—113).—XI. The Cu content of non-pigmented skin of cats and dogs (approx. 0.0004% of the dry wt.) is < that of pigmented skin. This fact, together with the increase in oxidation of *l*-3:4-dihydroxyphenylalanine by skin extracts due to certain concns. of Cu (A., 1931, 1186), indicate that Cu is concerned with melanin formation. XII. Blood-regeneration due to blood-transfusion in hæmorrhagic rabbits is accelerated by addition of Cu (0.6—2.0 mg. per kg. body-wt.), but not of Mn, Fe, Co, or Ni, to the transfused blood. F. O. H.

**Effect of fluorine on the phosphatase content of plasma, bones, and teeth of albino rats.** M. C. and E. M. LANTZ (J. Biol. Chem., 1935, 112, —311; cf. Phillips, A., 1932, 1278).—Feeding of harmful doses of NaF and injection of doses sufficient to cause acute poisoning have no significant effect on the phosphatase content of their plasma, bones, and teeth. W. McC.

**Effect of ammonia on acid-base equilibrium.** VENULET, F. GOEBEL, and R. TISLOWITZ (Compt. rend. Soc. Biol., 1935, 120, 1139—1142).—NH<sub>3</sub> added to milk or distilled or tap-H<sub>2</sub>O ingested by dogs abolishes alkalosis and displaces the acid-base equilibrium of the blood towards the acid side. The alkalosis produced by ingestion of NaHCO<sub>3</sub> or alkaline salt mixture is also decreased by addition of NH<sub>3</sub>, and intravenous injection of NH<sub>3</sub> decreases the alkaline reserve. R. N. C.

**Apparent intoxication in poultry, due to nitrogenous bases.** S. F. COOK and K. G. SCOTT (Science, 1935, 82, 465—467).—Intoxication induced

by N bases apparently occurred in poultry fed on a special diet which included functionally low-S fish-meal. Replacement of the latter by meat scrap, casein, skim-milk, or high-S fish-meal relieved the hæmorrhagic symptoms. Addition of NMe<sub>3</sub>, NHMe<sub>2</sub>, NH<sub>2</sub>Me, NHEt<sub>2</sub>, etc., ergot, and nicotine to a non-hæmorrhagic diet produced symptoms similar to those resulting from the special diet. Methylamines were present in the low-S fish-meal in amounts sufficient to produce the intoxication. The S compounds in the high-S fish-meal were sufficient to detoxicate the methylamines. Addition of dried blood, S, cystine, or cysteine to hæmorrhagic diets alleviated the symptoms. L. S. T.

**Effect of intravenous injections of amino-acids on the motility of the stomach in normal and fasting dogs.** H. BOWMAN, J. F. REGAN, and E. U. STILL (Amer. J. Physiol., 1935, 112, 438—441). R. N. C.

**Sensitivity to acetylcholine and velocity of hydrolysis by blood of acetylcholine in man.** G. INGVARSSON (Biochem. Z., 1935, 281, 370—376).—No difference could be detected in the rate of hydrolysis of acetylcholine (I) by bloods of sensitive and resistant individuals or in blood taken before and after injection of (I). Such differences in sensitivity arise in the nervous system rather than in any varying degree of inactivation of (I) by blood. P. W. C.

**Pharmacological properties of the acetylene linking.**—See this vol., 188.

**Action of acetylcholine on gaseous metabolism.** C. ZUMMO, D. ELIA, and A. PAGANO (Boll. Soc. ital. Biol. sperim., 1935, 10, 195—197).—Acetylcholine (I) does not affect gaseous metabolism in rats or pigeons; hence the increase caused by pilocarpine is not due to liberation of (I). R. N. C.

**Co-operative action of sympathetic nerve impulses, adrenaline, and sympathin on the nictitating membrane of the cat.** A. C. LIU (Amer. J. Physiol., 1935, 112, 690—694). R. N. C.

**Tyramine. II. Moderating effect on human basal metabolism: therapeutic assays in hyperthyroidism.** III. Effects on the different systems of the human organism. P. JACCHIA and F. CAPOCASALE (Boll. Soc. ital. Biol. sperim., 1935, 10, 201—204, 205—208).—II. Tyramine (I) depresses basal metabolism in hyperthyroid patients when given orally or intramuscularly; metabolism remains low when (I) is administered over long periods.

III. (I) given as above reduces gastric acidity, and in some cases increases blood-sugar. R. N. C.

**Derivatives of aminomethyldihydro-oxazine which exhibit adrenaline-like action.**—See this vol., 214.

**2:4-Dinitrophenol and respiration of tissues *in vitro*.** G. DOMINI (Boll. Soc. ital. Biol. sperim., 1935, 10, 362—364).—Sections of surviving liver and spleen show no change in their metabolism *in vitro* if taken from animals treated with fatal doses of 2:4-dinitrophenol (I). Metabolism is unaffected by addition of small quantities of (I) to the respiratory medium, but is depressed by higher concns. If the (I)

is added to the medium during the development of the manometric registration, small quantities are still ineffective, moderate quantities cause a rise of metabolism followed by a fall, whilst large quantities inhibit it, and  $O_2$  consumption falls. R. N. C.

**Influence of sodium taurocholate, hepatic bile, and gall-bladder bile on the absorption of oleic acid from the small intestine.** C. RIEGEL, K. O. ELSOM, and I. S. RAVDIN (Amer. J. Physiol., 1935, 112, 669—672).—Oleic acid introduced alone into an intestinal loop in the dog is practically unabsorbed, but the absorption is increased by the presence in the loop of Na taurocholate, and to a small degree by hepatic or gall-bladder bile. R. N. C.

**Therapy of poisoning by the active principle (potassium atractylate) of *Carlina gummifera*.** A. MARRAS (Boll. Soc. ital. Biol. sperim., 1935, 10, 357—359).—Correction by glucose or adrenaline of the hypoglycaemia induced in rabbits poisoned by K atractylate prevents or delays death, which is, however, due to other causes besides hypoglycaemia. R. N. C.

**Variations of the absorption spectrum of the blood of leucæmic fowls after intravenous injection of a lecithin-hydrogen peroxide complex.** J. MAGAT, D. ABRAGAM, and M. MAGAT (Compt. rend. Soc. Biol., 1935, 120, 1091—1093).—The absorption curve of the leucæmic fowl after injection of lecithin- $H_2O_2$  complex lies above that of the normal fowl between 450 and 600  $m\mu$ , with a feeble max. at 510  $m\mu$ , whilst the band at 600—640  $m\mu$  is less intense. The leucæmic blood probably contains a principle that inhibits the formation of peroxyhaemoglobin. R. N. C.

**Toxic action of pyrethrins on marine animals.** M. O. GAUDIN (Compt. rend. Acad. Agric. France, 1935, 21, 277—281).—Effects of administration of pyrethrins by injection or through respiratory organs are examined. A. G. P.

**Action of tetralin, 5-tetralol, and 5-tetralone on body temperature and metabolism.** H. R. KANITZ, A. LOHMEYER, and J. SCHOLZ (Arch. Hyg., 1935, 113, 234—244; Chem. Zentr., 1935, i, 2841).—Administration of tetralin caused a moderate fall in body temp., followed by a more permanent rise;  $O_2$  consumption was not changed, while the urinary quotient was increased. H. N. R.

**Action of chlorophyll on the mobilising effects of adrenaline with respect to sugar.** K. E. LARSSON (Compt. rend. Soc. Biol., 1935, 120, 1124—1126).—Injection of large doses of chlorophyll in rabbits suppresses to some extent the hyperglycæmic action of adrenaline. R. N. C.

**Hæmatopoietic action of Ah-Chiao (donkey-skin glue).** T. G. NI (Chinese J. Physiol., 1935, 9, 383—393).—The hæmatopoietic action was of a similar order to that of gelatin and was independent of Fe and Cu. H. G. R.

**Solvents of the active principles of chamæpitium.** A. BORSANI (Boll. Soc. ital. Biol. sperim., 1935, 10, 240—242).— $COMe$ ,  $EtOH$ ,  $Et_2O$ , and  $CHCl_3$  extracts of *Ajuga chamæpitys* show a transitory

pressor effect, whilst the corresponding residues show a depressor effect without an initial rise, indicating the presence of two active principles. The depressor principle is sol. in  $H_2O$  and is pptd. by  $EtOH$ . R. N. C.

**Synergism of narcotic poisons.** R. J. LESZCZYŃSKI (Poznań. Towarz. Przyj. Nauk. Prace Kom. Lek., 1934, 4, 1—16; Chem. Zentr., 1935, i, 2559).—Morphine, scopolamine, and the *Cannabis indica* alkaloids act synergistically with one another in the production of narcosis in dogs. R. N. C.

**Theories of narcosis.** (A) K. H. MEYER and H. HEMMI. (B) I. TRAUBE. (C) K. H. MEYER (Biochem. Z., 1935, 282, 444, 445—446, 447).—Polemical. W. McC.

**Absorption of bilirubin, rose Bengal, and tetrabromophenolsulphonephthalein by the liver.** M. ROYER (Compt. rend. Soc. Biol., 1935, 120, 809—812).—Absorption of bilirubin by the liver of the normal dog is > that of rose Bengal or tetrabromophenolsulphonephthalein; all three diminution coeffs. are < that of urobilin, and are reduced by intoxication with  $CHCl_3$ . R. N. C.

**Toxic action of local anæsthetics on the amphibian heart.** L. DONATELLI (Arch. Farm. sperim., 1935, 60, 482—496).—Comparative data are given for the lethal and toxic action of novocaine, stovaine, cocaine, pantocaine, and percaine on the heart of frogs and toads. F. O. H.

**Influence of diuretics on the chlorine of rat organs.** K. A. WINTER (Med. Klinik, 1934, 30, 1727—1728; Chem. Zentr., 1935, i, 2842—2843).—Salyrgan causes no diminution in tissue-Cl, but kidney-Cl falls by 75%. Euphyllin causes a considerable general fall in Cl. H. N. R.

**Action of curare and atropine on the secretions of the pancreas.** R. GAYET and M. GUILLAUME (Ann. Physiol. Physicochim. biol., 1934, 10, 532—533; Chem. Zentr., 1935, i, 2841).—The action of the two drugs is similar. H. N. R.

**Percaine.** F. FALCO (Rev. Fac. Quím. Ind. Agric., 1934, 3, 185—191).—Percaine (I) is extracted from viscera with  $EtOH$ . Photomicrographs are reproduced of the compounds of (I) with picric acid, Mayer's reagent,  $K_2Cr_2O_7$ ,  $HgCl_2$ ,  $AuCl_3$ , and  $K_4Fe(CN)_6$ . F. R. G.

**Fate of procaine in the dog.** J. G. DUNLOP (J. Pharm. Exp. Ther., 1935, 55, 464—481).—Procaine (I) in the normal dog disappears rapidly from the circulation, and is excreted slowly in the urine as non-toxic end-products; in the absence of the kidneys these are found in the blood during survival. Blood alone does not affect (I). The liver is not essential for detoxication of (I), but its action is more rapid and efficient than that of other tissues. R. N. C.

**Phenanthrene derivatives.** VI. Amino-alcohols of the ethanalamine and propanolamine type. N. B. EDDY (J. Pharm. Exp. Ther., 1935, 55, 419—429).—The pharmacological properties of 3- $\beta$ -diethylamino- $\alpha$ -hydroxyethylphenanthrene are described. Similar derivatives with the  $NH_2$  unsubstituted, or with the  $NEt_2$  attached to an Ac or a

hydroxy-*n*-propyl side-chain are less effective analgesics, and less like morphine in other respects. Phenanthrene and  $\text{NEt}_2 \cdot [\text{CH}_2]_6 \cdot \text{OH}$  are not analgesic. R. N. C.

**Removal of cardiac glucosides from the frog's ventricle.** G. KINGISEPP (*J. Pharm. Exp. Ther.*, 1935, **55**, 377—389).—Washing-out of cardiac glucosides from the heart produces recovery; the combination between the drugs and heart muscle resembles an absorption, but hysteresis must be assumed to occur. R. N. C.

**Mechanism of the action of fish serum on warm-blooded animals.** A. VON BEZNAK and L. VON TÓTH (*Arch. exp. Path. Pharm.*, 1935, **180**, 69—74).—Intravenous or subcutaneous injection of shad serum causes death, the min. lethal dose for rabbits being  $1.2 \pm 0.2$  c.c. per kg. There is a decrease in respiration, temp., and blood pressure. The lytic and lethal factors are retained by an ultrafilter. The toxic action is reduced by atophan. J. N. A.

**Effect of poisons of different pharmacological types on the chromatic function of frog's skin.** R. J. LESZCZYŃSKI (*Poznań. Powarz. Przyj. Prace Kom. Lek.*, 1934, **4**, 17—44; *Chem. Zentr.*, 1935, **i**, 2559).—Adrenaline lightens, and pituitrin (I) darkens, the colour of the skin by peripheral action. Ergotamine lightens the colour by sympathetic action; (I) abolishes, but does not invert, this action. Pilocarpine, eserine, acetylcholine,  $\text{CHCl}_3$ ,  $\text{Et}_2\text{O}$ ,  $\text{BaCl}_2$ , strophanthin, papaverine, Ca, K, and conc. NaCl solution produce a temporary lightening followed by darkening;  $\text{NaNO}_2$  lightens, and  $\text{C}_5\text{H}_{11}\text{NO}_2$  darkens, the colour, whilst atropine is without effect. The characteristic action is shown only by poisons that affect the sympathetic system. R. N. C.

**Detoxification of strychnine by sodium pentobarbital.** E. E. SWANSON (*J. Amer. Pharm. Assoc.*, 1935, **24**, 959—961).—Na pentobarbital is an antidote for strychnine poisoning in rabbits; the effect is < that of Na amytal. F. O. H.

**Potassium polythionates as antidotes for hydrocyanic acid poisoning.** A. CHISTONI and B. FORESTI (*Arch. int. Pharm. Ther.*, 1935, **49**, 439—444; *Chem. Zentr.*, 1935, **i**, 2843).— $\text{K}_2\text{S}_4\text{O}_6$  and  $\text{K}_2\text{S}_5\text{O}_6$  are not suitable antidotes for HCN poisoning, since the  $\text{K}^+$  assists the paralytic action of the poison on the nerve centres. H. N. R.

**Enzyme chemistry.** R. WILLSTATTER (*Scientia*, 1935, **57**, 210—220; *Chem. Zentr.*, 1935, **i**, 2548).—The nature, constitution, and specificity of enzymes are discussed. A. G. P.

**Progress in enzyme chemistry.** ANON. (*Nature*, 1936, **137**, 53—55).—An expansion of the paper read by E. Waldschmidt-Leitz before the British Association. L. S. T.

**Enzyme activity and anion effects.** W. KOPACZEWSKI (*Bull. Sci. Pharm.*, 1934, **41**, 391—402; *Chem. Zentr.*, 1935, **i**, 2383).—Activity is influenced by  $[\text{H}^+]$  and by the associated ions, but much more by the age of the prep., the concn. and physical condition of the substrate, and the purity of the enzyme. A. G. P.

**Thermodynamics of enzymic equilibria. Aspartase system.** K. P. JACOBSON and J. TAPADINHAS (*Biochem. Z.*, 1935, **282**, 374—382; cf. A., 1935, 121, 1530; Quastel *et al.*, A., 1926, 868).—The position of equilibrium attained in the aspartase (I) system is dependent on temp. and since the heat of amination (calc. from the temp. coeff. of *K*) accords with the val. for the difference in the heats of formation of the components of the system, it follows that (I) is a true catalyst. W. McC.

**High-pressure ultrafiltration with Cellophane as a means of enzyme purification and determination of particle size.** G. GORBACH and K. NITSCHKE (*Biochem. Z.*, 1935, **281**, 306—309).—The prep. of the membrane and its application to the concn. of invertase in yeast autolysates are described. P. W. C.

**Stereochemical specificity and equilibrium in the fumarase system.** Biochemical production of *d*-malic acid. K. P. JACOBSON and M. SOARES (*Biochem. Z.*, 1935, **282**, 383—386).—In solutions containing aspartase and relatively high  $[\text{NH}_4\text{Cl}]$ , fumarase produces *d*-malic acid in 100% yield from *dl*-malic acid and hence exhibits abs. configurative specificity. W. McC.

**Uricase and its action. VIII. Extraction and precipitation of ox-kidney uricase.** R. TRUSZKOWSKI and S. GUBERMANOWNA (*Biochem. J.*, 1935, **29**, 2787—2797; cf. A., 1934, 451).—Uricase (I) powder is prepared by thorough washing of minced kidney with  $\text{H}_2\text{O}$ ,  $\text{EtOH}$ , and  $\text{Et}_2\text{O}$  and drying at  $30^\circ$ . The apparent activity of the preps. depends on the availability of  $\text{O}_2$ . Active solutions are obtained by extracting the powder with aq.  $\text{Na}_2\text{CO}_3$  at  $p_{\text{H}} > 9.8$  for 48 hr. at room temp.  $\text{AcOH}$  and  $(\text{NH}_4)_2\text{SO}_4$  ppt. (I) from the extracts. (I) has an optimum  $p_{\text{H}}$  of 8.8 and is completely inactivated at  $p_{\text{H}} < 5.8$  or by tryptic digestion. The quantity of P removable by 2% aq. NaOH in the powder approx.  $\propto$  the activity.

**Uricase, amino-acid oxidase, and xanthine oxidase.** D. KEILIN and E. F. HARTREE (*Proc. Roy. Soc.*, 1935, **B**, **119**, 114—140).—Uricase (I) and  $\text{NH}_2$ -acid oxidase (II), like xanthine oxidase (III), function as true dehydrogenases. (I) is prepared by drying minced pig's liver with  $\text{COMe}_2$ . This prep. shows optimum activity at  $p_{\text{H}}$  9.25. Its inhibition by  $\text{CN}^-$  is reversible.  $\text{CO}$ ,  $\text{Na}_2\text{S}$ ,  $\text{NaF}$ , and urethane have very small or no inhibitory effects.  $\text{P}_2\text{O}_7^{4-}$  has a slight activating effect. Small amounts of Cu and Fe inhibit (I), but this inhibition is abolished when the metals are added in phosphate buffer containing  $\text{P}_2\text{O}_7^{4-}$ . (I) is sp. for uric acid (IV); alkyl derivatives of (IV) are not oxidised, although they may act as competitive inhibitors.  $\text{H}_2\text{O}_2$  is formed when  $\text{O}_2$  is the H acceptor for the oxidation. On the addition of *p*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  (V) and peroxidase (VI) a coupled oxidation of (V) by  $\text{H}_2\text{O}_2$  occurs, doubling the  $\text{O}_2$  uptake due to the oxidation of (IV) alone. (V) alone increases the  $\text{O}_2$  uptake owing to the (VI) activity of haematin compounds in (I) preps. It is suggested that the primary stage of the reaction is the oxidation of (IV) to uric acid 4:5-glycol; this then rearranges to form hydroxyacetylenediureinecarboxylic acid,

which gives allantoin on decarboxylation. The Michaelis const. for (II) with *dl*-alanine as substrate is about  $5 \times 10^{-3} M$ . (II) is irreversibly inhibited by  $H_2S$  in the presence of  $O_2$ . An inhibition by ethylurethane may be only a salt effect as other narcotics have no effect. (II) is inhibited by various tissue extracts such as liver-(I) and heart-muscle oxidase. Incubation with (III) almost completely inhibits (II), but this effect is considerably reduced if (III) is first boiled. Destruction of (III) by incubation with  $CN'$  does not affect this inhibition. A similar inhibition is shown by charcoal. The rate of oxidation of *l*-alanine by (II) is unaffected by the addition of *d*-alanine. The formation of  $H_2O_2$  on aerobic dehydrogenation is best shown by the coupled oxidation of EtOH (cf. following abstracts). (II) oxidises *N*-monomethyl- but not *N*-dimethyl- or  $\alpha$ -methyl-alanine. In addition to oxidative deamination, kidney slices promote the oxidation of *d*- and *l*-dihydroxyphenylalanine due to their polyphenol-oxidase content.

E. A. H. R.

**Coupled oxidation of alcohol.** D. KEILIN and E. F. HARTREE (Proc. Roy. Soc., 1935, B, 119, 141—159).—Addition of EtOH to mixtures of uricase (I) and uric acid (II), or of  $NH_2$ -acid oxidase (III) and  $NH_2$ -acids, doubles the  $O_2$  uptake; xanthine oxidase (IV) and hypoxanthine or MeCHO do not show the same effect unless catalase (V) is also present. EtOH undergoes a coupled oxidation to MeCHO by the  $H_2O_2$  formed in the dehydrogenation. This coupled oxidation requires the formation of nascent  $H_2O_2$  and a factor found in (I), (III), and (V) but not in (IV). This factor is probably (V) activating nascent  $H_2O_2$  so that it can oxidise EtOH. In the system (IV)+MeCHO+EtOH+(V), the  $H_2O_2$  formed promotes the secondary oxidation of EtOH to MeCHO, and MeCHO in turn is oxidised by the enzyme so that the  $O_2$  uptake is much more than doubled and may continue as long as any EtOH remains unoxidised if (IV) remains intact. Such reactions are termed "cyclic oxidations." When purines are the substrates cyclic oxidation does not go beyond tripling the  $O_2$  uptake, due perhaps to competitive inhibition by (II).

E. A. H. R.

**Action of cyanide and other respiratory inhibitors on xanthine oxidase.** M. DIXON and D. KEILIN (Proc. Roy. Soc., 1935, B, 119, 159—190).—Xanthine oxidase (I) is inactivated on incubation with  $CN'$ . This inactivation differs from normal  $CN'$  inhibition in that it is produced relatively slowly, is irreversible, and affects both aerobic and anaerobic oxidation, so that the dehydrogenase, and not some O-activating catalyst, is poisoned. Inactivation is much slower at  $20^\circ$  than at  $38^\circ$ . If sufficient time is allowed for the  $CN'$  to act, inactivation is complete. Aerobically (I) is protected against  $CN'$  by purines, so that addition of  $CN'$  subsequent to the addition of hypoxanthine (II) has no effect on the oxidation of (II). Anaerobically uric acid (III), adenine, and guanine protect (I) against  $CN'$ , but (II) protects (I) only in the presence of a H-acceptor, without which it may enhance the effect due to  $CN'$ . No inhibition is produced by  $CO_2$ ,  $H_2S$ ,  $P_2O_7^{4-}$ , or  $NaN_3$  even on incubation.  $NaN_3$ , but not the other three, produces a

large inhibition on anaerobic incubation in presence of (II).  $H_2S$  doubles the  $O_2$  uptake owing to its coupled oxidation by the  $H_2O_2$  formed. The identity of (I) and the Schardinger enzyme (IV) is supported by the fact that (IV) undergoes the same type of inactivation by  $CN'$ , and to the same extent, as (I). (IV) is also completely protected against  $CN'$  poisoning by (III).

E. A. H. R.

**Existence of dehydrogenases of the fatty acids in the human placenta.** G. TESAURIO (Boll. Soc. ital. Biol. sperim., 1935, 10, 325—326).—Extracts and sections of human placenta show dehydrogenase activity with succinic acid but not with fatty acids; the placenta is therefore not a site of fatty acid oxidation.

R. N. C.

**Enzymic dehydrogenation of glycerophosphoric acid.** T. WAGNER-JAUREGG and H. RAVEN (Z. physiol. Chem., 1935, 237, 233—235).—The dehydrogenation of Na glycerophosphate (I) by the dehydrase (II) of cucumber seeds is greatly accelerated by the flavin enzyme (III) (inactivated by heating to  $100^\circ$ ). The reaction is further hastened by simultaneous addition of the co-enzyme (IV), which by itself is much less active in the reduction of methylene-blue. HCN, even in high concn., has no influence on the rate of dehydrogenation of (I) by the system (II)-(III)-(IV).

H. W.

**Dehydrogenation of citric acid and isocitric acid by cucumber-seed dehydrase.** T. WAGNER-JAUREGG and H. RAVEN (Z. physiol. Chem., 1935, 237, 227—232; cf. A., 1935, 1023).—The action of citricodehydrase is greatly enhanced by the presence of flavin enzyme, and in this dehydrogenating system  $O_2$  is absorbed. The enzymic oxidation of citric acid (I) proceeds thus:  $(I) + \frac{1}{2} O_2 = CO_2 + X$ . The possibility that  $X = CO(CH_2 \cdot CO_2H)_2$  (II) is excluded since it is scarcely attacked under the experimental conditions. Fission of (I) into (II) and  $HCO_2H$  is a mode of anaerobic enzymic fission of (I), which may be a primary, but is certainly not a secondary, reaction.  $CH_2Ac \cdot CO_2H$ , ketipinic, aconitic, itaconic, hydroxy-fumaric, and hydroxymaleic acid, and AcOH do not behave as substrate to the dehydrase. *iso*Citric [ $\alpha$ -hydroxypropane- $\alpha\beta\gamma$ -tricarboxylic] acid is dehydrogenated more rapidly than (I) and the reaction is greatly accelerated by Warburg's yellow enzyme.

H. W.

**Liver enzymes. V. Aldehyde of liver.** L. REICHEL and K. ECKHOFF (Z. physiol. Chem., 1935, 237, 214—220; cf. A., 1934, 693, 807).—The methods of obtaining preps. of the dry enzyme cause destruction of the indophenol oxidase (I) and almost complete removal of flavin. Such preps. under aerobic or anaerobic conditions can therefore only immediately catalyse the dismutation process; this is related to the presence of cozymase, which occurs in considerable amount. Dehydrogenation takes place in the systems aldehyde (+co-enzyme) (II)-aldehyde (III)-cytochrome *Bc* (A., 1934, 453)-(I)- $O_2$  and (II)-(III)-flavoprotein, lactoflavin, or 9-*d*-araboflavin. Metabolism in the organism can therefore proceed through one or other intermediate systems. If the intermediate acceptors are not present in optimal concn. in the

dehydrase system, dehydrogenation is accompanied by dismutation. H. W.

**Constitution of starch and mode of action of starch-splitting enzymes.**—See this vol., 194.

**Destruction of certain hydrolytic enzymes in the course of their action.** R. BONNET and B. NATAF (Compt. rend., 1935, 201, 1060—1062).—Various amylase and invertase preps. lose activity during their action. As this takes place even in the absence of proteolytic enzymes it is not to be attributed to destruction of the active mols. by the latter. W. O. K.

**Action of the two amylases of barley.** C. S. HANES (Canad. J. Res., 1935, 13, 185—208).—Van Klinkenberg's results (cf. A., 1932, 91, 1062; 1933, 92) for the hydrolysis of starch, prepared by his method, by  $\beta$ -amylase (I) are confirmed. This method of prep. produces some reducing substances. Small's method gives a starch which, when completely hydrolysed by (I), has only 60% of the reducing power of maltose (II). Erythrogranulose (III) with  $\alpha$ -amylase (IV) gives only 40% of (II); one third of the reducing power of the products is not removed by *Monilia tropicalis*, and is thus not due to (II) or glucose; some of the reducing products are rapidly hydrolysed by (I). The production of reducing products from starch by (IV) is much faster than from the amount of (III) which is assumed to be present therein. (IV) thus does not act preferentially on (III). The non-maltose reducing products are formed preferentially in the initial stage of the hydrolysis. Possibly both  $\beta$ -starch [the portion susceptible to (I)] and (III) are formed by (I) and do not pre-exist as such in starch. R. S. C.

**Biochemical changes in wheat grain under the action of high temperatures.** V. L. KRETOVITSCH and E. N. RIAZANCEVA (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 409—412).—Heating the grain to 105—130° causes partial denaturation of the gliadin and a decrease in the hydration of the gluten and in catalase and diastatic activities. Heating to 60—90° causes an increase in diastatic activity. H. G. R.

**Hydrolysis of the phosphoric ester of starch and glycogen.** H. FRINGSHEIM and S. GINSBURG (Bull. Soc. Chim. biol., 1935, 17, 1599—1606).—The hydrolysis of starch by pancreatic diastase may give 100% yield of maltose without liberation of  $H_3PO_4$ . With glycogen, on the other hand, 10—23% dephosphorylation occurs. A. L.

**Emulsin. XXV. Coffee emulsin.** B. HELFERICH and F. VORSATZ (Z. physiol. Chem., 1935, 237, 254—260).—It is advocated that the term "emulsin" should be used generally for enzymes capable of hydrolysing glucosides and not to express a sp. action. Coffee emulsin is obtained by extraction of ground raw coffee (with or without pre-treatment with  $COMe_2$ ) with  $H_2O$ , pptn. with tannin, and detannising the ppt. by  $COMe_2$ . The behaviour of the product towards phenyl- $\alpha$ -D-mannoside,  $\alpha$ -D-galactoside, and  $\beta$ -D-galactoside indicates the presence of three enzymes; a feeble diastatic action is also detectable. It resembles lucerne emulsin, from which

it differs in its feeble  $\beta$ -D-glucosidase action. The  $\beta$ -D-glucosides of protocatechualdehyde, caffeic acid, and vanillin are so much more rapidly hydrolysed than phenyl- $\beta$ -D-glucoside or salicin by the  $\beta$ -glucosidase of coffee emulsin that the enzyme can thus be detected and to some extent determined, whereas its certain detection by salicin is impossible. The existence of different  $\beta$ -D-galactosidases is thus confirmed. H. W.

**Polysaccharides synthesised by micro-organisms.**—See this vol., 193.

**Glucoside syntheses with emulsin.**—See this vol., 56.

**Hydrolysis of  $\beta$ -glucosides and conjugated glycuronic acids by enzymes of liver and kidney.** E. HOFMANN (Biochem. Z., 1935, 281, 438—443).—Salicin,  $\beta$ -naphtholglycuronic acid,  $\beta$ -phenol-xyloside, -galactoside, and -glucoside, lactoseureide, and glycyrrhizic acid are all hydrolysed by enzyme preps. from horse's and rabbit's liver and kidney. With salicin, the  $p_H$  optimum appears to be dependent on the nature of the buffer solution, but the reaction does not occur below  $p_H$  5. P. W. C.

**Hydrolysis of lactose by enzymes of liver and kidney.** C. NEUBERG and E. HOFMANN (Biochem. Z., 1935, 281, 431—437).—Various enzyme preps., obtained as autolysates and as powders (dried with  $EtOH-Et_2O$ ) from horse's and rabbit's liver and kidney, which hydrolyse lactose to glucose and galactose are described. P. W. C.

**Invertase. II. Purification of invertase by adsorption methods.** N. TAKETOMI (J. Soc. Chem. Ind. Japan, 1935, 38, 559B).—Invertase (I) may be purified and separated from amylase (II) in aq.  $EtOH$  solution by adsorption on activated clay at 30°.  $Al(OH)_3$  and cholesterol readily adsorb (I), (II), and proteins, but not selectively. Active C is unsatisfactory for the separation of (I) from (II). H. G. M.

**Thiol compounds and their significance in the enzymic conversion of carbohydrates.** T. BERSIN (Z. Spiritusind., 1935, 58, 393—394).—The presence of oxidised and reduced forms of compounds of the cystine and glutathione types in living cells is noted, and the literature dealing with the effects of such autoxidisable compounds in the enzymic conversion (hydrolysis, fermentation, oxidation) of carbohydrates is reviewed and discussed. I. A. P.

**Influence of cations on fermentation by tumour cells.** V. Calcium and magnesium. I. A. LASNITZKI and O. ROSENTHAL (Biochem. Z., 1935, 281, 395—401).—Whereas K increases considerably the intensity of anaerobic fermentation of rat implantation tumours, Ca and Mg under the same conditions have no effect. P. W. C.

**Nature and specificity of Ricinus lipase.** H. E. LONGENECKER and D. E. HALEY (J. Amer. Chem. Soc., 1935, 57, 2019—2021).—Dry *Ricinus* lipase loses only a portion of its activity in many years. The activity is favoured by factors favouring the stability of  $H_2O$ -in-oil emulsions. For 14 oils examined there was no specificity when the no. of mols. hydrolysed is considered. R. S. C.

which gives allantoin on decarboxylation. The Michaelis const. for (II) with *dl*-alanine as substrate is about  $5 \times 10^{-3} M$ . (II) is irreversibly inhibited by  $H_2S$  in the presence of  $O_2$ . An inhibition by ethylurethane may be only a salt effect as other narcotics have no effect. (II) is inhibited by various tissue extracts such as liver-(I) and heart-muscle oxidase. Incubation with (III) almost completely inhibits (II), but this effect is considerably reduced if (III) is first boiled. Destruction of (III) by incubation with  $CN'$  does not affect this inhibition. A similar inhibition is shown by charcoal. The rate of oxidation of *l*-alanine by (II) is unaffected by the addition of *d*-alanine. The formation of  $H_2O_2$  on aerobic dehydrogenation is best shown by the coupled oxidation of EtOH (cf. following abstracts). (II) oxidises *N*-monomethyl- but not *N*-dimethyl- or  $\alpha$ -methyl-alanine. In addition to oxidative deamination, kidney slices promote the oxidation of *d*- and *l*-dihydroxyphenyl-alanine due to their polyphenol-oxidase content.

E. A. H. R.

**Coupled oxidation of alcohol.** D. KEILIN and E. F. HARTREE (Proc. Roy. Soc., 1935, B, 119, 141—159).—Addition of EtOH to mixtures of uricase (I) and uric acid (II), or of  $NH_2$ -acid oxidase (III) and  $NH_2$ -acids, doubles the  $O_2$  uptake; xanthine oxidase (IV) and hypoxanthine or MeCHO do not show the same effect unless catalase (V) is also present. EtOH undergoes a coupled oxidation to MeCHO by the  $H_2O_2$  formed in the dehydrogenation. This coupled oxidation requires the formation of nascent  $H_2O_2$  and a factor found in (I), (III), and (V) but not in (IV). This factor is probably (V) activating nascent  $H_2O_2$  so that it can oxidise EtOH. In the system (IV)+MeCHO+EtOH+(V), the  $H_2O_2$  formed promotes the secondary oxidation of EtOH to MeCHO, and MeCHO in turn is oxidised by the enzyme so that the  $O_2$  uptake is much more than doubled and may continue as long as any EtOH remains unoxidised if (IV) remains intact. Such reactions are termed "cyclic oxidations." When purines are the substrates cyclic oxidation does not go beyond tripling the  $O_2$  uptake, due perhaps to competitive inhibition by (II).

E. A. H. R.

**Action of cyanide and other respiratory inhibitors on xanthine oxidase.** M. DIXON and D. KEILIN (Proc. Roy. Soc., 1935, B, 119, 159—190).—Xanthine oxidase (I) is inactivated on incubation with  $CN'$ . This inactivation differs from normal  $CN'$  inhibition in that it is produced relatively slowly, is irreversible, and affects both aerobic and anaerobic oxidation, so that the dehydrogenase, and not some  $O$ -activating catalyst, is poisoned. Inactivation is much slower at  $20^\circ$  than at  $38^\circ$ . If sufficient time is allowed for the  $CN'$  to act, inactivation is complete. Aerobically (I) is protected against  $CN'$  by purines, so that addition of  $CN'$  subsequent to the addition of hypoxanthine (II) has no effect on the oxidation of (II). Anaerobically uric acid (III), adenine, and guanine protect (I) against  $CN'$ , but (II) protects (I) only in the presence of a  $H$ -acceptor, without which it may enhance the effect due to  $CN'$ . No inhibition is produced by  $CO_2$ ,  $H_2S$ ,  $P_2O_7^{4-}$ , or  $NaN_3$  even on incubation.  $NaN_3$ , but not the other three, produces a

large inhibition on anaerobic incubation in presence of (II).  $H_2S$  doubles the  $O_2$  uptake owing to its coupled oxidation by the  $H_2O_2$  formed. The identity of (I) and the Schardinger enzyme (IV) is supported by the fact that (IV) undergoes the same type of inactivation by  $CN'$ , and to the same extent, as (I). (IV) is also completely protected against  $CN'$  poisoning by (III).

E. A. H. R.

**Existence of dehydrogenases of the fatty acids in the human placenta.** G. TESAURIO (Boll. Soc. ital. Biol. sperim., 1935, 10, 325—326).—Extracts and sections of human placenta show dehydrogenase activity with succinic acid but not with fatty acids; the placenta is therefore not a site of fatty acid oxidation.

R. N. C.

**Enzymic dehydrogenation of glycerophosphoric acid.** T. WAGNER-JAUREGG and H. RAUEN (Z. physiol. Chem., 1935, 237, 233—235).—The dehydrogenation of Na glycerophosphate (I) by the dehydrase (II) of cucumber seeds is greatly accelerated by the flavin enzyme (III) (inactivated by heating to  $100^\circ$ ). The reaction is further hastened by simultaneous addition of the co-enzyme (IV), which by itself is much less active in the reduction of methylene-blue. HCN, even in high concn., has no influence on the rate of dehydrogenation of (I) by the system (II)-(III)-(IV).

H. W.

**Dehydrogenation of citric acid and isocitric acid by cucumber-seed dehydrase.** T. WAGNER-JAUREGG and H. RAUEN (Z. physiol. Chem., 1935, 237, 227—232; cf. A., 1935, 1023).—The action of citric dehydrase is greatly enhanced by the presence of flavin enzyme, and in this dehydrogenating system  $O_2$  is absorbed. The enzymic oxidation of citric acid (I) proceeds thus:  $(I) + \frac{1}{2} O_2 = CO_2 + X$ . The possibility that  $X = CO(CH_2 \cdot CO_2H)_2$  (II) is excluded since it is scarcely attacked under the experimental conditions. Fission of (I) into (II) and  $HCO_2H$  is a mode of anaerobic enzymic fission of (I), which may be a primary, but is certainly not a secondary, reaction.  $CH_2Ac \cdot CO_2H$ , ketipinic, aconitic, itaconic, hydroxymaleic, and hydroxymaleic acid, and  $AcOH$  do not behave as substrate to the dehydrase. *iso*Citric [ $\alpha$ -hydroxypropane- $\alpha\beta\gamma$ -tricarboxylic] acid is dehydrogenated more rapidly than (I) and the reaction is greatly accelerated by Warburg's yellow enzyme.

H. W.

**Liver enzymes. V. Aldehyde dehydrogenase of liver.** L. REICHEL and K. ECKHOFF (Z. physiol. Chem., 1935, 237, 214—220; cf. A., 1934, 693, 807).—The methods of obtaining preps. of the dry enzyme cause destruction of the indophenol oxidase (I) and almost complete removal of flavin. Such preps. under aerobic or anaerobic conditions can therefore only immediately catalyse the dismutation process; this is related to the presence of cozymase, which occurs in considerable amount. Dehydrogenation takes place in the systems aldehyde dehydrogenase (+co-enzyme) (II)-aldehyde (III)-cytochrome *Bc* (A., 1934, 453)-(I)- $O_2$  and (II)-(III)-flavoprotein, lactoflavin, or 9-*d*-araboflavin. Metabolism in the organism can therefore proceed through one or other intermediate systems. If the intermediate acceptors are not present in optimal concn. in the

dehydrase system, dehydrogenation is accompanied by dismutation. H. W.

**Constitution of starch and mode of action of starch-splitting enzymes.**—See this vol., 194.

**Destruction of certain hydrolytic enzymes in the course of their action.** R. BONNET and B. NATAF (Compt. rend., 1935, 201, 1060—1062).—Various amylase and invertase preps. lose activity during their action. As this takes place even in the absence of proteolytic enzymes it is not to be attributed to destruction of the active mols. by the latter. W. O. K.

**Action of the two amylases of barley.** C. S. HANES (Canad. J. Res., 1935, 13, 185—208).—Van Klinkenberg's results (cf. A., 1932, 91, 1062; 1933, 92) for the hydrolysis of starch, prepared by his method, by  $\beta$ -amylase (I) are confirmed. This method of prep. produces some reducing substances. Small's method gives a starch which, when completely hydrolysed by (I), has only 60% of the reducing power of maltose (II). Erythrogranulose (III) with  $\alpha$ -amylase (IV) gives only 40% of (II); one third of the reducing power of the products is not removed by *Monilia tropicalis*, and is thus not due to (II) or glucose; some of the reducing products are rapidly hydrolysed by (I). The production of reducing products from starch by (IV) is much faster than from the amount of (III) which is assumed to be present therein. (IV) thus does not act preferentially on (III). The non-maltose reducing products are formed preferentially in the initial stage of the hydrolysis. Possibly both  $\beta$ -starch [the portion susceptible to (I)] and (III) are formed by (I) and do not pre-exist as such in starch. R. S. C.

**Biochemical changes in wheat grain under the action of high temperatures.** V. L. KRETOVITSCH and E. N. RIAZANCEVA (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 409—412).—Heating the grain to 105—130° causes partial denaturation of the gliadin and a decrease in the hydration of the gluten and in catalase and diastatic activities. Heating to 60—90° causes an increase in diastatic activity. H. G. R.

**Hydrolysis of the phosphoric ester of starch and glycogen.** H. PRINGSHEIM and S. GINSBURG (Bull. Soc. Chim. biol., 1935, 17, 1599—1606).—The hydrolysis of starch by pancreatic diastase may give 100% yield of maltose without liberation of  $H_3PO_4$ . With glycogen, on the other hand, 10—23% dephosphorylation occurs. A. L.

**Emulsin. XXV. Coffee emulsin.** B. HELFERICH and F. VORSATZ (Z. physiol. Chem., 1935, 237, 254—260).—It is advocated that the term "emulsin" should be used generally for enzymes capable of hydrolysing glucosides and not to express a sp. action. Coffee emulsin is obtained by extraction of ground raw coffee (with or without pre-treatment with  $COMe_2$ ) with  $H_2O$ , pptn. with tannin, and detannising the ppt. by  $COMe_2$ . The behaviour of the product towards phenyl- $\alpha$ -D-mannoside,  $\alpha$ -D-galactoside, and  $\beta$ -D-galactoside indicates the presence of three enzymes; a feeble diastatic action is also detectable. It resembles lucerne emulsin, from which

it differs in its feeble  $\beta$ -D-glucosidase action. The  $\beta$ -D-glucosides of protocatechualdehyde, caffeic acid, and vanillin are so much more rapidly hydrolysed than phenyl- $\beta$ -D-glucoside or salicin by the  $\beta$ -glucosidase of coffee emulsin that the enzyme can thus be detected and to some extent determined, whereas its certain detection by salicin is impossible. The existence of different  $\beta$ -D-galactosidases is thus confirmed. H. W.

**Polysaccharides synthesised by micro-organisms.**—See this vol., 193.

**Glucoside syntheses with emulsin.**—See this vol., 56.

**Hydrolysis of  $\beta$ -glucosides and conjugated glycuronic acids by enzymes of liver and kidney.** E. HOFMANN (Biochem. Z., 1935, 281, 438—443).—Salicin,  $\beta$ -naphtholglycuronic acid,  $\beta$ -phenol-xyloside, -galactoside, and -glucoside, lactoseureide, and glycyrrhizic acid are all hydrolysed by enzyme preps. from horse's and rabbit's liver and kidney. With salicin, the  $p_H$  optimum appears to be dependent on the nature of the buffer solution, but the reaction does not occur below  $p_H$  5. P. W. C.

**Hydrolysis of lactose by enzymes of liver and kidney.** C. NEUBERG and E. HOFMANN (Biochem. Z., 1935, 281, 431—437).—Various enzyme preps., obtained as autolysates and as powders (dried with  $EtOH-Et_2O$ ) from horse's and rabbit's liver and kidney, which hydrolyse lactose to glucose and galactose are described. P. W. C.

**Invertase. II. Purification of invertase by adsorption methods.** N. TAKETOMI (J. Soc. Chem. Ind. Japan, 1935, 38, 559B).—Invertase (I) may be purified and separated from amylase (II) in aq.  $EtOH$  solution by adsorption on activated clay at 30°.  $Al(OH)_3$  and cholesterol readily adsorb (I), (II), and proteins, but not selectively. Active C is unsatisfactory for the separation of (I) from (II). H. G. M.

**Thiol compounds and their significance in the enzymic conversion of carbohydrates.** T. BERSIN (Z. Spiritusind., 1935, 58, 393—394).—The presence of oxidised and reduced forms of compounds of the cystine and glutathione types in living cells is noted, and the literature dealing with the effects of such autoxidisable compounds in the enzymic conversion (hydrolysis, fermentation, oxidation) of carbohydrates is reviewed and discussed. I. A. P.

**Influence of cations on fermentation by tumour cells.** V. Calcium and magnesium. I. A. LASNITZKI and O. ROSENTHAL (Biochem. Z., 1935, 281, 395—401).—Whereas K increases considerably the intensity of anaerobic fermentation of rat implantation tumours, Ca and Mg under the same conditions have no effect. P. W. C.

**Nature and specificity of Ricinus lipase.** H. E. LONGENECKER and D. E. HALEY (J. Amer. Chem. Soc., 1935, 57, 2019—2021).—Dry *Ricinus* lipase loses only a portion of its activity in many years. The activity is favoured by factors favouring the stability of  $H_2O$ -in-oil emulsions. For 14 oils examined there was no specificity when the no. of mols. hydrolysed is considered. R. S. C.

**Voltinism of the silkworm (*Bombyx mori*, L.).**  
**I. Activity of the lipase in relation to voltinism.** H. SATO and I. CHINO (Bull. Sericult. Japan, 1935, 8, 403).—The lipase of eggs incubated at 15° has an activity > that of eggs incubated at 25°. This and similar phenomena are due to instability of the voltinism determiner. P. G. M.

**Influence of oral administration and injection of various nutrients on enzyme actions of body-fluid of the silkworm.** S. MATSUMURA and T. OKA (Bull. Sericult. Japan, 1935, 8, 403—404).—Enzyme activity is increased by feeding or injection of the appropriate substrate only. P. G. M.

**Activation of enzymes. III. Role of metal ions in activation of arginase. Hydrolysis of arginine induced by certain metal ions with urease.** L. HELLERMAN and M. E. PERKINS (J. Biol. Chem., 1935, 112, 175—194).—A method for obtaining an arginase (I) prep. of high activity is described. So obtained it is neither activated nor, after treatment with oxidising agents, reactivated by cysteine; but it is activated by Ni<sup>++</sup>, Mn<sup>++</sup>, Fe<sup>++</sup>, and especially by Co<sup>++</sup>, and Co<sup>++</sup> effects complete reactivation after H<sub>2</sub>S inactivation. Arginine, without (I), best in presence of urease and any of the above ions, is hydrolysed. The effect is diminished by CN<sup>-</sup>, which, however, does not prevent hydrolysis of any urea in the mixture. The mol. of (I) probably contains a metallic component which can be separated by oxidising or other agents. The pronounced effect of Co<sup>++</sup> may be due to its ability to form complex mols. J. N. A.

**Quantitative measurement of tyrosinase.** M. GRAUBARD and J. M. NELSON (J. Biol. Chem., 1935, 112, 135—141).—A method for determining the activity of tyrosinase (I) is described. A unit is the amount of (I) which under specified conditions will bring about an uptake of 10 cu. mm. of O<sub>2</sub> per min. (I) appears to consist of one enzyme, the oxidation of *p*-cresol and dehydrogenation of pyrocatechol being both effected by active O<sub>2</sub>. J. N. A.

**Peptidase system of *Aspergillus parasiticus*.** M. J. JOHNSON and W. H. PETERSON (J. Biol. Chem., 1935, 112, 25—34).—The aminopolypeptidase (I) is preferentially pptd. from mixtures with dipeptidase by addition of 1.5—2.5 vols. of 95% EtOH. The (I) of *A. parasiticus* attacks peptide linkings adjacent to free NH<sub>2</sub>. Dipeptides are not attacked unless decarboxylated, and peptides composed entirely of glycine are not attacked. The crude enzyme from the mould also contains three distinct peptidases, capable of hydrolysing peptides in which Cl or Me is substituted in the NH<sub>2</sub>. The apparent basic dissociation consts.  $\times 10^{12}$  of leucyldiglycine, leucylglycine, triglycine, and diglycine are 19.0, 16.0, 19.0, and 14.0, respectively. F. A. A.

***a*- and *b*-Thymonucleic acid and the enzyme transforming the *a*- into the *b*-form (nucleogelase).** R. FEULGEN (Z. physiol. Chem., 1935, 237, 261—267).—Na *a*-thymonucleate (I) is transformed into the *b*-salt (II) by nucleogelase (pancreatic prep.) at *p*<sub>H</sub> 6.8—6.9. The tetranucleotide structure of the product follows, since (*a*) elimination of H<sub>2</sub>PO<sub>4</sub> or

purines does not occur, (*b*) protracted exposure of (II) to the action of the enzyme does not diminish the amount pptd. by mineral acid or increase the solubility in acid, (*c*) the at. ratio P:Na = 4:4 in both (I) and (II), (*d*) [ $\alpha$ ] of (II) resembles that of (I) in its unusual dependence on temp., and in its disappearance after addition of NaOH and return after neutralisation, (*e*) complete hydrolysis of (I) or (II) yields identical products in identical amounts, and (*f*) the analytical data for (II) are those required for a tetranucleotide based on the presence of deoxyribose as carbohydrate. H. W.

**Enzymic histochemistry. II. Micro-method for determination of tryptic activity.** L. WEIL (Biochem. J., 1936, 30, 5—10).—The CO<sub>2</sub>H groups liberated by the action of trypsin on tissue sections are determined by titration with 0.05*N*-NMe<sub>4</sub>-OH, the NH<sub>2</sub> having been blocked by CH<sub>2</sub>O. The reproducibility of the method is  $\pm 0.00007$  mg. of NH<sub>2</sub>-N. The tryptic activity in tumour tissue is independent of the thickness of the slice and time of extraction. J. N. A.

**Platinum potential corresponding to the inactivation of the proteolytic power of papain by oxidisers.** P. REISS (Compt. rend. Soc. Biol., 1935, 120, 908—910).—The proteolytic action of papain is arrested by oxidisers above a definite *E*<sub>h</sub>, which increases with fall of *p*<sub>H</sub>. R. N. C.

**Isolation and properties of pepsin and trypsin.** J. H. NORTHROP (Current Sci., 1935, 4, 370—376).—A summary.

**Acetylation of tyrosine in pepsin.** R. M. HERRIOTT (J. Gen. Physiol., 1935, 19, 283—299; cf. A., 1934, 1239).—“Cryst. 60% active acetylpepsin” contains 7 Ac per mol.; 3 of these may be removed by hydrolysis at *p*<sub>H</sub> 0.0 or 10. The phenolic OH of glycyltyrosine is acetylated by keten under the conditions used for pepsin, and it is probable that the 3 labile Ac, responsible for the decrease in activity, are attached to tyrosine phenolic groups in the pepsin mol. F. A. A.

**Enzymic histochemistry. XVI. Digestion of keratin by the larva of the moth *Tineola biselictella*.** Humm. K. LINDERSTRÖM-LANG and F. DUSPIVA (Z. physiol. Chem., 1935, 237, 131—158; cf. A., 1935, 784).—The intestinal cells and juice (*p*<sub>H</sub> 9.6—10.2) of the larvæ contain a proteinase (I) which degrades caseinogen (optimum *p*<sub>H</sub> 9.3) but does not attack wool (at *p*<sub>H</sub> 9.2 or 9.6—10.2). Juice from larvæ which have eaten wool, but not that from fasting larvæ and larvæ on diets poor in S (cotton wool, caseinogen), contains a -SH compound (or compounds) which rapidly oxidises in air. At *p*<sub>H</sub> 10, in presence of reducing agents (LiSH, SH·CH<sub>2</sub>·CO<sub>2</sub>H), (I) attacks wool liberating equiv. amounts of NH<sub>2</sub> and CO<sub>2</sub>H. When trypsin-kinase replaces (I) the wool remains unaffected. The mid-gut cavity contains a reducing agent the presence of which is independent of that of -SH compounds. The action of (I) is not inhibited by low concns. (0.01*N*) of -SH compound. W. McC.

**Changes of wheat proteins under the action of flour and yeast enzymes.** A. V. BLAGOVESHCHENSKI and M. P. YURGENSON (Biochem. J., 1935, 29, 805—

810).—Variations on treatment with flour enzyme (A., 1933, 1331) in the leucosine- and non-protein-N, gliadin, globulin, and glutenin fractions of flour and baking mixtures (obtained by extracting with  $H_2O$ , 72% EtOH, 10% NaCl, and 2% NaOH, respectively) indicate that the solvent effect of the enzyme is one of disaggregation as opposed to the proteolytic action of yeast enzymes. H. D.

**Does protease secretion occur in bacteria?** W. MOYCHO (Compt. rend., 1935, 201, 859—860).—Cultures of *B. prodigiosum* in peptone media develop to a greater extent if shaken, and the appearance of the red colour of prodigiosin is delayed. The secretion of proteases (I) does not occur until after the death of the cell. (I) are not liberated if the bacteria are killed by PhMe,  $CHCl_3$ , or  $Et_2O$ . R. N. C.

**Action of proteases on the protein of ungerminated cereals and on amylolytic activity** T. CHRZĄSZCZ and J. JANICKI (Biochem. Z., 1935, 281, 408—419).—The action of trypsin, papain, pepsin, and rennin on the protein and active amylase (I) content of ungerminated cereals was investigated. (I) is present in cereals, and the activity is increased by the action of proteases to an extent varying with different proteases and cereals. No abs. relationship exists between the increase of active (I) and the extent of protein degradation. The increase depends not exclusively on these factors, but also on the formation of substances having elutrient and kinase activity. Rennin, since it degrades oat- and buckwheat-protein (unattacked by pepsin), must contain protease. P. W. C.

**Phosphatases of the brain.** K. V. GIRI and N. C. DATTA (Current Sci., 1935, 4, 324).—In brain (of sheep) both "acid" (I) and "alkaline" phosphatase (optimum  $pH$  5.0 and 9.6, respectively) are present. (I) is not activated by  $Mg^{++}$ , and is therefore not identical with erythrocyte phosphatase (cf. Waldschmidt-Leitz, A., 1935, 534). F. R. G.

**Variations of serum-phosphatase after ingestion of chloroform.** H. METZGER, P. BARTHELME, and M. URBAN (Compt. rend. Soc. Biol., 1935, 120, 896—897).— $CHCl_3$  ingested by dogs daily for long periods causes an increase of serum-phosphatase, which disappears with cessation of administration. Bile secretion is not affected. R. N. C.

**Serum-phosphatase during gestation.** J. CAYLA and F. FABRE (Compt. rend. Soc. Biol., 1935, 120, 748—750).—Phosphatase increases by about 136% in pregnancy, and does not depend on the age of the mother.  $CaO$  fixation by the foetus is increased 7-fold during the last 2 months. R. N. C.

**Action of some chemical compounds on vegetable phosphatases.** J. COURTOIS (Compt. rend., 1935, 201, 855—856).—The affinity of any phosphatase for glycerophosphate depends on its origin; emulsin (I) and white mustard phosphatase react differently from takadiastase (II). NaF accelerates hydrolysis by the grain enzymes, and restrains that by (II); EtOH exhibits an inverse activity to NaF, whilst glycerol restrains (II) without affecting (I).  $AsO_4^{+++}$  and  $PO_4^{+++}$  inhibit all three to equal degrees. All these agents influence the affinity of each enzyme

for both glycerophosphates to the same degree.  $Mg^{++}$  does not accelerate any of the three, nor does 8-hydroxyquinoline (cf. A., 1935, 122). R. N. C.

**Phosphatase activity of tissues and plasma in tumours of bone.** C. C. FRANSEEN and R. McLEAN (Amer. J. Cancer, 1935, 24, 299—317).—The phosphatase activity of the blood-plasma is raised significantly in the osteoblastic type of osteogenic sarcoma, and on removal of the tumour mass the plasma-phosphatase val. falls to normal, rising again with recurrence of the tumour. The tumour tissue is also higher in phosphatase than are all other types of tumour tissue examined. The results support the theory of the synthesis of phosphatase by the osteoblasts. NUTR. ABS. (m)

**Micro-determination of phosphatase in serum.** E. MÜLLER (Z. physiol. Chem., 1935, 237, 35—39).—Amidol or metol is suitable as reducing agent in the colorimetric  $[(NH_4)_2MoO_4-sulphite]$  determination of  $PO_4^{+++}$  by the step-photometer. With Na  $\beta$ -glycerophosphate as substrate, the application of the method to phosphatase activity in serum (0.5 c.c.) is described. F. O. H.

**Energy relationships in the enzymic formation of lactic acid and synthesis of phosphagen.** O. MEYERHOF and W. SCHULZ (Biochem. Z., 1935, 281, 292—305).—The reaction phosphopyruvic acid (I) + creatine  $\rightarrow$  creatinephosphoric acid +  $AcCO_2H$  is associated with a negative heat val. of  $-3000$  g.-cal., whereas the analogous reaction (I) + arginine  $\rightarrow$  argininephosphoric acid +  $AcCO_2H$  is almost thermoneutral. P. W. C.

**Enzymic synthesis of creatinephosphoric acid by phosphate transfer from phosphopyruvic acid.** H. LEHMANN (Biochem. Z., 1935, 281, 271—291).—The synthesis of creatinephosphoric acid (I) in muscle poisoned with  $CH_2I \cdot CO_2H$  on addition of phosphoglyceric acid (II) and phosphopyruvic acid (III) is investigated using dialysed muscle extracts. The synthesis, which takes place only in presence of adenylic acid (IV) or adenylyl pyrophosphate (V), occurs particularly in old extracts dialysed for a long time in which spontaneous dephosphorylation no longer occurs.  $PO_4^{+++}$  transfer occurs in two stages: (IV) + (III)  $\rightarrow$  (V) +  $AcCO_2H$ ; (V) + creatine  $\rightarrow$  (I) + (IV). A small amount of (IV) may thus generate 100 times its amount of (I).  $Mg$  is necessary for both reactions. (III) permits a quicker and more complete transfer of  $PO_4$  than does (II). The reaction may be used for the prep. of (I) and also for the synthesis of argininephosphoric acid in crab's muscle extract. P. W. C.

**Dephosphorylation of starch by phosphatase.** H. PRINGSHEIM and F. LOEW (Bull. Soc. Chim. biol., 1935, 17, 1607—1613).—Complete dephosphorylation of amylopectin without maltose formation is not effected by several phosphatase preps. The dephosphorylation becomes proportionately easier, however, as diastatic action proceeds. A. L.

**Cozymase.** H. VON EULER, H. ALBERS, and F. SCHLENK (Z. physiol. Chem., 1935, 237, I—II; cf. A., 1935, 1024; Warburg *et al.*, *ibid.*, 400).—Improved methods of purification enable cozymase

(I) to be obtained almost pure and not as a mixture of isomerides. On acid hydrolysis (I) yields adenine (19.5%), nicotinamide, and  $\text{NH}_3$  (but no  $\text{CO}_2$ ). (I), which is probably a dinucleotide,  $\text{C}_{24}\text{H}_{35}\text{O}_{18}\text{N}_8\text{P}_2$ , is a monobasic acid. W. McC.

**Stability of the heat-stable glycolysis activator in cozymase, and of Warburg's co-enzyme.** H. VON EULER and G. GÜNTHER (Svensk Kem. Tidskr., 1935, 47, 285—290).—The glycolysis-activating power of cozymase is slightly enhanced when its oxidation-reduction activation is destroyed by heat. A study of lactic acid production indicates that the mechanism of glycolysis activation is the same for both "active" and "inactive" cozymase. The glycolysis activation is only slowly inactivated by 0.1N-NaOH at 100°, 0.5N-NaOH, or 0.5N-HCl. The relative activities at  $p_{\text{H}}$  5 (from fermentation measurements) after 1 hr. at 85° are approx.: cozymase 85%, Warburg's co-enzyme 30%. M. H. M. A.

**Cozymase as a hydrogen carrier.** H. VON EULER, E. ADLER, and H. HELLSTRÖM (Svensk Kem. Tidskr., 1935, 47, 290—293).—Substrate-dehydrogenase-cozymase systems give a reduced cozymase stable to atm.  $\text{O}_2$ , and reoxidised by flavin-enzyme. Cozymase is thus identified with the co-enzyme in the system substrate-dehydrogenase-co-enzyme-flavin-enzyme-acceptor. M. H. M. A.

**Action of cozymase.** H. VON EULER and R. VESTIN (Z. physiol. Chem., 1935, 237, 1—7).—Cozymase (I) [both highly purified ( $A_{C_0}=4 \times 10^5$ ) and relatively crude preps.] rendered fermentation-inactive by heat (A., 1935, 782, 1162, 1165, 1278) and normal (I) promote phosphorylation and formation of lactic acid by rat muscle in presence of hexose diphosphate (II) to approx. the same extent. Adenosine triphosphate can replace (I)+(II) in muscle glycolysis but not in yeast fermentation (cf. A., 1932, 778). Direct phosphorylation of  $\text{AcCO}_2\text{H}$  by yeast enzyme system (apozymase) in presence of (I) does not occur. Phosphorylation in muscle extract-glycogen-(I) preps. with (II) equals that with  $\text{AcCO}_2\text{H}$ . The nature of the various active centres of (I) (which are differentiated by reagents, e.g.,  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{H}$ , as well as by heat) is discussed. F. Ö. H.

**Oxidative inactivation of cozymase with Schar-dinger enzyme preparations.** F. LIPMANN (Nature, 1935, 136, 913—914).—An inhibition of fermentation occurs when yeast macerate is mixed with a milk prep. containing xanthine oxidase in presence of  $\text{O}_2$ . Fermentation recommences on addition of boiled yeast macerate or purified cozymase. L. S. T.

**Activators of glycolysis. II.** H. VON EULER and G. GÜNTHER (Z. physiol. Chem., 1935, 237, 221—226; cf. A., 1035, 1162).—Repetition of previous work with a much purer cozymase prep. shows that the ability to accelerate glycolysis is increased by heating the material at 100°. H. W.

**Fermentative enzymes. IV. Specificity of yeast-phosphatase.** E. BAUER, A. SCHAFFNER, and F. KRUMEY (Z. physiol. Chem., 1935, 237, 191—198; cf. A., 1935, 661).—Repetition of previous work following criticisms of Schuchardt (*ibid.*, 1026) and

Collatz (*ibid.*, 1026) shows that dried yeast of various origins yields phosphatase preps. identical within the limits of experimental error with those described previously with respect to sp. action on  $\alpha$ -glycerophosphate.  $\beta$ -Glycerophosphate is relatively slowly attacked. H. W.

**Phosphate transference by means of phosphopyruvic acid in alcoholic fermentation of sugar.** O. MEYERHOF and W. KIESSLING (Biochem. Z., 1935, 281, 249—270).—The velocity of degradation of phosphopyruvic acid (I) by yeast is increased by addition of sugar to an extent dependent on the fermentation velocity of the latter, to which  $\text{PO}_4'''$  of (I) is transferred. In presence of NaF, 2 mols. of (I), 2 mols. of hexose, and 2 mols. of  $\text{PO}_4'''$  are used and 2 mols. of  $\text{CO}_2$ , 2 mols. of EtOH, 1 mol. of hexose diphosphate (II), and 2 mols. of phosphoglyceric acid (III) are formed. The velocity is similarly increased in presence of  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{H}$  and (II) is again formed. The MeCHO arising remains, however, as such, the conversion into (III)+EtOH not taking place. By using different sugars as  $\text{PO}_4'''$  acceptors in systems containing NaF or  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{H}$ , the velocity of degradation of (I) is shown to correspond with the fermentation velocities of the various sugars. The latter velocity must therefore be determined by the ability and readiness of the sugar to act as  $\text{PO}_4'''$  acceptor. Including this new reaction in the general mechanism of alcoholic fermentation, a scheme is obtained which accounts both for the fermentation velocity of the sugars and for the requirements of the Harden-Young equation. P. W. C.

**Theory of mitogenetic radiation. V. Yeast as detector for mitogenetic rays.** M. MOISSEJEVA (Biochem. Z., 1935, 281, 349—357).—Using liquid yeast cultures as detector in a chamber with quartz base or wall and using blood which had been dried on filter-paper and immersed in  $\text{H}_2\text{O}$  as inductor, the detector and inductor being hermetically separated, a positive induction effect (max. 50%, average 21%) on the multiplication of the yeast occurs. P. W. C.

**Preparation and determination of trehalose in yeast.** A. STEINER and C. F. CORI (Science, 1935, 82, 422—423).—Treatment of yeast with  $\text{N}\cdot\text{H}_2\text{SO}_4$  followed by pptn. with  $\text{HgSO}_4+\text{Fe}_2(\text{SO}_4)_3$  in 7.5%  $\text{H}_2\text{SO}_4$  completely extracts the trehalose (I), and only traces of polysaccharide which are pptd. on neutralisation with  $\text{BaCO}_3$ . After removal of the added metals, concn. in vac., and addition of EtOH, cryst. (I) is obtained in 0.3—0.7% yield. A method for the determination of (I) in yeast is outlined. L. S. T.

**Relation of oxygen tension and temperature to the time of reduction of cytochrome.** T. J. B. STIER (J. Gen. Physiol., 1935, 19, 339—350).—The time for the appearance of the cytochrome absorption band in yeast suspensions at various temp. is linearly related to the  $\text{O}_2$  tension. Crit. tensions, increasing with rise of temp., are found below which the cytochrome band appears. The  $\text{O}_2$  tension within the suspension is lowered by respiration by the cells; the rate of lowering can be calc. from the data and agrees approx. with direct measurements. F. A. A.

**Constitution of cytochrome c.** J. ROCHE and M. T. BÉNEVENT (Bull. Soc. Chim. biol., 1935, 17, 1473—1493).—Hæmatin, prepared from pig's blood, successively oxidised and reduced with  $K_3Fe(CN)_6$  and  $Na_2S_2O_4$  gives a hæmochromogen with  $C_5H_5N$  which has an absorption spectrum almost identical with that of the corresponding hæmochromogen of cytochrome c from yeast. A. L.

**Fixation and exchange of cations in living organisms.** General character of the laws of base exchange. J. LAVOLLAY (Compt. rend., 1935, 201, 1150—1152).—If  $x$  is the concn. of a cation in a medium and  $Y$  the concn. in the organisms cultivated thereon, then the equation  $Y = Kx^{1/p}$  (where  $K$  and  $p$  are consts. and  $1/p < 1$ ) holds within certain limits of concn. for K in *Penicillium glaucum*, Mg in *Aspergillus niger*, and for Ca and Pb in brewer's yeast. If  $C_1$  and  $C_2$  represent the concns. of two cations, then in certain cases  $[C_1/C_2]_{fixed} = [C_1/C_2]_{medium}^a$ . The formal similarity of these laws to those controlling base exchange in zeolites and in soil indicates a close relationship to these phenomena. W. O. K.

**Yield of citric acid from sugar as a basis for estimating the schemes of its formation from the latter.** V. S. BUTKEVITSCH and M. S. GAJEVSKAJA (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 405—408).—Yield tests show that, with *A. niger*, the whole of the sugar is converted into citric acid, according to the scheme of either Raistrick or Virtanen.

H. G. R.

**Diffusible nature of the inhibitory agent produced by fungi.** J. C. CARTER (Phytopath., 1935, 25, 1031—1034).—Agar media staled by growth of *Helminthosporium sativum* and a bacterium inhibit the further growth of *H. sativum*. The inhibitory agent is diffusible and thermostable, and retains its activity after sterilisation. A. G. P.

**Biochemistry of micro-organisms. XLVII. Production of polysaccharides by *Penicillium luteum*.** Zukal. C. G. ANDERSON and H. RAISTRICK (Biochem. J., 1936, 30, 16—19).—When *P. luteum*, Zukal, is grown on a Czapek–Dox medium with glucose as sole source of C, the principal metabolic product is luteic acid, a malonylpolyglucose. In the early stages of growth a polymannose is present which tends to be replaced by a polygalactose with increasing age of the culture. No pentose is produced. J. N. A.

**Vitamin-A activity of the stem of a *Mucor*.** W. H. SCHOPFER and A. JUNG (Compt. rend. Soc. Biol., 1935, 120, 1093—1095).—The stem of *Phycomyces oakesleeanus* when completely developed contains carotene and exhibits considerable vitamin-A activity. R. N. C.

**Slime-mould pigment as indicator of acidity.** W. SEIFRIZ and M. ZETZMANN (Protoplasma, 1935, 23, 175—179).—The yellow pigment,  $C_{13}H_{13}O_2N_4$ , of *Physarum polycephalum* changes from greenish-yellow at  $p_H$  8 to orange-red at  $p_H$  1. Within the mould the pigment shows changes in the plasmodium from  $p_H$  8 when fruiting to  $p_H$  1.6 when a sclerotium is formed. The pigment is probably a flavin. A. G. P.

**Nature of inhibition between certain fungi parasitic on citrus.** J. G. ARRILLAGA (Phytopath., 1935, 25, 763—775).—Inhibitory action of *Diaporthe citri* towards *Phytophthora parasitica* or *P. citrophthora* results from the action of metabolic products of *D. citri*. The inhibitory agent is not an enzyme, is diffusible, filterable, and relatively thermostable, and is constantly produced in various substrates whether *Phytophthora* is present or not. A. G. P.

**Influence of *Phytomonas tumefaciens* and *P. rhizogenes* on the actual acidity of certain liquid and agar substrates.** A. R. WILSON (Phytopath., 1935, 25, 854—863).—Differences in the rate and direction of  $p_H$  changes effected by these organisms in a no. of media are determined. On carrot infusion free  $NH_3$  is produced. A. G. P.

**Relation between sulphur in various forms and rate of growth of the colourless flagellate *Chilomonas paramecium*.** S. O. MAST and D. M. PACE (Protoplasma, 1935, 23, 297—325).—*Chilomonas* synthesises starch (I), fat, protein, and protoplasm from inorg. compounds, without intervention of light. Energy is probably derived from oxidation of  $NH_3$ . With all S compounds examined the rate of fission increases to a max. and subsequently declines as the S source is progressively increased. The optimum concn. of S varies with the source. Growth, fission, and synthesis of (I) and fat continue in the absence of S. With insufficient S fat accumulates (defective oxidation) and death ultimately occurs. Insufficient C causes death through (I)-starvation. Excessive S or C causes the formation of substances inhibiting cell division. Neither S nor C is necessary for fission. A. G. P.

**Role of bacteria, particularly anaerobes, in the corrosion of steel.** R. VEILLON (Compt. rend. Soc. Biol., 1935, 120, 1045—1047). R. N. C.

**Action of microbes on fats.** L. M. HOROVITZ-VLASOVA and M. J. LIVSCHITZ (Zentr. Bakt. Par., 1935, II, 92, 424—435).—Lipolysis by a no. of bacteria and fungi is indicated principally by the increased acid val. of the fatty phase. Glycerol is not detectable in cultures. The Nile-blue and "potash" tests are suitable for detecting lipolysis. Oxidation of fats by the organisms yields peroxides, OH-acids, and aldehydes and is indicated by the presence of labile O compounds (pyrogallol test), increased acidity in the aq. phase, lowered I val., and increased  $n$ . Neither the lipase nor the oxidative enzyme of moulds appears in the substrate. Bacterial lipase is thermostable. A. G. P.

**Phytochemical reduction of lactaldehyde.**—See this vol., 191.

**Optical properties of fermentation lactic acids. I. Bacteria producing inactive lactic acid.** H. KATAGIRI and K. KITAHARA (J. Agric. Chem. Soc. Japan, 1935, 11, 997—1007).—Yeast mashies for sake manufacture contain both *d* and *l*-lactic acid formers; the resultant lactic acid from the sake produced is optically inactive. P. G. M.

**Formation of succinic acid by *B. coli*. Production of succinic acid in relationship to synthesis of proteins.** M. MICHAELIS (Z. physiol. Chem., 1935,

237, 181—185).—Determination of lactic and succinic acid (I). EtOH, AcOH, and  $\text{HCO}_2\text{H}$  formed by the growth of *B. coli* in sucrose solutions in presence of increasing amounts of  $\text{NH}_3$  shows that only in the case of (I) does a relationship between yield and  $[\text{NH}_3]$  exist; with increasing  $[\text{NH}_3]$  the yield of (I) declines. No relationship exists between the yields of (I) and AcOH. Apparently (I) is a product of the fission of the sugar, and in presence of sufficient  $\text{NH}_3$  is transformed by aspartase through fumaric acid into aspartic acid and thence into proteins. H. W.

Nature of the "sporogenes vitamin," an essential growth factor for *Cl. sporogenes* and related organisms. A. M. PAPPENHEIMER, jun. (Biochem. J., 1935, 29, 2057—2063; cf. Fildes *et al.*, this vol., 113).—The isolation of a highly conc. prep. of the sporogenes growth factor (I) from a conc. HCl extract of the  $\text{C}_5\text{H}_5\text{N}$ -Et<sub>2</sub>O solution of the saponifiable and unsaponifiable material of mare's urine is described. (I) is probably an unsaturated OH-acid of mol. wt. 200, and is purified by distillation of its Me ester, which is inactive.  $0.04 \times 10^{-6}$  g. of (I) per ml. added to an  $\text{NH}_2$ -acid medium promoted visible growth of *sporogenes*. (I) is distinct from other growth factors previously described. A. L.

*Leptothrix echinata*, a new iron bacterium, precipitating principally manganese. H. BEGER (Zentr. Bakt. Par., 1935, II, 92, 400—406).—The Mn-accumulating properties of the organism are described. A. G. P.

Carotenoids of purple bacteria. I. P. KARRER and U. SOLMSEN (Helv. Chim. Acta, 1935, 18, 1306—1315).—The isolation (by extraction with various solvents and chromato-absorption) of the following cryst. carotenoids from purple bacteria (called strain Z, as yet unidentified) is described: *rhodoviolascin*, m.p. 218° (max. at 573.5, 534, 496  $\text{m}\mu$ ;  $\text{SbCl}_3$  compound, max. at 642  $\text{m}\mu$ ) (C 84.15, H 10.23%), *rhodopin*, m.p. 159—160° (547, 508, 478  $\text{m}\mu$ ) (C 82.83, H 10.58%), both of which contain 2 O, which is not OH, and *rhodopurpurin*, m.p. 161—162°,  $\text{C}_{40}\text{H}_{50}\text{O}_5$  (550, 511, 479  $\text{m}\mu$ ). An amorphous pigment *flavorhodin* (502, 472  $\text{m}\mu$ ) was also isolated. All absorption max. are in  $\text{CS}_2$ . J. W. B.

Action of some sulphur compounds on fermentation of glucose by propionic bacteria (*Propionibacterium* II). P. CHAIX (Compt. rend., 1935, 201, 857—858).—*Propionibacterium* II does not affect glucose in absence of S derivatives, but ferments it in presence of cystine, cysteine, or glutathione (I). Max. action occurs with a (I) concn. of 1 : 25,000. R. N. C.

Photochemical reactions of SH-compounds in solution.—See this vol., 171.

Utilisation of  $\text{CO}_2$  in the dissimilation of glycerol by propionic acid bacteria. H. G. WOOD and C. H. WERKMAN (Biochem. J., 1936, 30, 48—53).—The mechanism of formation of the products of fermentation of glycerol (I) is investigated. Yeast is incubated anaerobically with (I) and  $\text{CaCO}_3$  and the volatile and non-volatile acids formed, and the  $\text{CO}_2$  and (I) utilisation, are determined. AcOH, EtCO<sub>2</sub>H, PrCO<sub>2</sub>H, succinic and sometimes lactic acid were

isolated;  $\text{CO}_2$  obtained from  $\text{CaCO}_3$  is utilised by propionic bacteria in the fermentation of (I). H. D.

Sulphur bacteria in the "pink" waters of the Surakhani oil fields.—See this vol., 48.

New autotrophic and thermophilic sulphur-bacteria association. V. CZURDA (Zentr. Bakt. Par., 1935, II, 92, 407—414).—In sulphated hot springs (Pystian) organisms utilising S as an energy source included two variants of *Thiobacterium* and a new *Thiospirillum* (*T. pistiense*). A. G. P.

Specific polysaccharide from the bacillus Calmette-Guerin (BCG). E. CHARGAFF and W. SCHAEFER (J. Biol. Chem., 1936, 112, 393—405).—Sp. polysaccharides were obtained from BCG by the Heidelberger-Menzel method and separated into H<sub>2</sub>O-sol. and -insol. fractions which on purification gave polysaccharide A,  $[\alpha]_D + 77.4^\circ$ , containing mannose, arabinose, and small quantities of inositol, and polysaccharide S, sol. in acids, and containing  $\text{Ca}_3(\text{PO}_4)_2$ . A protein,  $[\alpha]_D^{25} - 50^\circ$ , is also prepared with weak tuberculin activity. The A and S fractions are haptens without antigenic activity. H. D.

Refractometric study of diphtheria toxin. C. SIEBENMANN (Trans. Roy. Soc. Canada, 1935, [iii], 29, V, 41—43).—Under const. conditions, the quantity of toxin produced by cultures of *B. diphtheriae*  $\propto$  the amount of bacterial growth, which in turn is correlated with the fall in  $n$  of the medium. In general, high toxin production is associated with low vals. of  $n$ . W. O. K.

Variations of  $p_H$  in culture media designed for the production of staphylococcal toxin. J. SCHWARTZ (Compt. rend. Soc. Biol., 1935, 120, 1085—1086). R. N. C.

Relation of growth to toxin production of the Dochez N.Y. 5 strain of hæmolytic streptococcus. H. C. PLUMMER (Trans. Roy. Soc. Canada, 1935, [iii], 29, V, 45—52).—With various carbohydrate-free media, the quantity of toxin formed is related to the extent of growth. In presence of glucose or maltose, growth, but not necessarily the quantity of toxin produced, is increased; at neutral reactions both growth and toxin are regularly increased. W. O. K.

Neutralising action of two streptococcal antisera. F. H. FRASER and H. C. PLUMMER (Trans. Roy. Soc. Canada, 1935, [iii], 29, V, 63—68).—Of the toxins produced by 174 strains of hæmolytic streptococci, 157 were neutralised by N.Y. 5 antitoxin, 15 of the remainder by Smith antitoxin, whilst 2 strains were neutralised only by a mixture of the two antitoxins. One toxin was neutralised by each of the two antitoxins separately. W. O. K.

Action of quinoline derivatives on pneumococci and streptococci *in vitro*. I. BÜHRMANN (Z. Immunität., 1935, 84, 300—307; Chem. Zentr., 1935, i, 2833—2834).—18 quinoline derivatives [mostly 6-hydroxyquinoline-4-carboxylic acid (I) and 4-amino-2-phenylquinoline (II) derivatives] were examined in 0.01% solution. The growth of pneumococci was inhibited by the hydrochlorides of (I) Pr<sup>a</sup> ester, 4-amino-6-hydroxyquinoline (III), (II), 4-amino-2-*p*-tolylquinoline (IV), Bu<sup>s</sup> 3-2-phenyl-4-

quinolylaminoacetate, and 3:4-dihydro-1:2-naphth-acridineamine (V). Growth of streptococci was inhibited by (II), (III), (IV), and (V). J. S. A.

**Lipins of tubercle bacilli. XL. Presence of sterols.** R. J. ANDERSON, R. SCHOENHEIMER, J. A. CROWDER, and F. H. STODOLA (*Z. physiol. Chem.*, 1935, 237, 40—45).—Only traces of sterol-like substances were found in the  $\text{COMe}_2$ -sol. fat and crude  $\text{CHCl}_3$ -sol. waxes. They probably arise from extraneous sources (cf. A., 1935, 407, 663).

F. O. H.

**Active immunisation in poliomyelitis.** S. FLEXNER (*Science*, 1935, 82, 420—421). L. S. T.

**Nature of filterable viruses.** R. G. GREEN (*Science*, 1935, 82, 443—445). L. S. T.

**Titration of the *L* and *S* antigens of vaccinia virus in extracts of the vaccinated skin of the rabbit, calf, and guinea-pig.** J. CRAIGIE and F. O. WISHART (*Trans. Roy. Soc. Canada*, 1935, [iii], 29, V, 57—62).—Extracts of infected skin contain both the *L* (heat-labile) and *S* (heat-stable) antigens as demonstrated by reaction with pure anti-*L*- and anti-*S*-serum. The presence of the same *L* and *S* antigens in the infected skin of three different species suggests that the antigens of vaccinia are sp. products of the virus analogous to bacterial antigens. W. O. K.

**Purification of bacteriophage by electrophoresis and its therapeutic use.** L. MARMIER and V. GRYZEZ (*Ann. Inst. Pasteur*, 1935, 55, 641—653).—Details are given for obtaining bacteriophage preps. free from protein material, which on intravenous injection do not produce anaphylactic shock. The bacteriophage loses but little of its activity in purification. P. G. M.

**Action of medicinal substances on the cell.** G. ROSKIN (*Z. Immunität.*, 1935, 84, 251—267; *Chem. Zentr.*, 1935, i, 2697).—The action of medicinal substances on trypanosomes can be detected by failure to form the blue dye from Rongalit-white, and by the shifting of the isoelectric point of the cells (indicator, methylene-blue). The sensitivity of *Paramecia* to quinine (I) fluctuates periodically; saccharated  $\text{Fe}_2\text{O}_3$  renders them more sensitive to (I) in acid than in alkaline solution. The sensitivity of *Paramecia* to ultra-violet light is increased in presence of dil. (I) solutions. R. N. C.

**[Trypanocidal action of] antimony compounds.** F. G. CAWSTON (*Vet. Rec.*, 1935, 15, 1280).—Stibilase and trystibine are more effective than tartar-emetic against trypanosomes and schistosomes. R. N. C.

**Synthesis of chemotherapeutic compounds.**

**Synthetic "Naganin" in the U.S.S.R.** I. L. KRITSHEVSKI and I. S. MEERSON. II. Quinoline derivatives [for use] against malaria. I. L. KRITSHEVSKI and E. J. STERNBERG (*Z. Immunität.*, 1935, 79, 180—186, 438—459; *Chem. Zentr.*, 1935, i, 2843).—I. The synthesis of a compound as active against trypanosomes as "Fournau 309" is claimed.

II. A no. of 8-substituted aminoquinolines have been studied with regard to their action against d-malaria. 8- $\gamma$ -Diethylaminopropylamino-6-methoxyquinoline ("Plasmizide") has a therapeutic

index of 26.6; the corresponding OH-compound is also active. Lengthening of the C-chain in position 8 and the introduction of branched chains lower the val. of the product. H. N. R.

**Germicidal efficiency of chloramine-T and calcium hypochlorite.**—See B., 1936, 46.

**Integration of the endocrine system.** (Sir) W. LANGDON-BROWN (*Lancet*, 1935, 229, 1155—1161).—A lecture. L. S. T.

**Endocrine organs of the blue whale.** A. P. JACOBSEN (*Nature*, 1935, 136, 1029).—The presence of various hormones in the pituitary, thyroid, pancreas, ovary, and corpus luteum graviditatis is described. L. S. T.

**Reversion of the action of adrenaline and other active substances.** V. SUSANNA (*Arch. Int. Pharm. Ther.*, 1935, 49, 460—469; *Chem. Zentr.*, 1935, i, 2836).—Ergotamine reverses the pressor action of adrenaline, pituitrin, eserine, ephedrine, racetrine, strychnine,  $\text{NMe}_3$ , and  $\text{NH}_2\text{Bu}$ . Ethylurethane and chloral are without influence. A. G. P.

**Comparative study of sympathin and adrenaline.** W. B. CANNON and A. ROSENBLUETH (*Amer. J. Physiol.*, 1935, 112, 268—276).—The effects of sympathin from different sources in the cat are compared with those of adrenaline (I) on physiological indicators. It is concluded that there are two sympathins, one excitatory and the other inhibitory; the latter differs from acetylcholine, and both differ from (I). R. N. C.

**Response of the hyperthyroid heart to adrenaline.** C. H. McDONALD, W. L. SHEPARD, M. F. GREEN, and A. F. DE GROAT (*Amer. J. Physiol.*, 1935, 112, 227—230).—Prolonged thyroid feeding to terrapins increases the rate of  $\text{O}_2$  consumption in the isolated heart and the response of the rate of  $\text{O}_2$  consumption to adrenaline. R. N. C.

**Action of the hormone of adrenal cortex on the glycogen content of the liver.** H. A. HOCHFELD (*Biochem. Z.*, 1935, 282, 392—398).—In rats the glycogen content of the liver, after a 24-hr. fast, is progressively increased by administration of fat, of the hormone, and of fat + hormone. Possibly the hormone stimulates conversion of fat into carbohydrate. W. McC.

**Adrenaline and sugar content of foetal blood.** O. MACCHIARULO (*Arch. Gynakol.*, 1935, 159, 349—354).—Variable amounts of adrenaline (I) were detected in the blood and urine of infants following birth; comparable amounts were present 8 days later. There was no relationship between the sugar and (I) of the blood. (I) was present in the maternal blood several days before delivery and increased during labour. NUTR. ABS. (m)

**Tono-glycaemic index of adrenaline.** B. ENOCKSSON and A. GIERTZ (*Acta med. Scand.*, 1934, 59, Suppl., 116—126).—There is a relation ("tono-glycaemic index") in normal men between the hyperglycaemic and pressor actions of adrenaline, injected subcutaneously. This is about 3 in normal men and about 7 in normal women. Its variability depends chiefly on that of the pressor effect. The

hyperglycæmic and pressor effects in women are respectively  $>$  and  $<$  those in men. The dissociation of the two effects becomes manifest in certain diseases; the index rises in hypertonia and asthma, and falls in jaundice. R. N. C.

**Adrenaline in the venom of *Bufo arenarum*.** V. DEULOFEU (Z. physiol. Chem., 1935, 237, 171—172).—0.18 mg. of adrenaline was isolated from 45 g. of the dried venom. W. McC.

**Effect of continuous injection of adrenaline on the ketone content of the urine.** A. BAUDOUIN, H. BENARD, J. LEWIN, and J. SALLET (Compt. rend. Soc. Biol., 1935, 120, 860—862).—Urinary ketones in the dog are increased slightly by chloralose anaesthesia, and very considerably by continuous injection of adrenaline. The acidosis produced is  $<$  in diabetics. R. N. C.

**Inactivation of histamine in perfused organs.** F. R. STEGGERDA, H. E. ESSEX, and F. C. MANN (Amer. J. Physiol., 1935, 112, 70—73).—The kidneys and (less) the liver are most effective in inactivating histamine. R. N. C.

**Effect of dietary lipæmias on the insulin and adrenaline blood-sugar curves.** H. J. HAMBURGER (Klin. Woch., 1935, 14, 96—97).—The insulin blood-sugar curve in children fed with albumin paste containing cholesterol and pig's bile shows a fall  $>$  normal; the rise produced by adrenaline is weakened. R. N. C.

**Hypoglycæmic action of insulin in dogs with the pancreatic duct ligatured, and with or without secondary fatty degeneration of the liver.** E. AUBERTIN and E. CASTAGNOU (Compt. rend. Soc. Biol., 1935, 120, 1101—1104).—Ligature of the pancreatic ducts does not diminish the response to insulin in an otherwise healthy animal. Fatty degeneration of the liver causes a broadening of the blood-sugar curve, recovery being much slower. R. N. C.

**Hypoglycæmic action of insulin phosphotungstate and phosphotungstic acid administered by mouth.** H. N. MUKHERJEE (J. Physiol., 1935, 84, 362—366).—Insulin phosphotungstate suspension in phosphotungstic acid (I) solutions, or (I) alone, produces hypoglycæmia when administered to rabbits by mouth; the effect is apparently due to both constituents. R. N. C.

**Augmentation of the physiological response to insulin.** L. C. MAXWELL and F. BISCHOFF (Amer. J. Physiol., 1935, 112, 172—175).—The response to insulin in rats and rabbits is augmented by addition of basic  $\text{Fe}^{III}$  chloride to the insulin. R. N. C.

**Continuous injection of insulin in the dog: threshold dose by the intra-arterial and the mesenteric-intravenous routes.** A. BAUDOUIN, J. LEWIN, and E. AZERAD (Compt. rend. Soc. Biol., 1935, 120, 865—866).—The threshold dose by either route is approx. 0.01 unit per kg. per hr. R. N. C.

**Effect of hypophysectomy and cerebral manipulation in the dog on the response of the blood-sugar and -inorganic phosphorus to insulin.** I. L. CHAIKOFF, F. L. REICHERT, P. S. LARSON, and M. E. MATHES (Amer. J. Physiol., 1935, 112, 493—

503).—The response of blood-sugar and -inorg. P to insulin is augmented to successively increasing extents by craniotomy, radial incision of the dura, retraction of the right temporal lobe, and complete hypophysectomy. R. N. C.

**Continuous injection of insulin in the dog. Threshold dose by the peripheral intravenous route.** A. BAUDOUIN, E. AZERAD, and J. LEWIN (Compt. rend. Soc. Biol., 1935, 120, 769—771).—The threshold dose is about 0.05 unit per kg. per hr. R. N. C.

**Excretion of insulin by the dog.** J. A. SHANNON (Amer. J. Physiol., 1935, 112, 405—413).—The rate of insulin (I) excretion  $\propto$  plasma concn. of (I) between 0.013 and 0.565%. Intravenous injection of (I) does not affect the urea, xylose (II), or creatinine (III) excretion. The simultaneous excretion ratio of (III) and (I) is about 0.994. (II) excretion with moderate to high urine vols. is  $<$  the simultaneous (I) excretion (mean ratio 0.734). Phloridzin raises the glucose excretion to the level of that of (III) or (I), the excretion of (II) increasing to  $>90\%$  of that of (I). R. N. C.

**Reactions of ammonolysed parathyroid hormone.** R. G. ROBERTS, W. R. TWEEDY, and G. H. SMULLEN (J. Biol. Chem., 1935, 112, 209—214).—Parathyroid hormone (I) reacts as a typical protein with Na in liquid  $\text{NH}_3$ . The activity of (I) varies inversely with the liberation of the acidic  $\text{H}_2$ , and is diminished by the action of  $\text{NH}_3$  alone; it is not dependent on  $\text{S}\cdot\text{S}\cdot$  or any linkings readily reduced by  $\text{Na}\cdot\text{NH}_3$ . (I) has no prosthetic group (either with or without Fe) which catalyses the action of Na on  $\text{NH}_3$ . J. N. A.

**Action of small doses of parathyroid hormone on the magnesium of the organism.** M. COPPO and M. PISA (Z. ges. exp. Med., 1935, 95, 675—678; Chem. Zentr., 1935, i, 2390).—Total Mg and ash in the body of the rat are reduced by administration of 1 unit of parathormone (I) a day. The action of (I) on mineral metabolism probably results from its effect on Mg. R. N. C.

**Relation of contracture and tetany to experimentally-produced calcium deficiency in cats, with and without lesions of the cortical motor areas.** H. C. COOMBS, F. H. PIKE, and D. S. SEARLE (Endocrinol., 1935, 19, 421—431). R. N. C.

**Idiopathic hypoparathyroidism and tetany in the fowl.** F. B. HUTT and W. L. BOYD (Endocrinol., 1935, 19, 398—402).—A case is reported of a pullet with tetany and low blood-Ca, due to temporary idiopathic hypoparathyroidism. Parathormone, but not Ca gluconate, showed a curative effect. R. N. C.

**Depressor hormone as the origin of protein shock.** G. DE NITO (Deut. med. Woch., 1935, 61, 339—341).—Lymphoganglin (I), formed in the lymph glands, is considered to be the most important depressor factor of the animal organism. Injection produces effects characteristic of protein shock. Protein shock is probably due to (I) being discharged by the lymph glands on stimulation of the lymphatic

system by the foreign protein. A (I)-like substance can be extracted from plants. R. N. C.

**Existence of prosecretin.** V. B. SCOTT and E. U. STILL (Amer. J. Physiol., 1935, 112, 511—517).—Of the secretin (I) present in untreated duodenal mucosa one fraction is extracted by neutral 0.9% NaCl, and the other completely by acids, and partly by weak bases and aq. EtOH. (I) is present in the mucosa if digestive acids have been excluded. The prosecretin (II) theory of Bayliss and Starling is not considered to be entirely tenable; the acid-sol. (I) is probably held by adsorption on the protein mols., and, if (II) exists, by combination. R. N. C.

**Role of duodenal hormones (secretin) in carbohydrate metabolism.** J. LA BARRE (Bull. roy. Acad. Med. Belg., 1934, 14, 469—486).—A lecture. R. N. C.

**Effect of lactogenic hormone preparations on the blood-sugar level of rabbits and monkeys.** W. O. NELSON, C. W. TURNER, and M. D. OVERHOLSER (Amer. J. Physiol., 1935, 112, 714—717).—Lactogenic hormone preps., believed to be relatively free from other pituitary hormones, do not affect blood-sugar in either species. R. N. C.

**Action of pituitrin on venous blood pressure.** V. I. VON GONCZY and J. KISS (Z. ges. exp. Med., 1934, 94, 400—404; Chem. Zentr., 1935, i, 2835).—In most cases the pressure is increased by injection of pituitrin. Negative results sometimes obtained are associated with a predominance of histamine-like substance in the pituitrin prep. A. G. P.

**Acetonuria after administration of the (pituitary) fat-metabolism hormone.** K. J. ANSELMINO and F. HOFFMANN (Z. ges. exp. Med., 1934, 94, 305—308; Chem. Zentr., 1935, i, 2835; cf. A., 1935, 411).—Administration of the hormone increased the COME<sub>2</sub>, AcOH, and  $\beta$ -hydroxybutyric acid contents of blood and urine. A. G. P.

**Erythrophore and melanophore hormone.** A. JORES and G. WILL (Z. ges. exp. Med., 1934, 94, 389—393; Chem. Zentr., 1935, i, 2690).—The melanophore hormone (I) is not identical with Zondek's erythrophore hormone (II). (I) is > (II) in the basophile section of the pre-pituitary, whilst in the anterior lobe the (I)/(II) ratio is inverted. H<sub>2</sub>O extracts only a small quantity of (I) from pituitary powder, but the activity of the extract is increased considerably by treatment with alkali or contact with food, suggesting that the extract contains an inactive precursor of (I). The (II) potency of the extract is weakened by this treatment. (II) is extracted completely, but (I) only partly, from the powder by repeated treatment with 0.6% NaCl. (II) is readily sol. EtOH, but (I) only with difficulty. R. N. C.

**Melanophore hormone and adrenals.** A. JORES and H. BECK (Z. ges. exp. Med., 1934, 94, 295—299; Chem. Zentr., 1935, i, 2690).—The adrenal cortex is increased in size in rabbits or rats by injection of melanophore hormone (I). The adrenaline content is also increased. (I) may be identical with the corticotropic hormone. R. N. C.

**Influence of various hormones on spread of melanophores caused by posterior pituitary lobe extract.** H. MATSUDA (Folia Pharmacol. Japon., 1935, 19, 377—393). CH. ABS. (*p*)

**Effect of the thyrotropic hormone of the pituitary on blood-function.** S. THADDEA and A. WALY (Z. ges. exp. Med., 1934, 94, 359—369; Chem. Zentr., 1935, i, 2690). R. N. C.

**Comparison of the actions of the corticotropic hormone of the anterior pituitary in different species of animals.** K. J. ANSELMINO, L. HEROLD, and F. HOFFMANN (Z. ges. exp. Med., 1934, 94, 323; Chem. Zentr., 1935, i, 2690).—The hormone acts similarly on the adrenals in rats, guinea-pigs, rabbits, and mice. The growing male mouse is best suited for assay. R. N. C.

**Action of alkaline anterior pituitary extract on the mineral substances of the plasma.** R. GERSONMAN and A. D. MARENZI (Compt. rend. Soc. Biol., 1935, 120, 817—820).—In normal and thyroidectomised dogs the extract evokes an increase of total plasma-CO<sub>2</sub>, sugar, Ca, Mg, and inorg. P, and a fall of Cl and Na. The Ca increase appears in hypophysectomised, but not thyro-parathyroidectomised, dogs. R. N. C.

**Cows' milk as a possible excretory source of the anterior pituitary-like hormone.** A. I. WEISMAN, I. S. KLEINER, and E. ALLEN (Endocrinol., 1935, 19, 395—397).—The hormone is absent from pregnancy milk. R. N. C.

**Influence of pituitary growth-hormone on the phosphatase activity of bone and kidney.** W. E. WILKINS, J. A. CALHOUN, C. PILCHER, and E. M. REGEN (Amer. J. Physiol., 1935, 112, 477—480).—The phosphatase activity of the bones and kidney of the adult rat is slightly reduced. R. N. C.

**Growth-promoting hormone and tumour growth.** P. ENGEL (Z. Krebsforsch., 1935, 41, 488—496; Chem. Zentr., 1935, i, 2835).—The tumour-stimulating action of the pituitary growth-hormone is lowered by simultaneous injection of "preptan," but not by that of gonadotropic hormone. The direct inhibitory action of the latter on tumour growth is due to its influence on metabolic changes. A. G. P.

**Action of posterior pituitary hormone on the blood-sugar of the rabbit.** H. C. ELLSWORTH (J. Pharm. Exp. Ther., 1935, 55, 435—438).—Pitressin increases blood-sugar in very high doses only; pitocin is without effect. R. N. C.

**Posterior pituitary and carbohydrate metabolism.** F. HOGLER and F. ZELL (Wien. Arch. inn. Med., 1935, 27, 141—158).—In rabbits the posterior pituitary hormone affects carbohydrate metabolism. Tonephin acts on the liver cell, mobilising glycogen and raising blood-sugar. Hence injuries to the posterior pituitary may cause disturbances of carbohydrate metabolism. NUTR. ABS. (*m*)

**Chemistry of the pituitary gonadotropic hormone.** L. C. MAXWELL and F. BISCHOFF (J. Biol. Chem., 1935, 112, 215—221; cf. Wallen-Lawrence, A., 1934, 1039).—Partial or complete inactivation

of pituitary powder results from treatment with powerful oxidising agents and substances which react with  $\text{NH}_3$ ,  $\text{NH}_4$ , and  $\text{OH}$ , but mild oxidising and reducing agents have no effect. In 3 hr. at  $37^\circ$  0.1N-NaOH produces complete, whilst 0.033N-NaOH and 0.1N-HCl produce partial, inactivation. There is no evidence that the preps. contain two hormones, and  $\text{CH}_2\text{O}$ , although it produces inactivation, does not exert a selective destructive action.

W. McC.

**Prolan excretion in senility.** H. SAETHRE (Acta med. Scand., 1934, 59, Suppl., 440—442).—Prolan excretion is high in old women, but absent in girls of 13—15 years. Healthy men excrete about 5 mouse units per litre of urine, but elderly men almost as much as elderly women.

R. N. C.

**Effect of adrenals and pituitary on regulation of blood-pressure and inversion of the sex characters in man.** J. BAUER (Acta brev. Neerl. Physiol., 1934, 4, 157—161).—Theoretical.

R. N. C.

**Oxytocic properties of blood extracts and their physiological significance.** G. H. BELL and J. M. ROBSON (J. Physiol., 1935, 84, 351—361).—Oxytocic activity has been found in a no. of extracts from the blood of pregnant cows, women in labour, and rabbits before and after injection of posterior pituitary extract. The extracts also contain a factor inhibiting the reaction of the uterus to oxytocin *in vitro*; this activity increases on keeping.

R. N. C.

**Chemistry of oestrogenic substances.** J. W. COOK, E. C. DODDS, and F. L. WARREN (Nature, 1935, 136, 912—913).—Previous work is confirmed (cf. A., 1935, 1033, 1173).

L. S. T.

**Pineal gland and gonadotropic hormone.** P. ENGEL (Z. ges. exp. Med., 1934, 94, 333—345; Chem. Zentr., 1935, i, 2692).—The extract from  $\text{CO}_2$ -dried pineal powder with 0.5% alkali acts antagonistically to the gonadotropic hormone (pre-pitan).

R. N. C.

**Rate of disappearance and fate of mare's gonadotropic hormone following intravenous injection.** H. R. CATCHPOLE, H. H. COLE, and P. B. PEARSON (Amer. J. Physiol., 1935, 112, 21—26).—The hormone (I) after injection in large quantities in the rabbit and gelding disappears from the blood without being excreted or stored. The rate of disappearance in the gelding is  $>$  in the pregnant mare. Castration of the rabbit does not affect the rate of disappearance of (I). Thus (I) is not prolan, which is excreted in the urine.

R. N. C.

**Influencing of the time of coagulation of blood by the sex hormone and its variation in hormonal hermaphroditism and experimental sex changes.** E. LUNDBERG (Acta med. Scand., 1934, 59, Suppl., 432—438).—Injection of folliculin in growing female rabbits shortens the time of coagulation of the blood by approx. 50%; the effects appear 1—2 hr. after injection, and persist for  $>$  24 hr. In man the time is shortened by approx. 20%. There is little reaction in young female animals, and none in infants.

R. N. C.

**Hormones of the corpus luteum.** E. JARLOV (Acta. med. Scand., 1934, 59, Suppl., 438—440).—Corner's corpus luteum extract is adsorbed on excess of kieselguhr and the powder exhaustively extracted with  $\text{H}_2\text{O}$ . The extract, which should contain only folliculin (I), exhibits an action ("pre-pregnancy reaction") on the rabbit's uterus. Pure (I) preps. give the reaction only at certain places in the uterus.

R. N. C.

**Crystalline by-product obtained in large-scale extraction of theelin and theelol.**—See this vol., 214.

**Presence, in the urines of certain women, of a substance antagonistic to the oestrous hormones.** A. DURUPT, J. LAGARDE, and P. BREGOU (Compt. rend. Soc. Biol., 1935, 120, 852—853).—The antagonistic substance appears in the urine of dysmenorrhœics.

R. N. C.

**Standardisation of sex-stimulating substances: therapeutic efficiency.** E. LAQUEUR (Klin. Woch., 1935, 14, 339—341).—The min. dose of ketohydroxy-oestrin (I) necessary to produce "heat" in the castrated rat is 10—16 times that necessary for mice, whilst the rat unit of oestradiol monobenzoate (II) is 4 times the mouse unit. Hence the rat is 4—5 times as sensitive to (II) as to (I); in mice the two substances are equally potent.

R. N. C.

**Effects of the oestrogenic and the galactopoietic hormones on the mammary gland of the rabbit.** W. U. GARDNER, E. T. GOMEZ, and C. W. TURNER (Amer. J. Physiol., 1935, 112, 673—683).

R. N. C.

**Effect of injection of residual ovarian extracts.** H. W. MARLOW and F. GROETSEMA (Endocrinol., 1935, 19, 415—420).

R. N. C.

**Inhibition of thyroid activity by the follicular hormone (menformone).** J. G. HEYL, S. E. DE JONGH, and R. KOOR (Acta brev. Neerl. Physiol., 1934, 4, 126—127).

R. N. C.

**Inhibition of the oestrogenic effect of follicular hormone by progestin.** P. DE FREMERY, S. KOBER, and M. TAUSK (Acta brev. Neerl. Physiol., 1934, 4, 119—121).—The effect of the min. oral dose of oestrin in spayed mice is inhibited by 3 rabbit units of progestin injected simultaneously.

† C

**Isolation of folliculin and equilenin by chromatographic adsorption.** R. DUSCHINSKY and E. LEDEBER (Bull. Soc. Chim. biol., 1935, 17, 1534—1539).— $\alpha$ -Folliculin (I) is readily isolated from the  $\text{C}_6\text{H}_6$  extract of pregnant mares' urine after adsorption on  $\text{CaCO}_3$ ; with  $\text{Al}_2\text{O}_3$ , (I) and equilenin (II) are adsorbed, (II) being isolated as picrate.

A. L.

**Equilin prepared from pregnant mare urine.** G. F. CARTLAND and R. K. MEYER (J. Biol. Chem., 1935, 112, 9—14).—Equilin (I) prepared by Girard's method and further recrystallisation from EtOH has m.p. 238—240°,  $[\alpha]_D^{25} +331^\circ$  in EtOH. Assayed biologically in 10% aq. EtOH + 0.5%  $\text{Na}_2\text{CO}_3$ , the product has approx. 75% of the activity of standard theelin (II); assayed without the addition of  $\text{Na}_2\text{CO}_3$  its biological activity is only 30% that of (II). Colorimetrically (cf. A., 1935, 791) (I) has approx. 11% o

the val. of (II); this val. is not altered during the final recrystallisations. F. A. A.

**Difference between "male hormone" extracts from urine and from testicles in hypophysectomised rats.** J. FREUD (Acta brev. Neerl. Physiol., 1934, 4, 145—147).—The response of the seminal vesicles, ventral prostate, and periurethral tissue in hypophysectomised rats to testicle extracts is considerably > to male urine extracts. The "male hormone" of the testicle extracts is considered therefore to be different from that of the urine, or to be associated with some "co-substance" which acts synergistically. R. N. C.

**Use of gonadotropic hormones in the treatment of imperfectly-migrated testes.** A. W. SPENCE and E. F. SCOWEN (Lancet, 1935, 229, 1335—1338). L. S. T.

**Enzymic determination of vitamins.** F. PIRONE (Annali Chim. Appl., 1935, 25, 292—309).—The action of solutions of vitamin-A, -B, -C, and -D, of known biological activity, on the alcoholic fermentation of sucrose is studied by means of the CO<sub>2</sub> evolved. Acceleration of the fermentation (X)  $\propto$  concn. of the vitamin. The vitamin units are given by the following expressions: for -A and -D,  $11.36 \times (X-100)+23$ ; for -B,  $0.0823(X-100)+2.34$ ; for -C,  $0.0625(X-100)+0.19$ . T. H. P.

**Absorption of carotene and vitamin-A.** J. C. DRUMMOND, M. E. BELL, and E. T. PALMER (Brit. Med. J., 1935, ii, 1208—1210).—The carotene (I) and vitamin-A (II) content of the chylous fluid of a patient suffering from an effusion of chyle into the thoracic cavity were studied before and after oral administration, on separate occasions, of (II) (0.125 mg. in 9 days) and (I) (100 mg. in 7 days). A rise of the level of both followed the administration, but, relative to the amount ingested, was much more marked in the case of (II). Little (I) and (II) could be extracted directly from the fluid with Et<sub>2</sub>O, but treatment with EtOH rendered (I) easily extractable. (II) was present as ester. NUTR. ABS. (m)

**Do the ascorbic acid contents of the organs of the rat vary according to the presence or absence of vitamin-A in the diet?** L. RANDOIN, A. GROUD, and C. P. LEBLOND (Compt. rend. Soc. Biol., 1935, 120, 1082—1085).—Ascorbic acid is high in the organs of the rat, the presence or absence of vitamin-A causing no important variations. R. N. C.

**Determination of vitamin-A in body-fluids.** ROSENTHAL (Klin. Woch., 1935, 14, 307; Chem. centr., 1935, i, 2554).—Wendt's method gives uncertain results. The author's colour test (A., 1934, 149, 1413) is suitable for sera and other body-fluids. A. G. P.

**Determination of vitamin-A by means of its influence on the vaginal contents of the rat.** K. H. COWARD, M. R. CAMDEN, and E. M. LEE (Biochem. J., 1935, 29, 2736—2741).—The disappearance of keratinised cells from the vaginal smears of rats deficient in vitamin-A on feeding -A is used as a basis for the assay of -A. Results are rather less accurate than by the growth response method. H. D.

**Antineuritic vitamin. IV.** A. WINDAUS, R. TSCHESCHE, and R. GREWE (Z. physiol. Chem., 1935, 237, 98—104; cf. A., 1934, 1415).—Oxidation with BaMn<sub>2</sub>O<sub>8</sub> of the sulphate of the vitamin, removal of Ba, SO<sub>4</sub>, and Mn oxides from the solution, concn. in a vac., and treatment with picronic acid yields the picrolonate (I) of a base (II), C<sub>6</sub>H<sub>10</sub>N<sub>4</sub> (probably 5:6-diamino-2:4-dimethylpyrimidine) [hydrochloride (III), m.p. 265° (decomp.); picrate, m.p. 224.5° (decomp.)]. The liquors from (III) yield a second base, subliming at 110—120°/13 mm. (hydrochloride, m.p. 224°), probably the Ac derivative of (II). The liquors from (I) yield two cryst. fractions, m.p. 180° and 225°, of acidic character, containing N but free from S and Cl. The structure of vitamin-B<sub>1</sub> is discussed. F. O. H.

**Consumption of the antineuritic factor in the oryzanin feeding of different birds.** G. MARTINO (Boll. Soc. ital. Biol. sperim., 1935, 10, 300—302; cf. A., 1934, 460, 706). R. N. C.

**Is lactic impregnation of the tissues the true cause of avian polyneuritis?** R. LECOQ (Compt. rend. Soc. Biol., 1935, 120, 958—961).—Addition of lactic acid to the diet increases the vitamin-B requirements of the pigeon, and the normal protective doses of yeast for polyneuritis are no longer effective. R. N. C.

**Isolation of pyruvic acid from the blood of vitamin-B<sub>1</sub>-deficient pigeons.** R. E. JOHNSON (Biochem. J., 1936, 30, 31—32).—AcCO<sub>2</sub>H has been isolated as the 2:4-dinitrophenylhydrazone from the blood of vitamin-B<sub>1</sub>-deficient pigeons. AcCHO is not present. J. N. A.

**Content of vitamin- in (A) germinating wheat, (B) Italian wheats.** V. FAMIANI (Atti R. Accad. Lincei, 1935, [vi], 22, 84—85, 86—88).—(A) The vitamin-B<sub>1</sub> content of wheat tends to increase during germination.

(B) Data for 8 varieties are given. F. O. H.

**Gastro-intestinal symptoms of vitamin-(B) deficiency.** E. SCHTODT (Acta med. Scand., 1935, 84, 456—495). R. N. C.

**Extraction and stabilities of vitamin-B<sub>1</sub> and of lactoflavin.** B. BISBEY and H. C. SHERMAN (J. Biol. Chem., 1936, 112, 415—420).—Vitamin-B<sub>1</sub> is almost completely extracted from dried milk by 80% EtOH but scarcely at all by abs. EtOH; about half of the lactoflavin is extracted by 80% EtOH, the remainder being found active in the residue. H. D.

**Lactoflavin (vitamin-B<sub>2</sub>).** R. KUHN (Angew. Chem., 1936, 49, 6—10).—A lecture.

**Growth-promoting activity of l- and d-araboflavin [6:7-dimethyl-9-l-(or d-)-1'-arabityliso-alloxazine].** H. VON EULER, P. KARRER, and M. MALMBERG (Helv. Chim. Acta, 1935, 18, 1336—1338; cf. A., 1935, 1286).—Growth in rats given 10—40  $\times 10^{-6}$  g. daily doses of l-araboflavin (*ibid.*, 1134) ceases after 30—40 days, and even with the latter dose no const. growth-promoting activity is observed. Doses of 10  $\times 10^{-6}$  g. of d-araboflavin produce a const. wt. increase of 0.8 g. per day over the period of observation (50 days). Doses of 10  $\times 10^{-6}$  g. of l-riboflavin

and  $3 \times 10^{-6}$  g. of the *d*-form produce wt. increases of 1.3 g. and 0.9 g. per day, respectively. The synthetic stereoisomeride thus exhibits higher growth-promoting activity than does natural lactoflavin, although it differs only in the stereoisomerism of one OH in the sugar residue.

J. W. B.

**Vitamin- $B_2$  complex.** Differentiation of anti-blacktongue and "P.-P." factors from lactoflavin and vitamin- $B_6$  ("rat pellagra" factor). I—VI. T. W. BIRCH, P. GYORGY, and L. J. HARRIS (Biochem. J., 1935, 29, 2830—2850).—Data for the distribution of human pellagra-preventing ("P.-P.") factor (I), vitamin- $B_6$  ("rat pellagra" factor) (II), and lactoflavin (III) in various foodstuffs are tabulated. Rats fed on (I)-producing diets (A., 1929, 476) remain free from skin lesions; such diets cure (II)-deficiency disease. Hence rat pellagra is not analogous to human pellagra, rats having no need of, or being able to synthesise, (I). With maize diets (*ibid.*) containing (II), dogs develop "blacktongue," a condition rapidly cured by administration of autoclaved yeast, fresh fish, or anti-anæmia prep., but not of (III). The anti-blacktongue factor is therefore distinct from (II) and (III), but may be identical with (I). The "chicken pellagra" of Elvehjem and Koehn (A., 1935, 669) appears to be distinct from (II)-deficiency; its relation to human pellagra and blacktongue is not clear. The term "rat acrodynia factor" is proposed for (II). The extrinsic factor for pernicious anæmia (A., 1932, 1156) appears to be different from (II) or (III). Factors in the vitamin- $B_2$  complex are discussed.

F. O. H.

**Maintenance nutrition in the pigeon.** Influence of dietary protein and vitamin- $B_3$ . C. W. CARTER and J. R. O'BRIEN (Biochem. J., 1935, 29, 2746—2754).—For the normal growth of pigeons a diet of polished rice plus vitamin- $B_1$  must be supplemented with protein and - $B_3$  (liver concentrates).

H. D.

**Maintenance nutrition in the pigeon.** Vitamin- $B_3$  concentrates. C. W. CARTER and J. R. O'BRIEN (Biochem. J., 1936, 30, 43—47).—A prep. containing vitamin- $B_3$  activity is obtained by extraction of liver with 97% EtOH, concn. and addition of Et<sub>2</sub>O, extraction with H<sub>2</sub>O, and addition of COMe<sub>3</sub>.

H. D.

**"Enteral" vitamin- $I-B_7$ .** Behaviour of the vitamin towards primary alcohols. E. CENTANNI (Biochim. Terap. sper., 1935, 22, 137, 153).—The extract obtained from rice polishings with 95—100% EtOH, administered to pigeons on a diet of polished rice, did not protect from progressive emaciation ending fatally, but prevented digestive disturbances. The same extract, administered orally or intravenously, stimulated appetite markedly. The existence of an "enteral" vitamin (*I-B*.) regulating the digestive functions is therefore affirmed. MeOH (most effective), Pr<sup>o</sup>OH, Bu<sup>o</sup>OH, and C<sub>5</sub>H<sub>11</sub>·OH extracted the vitamin from rice polishings, in varying degree. The vitamin probably consists of several factors.

NUTR. ABS. (m)

**Behaviour of the enteral vitamin towards solvents.** E. MONTEVECHI (Biochim. Terap. sper., 1935, 22, 143).—The vitamin is insol. in fat solvents,

but sol. in 95% EtOH, which does not extract the antineuritic and growth-promoting vitamins. With 70% EtOH, the last two are completely, the first partly, extracted from rice polishings.

NUTR. ABS. (m)

**Synthesis of ascorbic acid in the tissues *in vitro*.** M. LAPORTA and E. RINALDI (Boll. Soc. ital. Biol. sperim., 1935, 10, 319—322).—Minced animal tissues in Ringer-Locke solution at *p*<sub>H</sub> 7.38 in presence of sugars, or their H<sub>2</sub>O or glycerol extracts, show no definite increase in their ascorbic acid content; the results of Guha and Ghosh (cf. A., 1935, 416) are not confirmed.

R. N. C.

**Cellular fixation and non-fixation of ascorbic acid in dystrophies from avitaminosis-C.** G. MOURIQUAND and A. COEUR (Compt. rend. Soc. Biol., 1935, 120, 1007—1009).—The Giroud-Leblond reaction after administration of ascorbic acid in avitaminosis-C is negative in certain cases.

R. N. C.

**Effect of thyroxine on vitamin-C metabolism.** J. MOSONYI (Z. physiol. Chem., 1935, 237, 173—177; cf. Demole *et al.*, A., 1935, 1423).—In guinea-pigs (but not in rats) administration of thyroxine or extract of thyroid gland markedly decreases the ascorbic acid (I) content of the adrenals and slightly decreases that of the liver. Simultaneous administration of vitamin-A counteracts the effect. In rats extirpation of the thyroid gland increases the (I) content of the adrenals (but not that of the liver), apparently due to increased synthesis in the adrenals.

W. McC.

**Seasonal variation in vitamin-C content of the organism.** F. IPPEN (Schweiz. med. Woch., 1935, 66, 431—432).—In healthy people receiving 200 ml. of orange juice by mouth or 0.1 g. of ascorbic acid orally or intravenously the urinary excretion of vitamin-C (I) showed a max. in all cases after 1 hr. Low curves are held to indicate a (I) deficit in the organism.

NUTR. ABS. (m)

**Polyploidy and vitamin-C.** F. W. SANSOME and S. S. ZILVA (Biochem. J., 1936, 30, 54—56; cf. A., 1934, 227).—There is no evidence that the ascorbic acid content of tomatoes is conditioned by their size (McHenry, A., 1935, 1287).

H. D.

**Effect of incomplete diets on concentration of ascorbic acid in the rat's organs.** Identity of ascorbic acid and the reducing agent of rat's gut. F. G. HOPKINS [with B. R. SLATER and G. A. MILLIKAN] (Biochem. J., 1935, 29, 2803—2819).—With rats on a normal mixed diet, the concn. of ascorbic acid (I) in liver and gut is 0.26 mg. per g. After a 48-hr. fast, the level in the gut rises to 0.40 mg., whilst that in the liver is unaffected. With diets of carbohydrate (II) alone, the concn. of (I) in the liver rises to 0.33 mg., whilst that in the gut remains normal; with protein+fat or fat alone, the liver and gut vals. are 0.19 and 0.37 mg., respectively. Diets of protein+(II) or of fat+(II) produce no significant effect. Determination of the velocity of reduction of 2:6-dichlorophenol-indophenol indicates the identity of the reducing agent in CCl<sub>3</sub>·CO<sub>2</sub>H extracts of rat's gut with (I). The bimol. coeff. of reduction

is unaffected over a considerable range of concn. of (I) and dye (cf. A., 1934, 1145). F. O. H.

**Reversible oxidation of vitamin-C in biological media.** N. BEZSSONOFF and M. WOLOSZYŃ (Compt. rend. Soc. Biol., 1935, 120, 893—895).—Vitamin-C (I) forms a reversible oxidation-reduction system with its oxidation product, which contains no dienolic group and is probably dehydroascorbic acid (II).  $E_h \propto$  the (I) concn., the variation being due to considerable ionisation differences between (I) and (II). The characteristic reducing agents of biological media increase the stability of the system and modify the properties of (I) from those observed in pure solution. R. N. C.

**Oxidation-reduction processes in experimental deficiency.** I. Alteration of capacity of tissues to reduce 2:6-dichlorophenol-indophenol in avian heriberi. M. MITOLO (Arch. Fisiol., 1934, 34, 102).—The capacity of tissues to reduce the indophenol is diminished in all organs, and particularly in the lungs and intestine. NUTR. ABS. (m)

**Variations of the power of vitamin-C in biological media to decolorise dichlorophenol-indophenol.** N. BEZSSONOFF and M. WOLOSZYŃ (Compt. rend. Soc. Biol., 1935, 120, 890—892).—The results obtained by dichlorophenol-indophenol titration of urine, milk, and cerebrospinal fluid to which known quantities of ascorbic acid have been added are untrustworthy. R. N. C.

**Reeds as a source of vitamin-C.** S. BALACHOVSKI (Compt. rend. Acad. Sci. U.R.S.S., 1935, 3, 270).—Leaves of the common reed (*Phragmites communis*) contain up to 0.2% of ascorbic acid. Anaerobic treatment of an aq. extract with lactic bacilli resulted in an increased reducing power. P. G. C.

**Vitamin-C (ascorbic acid) content of [East] Indian fruits.** J. P. SPRUYT and W. F. DONATH (Geneesk. Tijds. Nederl.-Indie, 1935, 75, 1944—1950).—The ascorbic acid content of various fruits was determined by the 2:6-dichlorophenol-indophenol titration method, both before and after treatment with  $H_2S$ . Addition of  $Hg(OAc)_2$  has no effect on the result. *Capsicum annum* (0.07—0.25%) and the banana (0.04—0.15%) have the highest vitamin-C contents. S. C.

**Origin of the vitamin-C in the organs of rats fed on vitamin-C-free diets.** H. VON EULER, C. GARTZ, and M. MALMBERG (Biochem. Z., 1935, 282, 399—405; cf. Guha *et al.*, A., 1935, 131).—*In vitro* rats liver and brain do not convert mannose (I) into ascorbic acid. Brain- and liver-hexosedehydrase, after addition of cozymase (II), dehydrogenate (I) and glucose. The (II) of the liver undergoes rapid spontaneous destruction. W. McC.

**Vitamin-C in invertebrates.** A. GIROUD and R. RATSIMAMANGA (Compt. rend. Soc. Biol., 1935, 120, 763—765).—Vitamin-C (I) is high in the hepatopancreas and sex glands of invertebrates, low in the muscles, and scarcely detectable in the intestine and gills. The ovaries of *Pecten maximus*, which contain a carotenoid, contain more (I) than the carotenoid-free testicles. R. N. C.

**Ascorbic acid content of certain organs of chicks raised on vitamin-C-deficient ration.** H. C. HOV (Science, 1935, 82, 423).—Chicks fed on such a diet, with or without ultra-violet irradiation, showed a high ascorbic acid (I) content in the adrenals, intestine, and intestinal mucosa; pancreas and kidney had approx. one third of the content of the liver or intestine, whilst muscle contained none. Part of (I) appeared to be excreted through the intestinal wall to the lumen. L. S. T.

**Examination of the cerebrospinal fluid for the detection of hypovitaminosis-C.** F. PLAUT and M. BULOW (Klin. Woch., 1935, 14, 276—277).—Young patients on a vitamin-C-deficient diet exhibit a low -C content of the cerebrospinal fluid. -C falls in old age. R. N. C.

**Reduction of 1-phospho-18-tungstic acid by ascorbic acid.** M. LAPORTA (Boll. Soc. ital. Biol. sperim., 1935, 10, 318—319).—Ascorbic acid and reductone are the only substances that reduce 1-phospho-18-tungstic acid (I) in the cold to any considerable extent; in neutral or alkaline solution it is reduced by many other substances. With org. liquids containing vitamin-C the intensity of the blue colour  $\propto$  -C content. The reduction is quantitatively reversible, and (I) can be determined by titration of the reduced (I) with 2:6-dichlorophenol-indophenol or I. R. N. C.

**Reactions of vitamin-C.** E. PITTARELLI and M. PITTARELLI (Biochem. Terap. sper., 1935, 22, 100).—Three reactions are described for the identification of ascorbic acid, based on the reduction of  $Fe(CNS)_3$ ,  $Cu(CNS)_2$ , and  $HgCl_2$ . The first and last might be used quantitatively. NUTR. ABS. (m)

**Determination of ascorbic acid.** M. VAN EEKELLEN and A. EMMERIE (Biochem. J., 1936, 30, 25—27).—In determining the ascorbic acid content of various substances and fluids by the  $Hg(OAc)_2$  method the extract must be made with  $CCl_3 \cdot CO_2H$  and the  $Hg(OAc)_2$  added at  $p_H$  5, an excess being avoided. The time between the pptn. and passage of  $H_2S$  must be  $> 5$ —10 min. Other methods are criticised. J. N. A.

**Conditions for the silver nitrate reaction as a test for ascorbic acid.** A. GIROUD, C. P. LEBLOND, R. RATSIMAMANGA, and M. RABINOWICZ (Compt. rend. Soc. Biol., 1935, 120, 967—968). R. N. C.

**Provitamin-D from plant and animal sources.** R. M. BETHKE, P. R. RECORD, and O. H. M. WILDER (J. Biol. Chem., 1935, 112, 231—238; cf. Waddell, A., 1934, 1043).—In chicks, irradiated cholesterol (I) is more efficacious in preventing rickets than is irradiated ergosterol (II) and calciferol (III), irradiated (II) and (III) being equally efficacious. Irradiated (I) is as potent as is cod-liver oil. Since equiv. rat units of vitamin-D (IV) from irradiated animal products (hog-brains, butter, lard) are more efficacious than (IV) from irradiated plant products (cottonseed oil, wheat middlings, lucerne leaf meal, yeast, fungus mycelium), it follows that the pro-(IV) of animal is not identical with that of plant products. The (IV) efficiencies of irradiated products from higher and lower plants are equal. W. McC.

**Vitamin-D content of egg yolk. II. Influence of various sources of vitamin-D on the antirachitic value. III. Antirachitic value of market eggs.** H. D. BRANION, T. G. H. DRAKE, and F. F. TISDALL (U.S. Egg and Poultry Mag., 1934, 40, No. 8, 22, 23, 58; No. 9, 22, 23, 52, 54).—Egg yolks are a good source of the antirachitic vitamin. Addition of 1% of cod-liver oil to the ration of hens increased the antirachitic potency of yolks 6–8 times. Large quantities of irradiated ergosterol (I) are transferred to the yolk with relative inefficiency. Small doses of (I) are transferred to the yolk as efficiently as is cod-liver oil. Ultra-violet irradiation of the birds, or exposure to sunshine during summer, causes only slight increase in the antirachitic val. of the eggs. Cold-storage for 8–11 months has little or no effect on the vitamin-D content of the eggs. NUTR. ABS. (m)

**Effect of vitamin-D on the calcium content of dentine.** E. W. FISH (J. Physiol., 1935, 84, 272–278).—Max. doses of vitamin-D administered with  $\text{CaCO}_3$  to dogs over long periods do not affect the Ca content of the dentine. Blood-Ca and the opacity of the bones to X-rays are increased, and new deposits of highly-calcified bone matrix are produced. R. N. C.

**Comparative antirachitic efficiency of irradiated milk, yeast milk, and cod-liver oil.** R. M. BETHKE, W. E. KRAUSS, P. R. RECORD, and O. H. M. WILDER (Proc. Amer. Inst. Nutrition, J. Nutrition, 1935, 9, No. 6, Suppl., 7).—Irradiated milk and cod-liver oil, fed to chicks, showed the same antirachitic potency, but the milk from cows fed on irradiated yeast had only about 10% of this val. When fed to rachitic infants, the two milks were equally efficient. NUTR. ABS. (m)

**Vitamin-D activity of cacao shell. I. Effect of fermenting and drying of cacao on the vitamin-D potency of cacao shell. II. Origin of vitamin-D in cacao shell.** A. W. KNAPP and K. H. COWARD (Biochem. J., 1935, 29, 2728–2735).—Vitamin-D is absent from the shell of the cacao bean dried in the dark, whether previously allowed to ferment or not; 21 I.U. per g. were found in that which had fermented and dried in the sun for 22 days. It is concluded that the occurrence of -D in the cacao bean is associated with the growth of ergosterol-producing yeast on it during fermentation. H. D.

**Use of purpurin as an indicator of the action of vitamin-D.** L. BUTTURINI (Boll. Soc. ital. Biol. sperim., 1935, 10, 215–217).—Purpurin colours the bone sections of rachitic rats whether or not vitamin-D is administered. R. N. C.

**Physiological system of products eliminated by plants.** A. FREY-WYSSLING (Protoplasma, 1935, 23, 393–409).—Secretions, excretions, and resorbed materials which are not subsequently assimilated ("recretions") are differentiated and their nature is discussed. A. G. P.

**Osmotic ratios of some Bengalese plants.** J. SEN-GUPTA (Ber. deut. Bot. Ges., 1935, 53, 783–795).—Cryoscopic determinations of the osmotic

pressure of saps of a no. of species from various localities and at different periods are recorded.

A. G. P.

**Mechanism of salt absorption by plant cells.** (A) W. J. V. OSTERHOUT. (B) F. C. STEWARD (Nature, 1935, 136, 1034–1035, 1035).—Discussions.

L. S. T.

**Intake of caesium by potato plants.** K. HELLER, K. PEH, and J. PINDUR (Z. Pflanz. Düng., 1935, 41, A, 36–37).—Addition of Cs salts to nutrient media for potatoes had no appreciable effect on the % of dry matter or of K, but increased the % of Cs in the plants. In higher proportions Cs tended to lower the total wt. of the plants. A. G. P.

**Incorporation of deuterium into growing organisms. II.** O. REITZ and K. F. BONHOEFFER (Z. physikal. Chem., 1935, 174, 424–434).—The experiments with green algæ (A., 1935, 661) have been continued, using water of higher D content. It has been possible to replace > half the H in the dry substance of the organisms with D without the algæ being killed. As the D content of the culture solution increases, the rate of growth of the algæ falls, and at a D content of 85–90% growth of *Scenedesmus acutus* ceases. After many days in culture solutions made with practically pure  $\text{D}_2\text{O}$ , however, a considerable proportion of the organisms start to grow again if placed in water of lower D content. Under conditions where any growth by chlorophyll assimilation occurs the assimilation of D is only half as rapid as that of H. R. C.

**Isotope exchange in soya beans.** K. OKABE and T. TITANI (Bull. Chem. Soc. Japan, 1935, 10, 552–554).—The exchange of H in soya beans by D has been observed by leaving the beans in contact with dil.  $\text{D}_2\text{O}$ . The exchange corresponds with a  $\text{H}_2\text{O}$  content of 25%, whereas analysis gives 10%, probably because of the replacement in the beans of H other than those of  $\text{H}_2\text{O}$  by D. R. S. B.

**Chlorophyll deficiencies in rice.** K. RAMIAH and S. RAMANUJUM (Proc. Indian Acad. Sci., 1935, 11, B, 343–368).—Genetic factors are examined. A. G. P.

**Action of electromagnetic short waves on the development of the plant embryo.** A. HERZUM (Magyar Orvosi Arch., 1934, 35, 392–395; Chem. Zentr., 1935, i, 2387–2388).—Exposure to short waves (12 m.) retards the growth of embryos of *Lupinus albus*. The action is sp. and increases with the period of exposure. The direct thermal effect is secondary. Brief exposure has a stimulative action.

**Hydrocyanic acid and nitrates in the germination of sorghum.** C. HAMANT (Compt. rend., 1935, 201, 1503–1505).—The total N in the grains, which contain an emulsin-like enzyme, is about 0.535%, of which about 0.046% is  $\text{NO}_3\text{-N}$ .  $\text{NO}_3\text{-N}$  of the germinating plant first increases and then decreases, the loss being found as HCN in a glucoside, formed exclusively in the plant, which also contains fructose and a hydroxybenzaldehyde as components.

**Occurrence of methoxyl, ethoxyl, and methylenedioxy-groups in substances of vegetable**

origin; mechanism of their formation by the plant. C. A. BROWNE and M. PHILLIPS (J. Washington Acad. Sci., 1935, 25, 517—524).—A theoretical discussion. Pictet's conception of the formation of OMe and CH<sub>2</sub>O<sub>2</sub> from CH<sub>2</sub>O in plants is inapplicable to *Penicillium*. The groups may be derived from hexoses by changes involving, in turn, hydrolysis, oxidation, reduction, and dehydration. Lignin, derived from carbohydrates, may be the precursor of many OMe-containing constituents of plants. A. G. P.

**Relationship between vitamin-A and plastids.** P. J. LAVERGNE (Compt. rend., 1935, 201, 1042—1044).—The plastids of the cells of *Elodea canadensis* and other plants give locally the SbCl<sub>3</sub> reaction for vitamin-A. W. O. K.

**Physiology of delayed germination in *Avena fatua*.** L. P. V. JOHNSON (Canad. J. Res., 1935, 13, C, 283—300).—Delayed germination is associated with a condition of the seed-coat tissues (brought about by post-fertilisation agencies) which restricts access of O<sub>2</sub> to the embryo. Normal germination may be restored by breaking the seed coat over the embryo or by soaking in 1—2% aq. KNO<sub>3</sub>. Exposure to artificially increased [O<sub>2</sub>] under germinating conditions had a stimulative effect. Treatment with pure O<sub>2</sub>, Et<sub>2</sub>O, or NaCNS produced irregular results. CH<sub>2</sub>Cl·CH<sub>2</sub>·OH and C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> were injurious. After-ripening probably induces changes in the seed coat which increase its permeability to O<sub>2</sub>. A. G. P.

**Chemical studies on methods of mulberry culture for young silkworms.** C. NAKASONE (Bull. Sericult. Japan, 1935, 8, 398). P. G. M.

**Concentration of cell sap of mulberry leaves.** Y. IMAMURA, K. KOIKE, and M. FURUYA (Bull. Sericult. Japan, 1935, 8, 396—397).—An investigation of cell sap concn. in different varieties by a method of plasmolysis. The concn. is lower in spring than in autumn. P. G. M.

**Atomic dynamics of plant growth.** G. HEVESY, K. LINDERSTRÖM-LANG, and C. OLSEN (Nature, 1936, 137, 66—67; cf. A., 1935, 1531).—Using radioactive P as indicator, it is found that the P atoms of maize leaves are present in a mobile state, and that during growth a continuous interchange of P occurs between different leaves. L. S. T.

**Action of follicular hormone on the growth of culture plants.** K. SCHARRER and W. SCHROPP (Biochem. Z., 1935, 281, 314—328).—The effects of increasing amounts (500—1000 mouse units) of cryst. preps. [both phenolic and the Na salt (I)], free from auxin but not completely free from equilin and hippulin, were investigated. With wheat, increased yields of grain and straw resulted, the effect being greater with (I). With rye and barley, the increases were within the limits of error except with 1000 units. Positive results were not obtained with oats.

With horse beans, 500 units led to an increase of 24% and 1000 units of 39% in the fruit, but the yield of straw was decreased. No significant effects were obtained with rape-seed or soya bean, but with sugar beet the yield was increased by 14%. This increase, however, affected only the dry substance wt., no increase in sugar or leaf being obtained. P. W. C.

**Developmental growth and the amino-acids.** I. *l*-Histidine. F. S. HAMMETT (Protoplasma, 1935, 23, 326—336).—*l*-Histidine (I) has no direct action on developmental growth, anabolism, or catabolism in *Obelia geniculata*. In concns. of *M*/31,000—21,000 (I) sustains the metabolic activity of maintenance. It is toxic in concns. > *M*/16,000. A. G. P.

**Influence of season on photosynthesis in the tropics.** B. N. SINGH and K. KUMAR (Proc. Indian Acad. Sci., 1935, 11, B, 437—456; cf. A., 1935, 794).—Seasonal variations are recorded in the intensity of assimilation of CO<sub>2</sub> by radish leaves of different ages under controlled conditions. Artificially increased illumination accelerates photosynthesis more effectively in winter than in summer. Summer rates of assimilation are increased by rise of temp. in the range 29—37°, but are not greatly affected by increases of [CO<sub>2</sub>]. The temp. coeff. of assimilation (21—31°) does not vary much from season to season, but at higher temp. ranges vals. are high in summer and low in winter. The chlorophyll content of leaves reaches max. during rains, is smaller, although still high, in winter, and is least in summer. The dry matter content and total leaf area in winter are > in summer. A. G. P.

**Role of potassium in the production of plant substance.** K. MAIWALD and A. FRANK (Z. Pflanz. Düng., 1935, 41, A, 8—28).—A discussion. A. G. P.

**Growth substance and cell division.** L. JOST (Ber. deut. Bot. Ges., 1935, 53, 733—750).—The response (elongation or division) of plant cells to growth substance (I) from various sources (bean sap, extracts of *Boletus edulis*) and of yeast preps. varies with the nature, position, age, and physiological condition of the cell, and with the concn. of (I) applied to it. Cell division may be induced by indolylacetic acid, and also by many unrelated substances, e.g., citric acid, NaCl, fructose. The possibility of the necessary presence of co-substances for the activity of (I) is discussed. The concn. of (I) necessary to cause cell division is approx. 1 in 10<sup>3</sup>—10<sup>4</sup>, whereas cell elongation is stimulated by 1 in 10<sup>7</sup>. A. G. P.

**Ascorbic acid (vitamin-C) and phytochemicals.** L. HAVAS (Nature, 1935, 136, 989; cf. A., 1935, 1431, 1548).—Injection of ascorbic acid into tomato plants increased the size of the tumours produced in them by *B. tumefaciens*. No marked change in *p<sub>H</sub>* of the sap of treated plants occurred. L. S. T.

**Pathological histology and phytochemistry of Psyllid yellows.** J. R. EYER (Phytopath., 1935, 25, 895).—Tissue surrounding feeding stylets of the potato psyllid nymph is examined. Sheath materials are of animal origin and contain chitosan and mucin. Surrounding tissue contains plant degradation products, arginine, tryptophan, and tyrosine. Diseased leaves and stems have abnormally high starch contents. The relationship between hexoses and starch in healthy plants is disturbed by the disease. Sucrose, the principal sugar of translocation, is absent or its formation is inhibited in diseased plants. A. G. P.

**Biochemical modifications in phytopathology. Disequilibrium of organic and mineral composition in parasite infections.** R. SALGUES (Compt. rend. Soc. Biol., 1935, 120, 780—782).—Fats, insol. carbohydrates (I), and ash in *Medicago lupulina*, L., are reduced during infection by *Septoria medicaginis*, Rob. and Desm., whilst proteins and sol. (I) are increased. Ca falls and P and K rise in the ash. The increase in sol. (I) is due to one of reducing sugars, whilst the fall in insol. (I) is due to disappearance of amyloids and hemicelluloses. R. N. C.

**Low-temperature masking of tobacco mosaic symptoms.** J. GRAINGER (Nature, 1936, 137, 31—32).—These symptoms are masked when the host plant is grown at a temp.  $< 11^{\circ}$  approx. L. S. T.

**Effect of tannic acid on infectivity of tobacco-mosaic virus.** H. H. THORNBERRY (Phytopath., 1935, 25, 931—937).—Inhibition of the virus by tannic acid (I) depends on the concn. of acid applied and the period of action. Removal of (I) by pptn. with gelatin or by ultrafiltration restores virus activity. Treatment of plants with (I) prior to inoculation inhibits infection to extents  $\propto$  the concn. of (I) used. When applied after inoculation, (I) in concns. of 0.01—10% has little effect on infection. A. G. P.

**Virus of tobacco mosaic. IV. Effects of different chemical agents on infectivity. V. Optimum hydrogen-ion concentration for purification by precipitation with lead acetate.** W. M. STANLEY (Phytopath., 1935, 25, 899—921, 922—930).—IV. Substances directly inactivating the virus are usually oxidising agents, protein precipitants, or agents inducing a change in  $[H^+]$  known to inactivate the virus. Prolonged action of  $HgCl_2$  in germicidal concns. did not affect the virus. In higher concns.  $HgCl_2$  affected purified virus preps. more markedly at  $p_H$  6—8 than at  $p_H$  3—5. The infectivity of the virus on *Phaseolus vulgaris* was increased by  $PO_4^{3-}$  buffers at  $p_H$  7.0, but on *Nicotiana* was unaffected or somewhat decreased. Charcoal completely adsorbed the virus from solutions, notably at  $p_H$  3—5.

V. The optimum  $p_H$  for pptn. by basic Pb acetate was 9.0, and for  $Pb(OAc)_2$ , 5.5. For elution from  $Pb(OAc)_2$  ppts. the optimum  $p_H$  was 7.0. A. G. P.

**Inhibiting influence of a virus on one of its mutants.** H. H. McKINNEY (Science, 1935, 82, 463—464).—Tobacco plants inoculated with virus mixtures in which the extract of yellow mosaic is much  $>$  that of the common mosaic develop at first symptoms of the former, but ultimately show those of the latter. With plants having yellow mosaic reinoculation with the common mosaic eventually suppresses symptoms of the former. L. S. T.

**Toxicity of ethyl alcohol towards dried and germinating seeds.** S. LALLEMAND and S. LALLEMAND (Bull. Soc. Chim. biol., 1935, 17, 1509—1521).—The toxicity of EtOH towards germinating seeds of *Lens esculenta* is  $<$  that towards the dry seeds, although in the former case the EtOH concn. is greater. A. L.

**Biological distribution of metals.** H. RAMAGE (Nature, 1936, 137, 67).—Spectroscopic determin-

ations of various metals in apple seeds, india-rubber tree seeds, Brazil nuts, etc. are recorded and discussed. L. S. T.

**Influence of soil sand on the determination of radium in plants.** K. G. KUNASCHEVA and B. K. BRUNOVSKI (Trav. Lab. biogeochem. Acad. Sci. U.R.S.S., 1935, 3, 45—48).—The anomalously high Ra content of *Struthiopteris germanica* does not depend on the presence of a large amount of sand, which has no influence on the Ra content of plants. CH. ABS. (e)

**Iodine contents of Chinese marine algæ.** P. S. TANG and C. S. CHANG (Chinese J. Physiol., 1935, 9, 369—374).—The I content of 12 further species (cf. A., 1935, 1436) is determined. H. G. R.

**Mode of combination of acetic acid in ginkgo wood (*Ginkgo biloba*).** K. KURSCHNER (Cellulosechem., 1935, 16, 107).—Polemical against Tang *et al.* (this vol., 123). R. S. C.

**Fructose anhydride from the leaves of the barley plant.** H. K. ARCHBOLD and A. M. BARTER (Biochem. J., 1935, 29, 2689—2693).—An aq. extract of barley leaves yielded a fructose anhydride (or a mixture of anhydrides) which on hydrolysis yielded reducing sugar equiv. to 105% of the wt. of anhydride taken, of which 94% was fructose. The more sol. fractions had  $[\alpha]_D^{25} -27^{\circ}$  and were more readily attacked by invertase than the less sol., which had  $[\alpha]_D^{25} -37^{\circ}$ . J. N. A.

**Pectin of ramie bast.** F. EHRLICH and R. HAENSEL (Cellulosechem., 1935, 16, 97—107, 109—114).—This pectin is much "altered." It contains much cyclic tetragalacturonic (pectolic) acid as  $H_2O$ -insol. Ca salt and only small amounts of  $\alpha$ -D-galacturonic acid, whilst most of the  $H_2O$ -sol. portion is a non-cyclic digalacturonic acid bound to carbohydrates, which include a disaccharide, large amounts of D-galactose, and some L-arabinose and methylpentose (? D-fucose). R. S. C.

**Properties of kelp colloids.** G. B. RICE and B. DUNSFORD (Proc. 5th Pacific Sci. Congr., 1934, 3, 2115—2121).—Colloidal preps. from *Nereocystis* were dialysed in collodion sacs. The solid matter in the initial and dialysed preps. averaged 0.079 and 2.4%, respectively. The respective  $p_H$  were 5.58 and 6.43. The dialysed preps. gave a flaky ppt. with electrolytes, but no ppt. on boiling. CH. ABS. (e)

**Unsaponifiable matter of algæ fats. I. Sterol.** K. SHIRAHAMA (J. Agric. Chem. Soc. Japan, 1935, 11, 980—984).—A sterol, "pervesterol," was isolated from various algæ and named. The consts. given agree with those reported by Heilbron *et al.* for fucosterol (A., 1934, 1347). The sterol from *Chishima nori* could not be purified. P. G. M.

**Chemical investigation of the seeds of *Allanblackia klainei*, Pierre.** L. ADRIAENS (Mat. grasses, 1933, 25, 9961—9962; Chem. Zentr., 1935, i, 2911—2912).—The acids from the seed-fat are 62.0% saturated (mainly stearic acid) and 37.5% unsaturated

(almost wholly oleic acid). Fractional crystallisation of the fat from COMe<sub>2</sub> affords an *oleodistearin*, m.p. 43.9—44.5°, I val. 27.8. H. N. R.

**African oil seeds.**—See B., 1936, 66.

**Wheat-germ oil.**—See B., 1936, 67.

**Essential oil from the rhizomes of *Cyperus rotundus*, Linn.**—See B., 1936, 44.

**Crystalline substance from the essential oil of *Lachnophyllum gossypinum*, Bge.** V. V. VILJAMS, V. S. SMIRNOV, and V. P. GOLMOV (J. Gen. Chem. Russ., 1935, 5, 1195—1204).—The oil contains β-pinene, camphene, and about 30% of a cryst. ester (I), CPr<sup>a</sup>:C:C:C:CH:CH:CO<sub>2</sub>Me, m.p. 32.6—32.8°, which when hydrolysed with aq. NaOH yields a mixture of products, of which COMeBu<sup>a</sup>, *n*-valeric and maleic acids were identified. When heated at 100° with 50% HNO<sub>3</sub> (I) yields Pr<sup>a</sup>CO<sub>2</sub>H and H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>. Catalytic hydrogenation (Pd-C) of (I) affords CH<sub>2</sub>Me[CH<sub>2</sub>]<sub>7</sub>CO<sub>2</sub>Me. R. T.

**Diterpene, from leaf- and wood-oil of *Sciadopitys verticillata*, S. and Z.**—See this vol., 207.

**Carotenoids from the anthers of *Lilium tigrinum*: antheraxanthin.** P. KARRER and A. OSWALD (Helv. Chim. Acta, 1935, 18, 1303—1305).—Hydrolysis (NaOEt-EtOH) of the ligroin extract of the anthers affords a mixture of pigments separated by chromato-absorption from EtOH solution by Ca(OH)<sub>2</sub> into capsanthin, and *antheraxanthin*, C<sub>20</sub>H<sub>58</sub>(56)O<sub>3</sub>, m.p. 211° (corr.), which has absorption max. at 490.5, 460.5, and 428 mμ in CHCl<sub>3</sub>, and gives a blue colour (max. 587 mμ) with SbCl<sub>3</sub>. J. W. B.

**New type of plant lipochrome.** I. M. HEILBRON, B. LYTTHGÖE, and R. F. PHIPERS (Nature, 1935, 136, 989).—A pigment, *myoxanthin*, m.p. 117—118° (uncorr.), has been isolated from the unsaponifiable fraction of *Rivularia nitida*. Unlike other phyto-carotenoids, it exhibits only one absorption band (max. 488—490 mμ) in CS<sub>2</sub>, resembling astacene in this respect, but differing from it in other respects. No hypophasic xanthophylls were detected in *R. nitida*. L. S. T.

**Plastid pigments of marsh dodder.** G. MACKENNEY (J. Biol. Chem., 1936, 112, 421—424).—2—3 mg. of rubixanthin, 4—6 mg. of lycopene, and 20—25 mg. of γ-carotene per kg. of fresh wt. were isolated from *Cuscuta subinclusa* and *salina*; traces of chlorophyll were detected. H. D.

**Hanfangchin B.**—See this vol., 217.

**Alkaloids obtained from jaborandi leaves.**

**Synthesis of pilocarpidine.**—See this vol., 215.

**Chemical investigation of the liana "Efiri."** IV. E. CASTAGNE (Congo, 1935, I, 32—37; Chem. Zentr., 1935, i, 2828; cf. this vol., 133).—From the EtOH extract of the stem of *Trichlistia gillettii* are isolated two alkaloids, *trichlisine*, C<sub>16</sub>H<sub>31</sub>O<sub>10</sub>N, m.p. about 255—260° (decomp.), [α]<sub>D</sub><sup>20</sup> +116.66° in 0.5N-HCl, and *trichliseine*, C<sub>23</sub>H<sub>40</sub>O<sub>7</sub>N, m.p. 135°, [α]<sub>D</sub><sup>20</sup> +68.49° in 0.5N-HCl. H. N. R.

**"Sotetsu" (*Cycas revoluta*, Thunb.). IV. Sotetsu-emulsin.** K. NISHIDA (Bull. Chem. Soc. Japan, 1935, 10, 524—530).—Sotetsu seed contains

a glucoside of CH<sub>2</sub>O, which splits off CH<sub>2</sub>O under the influence of an emulsin (I) which is also present. The isolation of (I) is described. (I) effects complete hydrolysis of salicin, the optimum conditions being *p*<sub>H</sub> 5.1 and 55—60°; the unimol. coeff. for the reaction increases with time and the velocity α the amount of (I) used (cf. following abstract). J. W. B.

**"Sotetsu" (*Cycas revoluta*, Thunb.). V. Sotetsu pollen.** I. K. NISHIDA (J. Agric. Chem. Soc. Japan, 1935, 11, 143—148).—The pollen does not contain starch, protamine, or spermine. Free adenine and choline are present, 2.24 g. of the latter (as aurichloride) being obtained from 1 kg. of pollen. P. G. M.

**Proteins of the cowpea (*Vigna sinensis*).** W. H. ADOLPH and H. C. CHIANG (Chinese J. Physiol., 1935, 9, 347—353).—The protein has been fractionated into vigin (globulin A) 45, glutelin 25, albumin 15, globulin B 10, and globulin C 5%, and the distribution of N determined in each fraction by the Van Slyke method. H. G. R.

**Artificial medium for epithelial cells and fibroblasts.** L. E. BAKER (Compt. rend. Soc. Biol., 1935, 120, 932—934). R. N. C.

**Air analysis apparatus.** T. C. SHEN (Chinese J. Physiol., 1935, 9, 363—368). H. G. R.

**Manometric device for gas analysis.** B. N. SINGH and P. B. MATHUR (Current Sci., 1935, 4, 313—314).—A simplified apparatus alternative to that of Haldane for measuring the respiratory gaseous exchange in plants is briefly described. N. M. B.

**Technique of toxicology.** R. FABRE (Chem. Weekblad, 1935, 32, 691—697).—Various techniques used in the isolation of foreign substances from tissues (destruction of org. matter, electrodialysis, extraction with solvents, etc.) are discussed. F. O. H.

**Determination of protein-nitrogen.**—See this vol., 219.

**Determination of salicylates in body-fluids.** L. E. ONTANEDA and A. V. J. FERLONI (Compt. rend. Soc. Biol., 1935, 120, 820—822).—Salicylates are determined as phenol in blood by Marenzi's modification of the method of Theiss and Benedict, and in urine by the method of Marenzi. R. N. C.

**Determination of phenols in blood and urine.** R. F. BANFI and A. D. MARENZI (Compt. rend. Soc. Biol., 1935, 120, 812—814).—More exact details are given for some of the steps in Marenzi's modification of the method of Theiss and Benedict. R. N. C.

**Modification of Young's method for the determination of inositol in animal tissues.** R. A. GREGORY (Biochem. J., 1935, 29, 2798—2802).—The method (A., 1934, 1246) is modified by replacing the COMe<sub>2</sub> extraction by dissolution of the tissue in 10% KOH followed by pptn. of impurities by ZnCl<sub>2</sub>. H. D.

**Modification of the copper-lime technique for the separation and recovery of carbohydrates from biological fluids.** R. M. ARCHIBALD (Trans. Roy. Soc. Canada, 1935, [iii], 29, V, 97—103).—A modification of the Van Slyke's CuSO<sub>4</sub>-Ca(OH)<sub>2</sub>

method for removing carbohydrates from solution is described which allows small quantities to be separated from urine and recovered in good yield. At most only a small fraction of the fermentable sugar originally present is converted into non-fermentable reducing material. W. O. K.

**So-called normal alcohol of the body.** R. N. HARGER and A. L. GOSS (*Amer. J. Physiol.*, 1935, **112**, 374—381).—Steam-distillates of fresh urine, blood, or minced tissues contain reducing substances. Any EtOH added to the fluid distils over in the first fraction of distillate, so that the reducing material of the second fraction cannot be EtOH. The difference between the reducing powers of the first and second fractions represents the normal EtOH of the tissue or fluid used, and is never  $> 0.3$  mg.-%; vals. are given for blood, urine, and certain tissues. The reducing substances of the first fraction of distillate are increased by storing the tissues in the refrigerator before distillation. R. N. C.

**Determination of thiocyanates in biological fluids by double distillation.** P. R. ORELLA (*Anal. Farm. Bioquim.*, 1935, **6**, No. 2, 41—51).—In this rapid modification of Chelle's method, the sample is distilled with 0.1N- $\text{H}_2\text{PO}_4$  or  $\text{H}_2\text{SO}_4$  to separate  $\text{CN}'$ , and then aq.  $\text{K}_2\text{CrO}_4$  and dil.  $\text{H}_2\text{SO}_4$  are added to decompose  $\text{CNS}'$ , liberating HCN, which is distilled separately. The HCN is collected in each case in NaOH and determined colorimetrically as Prussian-blue.  $\text{CNS}'$  was detected in human and horse's saliva and cow's milk, but not in human urine or human milk. No cyanides were found in any of these fluids. E. L.

**Rapid titrimetric determination of arsenic in biological material.** R. ALLCROFT and H. M. GREEN (*Biochem. J.*, 1935, **29**, 824—833).—Org. matter is destroyed with  $\text{HClO}_4$  and  $\text{HNO}_3$ , and As is distilled into aq.  $\text{AgNO}_3$  as  $\text{AsH}_3$  by addition of  $\text{SnCl}_2$ ,  $\text{H}_2\text{SO}_4$ , and Zn. 88% of As added to various org. materials in concns. of 1.3 p.p.m. was recovered. H. D.

**Application of the nitro-sulpho-perchloric acid method in the destruction of organic matter for the toxicological determination of arsenic.** E. KAHANE and M. POURTOY (*J. Pharm. Chim.*, 1936, [viii], **23**, 5—22).—Loss of As by entrainment during distillation is more liable with  $\text{As}^{\text{III}}$  than with  $\text{As}^{\text{V}}$  and during wet destruction of org. matter the tendency for the formation of  $\text{As}^{\text{III}}$  should be prevented by using excess of oxidising agent. In the  $\text{H}_2\text{SO}_4$ - $\text{HNO}_3$ - $\text{HClO}_4$  method (B., 1934, 380) this is attained by continuous addition of  $\text{HNO}_3$  or  $\text{HNO}_3$ - $\text{HClO}_4$ . Redistillation of the distillate is then unnecessary except as a precaution. E. H. S.

**Determination of chlorides in biological fluids by the use of adsorption indicators.** Use of dichlorofluorescein for the volumetric micro-determination of chlorides in cerebrospinal fluids and blood-serum. A. SAIFFER and M. KORNBLUM (*J. Biol. Chem.*, 1935, **112**, 117—122).—The liquid is treated with EtOH-Et<sub>2</sub>O, an EtOH solution of dichlorofluorescein is added, and then

titrated with standard  $\text{AgNO}_3$ . 1 mg. of NaCl can be rapidly determined with an error  $> 2\%$ .

J. N. A.

**Micro-methods for the determination of magnesium.** B. BASSANI and V. ZAMBOTTI (*Boll. Soc. ital. Biol. sperim.*, 1935, **10**, 261—263).—The presence of Zn in plasma and tissues introduces an error that may reach 2.5% in determinations of Mg by pptn. as  $\text{MgNH}_4\text{PO}_4$  (I) after ashing.  $\text{ZnNH}_4\text{PO}_4$  is pptd. at a lower  $p_{\text{H}}$  than (I), and either fails to redissolve on addition of excess  $\text{NH}_3$ , or more probably is carried down or adsorbed by the pptd. (I), since there is no definite ratio between the total and pptd. Zn, and the amount of Zn pptd. increases with the Mg/Zn ratio.

R. N. C.

**Extraction of lead by means of diphenylthiocarbazone.**—See this vol., 179.

**Determination of potassium in organs and parts of organs.** H. WILLSTAEDT (*Acta med. Scand.*, 1934, **84**, 104—107; *Chem. Zentr.*, 1935, i, 2860).—The sample is dried at  $110^\circ$  and ashed in presence of  $\text{H}_2\text{SO}_4$ . The ash is extracted with little  $\text{H}_2\text{O}$ , and K determined by the method of Jendrassik and Szél. J. S. A.

**Determination of small quantities of zinc.**—See this vol., 178.

**Spectrophotometric micro-determination of zinc in organic material.** J. DABROWSKI and L. MARCHLEWSKI (*Biochem. Z.*, 1935, **282**, 387—391).—After destruction of org. matter (cf. Ridge *et al.*, B., 1933, 858) the part of the ash sol. in HCl is freed from Cu by treatment with  $\text{H}_2\text{S}$ , and the Zn, after pptn. as  $\text{ZnS}$  and dissolution in HCl, is repptd. with 8-hydroxyquinoline (I). The amount of (I) (and hence the Zn content) in the ppt. is determined spectrophotometrically after separating the components by dissolving in HCl. W. McC.

**Determination of copper in organs.** Z. GRUZEWSKA and G. ROUSSEL (*Compt. rend. Soc. Biol.*, 1935, **120**, 934—936).—Cu is determined in organs after incineration by extraction of the ash with  $\text{H}_2\text{O}$ , oxidation of Fe with  $\text{HNO}_3$  and pptn. with excess of  $\text{NH}_3$ , and pptn. of Cu with 1-nitroso- $\beta$ -naphthol in AcOH. The ppt. is ignited in presence of  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  and Cu weighed as  $\text{CuO}$ . The Cu of rabbit liver remains in the insol. ash, Fe passing into the sol. fraction. R. N. C.

**Determination of total phosphorus in organs and organic liquids.** I. Technique. S. FIANDACA. II. Technical observations and physiological values. S. FIANDACA and I. CAPIZZI (*Boll. Soc. ital. Biol. sperim.*, 1935, **10**, 183—185, 185—186).—I. The sample is incinerated with  $\text{HNO}_3$  and  $\text{H}_2\text{O}_2$ , and Ca removed from the neutral solution with  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ . P is pptd. as  $\text{MgNH}_4\text{PO}_4$ , which is washed with  $\text{H}_2\text{O}$ , dissolved in 20%  $\text{H}_2\text{SO}_4$ , and N determined by the micro-Kjeldahl method.

II. Vals. obtained with solutions of  $\text{Na}_2\text{HPO}_4$  and  $\text{Na}_2\text{HPO}_4 + \text{Na}$  glycerophosphate oscillate between limits on either side of the calc. val. Vals. are given for the P of the blood and organs of the rabbit.

R. N. C.

# BRITISH CHEMICAL ABSTRACTS

## A—PURE CHEMISTRY

MARCH, 1936.

### General, Physical, and Inorganic Chemistry.

Absorption spectrum of hydrogen. II. The  $D$  state in the term scheme of hydrogen from photographs of  $H_\alpha$  and  $D_\alpha$ . H. BEUTLER, A. DEUBNER, and H. O. JÜNGER (Z. Physik, 1935, 98, 181—197; cf. A., 1935, 1291). A. B. D. C.

Ground state of  $(H_2)$ , the molecular ion  $(H_2^+)$ , and wave mechanics. O. W. RICHARDSON (Proc. Roy. Soc., 1935, A, 152, 503—514).—The agreement between the vals. of the fundamental consts. of the ground state of the  $H_2$  mol. (i) as determined by experiment, and (ii) as calc. by wave mechanics, is discussed. The properties of the mol. ion  $(H_2^+)$  as predicted by wave mechanics are compared with those predicted empirically from a study of various excited states of  $(H_2)$ . L. L. B.

Fine structure of  $D_\alpha$  with increased resolution. R. C. WILLIAMS and R. C. GIBBS (Physical Rev., 1936, [ii], 49, 40; cf. this vol., 127).—A correction. N. M. B.

Energy states of doubly excited helium. T. Y. WU (Physical Rev., 1934, [ii], 46, 239). L. S. T.

Doubly-excited states in helium. F. G. FENDER and J. P. VINTI (Physical Rev., 1934, [ii], 46, 77—78). L. S. T.

Absorption of fluorspar [transmitted] ultra-violet light by carbon black, gold, and rhombic sulphur. G. RATHENAU (Physica, 1936, 3, 42—60). Carbon black has an absorption max. at approx. 2500 Å., and a min. at approx. 1700 Å.; Au has an absorption max. at about the latter  $\lambda$ . S layers, transparent to ultra-violet light, were made by vaporisation in vac. on to a  $CaF_2$  plate at  $-80^\circ$ . S absorbs at about 2000 Å., and there is another band at 1800 Å. The results are discussed in relation to the at. and mol. spectra. A. J. M.

Light yield in the nitrogen spectrum excited by electron collision. O. HERRMANN (Ann. Physik, 1936, [v], 25, 166—184).—The excitation function, negative bands of the N spectrum and the abs. yield for 3 negative and 5 of the second positive group of  $N_2^+$  and  $N_2$  band spectra have been determined. A. J. M.

Dependence of intensities of rotation lines of band on the conditions of excitation. O. HERRMANN (Physikal. Z., 1936, 37, 100—103).—The lines in the  $R$  branch of the an. of the negative N<sub>2</sub> group at 3914 Å. have been determined for excitation with electrons of various velocities. A. J. M.

Excitation of the auroral green line by metastable nitrogen molecules. J. KAPLAN (Physical Rev., 1936, [ii], 49, 67—69; cf. A., 1934, 827).—The excitation in tubes which show the two new afterglow spectra of  $N_2$  is described. The conditions of excitation are compared with those in the night-sky and in the aurora borealis, in which cases, it is suggested, the  $^1S_0$  state of O which is responsible for the green line is produced by collisions of O atoms and metastable  $N_2$  mols. in the  $A^3\Sigma$  state. N. M. B.

Hopfield's Rydberg series and the ionisation potential and heat of dissociation of nitrogen. R. S. MULLIKEN (Physical Rev., 1934, [ii], 46, 144—146; cf. A., 1931, 1343). L. S. T.

Predissociation of the oxygen molecule. P. J. FLORY (J. Chem. Physics, 1936, 4, 23—27).—Optical data for  $O_2$  are interpreted as indicating that the initial process in the photochemical reactions of  $O_2$  due to light in the region of Schumann–Runge band absorption is the formation of normal  $^3P$  atoms by predissociation rather than the reaction of an optically excited mol. with a normal mol., as hitherto supposed. M. S. B.

Arc spectra of fluorine and potassium. B. EDLÉN (Z. Physik, 1936, 98, 445—460).—85 F I lines between 6000 and 9500 Å. are tabulated. A. B. D. C.

Intensity measurements in the spectra of neon and argon excited by electron collision. O. HERRMANN (Ann. Physik, 1936, [v], 25, 143—165).—Efficiency determinations for the excitation of the Ne and Ar spectra by electron collision have been made by an abs. method. The scattering of electrons and their angular distribution are taken into account. The abs. yield and excitation probabilities for 54 Ar lines, and the excitation functions for 52 Å and 16 Ne lines are recorded. Comparison of the abs. yields of 7 Ne and 7 Ar lines belonging to the same term shows no simple connexion between the two gases. A. J. M.

Intensity distribution of neon lines. E. LAU (Physikal. Z., 1936, 37, 110).—Polemical against Schütz *et al.* (A., 1935, 907). A. J. M.

[Intensity distribution of neon lines.] W. SCHÜTZ (Physikal. Z., 1936, 37, 110—111).—A reply to the above. A. J. M.

Absolute transition probability of potassium. E. F. M. VAN DER HELD and J. H. HEIERMAN (Physica, 1936, 3, 31—41).—The abs. intensity of light emitted

by K atoms in a  $C_2H_2$ -air flame, the flame temp., and the no. of emitting particles have been determined, and the abs. transition probabilities of the resonance lines of K calc. The abs. transition probabilities were also obtained for the sharp and diffuse series by photographic comparison with the resonance lines, using light of known colour temp. A. J. M.

**Arc spectrum of rubidium.** K. W. MEISSNER (Z. Physik, 1935, 98, 353—354). A. B. D. C.

**Fine structure in the ( $^2D$ ) series limit terms of the  $I^+$  spectrum.** S. TOLANSKY (Proc. Physical Soc., 1936, 48, 49—56; cf. A., 1935, 137).—Classifications and fine-structure data are tabulated for  $I^+$ , and fine structure analyses of 14 lines of the  $-D$  system and interval factors for 12 terms are given. Large interval factors associated with the  $5d$  electron terms of the  $^4S$  and  $^2D$  systems are correlated with observations for Sn II, and are due to perturbation by terms with large fine structure. Two types of perturbation in the fine structures are observed.

N. M. B.

**Nuclear spin of iodine. II. Fine structure in the arc spectrum and a fine structure perturbation effect.** S. TOLANSKY (Proc. Roy. Soc., 1935, A, 152, 663—672; cf. A., 1935, 137).—The fine structures of 13 of the classified lines of the I arc spectrum (6300—4760 Å.) have been measured. The nuclear spin is confirmed as  $5/2$ . The  $6s^4P_{5/2}$  is perturbed.

L. L. B.

**Absorption spectra of cerium, neodymium, and samarium.** F. W. PAUL (Physical Rev., 1936, [ii], 49, 156—162; cf. King, this vol., 2).—Data for  $\lambda$  and intensities of 600 Ce, 450 Nd, and 1500 Sm lines are tabulated in the region 12,000—2500 Å.

N. M. B.

**Absolute intensities in the spectrum of a low-pressure quartz mercury-vapour discharge burner.** A. J. MADDOCK (Proc. Physical Soc., 1936, 48, 57—62).—Abs. intensities of the main  $\lambda\lambda$  in the range 6000—2400 Å. are tabulated and discussed theoretically in relation to results for high-pressure arcs (cf. A., 1935, 800). Therapeutic effects are examined.

N. M.

**Collision-induced emission.** W. M. PRESTON (Physical Rev., 1936, [ii], 49, 140—144).—A new continuous spectrum associated with the weak forbidden Hg 2269-80 Å. line has been found in a low-pressure Hg discharge with a few cm. pressure of A or He added. It is attributed to radiation from excited Hg atoms in the  $^3P_2$  metastable state perturbed by the close approach of rare gas atoms. N. M. B.

**Thallium II spectrum.** C. B. ELLIS and R. A. SAWYER (Physical Rev., 1936, [ii], 49, 145—150). The Tl spectrum from the hollow-cathode discharge in He has been photographed in the range 9250—600 Å. Full data, classifications, and assignments for 115 previously known lines and 160 new lines which locate 35 new levels are tabulated. N. M. B.

**Hyperfine structure and the depolarisation of resonance radiation by a magnetic field.** A. ELLETT (Proc. Iowa Acad. Sci., 1934, 41, 251).

CH. ABS. (e)

**New "bright" method for investigation of the Stark effect with a homogeneous field.** W. STEUBING and J. A. SCHAEFER (Ann. Physik, 1936, [v], 25, 97—123).—The method enables very bright spectra to be produced in a measurable homogeneous electric field, and makes it possible to examine the Stark effect of some atoms and mols. which are difficult to excite by other methods. A. J. M.

**Analysis and interpretation of the nebular spectrum of Nova Herculis.** M. BLOCH and J. DUFAY (Compt. rend., 1935, 201, 1463—1465).—Lines are due to H I, He I, He II, O II, N II, C II, O III, N III, and probably C III. T. G. P.

**Absorption of monochromatic X-ray beams, of wave-length in the region 50—20 X units, in lead, tin, copper, and iron.** J. READ (Proc. Roy. Soc., 1935, A, 152, 402—417; cf. A., 1934, 577).—A curve relating the absorption coeff. of Pb and the  $\lambda$  has been obtained. The photo-electric absorption coeffs. calc. from this are 7—20% > corresponding vals. obtained from Gray's empirical law (A., 1931, 281).

L. L. B.

**Fluorescence X-ray yields from K shells of atoms.** R. J. STEPHENSON (Physical Rev., 1934, [ii], 46, 73—74).—A criticism and a revision of vals. (cf. A., 1934, 577).

L. S. T.

**Dose measurement of very soft X-rays.** E. WILHELMY (Physikal. Z., 1936, 37, 103—107).—The method employs an ionisation chamber of sufficient length to absorb the rays almost completely.

A. J. M.

**Effects of chemical binding on the X-ray  $K\alpha_{1,2}$  doublet lines of sulphur studied with a two-crystal spectrometer.** L. G. PARRATT (Physical Rev., 1936, [ii], 49, 14—16).—Using FeS,  $Cu_2S$ ,  $MgSO_4$ ,  $BaSO_4$ , and PbS targets, ionisation curves were recorded, and effects of binding on  $\lambda$ , on the  $\alpha_1$ ,  $\alpha_2$  separation, and on the doublet contour were measured. The  $\lambda$  shift of the  $SK\alpha_{1,2}$  lines from sulphates to sulphides was observed in the process of shifting.

N. M. B.

**Excitation potential of  $K\alpha_{3,4}$  satellite lines.** L. G. PARRATT (Physical Rev., 1936, [ii], 49, 132—139).—The  $K\alpha$  satellite lines intensity-X-ray tube voltage curve has been determined for the Ti  $K\alpha_{3,4}$  lines. For voltages > 11 kv. the ratio satellite intensity/Ti  $K\alpha_1$  line intensity is 2.21%; the ratio of peak intensities  $\alpha_4/\alpha_1$  is 0.69%. The Ti  $K\alpha_{3,4}$  excitation potential is  $5450 \pm 100$  volts, in good agreement with the calc. voltage, 5455, required to produce a state of  $KL_{III}$  ionisation in the Ti atom, and supporting the Wentzel-Dryvesteyn theory of satellite line origins.

N. M. B.

**Absorption ratio within the L-shell.** H. SCHWARZ (Ann. Physik, 1935, [v], 23, 571—588).—Measurements of the fluorescence radiation of Sn excited by the  $K\alpha$  lines of Cr (2.285 Å.), Cu (1.54 Å.), and Mo (0.71 Å.) lead to intensity ratios for the three lines, which correspond with the three L-levels.

A. J. M.

**Asymmetry of the electric charge distribution in the  $^{201}_{80}Hg$  nucleus.** H. SCHULER and T. SCHMIDT (Z. Physik, 1935, 98, 239—251).

A. B. D. C.

**Emission constants of single- and poly-crystalline materials.** A. RÖCKNAGEL (Z. Physik, 1935, 98, 355—362).—Theoretical. Richardson's emission const.  $A$  for a single crystal can be double that for polycryst. samples of the same material. A. B. D. C.

**Thermionic emission from tungsten and thoriated tungsten filaments.** W. B. NOTTINGHAM (Physical Rev., 1936, [ii], 49, 78—97).—Electron emission has been investigated as a function of applied potential from a few volts retarding to 1400 volts accelerating. The electron energy distribution was deficient in slow electrons. The negative temp. coeff. of the work function for pure W is  $4.3 \times 10^{-5}$  volt per degree. Electron emission data in accelerating fields show large deviations from the Schottky mirror image theory. N. M. B.

**Photo-electric effect for the L-shell.** H. HALL and W. RARITA (Physical Rev., 1934, [ii], 46, 143) L. S. T.

**Spark potential for electrolytic valve action.** W. BÄR (Z. Physik, 1935, 98, 267—279). A. B. D. C.

**Shot effect of secondary emission.** I. M. ZIEGLER (Physica, 1936, 3, 1—11).—A method of measuring fluctuations in the current in a vac. tube by comparing them with the definite fluctuations brought about in another tube by the pure shot effect is described. A. J. M.

**Electron-microscopic investigations of electron emission from cold metals.** A. WEHNELT and W. SCHILLING (Z. Physik, 1935, 98, 286—287).—A cold Mo cathode emits electrons from independent points; these centres last for several min. and then suddenly cease to emit, whilst new centres appear. A. B. D. C.

**Electron-optical structural image and emission from barium-nickel cathodes.** E. BRÜCHE (Z. Physik, 1935, 98, 77—107).—Changes in heated cathodes during electron emission have been followed by the electron microscope. A. B. D. C.

**Electron-optical images of emitting wires.** H. MAHL (Z. Physik, 1935, 98, 321—323).—Images of W and Mo wires are reproduced. A. B. D. C.

**Pressure of a degenerate electron gas and related problems.** (Sir) A. EDDINGTON (Proc. Roy. Soc., 1935, A, 152, 253—272).—A straightforward deduction of the formula  $P = K\sigma^{5/3}$  ( $P$  = min. electron pressure corresponding with an electron density  $\sigma$ ) from relativistic principles is given. The pressure is found directly, and not by way of the amutonian. The usual (Dirac) theory of at. phenomena follows from the present basis. The results are applied to a determination of the val. of the cosmical const. The existence of a vast no. of occupied negative energy levels is one of the essential consequences of the analysis. L. L. B.

**Reflexion coefficient of electrons.** M. J. COPLEY and F. E. PHIPPS (Physical Rev., 1934, [ii], 46, 144). L. S. T.

**Scattering of slow electrons by diatomic molecules.** J. B. FISK (Physical Rev., 1936, [ii], 3).—Mathematical. The Ramsauer effect is treated by a method analogous to that used for

atoms. Total cross-sections for elastic scattering are calc. in terms of three parameters related with band spectroscopy. Results for incident electron velocities 0—40 volts for  $N_2$ ,  $O_2$ , and  $H_2$  are in good agreement with experiment. N. M. B.

**Electron attachment and ion formation in gases.** W. ROGOWSKI (Z. Physik, 1935, 98, 399—414). The mass action law is applied with success to formation of ions in gases. A. B. D. C.

**Energy losses by positive ions to probes in the plasma of gas discharges.** W. MOLTAN (Z. Physik, 1935, 98, 227—238).—Probe heating  $\propto$  probe potential to 200 volts, indicating that the accommodation coeff. for the ions is much  $< 1$ , and that there is a negligible electron emission from the probe. A. B. D. C.

**Retardation of hydrogen positive rays by metals.** H. BÄTZNER (Ann. Physik, 1936, [v], 25, 233—262).—The velocity decrease of  $H^+$  particles with 4—60 e.k.v. in passing through films of Al, Cu, Ag, Sn, and Au has been measured. The relative at. retarding powers for this energy region depend on the at. vol. rather than on the at. no., in contrast to the relation for high energy. Vals. for the range of the particles in Al are calc. L. J. J.

**Negative atomic hydrogen ions.** W. H. BENNETT and P. F. DARBY (Physical Rev., 1936, [ii], 49, 97—99). Negative at. H ions have been directly observed at the heads of striations in discharges in  $H_2O$  vapour; they form readily in these regions of high density of slow electrons, but are easily lost by collision. N. M. B.

**Determination of the conditions for inelastic collision with the aid of slow  $K^+$  ions.** O. SCHMIDT (Z. Elektrochem., 1935, 42, 8—21).—Theoretical. The significance of experimental results (A., 1934, 863, 937) is discussed. E. S. H.

**Collision of  $K^+$  ions with inorganic and organic gases. III. Effective cross-section [of particles] and area of mass-spectrographic distribution curves.** O. SCHMIDT (Ann. Physik, 1936, [v], 25, 92—96; cf. A., 1935, 5).—For const. max. intensity, the area  $F$  of the curve of scattering  $\propto$  pressure of the gas and is related to the effective cross-section  $Q$ . For pure scattering in similar gases  $F/Q = a = \text{const.}$  (Xe, Kr, Ar, and  $CO_2$ ,  $N_2$ ,  $MeCl$ ). For other gases, the val. of  $a$  and the loss of energy on impact either increase (inert gases) or decrease (paraffins and olefines and He) with decreasing mass. L. J. J.

**Relative at. wt. of oxygen in water and in air.** M. DOLB (J. Amer. Chem. Soc., 1935, 57, 2731).—The at. wt. of O in air is 16.00008 if that of O in Lake Michigan  $H_2O$  is 16.00000. E. S. H.

**At. wt. of gallium.** G. E. F. LUNDELL and J. I. HOFFMANN (J. Res. Nat. Bur. Stand., 1935, 15, 409—420).—Conversion of pure Ga into  $Ga_2O_3$  through  $Ga_2(SO_4)_3$ ,  $Ga(OH)_3$ , or  $Ga(NO_3)_3$  and ignition at 1200—1300° gave at. wt. of Ga 69.74.  $Ga_2O_3$  has  $d$  5.95. A. R. P.

**At. wt. of rubidium.** E. H. ARCHIBALD, J. G. HOOLEY, and N. W. F. PHILLIPS (Trans. Roy. Soc.

Canada, 1935, [iii], 29, III, 155—162, and J. Amer. Chem. Soc., 1936, 58, 70—72).—The at. wt., determined from the Ag : RbCl ratio, and using Johnson's method of determining the nephelometric end-point, was 85.48 (cf. A., 1931, 584). H. J. E.

**Mass ratio of hydrogen and deuterium from band spectra.** W. W. WATSON (Physical Rev., 1936, [ii], 49, 70—72).—Corrections of  $B_e$  rotational const. for uncoupling terms and interactions between nuclear and electronic motions for some diat. hydride and deuteride mols. are calc. If  $H-1.0081$ , D must be  $>$  the generally accepted val. 2.01423, and is approx. 2.0148 (cf. Aston, A., 1935, 677). N. M. B.

**Mass ratio of the lithium isotopes from the spectrum of  $Li_2$ .** G. M. ALMY and G. R. IRWIN (Physical Rev., 1936, [ii], 49, 72—77; cf. *ibid.*, 1935, [ii], 48, 104).—Rotational and vibrational analyses of the  $\rightarrow Li_2$  band system are tabulated. The mass ratio  $Li^7/Li^6$  calc. from the observed isotope effect is  $1.16640 \pm 0.00016$ , and the mass coeff.  $1.04077 \pm 0.00004$ . A small electronic isotope shift,  $-0.064 \pm 0.010$  cm.<sup>-1</sup>, has been found. N. M. B.

**Alpha-particle yield from lithium under proton bombardment.** N. P. HEYDENBURG, C. T. ZAHN, and L. D. P. KING (Physical Rev., 1936, [ii], 49, 100—101).—Observed thick film yields for the proton energy range 40—225 kv. are in good agreement with those of Herb (cf. A., 1935, 1186) at higher voltages. N. M. B.

**Measurement of  $\beta$ -radiation from radium in  $r$ -units.** H. SMEREKER and K. JURIS (Strahlenther., 1935, 52, 327—337; Chem. Zentr., 1935, i, 3249).—Measurement by the method described shows the unfiltered  $\beta$ -radiation to be 200 times as strong as the  $\gamma$ -radiation. J. S. A.

**Quantum energy of some nuclear  $\gamma$ -rays.** R. FLEISCHMANN (Naturwiss., 1936, 24, 77—78).—The quantum energy of  $\gamma$ -rays emitted by neutron bombardment was determined by the coincidence method of Bothe *et al.* (A., 1929, 116), to avoid scattering effects. The absorption of secondary electrons emitted by the action of the  $\gamma$ -rays on Al was determined. The quantum energies are  $>$  those obtained by the direct absorption method (this vol., 6). Quantum energy shows dependence on at. no. similar to the packing fraction. A. J. M.

**Emission of  $\gamma$ -quanta on disintegration of lithium by fast protons.** K. ALEXOPOULOS (Z. Physik, 1935, 98, 336—341).— $\gamma$ -Quanta are emitted on bombardment with protons of 450 e.kv. A. B. D. C.

**Rayleigh scattering of hard radiation by heavy atoms.** W. FRANZ (Z. Physik, 1935, 98, 314—320).—Theoretical. Rayleigh scattering of 4.7 X  $\gamma$ -radiation by Pb should amount to 1% of the Klein-Nishina scattering. A. B. D. C.

**Scattering of the Th-C''  $\gamma$  rays.** C. C. LAURITSEN and J. R. OPPENHEIMER (Physical Rev., 1934, [ii], 46, 81). L. S. T.

**Production of electron-pairs by  $\gamma$ -rays in krypton.** M. N. S. IMMELMAN (Naturwiss., 1936, 24, 61—62).—The probability of production of an

electron-pair in Kr by  $\gamma$ -rays from Th-C'' ( $h\nu=2.6 \times 10^6$  ev.) is about  $\frac{1}{6}$  of the probability of production of Compton electrons with energy  $> 1.25 \times 10^6$  ev. Examination of 300 Wilson photographs gave 51 Compton electrons of the above energy, and 4 electron-pairs. A. J. M.

**Determination of neutron intensities by means of Fermi electrons from rhodium.** R. DOPEL (Physikal. Z., 1936, 37, 96—100).—The Fermi effect with Rh has been investigated with a view to its use for determining the intensity of a weak beam of neutrons mixed with strong  $\gamma$ -rays. There are two emissions of electrons, half-life 35 sec. and 3.8 m. The initial intensity ratio of the short- to the long-lived is 6.7, and half-val. thickness of Al for absorption of the electrons is 0.45 mm. for both emissions. The optimum conditions for the determination of neutron intensities are examined, and the prep. of neutron standards for comparative work is described. A. J. M.

**Neutrons from the disintegration of deuterium by deuterons.** T. W. BONNER and W. M. BRUBAKER (Physical Rev., 1936, [ii], 49, 19—21; cf. this vol., 6; Crane, A., 1934, 714; McMillan, A., 1935, 559).—The excitation functions for the emission of neutrons from D and Be by  $D_2$  were investigated in the energy range 0.5—0.9 m.e.v. The yield of neutrons from a  $D_3PO_4$  target varied nearly linearly, and from a Be target nearly exponentially, with the bombarding energy. The no. of neutrons from Be increases from 1 to 3 times as many as from  $D_3PO_4$  in the range. The neutrons from D are nearly homogeneous, with 2.55 m.e.v. max. energy. The energy of the disintegration is  $3.21 \pm 0.13$  m.e.v. N. M. B.

**Absorption of residual neutrons.** J. TUTIN (Nature, 1936, 137, 34).—Neutrons may be captured in energy levels outside the nucleus. L. S. T.

**Absorption law for slow neutrons.** F. RASETH, E. SEGRE, G. FINK, J. R. DUNNING, and G. B. PEGRAM (Physical Rev., 1936, [ii], 49, 104).—The validity of the Fermi-Bethe absorption law was tested by measuring the absorption of neutrons by a thin film of Cd and of Ag on the edge of a disc rotating at high velocity with and against, respectively, the neutron beam. For Ag the law is obeyed, but for Cd a change of 6.3% in the absorption coeff. indicates that the capture cross-section varies with the velocity less rapidly than  $1/v$ , where  $v$  is the neutron velocity (cf. following abstract). N. M. B.

**Velocities of slow neutrons.** G. A. FINK, J. R. DUNNING, G. B. PEGRAM, and D. P. MITCHELL (Physical Rev., 1936, [ii], 49, 103; cf. A., 1935, 1441).—Velocity distribution curves for slow neutrons from sources at room temp. and liquid air temp. are given and discussed. N. M. B.

**Slowing down of neutrons.** G. C. WICK (Physical Rev., 1936, [ii], 49, 192—193).—Fermi's statement, that an impact of a neutron with a proton reduces, on an average, the neutron energy by  $1/e$ , is explained (cf. A., 1935, 910). N. M. B.

**Influence of the velocity of slow neutrons on their capture by certain nuclei.** P. PREISWERTK and H. VON HALBAN, jun. (Nature, 1935, 136, 1027).

The radioactivation of Ag by neutrons from a Be+Rn source at different temp. after traversing paraffin wax with a Cd shield interposed at various distances indicates that the cross-section for neutron capture varies inversely as the velocity of the neutrons relative to the Ag atoms. Contrary to Moon and Tillman (A., 1936, 802), cooling the paraffin wax to 90° abs. increases the radioactivity induced in I by 10%.

L. S. T.

**Energy of disintegration of radio-phosphorus [ $P^{30}$ ].** C. D. ELLIS and W. J. HENDERSON (Proc. Roy. Soc., 1935, A, 152, 714—723).—The energy of the upper limit of the positrons from [ $P^{30}$ ] is found to be  $2.9 \pm 0.1 \times 10^6$  volts, corresponding with the formation of the product nucleus  $Si^{30}$  in its ground state. Assuming that this energy determines the difference of internal energy of  $Si^{30}$  and  $P^{30}$ , it is found, on the basis of existing data, that the difference in mass of  $Al^{27}$  and  $Si^{30}$  is the same whether calc. from  $_{13}Al^{27} + _2He^4 \rightarrow _{14}Si^{30} + _1H^1$ , or from the two stages  $_{13}Al^{27} + _2He^4 \rightarrow _{15}P^{30} + _0n^1$  and  $_{15}P^{30} \rightarrow _{14}Si^{30} + e^+$ .

L. L. B.

**New artificial radioactive elements. II.** O. D'AGOSTINO (Gazzetta, 1935, 65, 1071—1087; cf. A., 1935, 276).—The identification of 17 active elements obtained by neutron bombardment of Li, B, Na, Al, P, Cl, K, Mn, Cu, Zn, Ga, As, Se, Ag, Cd, In, Sb, I, Ba, W, and Re and some experiments on the separation of radioactive isotopes are described.

O. J. W.

**Radioactivity produced in thorium and in uranium by means of neutron bombardment.** O. D'AGOSTINO and E. SEGRE (Gazzetta, 1935, 65, 1088—1098; cf. A., 1934, 826).—In the Th activity produced by neutron bombardment two periods have been established, viz., 1 min. and 24 min. The latter is due to a new isotope of Th. The 13 and 100 min. activities of U are not due to any element of at. no. 80—92, but to an element 93 or 94 and at. wt. 239.

O. J. W.

**Angular distribution of the products of artificial nuclear disintegration.** J. GIARRATANA and C. G. BRENNECKE (Physical Rev., 1936, [ii], 49, 35—40). Using special technique, measurements, accurate to  $\pm 8\%$ , of the angular distribution of  $\alpha$ -particles from the disintegration of Li by fast protons showed that the emission is random in direction.

N. M. B.

**Capacity of the elements for disintegration. Results of old and new methods.** G. STETTER (Physikal. Z., 1936, 37, 88—95).—A critique of the scintillation method of investigating at. disintegration, and discussion of results obtained by more modern methods.

A. J. M.

**Production of cosmic-ray showers at a considerable depth below ground-level.** D. H. LITTLE and J. D. CRAWSHAW (Nature, 1935, 136, 1026).—Much of the radiation which penetrates must consist of positive or negative electron

L. S. T.

**Secondary effect of cosmic rays.** A. SCHWEG (Physik, 1935, 98, 288; cf. A., 1935, 1297).

A. B. D. C.

**Fluctuations in cosmic-ray ionisation as given by several recording meters at the same station.** R. L. DOAN (Physical Rev., 1936, [ii], 49, 107—122).—Intensity variations over 10 weeks are recorded and analysed. Statistical agreement is found. The barometer effect is 1—2% per cm. Hg. Marked ionisation increase during rainfall is probably due to  $\gamma$ -radiation from active deposits brought down from the upper atm. Time distribution of ionisation bursts is purely random, with no evidence of barometer effect on burst frequency.

N. M. B.

**Super-Novae and cosmic rays.** W. BAADE and F. ZWICKY (Physical Rev., 1934, [ii], 46, 76—77).

L. S. T.

**Penetrating power of asymmetric component of cosmic radiation.** S. A. KORFF (Physical Rev., 1934, [ii], 46, 74—75).

L. S. T.

**Analysis of ultra-radiation.** B. GROSS (Physikal. Z., 1936, 37, 12—18).—Theoretical. The energy of a primary ray is calc. as a function of depth and range.

A. J. M.

**Excitation function of lithium under proton bombardment.** M. OSTROFSKY, G. BREIT, and D. P. JOHNSON (Physical Rev., 1936, [ii], 49, 22—34).—The yield of  $\alpha$ -particles in the bombardment of Li with protons for different depths and widths of the "potential well," and the asymptotic form of the dependence of the collision cross-section on velocity at low velocities, are calc. Estimates of the theoretical variation of the yield with velocity are made for  $Li^7 + H^2$ . The "well" for the quant. representation of the  $\alpha$ -particle reaction is compared with the mass of  $Be^8$ , and both can be fitted by attributing the formation of  $Be^8$  from  $Li^7$  to the addition of a proton into a  $p$  level.

N. M. B.

**Radiative collision between fast charged particles.** C. MÖLLER (Proc. Roy. Soc., 1935, A, 152, 481—496).—Mathematical. A correspondence method, which is relativistically invariant and forms an immediate generalisation of the method previously used in the treatment of the non-radiative collision of fast particles, is developed for the treatment of the radiative collision between two particles. (Cf. A., 1931, 1109.)

L. L. B.

**Apparent failure of the photon theory of scattering.** R. S. SHANKLAND (Physical Rev., 1936, [ii], 49, 8—13).—Using Ra-C  $\gamma$ -radiation and air, Al, Be, filter-paper, and paraffin scatterers, coincident discharges were recorded in special Geiger-Müller electron and photon counters at various angles. There were fewer coincidences in the correct positions than expected, and those observed could be accounted for as chance coincidences due to the finite resolving time of the apparatus. Results do not agree with the photon theory of scattering.

N. M. B.

**Exchange forces and the structure of the nucleus.** J. H. BARTLETT, jun. (Physical Rev., 1936, [ii], 49, 102; cf. Feenberg, this vol., 134).—The possibility of a Heisenberg exchange followed by a Majorana exchange, i.e., an interchange of spin co-ordinates and not of space co-ordinates, is examined.

N. M. B.

**Interaction of light nuclei. II. Binding energies of the nuclei and  $\text{He}_2^3$ .** H. S. W. MASSEY and C. B. O. MOHR (Proc. Roy. Soc., 1935, A, 152, 693—705).—The validity of the variation method as applied to  $\text{H}_1^2$  is examined by comparing results obtained by its use with exact solutions. The method must be used with caution in determining binding energies due to short-range interactions. The binding energies of  $\text{H}_1^3$  and  $\text{He}_2^3$  can be explained by introducing attractive forces between the neutrons on the one hand and the protons on the other. The attraction between two neutrons must be much  $<$  that between a neutron and a proton, so the existence of a stable  $n_0^2$  nucleus is precluded. The anomalous attraction between two protons at small distances must also be much  $<$  that between a neutron and a proton, and cannot be sufficient to produce a stable nucleus  $\text{He}_2^3$ . (Cf. A., 1935, 274.) L. L. B.

**Energies of nuclear reactions.** H. A. WILSON (Proc. Roy. Soc., 1935, A, 152, 497—502).—The energies of 17 nuclear reactions are discussed, and in order to make the reaction equations consistent, the vals. of some of the energies are revised. The at. wts. of the 13 light elements involved are calc. from the reaction energies, and vals. obtained in good agreement with those of Bethe (Physical Rev., 1935, [ii], 47, 634) and of Oliphant *et al.* (A., 1935, 803).

L. L. B.

**Recombination of neutron with proton.** S. KIKUCHI, K. HUSIMI, and H. AOKI (Nature, 1936, 137, 30—31).—From the relative intensities of the  $\gamma$ -rays emitted under neutron bombardment by  $\text{H}_2\text{O}$  and aq.  $\text{H}_3\text{BO}_3$  and an aq. solution of a Cd salt, the mean cross-section found for the recombination of neutron with proton lies between  $8.3 \times 10^{-28}$  and  $3.0 \times 10^{-28}$  cm.<sup>2</sup>

L. S. T.

**Spontaneous disintegration of proton or neutron according to the Fermi theory.** H. C. WOLFE and G. E. UHLENBECK (Physical Rev., 1934, [ii], 46, 237).

L. S. T.

**Neutron collisions and the  $\beta$ -ray theory of Fermi.** A. NORDSIECK (Physical Rev., 1934, [ii], 46, 234—235).

L. S. T.

**Energy of removal of neutrons and  $\alpha$ -particles from nuclei and  $\alpha$ -instability below the radio-elements.** E. D. EASTMAN (Physical Rev., 1934, [ii], 46, 238—239).—A discussion emphasising the  $\alpha$ -instability of elements of relatively low at. no. (cf. A., 1934, 939).

L. S. T.

**Hydrogen atom.** V. FOCK (Z. Physik, 1935, 98, 145—154).—Group theory describes very simply many of the phenomena associated with the H atom, including the Compton effect for bound electrons.

A. B. D. C.

**Singular magnetic poles.** B. O. GRONBLOM (Z. Physik, 1935, 98, 283—285).—Theoretical.

A. B. D. C.

**Creation of electron pairs by fast charged particles.** H. J. BHABHA (Proc. Roy. Soc., 1935, A, 152, 559—586).—Mathematical. The creation of electron pairs by the collision of fast charged particles is calc., taking into account the effect of screening. The probability of the creation of a pair

as a function of impact parameter is investigated, and various cases are treated which have not been considered before. Most of the formulæ can be derived by a method similar to that given by Weizsäcker (A., 1934, 712).

L. L. B.

**Light aberration and the Doppler effect.** K. PAPELLO (Z. Physik, 1936, 98, 490—495).—Aberration of light from stars depends on the distance of the star from the earth, and the relative or abs. velocity of the observer, indicating that the velocity of light is a function of time.

A. B. D. C.

**Orbits of electrons in magnetrons with space charge.** H. AWENDER, A. THOMA, and D. M. TOMBS (Z. Physik, 1936, 98, 534—535).—A correction (cf. this vol., 4).

A. B. D. C.

**Probability of radiative processes for very high energies.** L. W. NORDHEIM (Physical Rev., 1936, [ii], 49, 189—191).—Mathematical. The present theory (cf. Bethe, A., 1934, 1150) is modified for high energies and cosmic-ray phenomena.

N. M. B.

**Temperature dependence of free electron susceptibility.** E. C. STONER (Proc. Roy. Soc., 1936, A, 152, 672—692).—Mathematical. Various formulæ required in the application of the Fermi-Dirac statistics to the calculation of magnetisation are given in a convenient form, and calculations are made of the magnetisation as a function of  $H$  and  $T$  for the spin and diamagnetic effects considered separately or together, at both low and high temp. Under certain conditions the formulæ derived will hold approx. for electrons in metals.

L. L. B.

**Magnetic moment of the neutron.** A. LANDÉ and D. R. INGLIS (Physical Rev., 1934, [ii], 46, 76).—Disagreement with Schuler's val. of  $-1.65$  magnetons (A., 1934, 580) is expressed.

L. S. T.

**Interpretation of present values of nuclear moments.** G. BREIT and I. I. RABI (Physical Rev., 1934, [ii], 46, 230—231).—A discussion of recent speculations on the magnetic moment and nature of the neutron and proton.

L. S. T.

**Progression of nuclear resonance levels with atomic number.** H. MARGENAU and E. POLLARD (Physical Rev., 1934, [ii], 46, 228; cf. A., 1935, 804).

L. S. T.

**Disintegration of  $\text{H}^2$  and the stellar abundance of  $\text{H}^2$  and  $\text{H}^3$ .** H. H. GOLDSMITH (Physical Rev., 1934, [ii], 46, 78—79).

L. S. T.

**Electric quadrupole moments of some atoms and the magnetic moment of the proton.** H. SCHÜLER and T. SCHMIDT (Z. Physik, 1936, 98, 430—436).—Lack of symmetry shown by Cu, As, Eu, Lu, Hg, and Bi nuclei indicates rod- and plate-like electric charge distribution, and gives a magnetic moment of  $1.5$  for the proton in these nuclei.

A. B. D. C.

**Relativistic self-consistent field.** (Miss) B. SWIRLES (Proc. Roy. Soc., 1935, A, 152, 625—649).—Mathematical. A relativistic treatment of a many-electron atom on the lines of the self-consistent field method with "exchange" is developed. Tables are given from which the expression for the

total energy of an atom containing  $s$ ,  $p$ ,  $d$  electrons may be constructed.

L. L. B.

**Band spectrum of  $\text{OH}^+$ .** F. W. LOOMS and W. H. BRANDT (Physical Rev., 1936, [ii], 49, 55—67).—Full data are given for two bands at 3332 and 3565 Å. in the electrodeless discharge in pure  $\text{H}_2\text{O}$  vapour (cf. Rodebush, A., 1934, 39) and for new bands at 3695 and 3893 Å., which are, respectively, the (1,0), (0,0), (1,1), and (0,1) bands of  $\text{OH}^+$ . Rotational analysis shows that they correspond with a  $^3\Pi \rightarrow ^3\Sigma^-$  transition in which the  $^3\Pi$  state is inverted. Multiplet intervals in both states are determined from the 9 strong branches and the satellite branches.  $\Delta$ -type doubling and perturbations are examined. The  $^3\Sigma^-$  state concerned in the transition and the perturbing state are mol. levels which dissociate into the ground states of O and  $\text{H}^+$  and  $\text{O}^+$  and H, respectively.

N. M. B.

**Rotation constants  $B$ ,  $D$ , and  $\gamma$  for the  $^3\Pi$  terms of  $\text{TiO}$ ,  $\text{C}_2$ ,  $\text{CO}$ ,  $\text{PH}$ ,  $\text{AlH}$ , and  $\text{NH}$ .** A. BUDÓ (Z. Physik, 1936, 98, 437—444).

A. B. D. C.

**Absorption spectrum of copper hydride.** B. GRUNDSTROM (Z. Physik, 1935, 98, 128—132).

A. B. D. C.

**Strontium deuteride and hydride spectra.** W. W. WATSON, W. R. FREDRICKSON, and M. E. HOGAN, jun. (Physical Rev., 1936, [ii], 49, 150—155; cf. A., 1932, 439; 1935, 1443).—Analyses of the  $B$  and  $C$  band systems of  $\text{SrD}$  and of part of the  $D$  system of  $\text{SrH}$  are reported.

N. M. B.

**Isotope effect for gold hydride ( $\text{AuH}/\text{AuD}$ ).** T. HEIMER (Naturwiss., 1936, 24, 78).—The arc emission band spectrum of  $\text{AuD}$  has been examined, and compared with results for  $\text{AuH}$ .

A. J. M.

**Anomalous rotation of  $\text{HgH}$  molecules.** F. F. RIEKE (Physical Rev., 1934, [ii], 46, 236—237).

L. S. T.

**Absorption bands of gaseous  $\text{HI}$ .** D. E. KIRKPATRICK (Physical Rev., 1936, [ii], 49, 104).—Measurements of the centres of the 1  $\leftarrow$  0 and 2  $\leftarrow$  0 absorption bands gave the vals.  $2260 \pm 30$  and  $4416 \pm 75 \text{ cm}^{-1}$ , in agreement with Salant (cf. A., 1931, 545) and Nielsen (cf. A., 1935, 806).

N. M. B.

**Band spectra of  $\text{BiBr}$ ,  $\text{BiCl}$ ,  $\text{BiF}$ , and  $\text{BiI}$  in absorption.** F. MORGAN (Physical Rev., 1936, [ii], 49, 41—46).—Data and vibrational analyses are reported.  $\text{BiBr}$  has two systems for each of the isotopes  $\text{Br}^{79}$  and  $\text{Br}^{81}$  with origins at 4045.7 and 4869.1 Å., the latter system degrading to the red.  $\text{BiCl}$  has a system in the range 3600—4000 Å. for both  $\text{Cl}$  and  $\text{Cl}^{37}$ , in addition to a system at 4300—5500 Å. (cf. Saper, A., 1933, 207). Vibrational analyses are confirmed by the respective isotope shifts. A system 4150—4900 for  $\text{BiF}$ , and a system 4150—4300 Å. for  $\text{BiI}$  have been observed and analysed.

N. M. B.

**Absorption spectra of  $\text{PbF}$ ,  $\text{PbCl}$ , and  $\text{PbBr}$ .** MORGAN (Physical Rev., 1936, [ii], 49, 47—50).—Data and vibrational analyses are given.  $\text{PbF}$  has a single system of double-headed bands in the 4100—5300 Å.  $\text{PbCl}$  has a system with origin for each the isotopes  $\text{Cl}^{35}$  and  $\text{Cl}^{37}$ .  $\text{PbBr}$  has a system in the range 4400—5400 Å. for

both  $\text{Br}^{79}$  and  $\text{Br}^{81}$ . Analyses are confirmed by the respective isotope shifts; all the bands degrade to the red.

N. M. B.

**End-isotope effect for triatomic molecules.** M. WEHRLI (Naturwiss., 1936, 24, 14—15).—The end-isotope effect has been investigated for  $\text{TeCl}_2$ , the relative abundance of the mols. being  $\text{TeCl}_2^{35} : \text{TeCl}_2^{35}\text{Cl}^{37} : \text{TeCl}_2^{37} = 1 : 0.32 : 0.10$ . In contrast to diat. mols. there is no simple connexion between the isotopic splitting,  $\Delta\nu$ , and the frequency, except in two special band series, one due to excitation of symmetrical vibrations only, and the other to excitation of the antisymmetrical and deformation vibrations. The isotopic factor,  $f_1$ , is 0.0131 (theory for linear mol. 0.0139).

A. J. M.

**Absorption spectra of the chlorides and oxychlorides of sulphur.** R. K. ASUNDI and R. SAMUEL (Proc. Physical Soc., 1936, 48, 28—34; cf. A., 1935, 680).—Absorption curves, in the visible and ultra-violet, are given for the vapours of  $\text{SCl}_2$ ,  $\text{S}_2\text{Cl}_2$ ,  $\text{SOCl}_2$ , and  $\text{SO}_2\text{Cl}_2$ . Heats of formation and linking energies are derived, and results are correlated with photodissociation processes.

N. M. B.

**Spectrophotometric studies. II—V.**—See this vol., 221.

**Extinction of mesomorphic liquids in a magnetic field.** Y. BJORNSTAHL (Z. physikal. Chem., 1935, 175, 17—37).—Melts of  $p$ -azoxyanisole,  $p$ -azoxyphenetole, and  $p$ -azoxyanisolephenetole have been examined. The extinction coeff.,  $\epsilon$ , is unaffected by a transverse field, and there is no dichroism in the field. The depolarisation of linearly polarised light by the liquid is changed in the field. In a longitudinal field  $\epsilon$  decreases with increasing field strength,  $F$ , ultimately approaching a limit. If  $\epsilon$  is measured with rising and falling  $F$ , hysteresis may appear. For moderate  $F$   $\epsilon$  decreases in jumps with rising  $F$ . In a given longitudinal field  $\epsilon$  is independent of the temp. It is difficult to account for these observations on the swarm theory of mesomorphic liquids. Ornstein's theory (A., 1935, 20) is criticised.

R. C.

**Absorption spectra of tautomeric selenazoles.** R. F. HUNTER (Nature, 1935, 136, 1030).—The ultra-violet absorption curve of 1-hydroxylbenzelenazole (I) in  $\text{MeOH}$  is practically identical with that of 1-keto-2-methyl-1 : 2-dihydrobenzelenazole and distinct from that of the  $O$ -Me ether. In aq.  $\text{NaOH}$  the curve of (I) is moved to the left (deformation) and there is a decrease in the max. due to the production of the ion  $\text{C}_6\text{H}_4\text{<N>CO}$  on which tautomeric change depends. 1-Thiolbenzelenazole shows marked similarity to thiazole analogues in the ultra-violet region; the curve for  $\text{MeOH}$  solution is similar to that of 1-thio-2-methyl-1 : 2-dihydrobenzelenazole.

L. S. T.

**Ultra-violet absorption spectra of some complex aromatic hydrocarbons.** I. W. V. MAYNEORD and E. M. F. ROE (Proc. Roy. Soc., 1935, A, 152, 298—324).—An investigation has been made of the ultra-violet absorption spectra of  $\text{EtOH}$  solutions of  $\text{C}_6\text{H}_6$ ,  $\text{C}_{10}\text{H}_8$ , anthracene, 1 : 2-benzanthracene, 1 : 2 : 5 : 6-dibenzanthracene, phenanthrene, and their

derivatives, and of chrysene, picene, pyrene and its derivatives. The spectra of chemically related compounds are compared, and the effects of the addition of various groups are noted. Changes have been observed in the absorption spectra on cooling the solutions to  $-183^{\circ}$ .  
L. L. B.

**Ionic dispersion in the extreme infra-red.** C. H. CARTWRIGHT (Physical Rev., 1936, [ii], 49, 101—102).—A study of the absorption coeff. and reflecting power curves of  $\text{H}_2\text{O}$  and of KI and KCl solutions indicates that the dispersion of electrolytes in the extreme infra-red can be pictured classically, according to Maxwell's equations, by considering the ions to follow in translation the alternations of electromagnetic waves. The motion of the ions decreases in amplitude, because of inertia and friction, with increasing frequency of radiation. In electrolytes of KCl and KI the ions seem to move with respect to the  $\text{H}_2\text{O}$  mols. except for friction. N. M. B.

**Choice of spectral reference rays in the study of every infra-red region (photographic infra-red), especially for the determination of fluorescence spectra.** C. DHÉRE and O. BIERMACHER (Compt. rend. Soc. Biol., 1935, 120, 1162—1166).—Standard reference lines for the infra-red are A 912.4 and 1064  $\text{m}\mu$ , Hg 1014 and the combined He, Cu, and Ag spectra for 500—850  $\text{m}\mu$ . Acid porphyrin solutions show fluorescence bands between 667.8 and 728.2  $\text{m}\mu$ , coincident with the two Cu lines.  
R. N. C.

**Infra-red absorption spectrum of water and alcohols in non-polar solvents.** E. L. KINSEY and J. W. ELLIS (Physical Rev., 1936, [ii], 49, 105).—Absorption curves in the range 1.0—2.5  $\mu$  for  $\text{H}_2\text{O}$  dissolved in  $\text{CS}_2$  and for  $\text{MeOH}$  in  $\text{CCl}_4$ , compared with those for liquid and vapour  $\text{H}_2\text{O}$  and  $\text{MeOH}$ , show vapour-like characteristics and strong OH bands, indicating that the interaction between mols. in the liquid is weakened or destroyed in solution, and that the interaction affects, relatively, only the polar part of the mol.  
N. M. B.

**Rotation-vibration spectrum of acetylene in the photographic infra-red.** G. W. FUNKE and G. HERZBERG (Physical Rev., 1936, [ii], 49, 100).—Data and interpretations of 3 new  $\perp$  and 6 new  $\parallel$  bands are reported and discussed.  
N. M. B.

**Quantitative absorption measurements of the CH overtones for simple hydrocarbons. I. Halogen derivatives of methane, ethane, and ethylene.** B. TIMM and R. MECKE (Z. Physik, 1935, 98, 363—381).—Photometer measurements are given for the third CH overtone in spectra of  $\text{CHCl}_3$ ,  $\text{CH}_2\text{Cl}_2$ ,  $\text{MeCl}$ ,  $\text{CHBr}_3$ ,  $\text{CH}_2\text{Br}_2$ ,  $\text{MeBr}$ ,  $\text{C}_2\text{HCl}_3$ ,  $\text{C}_2\text{H}_2\text{Cl}_4$ ,  $\text{C}_2\text{H}_3\text{Cl}_3$ ,  $\text{C}_2\text{H}_4\text{Cl}_2$ ,  $\text{EtCl}$ ,  $\text{Pr}^n\text{Cl}$ ,  $\text{C}_2\text{H}_2\text{Br}_4$ ,  $\text{C}_2\text{H}_3\text{Br}_3$ ,  $\text{EtBr}$ ,  $\text{C}_2\text{HCl}_3$ ,  $\text{C}_2\text{H}_2\text{Cl}_2$ , and  $\text{C}_2\text{H}_3\text{Cl}$ . Absorption intensity  $\propto$  to the no. of CH groups, the halide atom having little influence on the electrical properties of an aliphatic CH linking. Transition moments are calc. and used to determine variation of dipole moment with nuclear separation in a homopolar linking.  
A. B. D. C.

**Rotation-vibration spectra of methyl halides in the photographic infra-red to 1.11  $\mu$ .** H.

VERLEGER (Z. Physik, 1935, 98, 342—352).—Resolved vibration bands are given for  $\text{MeCl}$ ,  $\text{MeBr}$ , and  $\text{MeI}$ , and give moments of inertia for the axis normal to the symmetry axis of 60, 80, and  $90 \times 10^{-40}$  g.-cm.<sup>2</sup>; that about the symmetry axis is  $4.1 \times 10^{-40}$  for all three.  
A. B. D. C.

**Infra-red evidence for the existence of an isomeric form of HCN.** D. WILLIAMS (J. Chem. Physics, 1936, 4, 84).—The infra-red spectrum of a saturated solution of HCN has a strong band at 4.76  $\mu$  and a much fainter band at 4.95  $\mu$ . Since a shift of approx. 0.2  $\mu$  represents the difference between the band for org. cyanides and their isomeric forms at 4.5  $\mu$  the absorption at 4.95  $\mu$  is attributed to a small quantity (about 2%) of the isomeride HNC.

M. S. B.  
**Relations between electrochemical constants, infra-red spectrum, and reaction properties.** F. VLES (Compt. rend., 1935, 201, 1475—1477).—The  $\lambda\lambda$  of the bands calc. from the previous relationship (A., 1935, 444) for  $\text{BzOH}$ ,  $\text{NH}_2\text{Ph}$ , anthranilic acid, and methylene-blue, and for the decomp. of  $\text{CO}(\text{NH}_2)_2$  by urease, are ascribed to sp. groups of atoms.  
T. G. P.

**Infra-red spectra of amino-acids and polypeptides.** E. HEINTZ (Compt. rend., 1935, 201, 1478—1480; cf. A., 1935, 1053).—Data are recorded for glycine, *dl*-alanine, *l*-cystine, cysteine, *l*-leucine, *d*-glutamic acid, *d*-arginine, *dl*-proline, tyrosine, *l*-histidine, phenylalanine, three peptones, and an albuminose of casein. The vals. confirm the previous relationship (A., 1935, 444).  
T. G. P.

**Raman spectrum of deuterium. II. Intensity and polarisation characters.** S. BHAGAVANTAM (Proc. Indian Acad. Sci., 1935, 2, A, 477—482; cf. A., 1935, 1445).—Data are recorded and classified. Vibration lines are polarised; rotation lines are nearly completely depolarised.  
H. J. E.

**Raman spectra of carbon and silicon tetrachlorides.** R. ANANTHAKRISHNAN (Proc. Indian Acad. Sci., 1935, 2, A, 452—458).—Two new lines of low intensity were found for  $\text{CCl}_4$  (434, 145  $\text{cm}^{-1}$ ). A new line at 440.5  $\text{cm}^{-1}$  was found for  $\text{SiCl}_4$ . The origin of these lines is discussed.  
H. J. E.

**Raman spectrum and fundamental vibration frequencies of silane ( $\text{SiH}_4$ ).** F. B. STITT and D. M. YOST (J. Chem. Physics, 1936, 4, 82).—Two Raman lines have been found for  $\text{SiH}_4$  and, combined with the infra-red data of Steward and Nielsen (A., 1935, 914), have led to the following arrangements of fundamentals:  $\nu_1$  2187,  $\nu_2$  978,  $\nu_3$  2183, and  $\nu_4$  910  $\text{cm}^{-1}$ .  
M. S. B.

**Raman spectra of some formates and the constitution of formic acid.** C. S. VENKATESWARAN (Proc. Indian Acad. Sci., 1935, 2, A, 615—620).—The Raman spectra of  $\text{HCO}_2\text{Na}$ ,  $(\text{HCO}_2)_2\text{Ca}$ ,  $(\text{HCO}_2)_2\text{Cd}$ , and  $(\text{HCO}_2)_2\text{Pb}$  have been measured for the solids and their aq. solutions; average frequencies for the  $\text{HCO}_2$  ion are 2834, 2732, 1717, 1534, 1347, and 857  $\text{cm}^{-1}$ . These frequencies are compared with those of  $\text{HCO}_2\text{H}$ ,  $\text{HCO}_2\text{Me}$ ,  $\text{AcOH}$ , and  $\text{NaOAc}$ . The existence of the lines 2834 and 2732  $\text{cm}^{-1}$  proves the presence of the

CH group. The 1534  $\text{cm}^{-1}$  line, of doubtful origin, is characteristic of formates. J. W. S.

**Raman spectrum of oxalic acid.** W. R. ANGUS and A. H. LECKIE (J. Chem. Physics, 1936, 4, 83—84).—Contrary to Hibben's conclusion (this vol., 9), the frequencies 1661 and 1759 are present in the spectrum of solid  $\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$  and are as strong as the corresponding frequencies in aq. solution. This agrees with Rao's data (A., 1935, 807) on the assumption that the latter were obtained from the  $2\text{H}_2\text{O}$  crystals. M. S. B.

**Raman spectrum of dioxan.** A. SIMON and F. FEHER (Ber., 1936, 59, [B], 214—217).—Repeated freezing and melting of dioxan causes a gradual lowering of the m.p., apparently due to the formation of a polymeric form. Evidence of isomerisation to acetaldehyde ethylene diacetal is not obtained. The Raman spectrum of dioxan gives results correcting and expanding those of Villars (A., 1931, 145). H. W.

**Raman effect of acetylenes. II. Di-iodoacetylene, liquid acetylene, and deuteroacetylenes.** G. GLOCKLER and C. E. MORRELL (J. Chem. Physics, 1936, 4, 15—22; cf. A., 1935, 146).—A new type of apparatus is described. Data are recorded for  $\text{C}_2\text{I}_2$ , liquid  $\text{C}_2\text{H}_2$ , and gaseous  $\text{C}_2\text{H}_2$ ,  $\text{C}_2\text{HD}$ , and  $\text{C}_2\text{D}_2$ . Marked differences between the spectra of liquid and gaseous  $\text{C}_2\text{H}_2$  indicate mol. distortion in the liquid state, so that the mol. is no longer linear. Free energies have been calc. and the equilibrium const. for  $\text{C}_2\text{H}_2 + \text{C}_2\text{D}_2 \rightleftharpoons 2\text{C}_2\text{HD}$  has been determined at temp. 273—700° abs. M. S. B.

**Fundamental frequencies of acetylene.** G. GLOCKLER and C. MORRELL (Physical Rev., 1934, [ii], 46, 233).—The frequencies 382 (5), 618 (2), 631 (5), 1762 (1), 1959 (10), 3338 (5)  $\text{cm}^{-1}$  have been found by Raman scattering in liquid  $\text{C}_2\text{H}_2$ . L. S. T.

**Spectrum and force constants of the ethylene molecule.** L. G. BONNER (J. Amer. Chem. Soc., 1936, 57, 34—39).—The Raman and infra-red absorption spectra in the photographic region have been reinvestigated. Three new Raman lines and 1 new infra-red absorption bands have been found. frequency vals. have been assigned to all the 12 fundamental vibration modes of the  $\text{C}_2\text{H}_4$  mol., on the basis of the new data, and 8 of the force consts. of the mol. have been obtained. E. S. H.

**Constitution of the  $\alpha\beta$ -dihalogen derivatives of ethane.** H. C. CHENG (J. Chim. phys., 1935, 32, 724).—Cabannes and Rousset's apparatus (A., 1933, 446) has been used for measuring depolarisation. Raman lines of  $(\text{CH}_2\text{Cl})_2$ ,  $\text{CH}_2\text{Cl}-\text{CH}_2\text{Br}$ , and  $(\text{CH}_2\text{Br})_2$ . It is concluded that the *cis*- and *trans*-forms of these compounds should coexist in the liquid state, and an attempt is made to classify the fundamental frequencies due to each form. J. W. S.

**Raman spectrum of deuterobenzene.** R. C. ORD, jun. (J. Chem. Physics, 1936, 4, 82—83).—The Raman spectrum given by Wood (A., 1935, 1189) for  $\text{C}_6\text{D}_6$  requires force consts. much > usually attributed to benzene linkings. It is suggested that some of the lines are attributable to  $\text{C}_6\text{D}_5\text{H}$ . M. S. B.

**Raman spectra of benzene and its derivatives.** K. W. F. KOHLRAUSCH (Physikal. Z., 1936, 37, 58—79).—A review. A. J. M.

**Partial interpretation of the Raman and infra-red spectra of benzene.** E. B. WILSON, jun. (Physical Rev., 1934, [ii], 46, 146—147).—Raman-active and infra-red-active fundamentals of  $\text{C}_6\text{H}_6$  have been assigned to definite modes of vibration of the regular plane hexagon model. The doublet at 1600  $\text{cm}^{-1}$  in the Raman spectrum is explained on the basis of quantum-mechanical resonance between  $\nu_8$  and  $\nu_1 + \nu_6$ . The suggestion that the spectra of  $\text{C}_6\text{H}_6$  are incompatible with hexagonal symmetry is not justified. L. S. T.

**Molecular scattering of light: Cabannes-Daure effect, critical opalescence of binary mixtures.** A. ROUSSET (Ann. Physique, 1936, [xi], 5, 5—135; cf. A., 1934, 473, 830, 1302).—The continuous spectrum surrounding the exciting line in the scattering of light by liquids (Cabannes-Daure effect) is attributed to part of the anisotropic scattering due to variations of mol. orientations. The arrangement of cybotactic groups limiting the relative orientations of the axes of the mols. changes the statistical wt. of the rotational levels so that the intensity max. of the *P* and *R* branches are approx. identical with that of the fundamental line. In presence of strong permanent moments the anisotropic scattering of a vibrating mol. is wholly in the *Q* branch, explaining the weak intensity of the Cabannes-Daure effect in strongly polar mols. Measurements of the depolarisation factors  $\rho$  for  $\text{H}_2\text{O}-\text{Pr}^n\text{CO}_2\text{H}$ ,  $\text{C}_6\text{H}_{14}-\text{PhNO}_2$ ,  $\text{NH}_2\text{Ph}-\text{cyclohexane}$ , and  $\text{H}_2\text{O}-\text{NEt}_3$  show that on approaching the crit. temp. of complete miscibility  $\rho$  reaches a min. and increases rapidly near the crit. point, indicating that the scattering due to variations of the mol. field increases more slowly than the opalescence near the crit. point. The sharp rise of  $\rho$  is attributed to a partly depolarised secondary scattering increasing more rapidly in intensity than in the case of the primary scattering. The law of variation of opalescence with  $\lambda$  is deduced, intensity of scattering in two directions relative to the incident beam and variations of  $\lambda\lambda$  are examined, and results are discussed in relation to available theory. N. M. B.

**Raman spectra of amino-acids and related compounds. I. Ionisation of the carboxyl group.** J. T. EDSALL (J. Chem. Physics, 1936, 4, 1—8).—Raman spectra have been determined for four  $\text{NH}_2$ -acids, their hydrochlorides and Et esters of two,  $\text{HCO}_2\text{H}$ ,  $\text{AcOH}$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{CH}_2\text{Cl}-\text{CO}_2\text{H}$ , and their Na salts,  $\text{NH}_3\text{MeCl}$ ,  $\text{NH}_3\text{EtCl}$ ,  $\text{CO}(\text{NH}_2)_2$ ,  $\text{MeOAc}$ , and  $\text{COMe}_2$ . For aliphatic acids there is a shift of the C:O frequency from 1670 to 1720 on dissolution in  $\text{H}_2\text{O}$ , but no similar shift for  $\text{MeOAc}$  and  $\text{COMe}_2$ . The presence of  $\text{NH}_3^+$  attached to the  $\alpha$ -C increases the same frequency by approx. 20. On ionisation of  $\text{CO}_2\text{H}$  the C:O frequency vanishes, lines of the region 1200—1420 undergo characteristic changes, and, in general, the frequency of a powerful line in the region 750—930 is increased by 20—40, whilst each additional Me group on the  $\alpha$ -C decreases it by approx. 50, and, finally, the C-H frequency in  $\text{HCO}_2\text{H}$  is

decreased. Certain strong frequencies in  $\text{NH}_3\text{Me}$  and  $\text{NH}_3\text{Et}$  are decreased by ionisation. M. S. B.

**Dust effects.** L. ŠPLAIT (Z. Physik, 1935, 98, 396—398).—Polemical, against Mitra (A., 1935, 1301). A. B. D. C.

**Collision broadening of Rayleigh lines in compressed gases.** E. KAPPLER (Ann. Physik, 1936, [v], 25, 272—278).—Theoretical. The undisplaced component is not broadened by collisions, provided that the incident frequency is far removed from any characteristic frequency of the mol. The intensity distribution observed by Weiler (A., 1935, 1190) is not the effect of collisions on the rotational wings of the Rayleigh line. L. J. J.

**Collision broadening of the undisplaced component of radiation scattered by carbon dioxide at high pressures.** E. KAPPLER and J. WEILER (Ann. Physik, 1936, [v], 25, 279—280).—Up to 59 atm. pressure, radiation scattered through  $90^\circ$  shows no broadening either in the  $Q$  branch or in the polarised Tyndall scattering (cf. preceding abstract). L. J. J.

**Resonance fluorescence of benzene.** II. G. R. CUTHBERTSON and G. B. KISTIAKOWSKY (J. Chem. Physics, 1936, 4, 9—15).—Previous work (A., 1932, 1189) has been amplified and corr. On absorption of the Hg line 2536 Å. the changes of the quantum no. of one vibration only ( $990\text{ cm}^{-1}$ ) of the non-excited  $\text{C}_6\text{H}_6$  mol. are unrestricted in fluorescence. The changes for other vibrations are  $>1$  (or 2 if required by selection rules). Five frequencies other than the above have been identified: 432, 791, 1542, 2557, and  $3174\text{ cm}^{-1}$ . For  $\text{C}_6\text{D}_6$  the frequencies 944 ( $\Delta\nu$  unrestricted) and 2460 have been observed. The quenching of the resonance fluorescence of  $\text{C}_6\text{H}_6$  in  $\text{He}$ ,  $\text{H}_2$ ,  $\text{N}_2$ ,  $\text{CO}_2$ , and cyclohexane consists in a change to high-pressure fluorescence, and some new high-pressure fluorescence bands have been observed. The resonance spectra of PhF and PhMe are nearly continuous even at 0.01 mm. pressure. The fluorescence of PhEt and PhCl is too faint to be examined. M. S. B.

**Fluorescence of ruby, sapphire, and emerald.** C. S. VENKATESWARAN (Proc. Indian Acad. Sci., 1935, 2, A, 459—465).—New bands in the fluorescence spectrum of ruby have been measured. That of sapphire is very similar. Emerald gave two sharp lines at  $\lambda\lambda$  6806, 6835 Å., together with diffuse bands. H. J. E.

**Fluorescence of some pure substances.** E. CANALS, P. PEYROT, and R. NOËL (Compt. rend., 1935, 201, 1488—1489; cf. A., 1935, 1058).—Vals. for the depolarisation factors ( $\rho$ ) and the relative intensities of fluorescence for eight alcohols are recorded. The spectra lie between 4400 and 4900 Å. T. G. P.

**Extinction of fluorescence of methylene-blue by ferrous iron.** H. HELLSTRÖM (Naturwiss., 1935, 24, 76—77; cf. A., 1935, 1087).—The relative intensity of fluorescence of methylene-blue (I) at various  $[\text{Fe}^{2+}]$  and  $p_{\text{H}}$  3 (citrate buffer), and at various  $p_{\text{H}}$  and const.  $[\text{Fe}^{2+}]$  has been determined. The intensity of fluorescence rapidly diminishes on adding  $\text{Fe}^{2+}$ , the extinction velocity being dependent on  $p_{\text{H}}$ . There

may be an unstable compound of (I) and  $\text{Fe}^{2+}$  which readily dissociates. A. J. M.

**Fluorescence of porphyrins.** I. A. STERN and H. MOLVIG (Z. physikal. Chem., 1935, 175, 38—62; cf. A., 1926, 885; A., 1935, 808, 1444).—Fluorescence spectra in dioxan have been determined. Porphyrins which in the positions 1—8 of porphin have substituted Me, Et, and various Me ester groups have five fluorescence bands in the visible. As with the absorption spectra, the position of the max. varies little with the nature of the substituents. The positions of the max. of the principal bands are near those of the red bands in the absorption spectra. Porphyrins with vinyl groups have four fluorescence bands in the visible, the max. of which are shifted towards the red compared with those of porphyrins without unsaturated groups. Porphyrins containing both unsaturated and CO groups and  $\gamma$ -substituted porphyrins may have fluorescence spectra different from the above. The effect of varying substitutions in dihydroporphin on the fluorescence spectrum is much greater and more complicated than with porphin, but certain regularities, observable in absorption spectra, emerge, and may assist in the determination of constitution. The fluorescence spectra of two solid porphyrins and an Al salt have been determined. Solid pyromethenes have one fluorescence band in the visible, usually between 590 and 640  $\mu$ . R. C.

**Porphyrin-gelatin phosphorescence.**—See this vol., 346.

**Quantum theory of the phosphorescence of crystal phosphors.** T. MUTO (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1935, 28, 171—206).—Mathematical. J. W. S.

**Optimum " concentration of active foreign substances in crystal phosphors.** G. SCHUMANN (Z. Physik, 1935, 98, 252—261).—This optimum concn. is not uniquely defined, factors such as prep. of the crystal and conditions of observation having been overlooked. A. B. D. C.

**Optical and electrical properties of didymium glass.** K. PROSAD, D. K. BHATTACHARYA, and L. M. CHATTERJEE (Z. Physik, 1935, 98, 324—335). Fluorescence bands of Dy glass are identical with the Raman spectrum obtained from incident  $\lambda\lambda$  equal to those of absorption bands. Photo-conductivity has been determined using sunlight and that transmitted by yellow and blue filters. A. B. D. C.

**Luminescence of solid solutions of rhoduline.** S. I. GOLUB (Physikal. Z. Sovietunion, 1935, 7, 49—57).—The spectra of the fluorescence and phosphorescence of solid solutions of rhoduline in sugar are identical. CH. ABS.

**Study of thermoluminescence in some crystals.** T. MUTO (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 28, 207—220).—Thermoluminescence is studied in terms of the excitation of an electron of an impurity atom, usually a rare-earth metal, by a heat quantum, followed by photo-emission. Variation of bands with temp., disappearance of

time, and the effect of heating the crystal and then treating with X-rays are interpreted theoretically.

R. S. B.

**Mitogenetic radiation.** J. B. BATEMAN (Biol. Rev. Camb. Phil. Soc., 1935, 10, 42—71; Chem. Zentr., 1935, i, 3294).—A crit. review. The existence of mitogenetic radiation is unproven, and its allocation to the ultra-violet region is improbable.

J. S. A.

**Relation between the photo-potential and the chemical properties of photo-sensitive organic substances.** H. T. NGA (J. Chim. phys., 1935, 32, 725—740).—As with inorg. electrodes, the photo-electric potential of org. substances appears only in presence of  $H_2O$ . The effect appears instantaneously only with mols. containing atoms of variable valency, the  $NH_2$ -group being the most active. All compounds containing this group are not photo-sensitive, nor are their leuco-derivatives, but a mixture shows the effect, as does a dye to which is added the leuco-base of a less readily reducible dye. It is concluded that in these compounds the effect is due to displacement of the oxidation-reduction equilibria, produced by the primary photolysis of  $H_2O$ .

J. W. S.

**Flow method applied to space charge and ionic processes in oil.** K. CHRIST (Z. Physik, 1935, 98, 23—65).—The method of a fluid flowing at right angles to an electric field has been applied to dielectric liquids; it shows the transference of a positive charge from metal to oil, and the presence of space charge when an electric current passes through the oil. It can be used to measure ionic mobilities.

A. B. D. C.

**Superposition of field distribution and conductivity.** W. O. SCHUMANN (Z. Physik, 1935, 98, 44—74).—Theoretical discussion of inhomogeneous dielectrics.

A. B. D. C.

**Determination of dielectric constants of organic liquids at radio-frequencies. I. Carbon tetrachloride and chloroform.** R. M. DAVIES (1936, [vii], 21, 1—41).—The resonant circuit method was used to obtain the dielectric constants of  $CCl_4$  and  $CHCl_3$ ,  $C_6H_6$  being employed as standard. Vals. obtained at  $20^\circ$  and  $25^\circ$ , respectively, :  $CCl_4$  2.236<sub>0</sub>, 2.226<sub>7</sub>;  $CHCl_3$  4.796<sub>4</sub>, 4.708<sub>6</sub>.

A. J. M.

**Density and molecular polarisation of menthol and borneol.** H. HARMS (Z. physikal. Chem., 1935, 135, 440—442).—The dipole moments of *l*-menthol are  $(1.62 \pm 0.03) \times 10^{-18}$  and  $(1.65 \pm 0.03)$  e.s.u., respectively. The association in  $C_6H_6$  solutions has been examined.

R. C.

**Molecular volume of alkanes.**—See this vol., 309.

**Dispersion of air, krypton, and xenon in the ultra-violet.** W. KRONJÄGER (Z. Physik, 1935, 98, 22).—Dispersion is given down to  $\lambda = 2000$  Å.

A. B. D. C.

**Refractive indices and dispersions of volatile compounds of fluorine and boron.** Carbon tetrafluoride, nitrogen trifluoride, fluoroform, carbon tetrachloride, nitrogen compound of fluorine  $(CF_3N)_2$ , boron trifluoride, nitrogenous boron hydride,  $N_3H_6$ . K. L. RAMASWAMY (Proc. Indian

Acad. Sci., 1935, 2, A, 630—636).—Measurements have been made with a Rayleigh type interferometer at room temp. and for  $\lambda$  4359—6440 Å. Combining with dielectric const. data (this vol., 139) the vals. of the electronic and at. polarisation are deduced.  $(CF_3N)_2$  and  $B_3N_3H_6$  have appreciable vals. of at. polarisation. From the variations of  $n$  with pressure the compressibilities of the gases have been deduced.

J. W. S.

**Refractometric investigations in the series of saturated normal nitriles.** B. DARAGAN (Bull. Soc. chim. Belg., 1935, 44, 597—624).— $d_4^{20}$  vals. for various temp., and  $n_D^{20}$ ,  $n_D^{54.4}$ ,  $n_D^{74}$ , and  $n_D^{95}$  for the  $He_{red}$ ,  $He_{yellow}$ ,  $He_{green}$ ,  $Hc_{violet}$ ,  $H_a$ ,  $D$ ,  $H_s$ , and  $H_v$  lines are recorded for the series MeCN to  $C_{13}H_{27}CN$ . The mol. refractions are calc. and the increments for each  $CH_2$  deduced. The results are in accord with data for paraffins (A., 1934, 132), but diverge from those for glycols.

J. W. S.

**Rotatory dispersion of aliphatic aldehydes.** P. A. LEVENE and A. ROTHEN (J. Chem. Physics, 1936, 4, 48—52; cf. A., 1934, 12, 1293).—Rotatory dispersion curves of aldehydes of the type  $CHMeEt[CH_2]_nCHO$  have been determined in the visible and ultra-violet regions. The  $\cdot CHO$  band at  $\lambda$  2950 is active and the sign of its contribution changes as  $n$  changes from 0 to 1 and higher members. The magnitude of the contribution varies periodically with the no. of C between the  $\cdot CHO$  and the asymmetric C.

M. S. B.

**Photographic measurement of the magnetic rotatory dispersion of water.** I. T. PIERCE and R. W. ROBERTS (Phil. Mag., 1936, [vii], 21, 164—176).—The magnetic rotation of  $H_2O$  for 11 lines of the Hg spectrum from 5780 to 2483 Å. has been determined, and a formula has been derived for the dispersion of the Verdet const.

A. J. M.

**Magnetic birefringence in solutions of organic substances.** I. S. W. CHINCHALKAR (Proc. Indian Acad. Sci., 1935, 2, A, 525—531).—Data are recorded for several aromatic hydrocarbons with two or more  $C_6$  rings in the mol., dissolved in  $CCl_4$ , EtOH,  $Et_2O$ , or EtOAc. For  $Ph_2$  and most of its simple derivatives the mol. magnetic birefringence is approx. 4 times, for  $m-C_6H_4Ph_2$  approx. 9 times, and for  $C_6H_5Ph_3$  approx. 16 times that of  $C_6H_6$ , indicating that the  $C_6$  rings in these mols. are either coplanar or parallel. When the  $C_6$  rings are condensed, the magnetic and optical anisotropies are  $>$  when they are separate.

H. J. E.

**Thiele's theory of partial valency in terms of electrons.** F. E. RAY (Proc. Iowa Acad. Sci., 1934, 41, 157—160).—A discussion.

CH. ABS. (e)

**Theory of liquids.** V. T. S. WHEELER (Proc. Indian Acad. Sci., 1935, 2, A, 466—476; cf. A., 1935, 1198).—The application of the theory in the calculation of surface tension, internal pressure, cohesion, mol. vibration, internal latent heats, and compressibilities is reviewed.

H. J. E.

**Parachors and chemical constitution. VI. Quadrivalent tellurium compounds.** B. SINGH and R. KRISHNAN (J. Indian Chem. Soc., 1935, 12, 711—714; cf. A., 1928, 355).—The parachors of

$\alpha$ -dimethyltelluri-dichloride, -dibromide, and -dinitrate have been determined and are in good agreement with vals. calc. on the basis of a shell of 10 Te valency electrons. R. S.

**Parachor and molecular refraction of hydrazine and [its] aliphatic derivatives.** L. D. BARRICK, G. W. DRAKE, and H. L. LOCHE (J. Amer. Chem. Soc., 1936, 58, 160—162).—Vals. for parachors (figures given after compound) agree with those calc. from Sugden's consts. (A., 1924, ii, 662), but differ considerably from those calc. from the consts. of Mumford and Phillips (A., 1929, 1219):  $N_2H_4$ , 90.7,  $(CMe_2 \cdot N)_2$ , 302.2,  $(CMeEt \cdot N)_2$ , 379.8,  $(\cdot NHPr^B)$ , 327.1,  $(\cdot NH \cdot CHMeEt)$ , 400.8,  $(\cdot NPr^B)$ , 318.4,  $(\cdot N \cdot CHMeEt)$ , 395.5,  $CMe_2 \cdot N \cdot NHPr^B$ , 313.7,  $CMeEt \cdot N \cdot NH \cdot CHMeEt$ , 387.6, 3 : 5 : 5-trimethylpyrazoline 288.4. The mol. refractions of these compounds agree with the calc. vals. provided (i) each N in the N-N and N-N linkings is given the primary amine val. and (ii) the C-N linking is given the val. of C-C and the N that of a sec.-amine. H. B.

**Predissociation limit of CO at 11.6 volts.** R. SCHMID (Physikal. Z., 1936, 37, 55—56).—New spectral evidence is given for the existence of a predissociation limit for CO at 11.6 volts (cf. A., 1935, 1299). A. J. M.

**Highly dilute flames of K-I<sub>2</sub>.** E. E. ROTH (Magyar chem. Fol., 1934, 40, 65—81; Chem. Zentr., 1935, i, 2311).—The heat of the secondary gas reaction is sufficient to excite only the red, but not the violet, K doublet. The heat of dissociation of K<sub>2</sub> is calc. as 187 kg.-cal. from the diminution in light intensity on superheating the reaction zone. J. S. A.

**Plano-radiate compounds.** H. J. BACKER (Chem. Weekblad, 1936, 33, 67—71).—A survey of published data indicates that, whilst in compounds of the type CX<sub>4</sub> the X are distributed symmetrically in space, in compounds of the type C<sub>6</sub>X<sub>6</sub> (C<sub>6</sub>=benzene ring) they take up a symmetrical radial arrangement in the plane of the C<sub>6</sub> ring. The resultant compounds are characterised by high m.p., readiness to crystallise, chemical stability, and volatility. D. R. D.

**Exchange of energy between diatomic gas molecules and a solid surface.** J. M. JACKSON and A. HOWARTH (Proc. Roy. Soc., 1935, A, 152, 515—529).—The theory of the accommodation coeff. developed by Jackson and Mott for monat. gases (A., 1932, 1074) has been extended for diat. mols. The gas mol. is treated (a) as an oscillator, when the exchange of energy between the rotations of the gas mol. and the vibrations of the solid is negligible, and (b) as a plane rotator, when the effect of the rotations is small for H<sub>2</sub> and larger for O<sub>2</sub>. L. L. B.

**Distance between molecules and the determination of the volume they occupy in the liquid state (by density).** A. E. MAKOVETZKI (Trans. Kirov Inst. Chem. Tech. Kazan, 1935, No. 3, 83—102).—Expressions are derived for calculating intermol. distances in liquids, the results differing from those derived from van der Waals' equation. CH. ABS. (e)

**Dependence of interatomic distance on single linking-double linking resonance.** L. PAULING, L. O. BROCKWAY, and J. Y. BEACH (J. Amer. Chem. Soc., 1935, 57, 2705—2709).—Using experimental vals. for C-C linkings, a function showing the dependence of interat. distance on linking character for single-double linking resonance is plotted. The electronic structure of mols. containing double or triple linkings or aromatic nuclei and of mols. containing C-Cl linkings adjacent to double linkings, and the dependence of linking angles on single-double linking resonance are discussed. E. S. H.

**Radial distribution method of interpretation of electron diffraction photographs of gas molecules.** L. PAULING and L. O. BROCKWAY (J. Amer. Chem. Soc., 1935, 57, 2684—2692).—Tests on CCl<sub>4</sub> and other tetrahalides, Br, Cl<sub>2</sub>, C<sub>6</sub>H<sub>6</sub>, CS<sub>2</sub>, and COS show that the radial distribution function given by a sum of Fourier terms corresponding with the rings of an electron diffraction photograph of gas mols. provides vals. of the important interat. distances accurate to 1 or 2%. Revised vals. of interat. distances and linking angles for several substances are given. E. S. H.

**Effect of electric and magnetic fields on the properties of gases.** A. A. ZAITZEV (Uspek. Fiz. Nauk. U.S.S.R., 1934, 14, 1009—1019).—A discussion. CH. ABS. (e)

**Dissociation of some molecules with free valencies.** H. LESSHEIM and R. SAMUEL (Phil. Mag., 1936, [vii], 21, 41—64; cf. A., 1935, 1057).—In the case of the mols. BeF, MgF, CaF, SrF, BeO, MgO, CdF, BeCl, MgCl, and CaCl, there is good agreement between the energy of excitation of the products of dissociation and the terms of the metal atom if the ground level of the mol. is correlated to the  $sp^3P$  term of the metal. Correlation of the ground level to the repulsive term  $s^2 \ ^1S$  is also possible in some of these mols. A. J. M.

**Statistical perturbation theory. II. Perturbation calculations with exchange for the Thomas-Fermi theory.** P. GOMBAS (Z. Physik, 1936, 93, 417—429; cf. this vol., 134). A. B. D. C.

**Polymerisation and condensation.** E. K. RIDEAL (Trans. Faraday Soc., 1936, 32, 3—10).—A general review of the present state of knowledge regarding types of linking, mechanical properties, swelling and dispersion, and mol. wt. of highly polymerised substances, and the kinetics of their production. F. L. U.

**Influence of van der Waals forces and primary linkings on binding energy, strength, and orientation, with special reference to artificial resins.** J. H. DE BOER (Trans. Faraday Soc., 1936, 32, 10—37; cf. A., 1934, 727).—The mutual orientation of C<sub>6</sub>H<sub>6</sub> rings parallel to their planes is discussed with reference to the van der Waals and repulsive forces. In calculating the tensile strength of either NaCl or synthetic resins of the PhOH- or *m*-cresol-CH<sub>2</sub>O type, the inclusion of van der Waals forces still further increases the discrepancy between theory and observation, which is attributed to weakness due respectively to defects in the lattice and to the

smallness of the no. of C-C linkings actually formed compared with the no. possible. In the case of well-oriented cellulose derivatives the calc. vals. agree with experiment. Calculation of the relative positions of  $C_6H_6$  rings in polystyrene indicates that they will tend to lie perpendicular to the direction of the aliphatic C chains, a conclusion in agreement with the observed strongly negative fluxional birefringence.

F. L. U.

Absolute measurement of efficiency of X-ray fluorescent screen. O. GAERTNER (Z. tech. Phys., 1935, 16, 9—12; Chem. Zentr., 1935, i, 3100; cf. A., 1935, 273).—A Cd tungstate screen absorbed 50% of the incident X-radiation, and emitted 0.54% as visible light.

J. S. A.

Intensity of interference lines in Debye X-ray diagrams. N. SELJAKOV, A. STEFANOVSKI, and J. HURGIN (Z. Physik, 1935, 98, 66—71).—Variation of the lattice area covered by the incident beam when its angle is varied accounts for anomalous intensities of different orders of reflexion from chemical catalytic lattices; these anomalies measure the extent of defects in the lattice.

A. B. D. C.

Precision measurements with the Debye-Scherrer method. II. M. STRAUMANIS and A. IRVING (Z. Physik, 1936, 98, 461—475; cf. this vol., 181).—The film is extended to give interference rings around the incident and exit portions of the primary beam; this allows measurement of the film to be made independently of camera and film curvature dimensions. Accurate lattice consts. are tabulated for Al,  $As_2O_3$ , Au, Fe,  $Fe_2O_3$ , MgO, NaCl, Pb,  $Pb(NO_3)_2$ , Si,  $TiCl_3$ , W, and  $WO_3$ .

A. B. D. C.

Relation between mechanical strain and intensity of X-rays reflected by a quartz plate. III. E. FUKUSHIMA (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 1—14; cf. this vol., 15).—The increase in intensity of the interior reflexion of X-rays transmitted through a quartz plate under the influence of heterogeneous strain has been studied theoretically.

R. S. B.

Effect of temperature on the reflexion of X-rays by crystals. I. Isotropic crystals. C. ZENER and G. E. M. JAUNCEY. II. Anisotropic crystals. C. ZENER (Physical Rev., 1936, [ii], 49, 17—18, 122—127).—I. A short derivation of the Debye-Waller temp. factor in the reflexion of X-rays from isotropic crystals is given.

II. Mathematical. The temp. factor  $e^{-M}$  is a function of reflexion plane orientation. The case of metals with hexagonal symmetry is treated. The ratio of the const.  $M$  for reflexion  $\perp$  to and  $\parallel$  to the principal axis is 1.80 and 1.73 for Zn and Cd, respectively.

N. M. B.

X-Ray studies of crystals vibrating piezoelectrically. C. V. BERTSCH (Physical Rev., 1936, [ii], 49, 128—132; cf. Colby, A., 1934, 1296).—Intensity investigations for quartz and Na K tartrate, using the patterns and regular reflexion from the crystal surfaces, are reported.

N. M. B.

Systematic packing of spheres, with particular relation to porosity and permeability. L. C.

GRATON and H. J. FRASER (J. Geol., 1935, 43, 785—909).—The geometry of close-packing is discussed.

L. S. T.

Orientation of molecules of liquids from the X-ray scattering pattern. A. PETERLIN (Physikal. Z., 1936, 37, 43—52).—The theoretical scattering curve for  $CCl_4$  is calc., and agrees well with the experimental curve of Pierce (A., 1932, 12).

A. J. M.

Schiller structure. R. T. COLONY (Amer. Min., 1935, 20, 828—837).—A discussion.

L. S. T.

Tabulation of crystal forms and discussion of form-names. A. F. ROGERS (Amer. Min., 1935, 20, 838—851).

L. S. T.

Metallic surfaces and thin films with particular reference to aluminium. BRITISH ALUMINIUM Co. (Intelligence Memo., 49 pp.).—An exhaustive review.

Disperse structures. I. Systematics. V. S. VESELOVSKI. II. X-Ray investigation of the disperse structures of graphitic substances. V. S. VESELOVSKI and K. V. VASILIEV (J. Phys. Chem. U.S.S.R., 1934, 5, 977—981, 982—995).—I. A review of crystal structure and classification.

II. X-Ray data for graphitic substances are discussed.

CH. ABS. (e)

Crystalline boron. S. VON NARAY-SZABÓ (Naturwiss., 1936, 24, 77).—Cryst. B (Morck) consists chiefly of the adamantine form, together with irregular hexagonal leaflets of the graphitic form. X-Ray investigation gave for the adamantine form (tetragonal),  $a$  12.55,  $c$  10.18, identity period along [110], 17.61 Å., and for the graphitic form (rhombohedral),  $a$  17.64,  $b$  25.0,  $c$  10.26 Å.

A. J. M.

Crystal structure of solid oxygen. L. VEGARD (Z. Physik, 1935, 98, 1—16).— $\gamma$ - $O_2$  has a cubic structure, space-group  $T_h^h$ , the unit cell containing 8 rotating mols. ordered in pairs; the pair centres form a face-centred cubic structure of closest spherical packing for the pairs.  $\beta$ - $O_2$  has a rhombohedral cell of 6 mols.

A. B. D. C.

Crystalline properties and magnetic anisotropy of distilled bismuth. A. GOETZ, O. STIERSTADT, and A. B. FOCKE (Z. Physik, 1935, 98, 118—127).—High-vac. distillation of Bi produces a microcryst. layer 0.5—0.1 mm. thick carrying a macrocryst. conglomerate of similarly oriented crystals.

A. B. D. C.

Isomorphism of  $Mg_3Al_2$  and  $\alpha$ -manganese. F. LAYES, K. LOHBERG, and P. RAHLFS (Nachr. Ges. Wiss. Göttingen, 1934, [ii], 1, 67—71; Chem. Zentr., 1935, i, 3103).—Complete analysis of the crystal structure of " $Mg_3Al_2$ " shows the space-group to be  $T_h^h$ ,  $a$  10.54 Å., with 58 atoms per unit cell, giving a true formula  $Mg_{17}Al_{12}$ .

J. S. A.

Structure of aluminium carbonitride,  $Al_5C_3N$ . M. VON STACKELBERG and K. F. SPIESS (Z. physikal. Chem., 1935, 175, 140—153).— $Al_5C_3N$  has a hexagonal structure;  $a$  3.280,  $c$  21.55 Å.,  $Z=2$ , space-group  $C_{6h}^{2h}$ . The lattice consists of hexagonal planes, 5 Al planes interleaved with 3 C planes and 1 N plane forming a layer, which consists of two parts similar in structure to  $Al_4C_3$  and AlN, respect-

ively. The lattice of AlN has  $a$  3.104,  $c$  4.965 Å. 2.15 Å. is deduced by Zachariasen's method as the mean "univalent radius" of the N<sup>III</sup> ion. Apparently AlN is able to hold some Al<sub>4</sub>C<sub>3</sub> in solid solution.

R. C.

**Crystal structure and colloid-chemical properties of vanadium pentoxide.** J. A. A. KETELAAR (Chem. Weekblad, 1936, 33, 51-57). V<sub>2</sub>O<sub>5</sub> forms hemimorphic rhombic crystals of space-group  $C_{2v}^2$ , with 2 mols. in the unit cell;  $a$  11.48,  $b$  4.360,  $c$  3.555 Å., and  $d_{\text{calc}}$  3.37. The structure is built up of chains of O tetrahedra linked by shared corners, accounting for formation of elongated micelles in colloidal solution.

D. R. D.

**Structure of thin films of metallic oxides and hydrates.** N. SMITH (J. Amer. Chem. Soc., 1935, 58, 173-179).—Electron diffraction indicates that oxide films removed from heated metals are polycryst., showing no evidence of preferred orientation or pseudomorphism. The film on Ni is NiO, Cu<sub>2</sub>O on Cu, and Fe<sub>3</sub>O<sub>4</sub> mainly on Fe. Hydroxide pptts. from salt solutions are cryst., but show evidence of distortion.

E. S. H.

**Complex nitrites of iron, cobalt, nickel, and copper: structure and magnetic susceptibility.** L. CAMBI and A. FERRARI (Gazzetta, 1935, 65, 1162-1190).—The prep. of 15 compounds  $M^I[M^II(Fe(NO_2)_6)]$  is described ( $M^I=K, NH_4, Tl$ ;  $M^II=Ba, Sr, Ca, Pb, Hg, Cd$ ). Vals. of lattice consts. and  $d_{\text{calc.}}$ , obtained from X-ray measurements, are given. Comparison with previous data shows that the mol. vols. of the complex ions  $[Fe(NO_2)_6]^{IV}$ ,  $[Co(NO_2)_6]^{IV}$ , and  $[Ni(NO_2)_6]^{IV}$  are 120.3, 123.5, and 128.9, respectively. Magnetic susceptibility measurements show that  $[Fe^{II}(NO_2)_6]^{IV}$  is predominantly diamagnetic like  $[Co^{III}(NO_2)_6]^{IV}$ , whereas  $[Co^{II}(NO_2)_6]^{IV}$  is paramagnetic (1 Bohr magneton) like  $[Cu^{II}(NO_2)_6]^{IV}$ .

O. J. W.

**Crystallography of hexa- $\omega$ -bromomethylbenzene.** J. BEINTEMA, P. TERPSTRA, and W. J. VAN WEERDEN (Rec. trav. chim., 1935, 54, 962-969).—The hexagonal unit cell of  $C_6(CH_2Br)_6$  contains 3 mols. and has  $a$  11.373,  $c$  5.377 Å., but the crystal has a rhombohedral lattice with  $a$  9.621 and  $\alpha$  116° 36'. It is concluded that the atoms of each mol. are coplanar, and that each Br lies on a circle of radius 3.75 Å.

J. W. S.

**X-Ray study of symmetrical trinitrotoluene and cyclotrimethylenenitroamine.** R. HULTGREN (J. Chem. Physics, 1936, 4, 84).— $C_6H_2Me(NO_2)_3$  is orthorhombic with  $a$  14.85,  $b$  39.5,  $c$  5.96 Å. For 16 mols. per unit cell  $d_{\text{calc.}}$  is 1.710 (lit. 1.654). The crystals of cyclotrimethylenenitroamine are also orthorhombic. X-Ray analysis gives  $a$  11.5,  $b$  13.2,  $c$  10.6 Å. For 8 mols. per unit cell  $d_{\text{calc.}}$  is 1.82.

M. S. B.

**Alkaline-earth cacodylates. II.** R. TROLLAIS (Bull. Soc. chim., 1936, [v], 3, 87-95).—Cacodylates of Ca, Sr, and Ba belong to the monoclinic system, with  $a:b:c=3.363:1.2414, 1.813:1.2335, 1.5737:1.13332$ , respectively. Forms found present are Ca:  $ph_1m$  and  $pa_1h_1m$ , Sr:  $pmb_{1/3}b_1h_{1/2}$  and  $pme_1b_{1/3}b_1h_{1/2}$ , Ba:  $pa_1h_1m$ ,  $pa_1e_1h_1m$ ,  $pa_1m$ , and

$pa_1h_1mb_{1/2}$ . The Sr salt shows twinning (cf. *ibid.*, 70).

E. E. A.

**Fine structure of plant chitin.** G. VAN ITERSOM, jun., K. H. MEYER, and W. LOTMAR (Rec. trav. chim., 1936, 55, 61-63).—X-Ray examination of plant chitin from *Phycomyces* is described and the results are compared with those previously recorded for animal chitin (cf. A., 1935, 753). An arrangement of the acetylglucosamine residues in the elementary cell of plant chitin fibres is suggested.

E. E. A.

**X-Ray spectrography of polymerides, particularly those having rubber-like extensibility.** J. R. KATZ (Trans. Faraday Soc., 1936, 32, 77-94).—A general discussion of the interpretation of X-ray spectrograms of cryst. and amorphous polymerides. Synthetic rubbers should be made under control by X-ray analysis. No polymeride of isoprene has yet been found to have the X-ray characteristics of natural rubber. Spectrographic data indicate that the extensible units in rubber and in polymerides with similar properties are single mols.

F. L. U.

**Dependence of cybotactic groups on specific volume.** R. D. SPANGLER (Proc. Iowa Acad. Sci., 1934, 41, 253-254; cf. A., 1935, 1297).—X-Ray diffraction data are recorded for Et<sub>2</sub>O near its crit. point. The cybotactic groupings depend more on sp. vol. than on temp. The indications of groups disappear at about the crit. sp. vol.

CH. ABS. (c)

**Effect of crystal size on lattice dimensions.** G. I. FINCH and S. FORDHAM (Proc. Physical Soc., 1936, 48, 85-94).—Lattice consts. of the Li, Na, and K halides are determined by the electron-diffraction method. Slight divergences from results by X-ray diffraction indicate that crystal size appreciably influences lattice dimensions.

N. M. B.

**Electron-diffraction investigation of carbonyl chloride, the six chloroethylenes, thiocarbonyl chloride,  $\alpha$ -methylhydroxylamine, and nitromethane.** L. O. BROCKWAY, J. Y. BEACH, and L. PAULING (J. Amer. Chem. Soc., 1935, 57, 2693-2704).—The C-Cl distances determined vary between 1.67 and 1.73 Å., which is 5-20% < the normal single linking val. The decrease is due to the partial double linking character caused by resonance resulting from the conjugation of an unshared pair of electrons on the Cl atom with the adjacent double linking. The vals. for the angle Cl-Cl-X are smaller than the tetrahedral val. for the angle between a single and a double linking for the same reason. The vals. for other interat. distances are in good agreement with the accepted covalent radii.

E. S. H.

**Diffuse rings produced by electron scattering.** L. H. GERMER (Physical Rev., 1936, [ii], 49, 163-166; cf. A., 1933, 657).—Two diffuse diffraction rings have been obtained by electrons scattered from vaporized ZnS, and from unpolished surfaces of  $Cu_2O$ , contrary to the view that such rings from polished metal surfaces are evidence that surfaces are amorphous. The possibility of an amorphous layer on polished metals is not excluded.

**Structure of ice II.** R. L. McFARLAN (J. Chem. Physics, 1936, 4, 60—64).—X-Ray analysis of ice II indicates a side-centred orthorhombic cell,  $a$  7.30,  $b$  4.50,  $c$  5.56 Å. The cell contains 8 mols., has the symmetry of space-group  $V^5-C222_1$ , and gives  $d$  1.21. The transition from ice I to II breaks up the  $H_2O$  mol. and gives an ionic crystal for II.

M. S. B.

**Structure of ice.** W. H. BARNES (Trans. Roy. Soc. Canada, 1935, [iii], 29, III, 53—60).—A crit. discussion of the structure proposed by Bernal and Fowler (A., 1933, 1106).

H. J. E.

**Structure and entropy of ice and of other crystals with some randomness of atomic arrangement.** L. PAULING (J. Amer. Chem. Soc., 1935, 57, 2680—2684).—The  $H_2O$  mols. in ice are so arranged that each is surrounded by 4 others, each mol. being oriented so as to direct its 2 H towards two of the four neighbours, forming H linkings. Only one H lies near each 0-0 axis. There are  $(3/2)^N$  such configurations for  $N$  mols., giving a residual entropy of  $R \log_e 3/2 = 0.805$  e.u., in good agreement with the experimental val.

E. S. H.

**Crystal structure from data on magnetic susceptibilities.** O. M. JORDAHL (Physical Rev., 1934, [ii], 46, 79).—Experimental results on the crystal structure of  $CuSO_4 \cdot 5H_2O$  (A., 1934, 243) agree with the conclusions of the author (*ibid.*, 241) deduced from an analysis of the magnetic data.

L. S. T.

**X-Ray investigation of the solid solution nature of nitrate-contaminated barium sulphate precipitates.** G. H. WALDEN, jun., and M. U. COHEN (J. Amer. Chem. Soc., 1935, 57, 2591—2593). Apparatus and technique for determining the lattice parameters of powdered crystals with a precision of 0.01% are described. A study of the lattice parameters of  $BaSO_4$  ppts., containing  $NO_3^-$  in absence of all foreign cations other than  $H^+$ , shows that the contaminant enters the  $BaSO_4$  lattice with formation of a solid solution. The general problem of ppt. contamination is discussed in the light of the results.

E. S. H.

**Crystal structure and constitution of  $BF_3 \cdot 2H_2O$ .** J. KLINKENBERG and J. A. A. KETELAAR (Rec. trav. chim., 1935, 54, 959—961).— $BF_3 \cdot 2H_2O$  is isomorphous with  $NH_4ClO_4$ , its orthorhombic unit containing 4 mols. and having  $a$  8.74±0.06,  $b$  4.7±0.03,  $c$  7.30±0.10 Å. These cell dimensions are almost identical with those of  $NH_4BF_4$ , viz.,  $a$  8.7±0.05,  $b$  4.68±0.05, and  $c$  7.21±0.03 Å., respectively. This is interpreted as indicating that the formula should be written  $(OH_3)(BF_3OH)$ .

J. W. S.

**Physical investigations on alkali halide crystals.** R. HILSCH (Angew. Chem., 1936, 49, 69—73).—Reference to published work concerning optical properties and electrical conductivity, especially of crystals containing excess of alkali or halide ions.

E. S. H.

**Effect of thermal and mechanical tempering on electromotive force and current-voltage curves of rock-salt crystals.** A. VENDERVINSCH and R. DRISINA (Z. Physik, 1935, 98, 108—117). The effects of tempering NaCl crystals

on deviations from Ohm's law show that these deviations are due to the presence of a high-voltage polarisation.

A. B. D. C.

**Variation of alternating-current resistance of nickel in longitudinal magnetic fields.** M. M. SEN GUPTA, H. B. MOHANTY, and S. SHARAN (Z. Physik, 1935, 98, 262—266).—A.-c. measurements are free from many irregularities found with d.c. Hysteresis is less for a.c. (cf. A., 1935, 267).

A. B. D. C.

**Phenomenon in transformations [in metals and alloys] extending over a temperature range.** A. SCHULZE (Z. Metallk., 1935, 27, 251—255).—Magnetic transformations and the change from regular to random orientation of the atoms in the lattice are preceded by inflexions in the curves of electrical resistance, temp. coeff. of resistance, and thermal expansion. This anomaly is shown by Fe, Ni, and Ni-Fe alloys (magnetic transformations) and by Au-Cu and  $\beta$ -Zn-Cu alloys (lattice reorientation).

A. R. P.

**Magnetic behaviour of nickel wire under high torsion.** R. GANS (Ann. Physik, 1936, [v], 25, 77—91).—Theoretical.

L. L. J.

**Processes of technical magnetisation. I. Weiss' theory of the technical magnetisation curve.** K. H. R. WEBER (Z. Physik, 1935, 98, 155—180).

A. B. D. C.

**Relation of spontaneous and true magnetisation to [optical] emissivity.** W. GERLACH (Ann. Physik, 1936, [v], 25, 209—212).—The anomalous resistance-temp. curve of Ni in the neighbourhood of the Curie point is associated with a similar anomaly in the emissivity-temp. curve for long  $\lambda$ , in accordance with the Hagen-Rubens relation. Both effects are quantitatively related to the spontaneous magnetisation; data for  $\lambda$  24  $\mu$  and 8.7  $\mu$  are recorded from 100° to 310°. True magnetisation depresses the emissivity, in further agreement with theory.

L. J. J.

**[Optical] emissivity of nickel.** E. LOWE (Ann. Physik, 1936, [v], 25, 213—222; cf. preceding abstract).—Measurements of total radiation and radiation at a series of  $\lambda$  from < 4.5 to 24  $\mu$  for polished Ni between 100° and 450° are recorded. Magnetisation has no effect on the total emission, but for  $\lambda > 8$ —10  $\mu$  the emission at the Curie point is depressed 0.6% in a field of 4000 gauss.

L. J. J.

**Effect of tension on magnetisation [of nickel] above the Curie point.** G. SCHARFF (Ann. Physik, 1936, [v], 25, 223—232).—The Curie temp. is independent of tension. Ferromagnetic and true magnetisation can be distinguished by the effect of tension, since the former is depressed, the latter unaffected. Ferromagnetisation can be detected up to 12° above the Curie point.

L. J. J.

**Transverse magnetic effect.** J. E. VERSCHAFFELT (Wis. nat. Tijds., 1934, 7, 53—66; Chem. Zentr., 1935, i, 3638).—Theoretical.

J. S. A.

**Surface magnetisation in ferromagnetic crystals.** L. W. MCKEEHAN and W. C. ELMORE (Physical Rev., 1934, [ii], 46, 226—228; cf. this vol., 145).

L. S. T.

**Variation of volume magnetostriction and Weiss' factor with temperature and lattice constant.** M. KORNETZKI (*Z. Physik*, 1935, 98, 289—313).—Ferromagnetic substances showing vol. magnetostriction should have Curie points that vary with vol. Measurements on Fe, Fe-Ni, and Ni-Cu alloys between 20° and 90° confirm this. A. B. D. C.

**Behaviour of single crystals of aluminium of different degrees of purity prepared from the molten metal and by recrystallisation.** F. GISEN (*Z. Metallk.*, 1935, 27, 256—261).—Single crystals of 99.5—99.998% Al can be prepared (i) by maintaining the metal at 800—820° until all nuclei disappear, then cooling very slowly without disturbance to < the m.p., or (ii) by drawing rod to 40—45% reduction, annealing at 250° for 15 hr. to obtain a fine-grained structure, stretching 0.5—1%, and slowly heating from 430° to 480° during 45 hr. The crit. shear strength of crystals prepared by method (ii) decreases almost linearly with decreasing purity from about 300 g. per sq. mm. for the 99.998% metal to 70 g. per sq. mm. for the 99.5% metal, whereas that of crystals prepared by method (i) is < 20 g. per sq. mm. irrespective of the purity. This difference is ascribed to the more pronounced mosaic structure of crystals prepared by method (ii); X-ray examination confirms this theory. A. R. P.

**Strength and modulus of elasticity of amorphous materials, related to their internal structure.** R. HOUWINK (*Trans. Faraday Soc.*, 1936, 32, 122—131).—The internal structure of asphalts, resins, and glass is discussed, and their tensile strengths and vals. of Young's modulus are compared. Smekal's theory of "Lockerstellen" is adopted to account for the discrepancy between calc. and observed strengths, weaknesses in macromols. of an insol. PhOH-CH<sub>2</sub>O resin being due to non-reaction between such reactive groups as happen to be out of alignment. F. L. U.

**High elasticity of three-dimensionally polymerised amorphous materials in relation to their internal structure.** R. HOUWINK (*Trans. Faraday Soc.*, 1936, 32, 131—143; cf. preceding abstract).—"High elasticity," i.e., elastic deformation which > 1%, is observed in asphalts and glass, in which it may reach 20% and is connected with a viscosity range of 10<sup>11</sup>—10<sup>13</sup> poises. In hardening resins at about 120° it reaches 240%. A relation between the conditions for high elasticity and the formation of insol. elastic three-dimensional networks is shown, and calculations are given to explain changes of Young's modulus, yield val., and strain at the yield val. when such structures are formed. F. L. U.

**Inorganic substances with rubber-like properties.** K. H. MEYER (*Trans. Faraday Soc.*, 1936, 32, 148—152; cf. A., 1935, 1450).—The elastic behaviour and X-ray patterns of elastic S and of polyphosphonitrilic chloride are described. They present many analogies with org. polymerides, and their extensibility is attributed to long flexible chains of mols. which become straight when stretched, and undergo flexion by Brownian movement when ten-

sion is relaxed, with consequent shortening of the specimen. F. L. U.

**Constitution of the crystallised part of cellulose. IV. Elasticity of cellulose.** K. H. MEYER and W. LOTMAR (*Helv. Chim. Acta*, 1936, 19, 68—86).—The influence of moisture, temp., orientation, and tension on the modulus of elasticity *E* of several natural cellulose (I) fibres and some derivatives of (I) has been determined using Polanyi's dynamometer and also an acoustic method of measurement. The temp. coeffs. of the tension are zero or negative except for (I) acetate, which gives a positive val. like rubber, because of its amorphous structure. In the other fibres, with a cryst. network, the attractive forces between the atoms, or the deformation of the valency angles, are responsible for the elasticity. *E* for natural fibres of high orientation, such as ramie, hemp, and linen, approaches a val. of approx. 11,000 kg. per sq. mm.  $\pm 10\%$ , which is close to the val. calc. for the (I) model if the angular forces are 20% of the principal valency force. Artificial (I) fibres or (I) derivatives have vals. of *E* between 100 and 5000 kg. per sq. mm. M. S. B.

**Crystal plasticity. V. Completion of the rate of slip formula.** E. OROWAN (*Z. Physik*, 1935, 98, 382—387; cf. A., 1934, 949).—A term is added to the earlier rate of slip formula to take account of forces arising in the crystal opposed to the applied force: these are likely to be significant for org. crystals. A. B. D. C.

**Variation of the adiabatic elastic moduli of rock-salt between 80° and 270° abs.** F. C. ROSE (*Physical Rev.*, 1936, [ii], 49, 50—54).—Balamuth's method for measuring Young's modulus of a cubic crystal (cf. A., 1935, 154) is extended to the measurement of all the elastic moduli of any solid crystal below 0°. Data for the variation with temp. of the adiabatic and isothermal elastic moduli and elastic consts. of rock-salt in the range 80—270° abs. are given. N. M. B.

**Relation between heat of transition and transition point of enantiotropic modifications.** J. A. M. VAN LIEMPT (*Rec. trav. chim.*, 1935, 54, 934—936).—An equation is derived connecting heat of transmission with the temp., and the at. frequencies and densities of the modifications at the transition temp. Direct confirmation is lacking owing to absence of data, but by substituting the ratio of the at. frequencies by the ratio of the abs. temp. at which the forms have equal sp. heats, the calc. transition temp. for Sn and S are of the same order as the experimental vals. J. W. S.

**Rates of vaporisation of metals in a gaseous atmosphere.** J. A. M. VAN LIEMPT (*Rec. trav. chim.*, 1936, 55, 1—6).—A formula is derived which is in agreement with experimental data and with Weber's formula. The deviations which are observed at high pressures are explained. E. E. A.

**Mol. wt. of polystyrenes and shape of the molecules in solutions.** R. SIGNER (*Trans. Faraday Soc.*, 1936, 32, 296—307).—Experiments on mol. wts. of polystyrenes as determined by u r centrifuging and on their fluxional birefringence a.

to the conclusion that in certain solvents the mols. are linear, straight for the fractions of lower, and curved for those of higher, mol. wt. (cf. A. 1933 '93, 902; 1935, 162, 700). F. L. U.

Rendering visible standing ultrasonic waves in transparent solid substances. III. Optical strain analysis of elastic vibrations. E. HIEDEMANN and K. H. HOESCH (Z. Physik, 1935, 98, 141—144; cf. A., 1935, 1312).—Longitudinal and transverse waves give different patterns. A. B. D. C.

Determination of ultrasonic velocity in 52 organic liquids. S. PARTHASARATHY (Proc. Indian Acad. Sci., 1935, 2, A, 497—511).—Data for 52 liquids (hydrocarbons, alcohols, ketones, halogen derivatives, etc.) at 23—24.5° are given. Aromatic compounds in general gave higher velocities than did aliphatic compounds. Mols. with electric moment, or long mols., also gave high velocities. Adiabatic compressibility data are tabulated. H. J. E.

Longitudinal thermoelectric effect. VI. Mercury. J. L. CH'EN and W. BAND (Proc. Physical Soc., 1936, 48, 164—167; cf. A., 1935, 1312).—The Benedicks e.m.f. in Hg in an unconstricted glass tube undergoes a reversible decrease with rising temp. It is suggested that there is an anisotropic quasi-cryst. arrangement of the surface mols. depending on temp. N. M. B.

Thermomagnetic properties of nickel. II. W. BAND and Y. K. HSU (Proc. Physical Soc., 1936, 48, 168—177; cf. *ibid.*, 1935, 47, 910).—Curves are given for the homogeneous thermoelectric e.m.f. in pure Ni wire 1 mm. diameter for tensions  $\geq$  8 kg. Benedicks coeffs. are found as functions of magnetic field and tension. An antisymmetric part of the e.m.f. with respect to the magnetisation has been discovered. Evidence suggests that the homogeneous effect is controlled by the regularity of the micro-crystals in the wire. N. M. B.

Ionic complexes of polymeric compounds. v. WALTER (Trans. Faraday Soc., 1936, 32, 396—397).—Determination of the electrical conductivity of mono- and poly-meric methylenecarbamides in  $\text{HCO}_2\text{H}$  in conjunction with that of the mol. wt. in the same solvent and of the  $\text{NH}_2$  end-groups reveals the presence of ionic complexes. The role of the latter in the formation of resins from  $\text{CO}(\text{NH}_2)_2$  and  $\text{CH}_2\text{O}$  is discussed. F. L. U.

Electrical conductivity of alkali metal flames. KISSELMANN and A. BECKER (Ann. Physik, 1936, [1], 25, 49—73).—The conductivity of Li, Na, K, Rb, and Cs chloride vapours in the Meker burner flame at 1250—1950° abs. has been investigated. The metal-free flame the conductivity-temp. relation corresponds with electron emission by a component of ionisation potential 2.50 volts. For the metal vapour, the conductivity  $\propto$  the square of the total metal concn.; the conductivity-temp. relation is independent of the concn., and corresponds approx. with electron emission by free metal ions formed by chemical dissociation. L. J. J.

Phase-equilibrium of superconductors in a magnetic field. H. LONDON (Proc. Roy. Soc., 1935, A, 150, 650—663).—Mathematical. The disturbance

of superconductivity by a magnetic field is treated thermodynamically (A., 1935, 689). A threshold val. of the c.d. and not of the magnetic field is the decisive quantity. L. L. B.

Superconductivity of thin metallic films. A. D. MISENER and J. O. WILHELM (Trans. Roy. Soc. Canada, 1935, [iii], 29, III, 5—11).—The transition temp. for Pb films falls rapidly as the film thickness is decreased below  $9 \times 10^{-5}$  cm. The films were deposited electrolytically on constantan wire cores. H. J. E.

Effect of magnetic fields on the superconductivity of thin films of tin. A. D. MISENER, H. G. SMITH, and J. O. WILHELM (Trans. Roy. Soc. Canada, 1935, [iii], 29, III, 13—21).—The critical magnetic field necessary to interrupt the superconducting state of Sn is greater for thin films than for massive Sn. Hysteresis effects occurred in thin films. H. J. E.

Magnetic anisotropy of naturally occurring substances. I. Mother of pearl. P. NILAKANTAN (Proc. Indian Acad. Sci., 1935, 2, A, 621—629).—From measurements of the abs. susceptibility and magnetic anisotropy of the nautilus *Turbo, Haliotis, M. margaritifera, Mytilus viridis*, and *Nautilus pompilius* it is concluded that the *c* axes are in each case normal to the elementary lamina. The *a* and *b* axes are probably in some cases distributed at random and in others the *a* axis is approx. along the line of growth. J. W. S.

Magnetism and polymerisation. J. FARQUHARSON (Trans. Faraday Soc., 1936, 32, 219—226).—Polymerisation is accompanied by a change in diamagnetic susceptibility, measurement of which can be used to find the mol. wt. of the product with an accuracy which decreases with increase in the degree of polymerisation. Results of experiments with  $(\text{CH}_2\text{CMe})_2$ , cyclopentadiene,  $\text{CNCl}_3$ , and  $\text{PhNO}$  are given. F. L. U.

Electrical resistance and magnetic susceptibility of sugar carbon submitted to various thermal treatments. P. CORRIEZ (Compt. rend., 1935, 201, 1486—1488; cf. this vol., 143).—Vals. are recorded for specimens heated from 1000° to 2000°. T. G. P.

Character of linking in the carbon monoxide molecule. R. I. JANUS and J. S. SCHUR (Physikal. Z. Sovietunion, 1935, 7, 19—25).—A simple method of measuring the magnetic susceptibility of gases is described. The val. for CO is  $-118 \pm 6 \times 10^{-7}$ . CO contains a triple linking. CH. ABS. (e)

Diamagnetism and change of state. P. S. VARADACHARI (J. Annamalai Univ., 1935, 5, 18—26).—Evidence is given that the decreased magnetic susceptibility of many aromatic compounds on solidification is due to the decomp. on fusion of polymerides present in the solid state. The sharp lines in solid  $\text{C}_6\text{H}_6$  and  $\text{Ph}_2\text{O}$  (cf. Gross, A., 1935, 564) may be due to such polymerides.  $\text{H}_2\text{O}$  is considered in the light of Raman data. Differences between the susceptibilities of the liquid and vapour states of org. compounds are eliminated if the v.d. is taken into account in calculating mol. susceptibility. N. M. B.

**Magnetochemistry of rhenium : metallic rhenium and septavalent rhenium.** N. PERRAKIS and L. KAPATOS (*Praktika*, 1934, 9, 121—125; *Chem. Zentr.* 1935, i, 3110).—Measurement of the magnetic susceptibility of  $\text{Re}_2\text{O}_7$  gives for  $\text{Re}^{\text{VII}}$  the same val. as found by Albrecht and Wedekind for metallic Re. For Re prepared by reduction of  $\text{NH}_4\text{ReO}_4$ , the author's previous val. was confirmed.  $\chi$  for  $\text{KReO}_4$  and  $\text{NH}_4\text{ReO}_4$  are recorded. J. S. A.

**Diamagnetic susceptibilities of salts forming ions with inert gas configurations. II. Alkaline halides.** G. W. BRINDLEY and F. E. HOARE (*Proc. Roy. Soc.*, 1935, A, 152, 342—353).—The method previously described (A., 1935, 149) has been used to determine the diamagnetic susceptibilities of the halides of Li, Rb, and Cs. The results indicate that the susceptibilities are additive within the limits of experimental error except for  $\text{LiCl}$ ,  $\text{LiBr}$ , and  $\text{LiI}$ , and  $\text{CsCl}$ ,  $\text{CsBr}$ , and  $\text{CsI}$ . It is suggested that the low vals. in the latter cases are due to deformation of the ions produced by (a) the close approach of the negative ions in the Li salts, and (b) the change of crystal structure in the Cs salts. A series of ionic susceptibilities for ions in crystals of the rock-salt type is derived. L. L. B.

**Temperature coefficient of susceptibility of tetrahydronaphthalene.** B. N. RAO (*Current Sci.*, 1935, 4, 404—405).—The susceptibility, studied in the range 23—70°, showed no temp. effect. The abs. val. was  $-0.688 \times 10^{-6}$ , showing no variation with field strength. N.

**Temperature of the Langmuir hydrogen flame.** H. VON WARTENBERG and H. J. REUSCH (*Nachr. Ges. Wiss. Göttingen*, 1934, [ii], 1, 141—145; *Chem. Zentr.*, 1935, i, 2654).—The temp. of an at. H flame was determined by the reversal of lines of the Li flame, using the solar image as comparison. Near the electrode 4600—4800° was recorded. J. S. A.

**Temperature rise in a material of which the thermal properties vary with temperature.** J. H. AWBERRY (*Proc. Physical Soc.*, 1936, 48, 118—124).—Mathematical. N. M. B.

**Polymorphism.** H. E. PHIPPS and J. H. REEDY (*J. Physical Chem.*, 1936, 40, 89—100).—An accurate method for determining the transition temp. of sol. substances by means of a dipping refractometer is described. Examination of  $\text{NH}_4\text{NO}_3$  III petrographically indicates that it is orthorhombic. Redetermination of the transition point of  $\text{CCl}_4$  by heating and cooling curves gives  $-47.66 \pm 0.2^\circ$ . The effect of impurities on this is much > on the m.p. M. S. B.

**Temperature dependence of free electron specific heat.** E. C. STONER (*Phil. Mag.*, 1936, [vii], 21, 145—160).—Mathematical. The Fermi-Dirac statistics are applied to obtain the variation of energy and sp. heat over the whole temp. range, the range of validity of the formulæ being specially considered. A. J. M.

**Equation for approximating heat capacities of gases calculated from spectral data.** I. N. GODNEV (*J. Amer. Chem. Soc.*, 1936, 58, 180—181). The proposed equation has been applied satisfactorily

to data for  $\text{CO}$ ,  $\text{N}_2$ , and  $\text{S}$  in the range 100—5000° abs.

**Rotation and entropy of hydrogen sulphide.** K. CLUSIUS and A. FRANK (*Naturwiss.*, 1936, 24, 62).—There is no difference between the entropy of  $\text{H}_2\text{S}$  calc. thermodynamically and statistically, in contrast with  $\text{H}_2\text{O}$ . There is therefore no zero-point rotation of its *o*-modification. This difference between  $\text{H}_2\text{O}$  and  $\text{H}_2\text{S}$  is connected with the existence of a no. of solid phases of  $\text{H}_2\text{S}$  under ordinary pressures, whereas only one stable form of  $\text{H}_2\text{O}$  exists. A. J. M.

**Thermal data on organic compounds. XV. Heat capacity, entropy, and free energy data for the isomeric butenes.** S. S. TODD and G. S. PARKS (*J. Amer. Chem. Soc.*, 1936, 58, 134—137; cf. A., 1935, 825).—The heat capacities of the four isomeric butenes have been determined between liquid-air temp. and their respective b.p. The mol. entropies and free energies of formation have been calc. The thermodynamic stability varies considerably with the configuration of the mol. E. S. H.

**Glass. XII. New heat capacity data for organic glasses. Entropy and free energy of *dl*-lactic acid.** G. S. PARKS, S. B. THOMAS, and D. W. LIGHT. **XIII. Glass formation by a hydrocarbon polymeride.** J. D. FERRY and G. S. PARKS (*J. Chem. Physics*, 1936, 4, 64—69, 70—75).—XII. Sp. heat measurements have been made on  $\text{Bu}^n\text{OH}$ , *dl*-lactic acid (I), and  $\gamma$ -methylhexane in glassy, liquid, or incompletely cryst. states by Nernst's method. As with other glass-forming substances (cf. A., 1930, 1359), there is a transition region over a temp. interval of 8—20°, depending on the nature of the glass and its thermal history. Through this temp. interval the material passes from a hard glass to a more or less viscous liquid, whilst the sp. heat rises rapidly. The sp. heat of cryst. (I) has also been determined at different temp. The heat of fusion of the crystals at 289.9° abs. is 30.1 g.-cal. per g. The entropy and free energy of formation of (I) have been calc.

**XIII. Polyisobutene**, average mol. wt. 4000, forms a glass of nature similar to those of low mol. wt. The transition region, through which the sp. heat increases by 32%, is 192—202° abs. The expansion coeff. has been measured at 160—300° abs. and increases by 200% between 185° and 205° abs. In agreement with the behaviour of other glass-forming substances,  $\eta$ , at the mean transition temp., is approx.  $10^{13}$  poises. The influence of mol. structure on glass formation is discussed. M. S.

**Purification and physical properties of organic compounds. XII. Lower aliphatic bromides.** E. L. SKAU and R. McCULLOCH (*J. Amer. Chem. Soc.*, 1935, 57, 2439—2440; cf. this vol., 290).—Revis data for the b.p., f.p., and *d* of  $\text{Et}$ ,  $\text{Pr}^n$ ,  $\text{Pr}^i$ ,  $\text{Bu}^n$ ,  $\text{Bu}^i$ , and *n*-amyl bromides are recorded. E. S. H.

**Regularities in the m.p. of polyenes.** R. and C. GRUNDMANN (*Ber.*, 1936, 69, [B], 224). The same regularities are observed in the absorption and fluorescence spectra of the purely aliphatic polyenes and of the  $\omega\omega'$ -diphenylpolyenes. In ex

ation of further physical regularities it is found that the m.p. of polyenes are to a first approximation a linear function of the no. of conjugated double linkings. The inclination of the graphs is nearly identical for aldehydes, carboxylic acids, and their Me esters, but is steeper for the alcohols. Among *cis-trans*-isomerides the *cis*-forms ( $H_2C_2O_4$ , maleic, *cis-cis*-muconic acid) show a different sequence of m.p., and the 2-furylidene-polyene-aldehydes and -carboxylic acids do not conform to the scheme. The following new or amended m.p. are recorded: sorbaldehyde, m.p. sorbate, m.p. 15°; decatetraenoic acid, m.p. 226.5°.

H. W.

Time of melting of thin fuses. II. J. A. M. VAN LIEMPT and J. A. DE VRIEND (Z. Physik 1935 13—40; cf. A., 1935, 289).—Currents, *I*, up to 20 times the limiting current require a time *t*, for fusion, where  $I^2t = \text{const.}$

A. B. D. C.

Thermochemical properties of nitrous oxide. SUTTON, H. R. AMBLER and G. W. WILLIAMS, (Proc. Physical Soc., 1936, 48, 189—202).—The conditions of initiation and of pressure under which direct decomp. will propagate progressively and explosively through  $N_2O$  are examined. The heat of formation, determined by explosive thermal decomp. at 42 atm., is  $-19.52 \pm 0.1$  g.-cal. per mol. at const. pressure. A simple method for comparing *p* for two gases is applied to  $N_2O$  and  $CO_2$  over 10—45 atm.

N. M. B.

Continuation of vapour-pressure curve above critical. F. KRUGER (Physikal. Z., 1936, 37, 100).—Theoretical. The methods of Eucken (A., 1934, 1062) and of Trautz and Ader (*ibid.*, 1923) gave identical results in the neighbourhood of the crit. point.

A. J. M.

Vapour pressure of glycols. O. J. SCHIERHOLTZ (J. Amer. Chem. Soc., 1935, 57, 2709—2711).—V.p. (10—760 mm.), and *d* are recorded for ethylene,  $\alpha\beta$ - and  $\alpha\gamma$ -propylene,  $\gamma$  and  $\beta\gamma$ -butylene glycols.

E. S. H.

Isopiestic method of determining the vapour pressures of salt solutions. A. JANIS (Proc. Roy. Soc. [iii], 29, III, 87—89).—A modification of Smclair's method for use with larger samples is described (cf. A., 1933, 587).

H. J. E.

of expansion of silver iodide and of thallium. G. JONES and F. C. JONES (J. Amer. Chem. Soc., 1935, 57, 2532—2536).—A differential dilatometer, which acts simultaneously as a thermo-regulator, is described. The following mean cubical coeffs. of expansion have been determined: pyrex glass  $9.85 \times 10^{-6}$ , PhMe  $1.111 \times 10^{-3}$ , AgI  $1.1 \times 10^{-4}$ , TiCl  $1.59 \times 10^{-4}$ , TiBr  $1.53 \times 10^{-4}$ , TH  $1.35 \times 10^{-4}$ .

elastic curves and compressibilities of nitrogen and argon. P. W. BRIDGMAN (Proc. Amer. Acad. Sci., 1935, 70, 1—32; cf. A., 1935, 156).—*p* and *v* changes on melting were determined at pressures up to 6000 atm. The heats of fusion were calculated. *P-V-T* data are given.

CH. ABS. (e)

Viscosity of uranium oxide and its mixtures with water at 25°. G. JONES and B. J. FERNWALT

(J. Chem. Physics, 1936, 4, 30—33).— $\eta$  is nearly a linear function of *d*. An expression relating fluidity to the increase in *d* over that of ordinary H<sub>2</sub>O is shown to be valid to 0.006% over the whole concn. range whilst Bingham's equation is valid to 0.01%.

M. S. B.

Absolute measurement of the viscosity of liquid tin. A. J. LEWIS (Proc. Physical Soc., 1936 48, 102—110; cf. Stott, A., 1933, 895).—Using the capillary flow method,  $\eta$ , with independent correction was measured for the temp. range 235—330°. The temp. variation of  $\eta$  and the val. at the f.p. agree with Andrade's theory (cf. A. 1934 356).

N. M. B.

Association of substances which are solid at ordinary temperatures [determined] by the fluidity method. E. C. BINGHAM and J. E. HATFIELD (Physics, 1935, 6, 64—68).—The fluidities of  $BzOH$ ,  $C_{10}H_8$ ,  $CH_3Ph \cdot OBz$ ,  $Me_2C_2O_4$ ,  $Et_2C_2O_4$ ,  $Pr_2C_2O_4$ , and succinic, glutaric, and adipic acids and of mixtures of  $BzOH$  and  $C_{10}H_8$  with  $CH_3Ph \cdot OBz$  were measured. A viscosimeter bath suitable for use up to 230° is described.

CH. ABS. (e)

Molecular dimensions from viscosity studies. R. M. THEIS and H. B. BULL (J. Physical Chem., 1936, 40, 125—131).—The viscosity of stearic acid and lecithin in  $CCl_4$  has been determined and a linear relation observed between  $c\eta_0/(\eta - \eta_0)$  and *c*, where  $\eta_0$  and  $\eta$  are the viscosities of the solvent and solution, respectively. The possibility of applying Eisen-schitz' equation (A., 1932, 121) to determine the ratio of the length of the solute mols. to their diameter is discussed.

M. S. P.

Partial molal volumes of ammonia and hydrogen in liquid ammonia-hydrogen mixtures under pressure at 100°. R. WIEBE and T. H. TREMEARNE (J. Amer. Chem. Soc., 1935, 57, 2601—2603).—Data are recorded and their thermodynamic significance is discussed.

E. S. H.

Density of solutions of alkali metal halides in liquid ammonia. W. C. JOHNSON and R. I. MARTENS (J. Amer. Chem. Soc., 1936, 58, 15—18).—Data are recorded for solutions of the chlorides, bromides, and iodides of Li, Na, and K in liquid  $NH_3$ , between  $-32^\circ$  and  $-60^\circ$  over as wide a concn. range as solubility permits.

E. S. H.

[Refractive index of] mixtures of piperine and iodides. S. GRUM-GRSHIMAILO (Trans. Inst. Econ. Min. U.S.S.R., 1934, No. 61, 21—23, 27—28).—The vals. of *n* recorded for piperine,  $SbI_3$ , and  $AsI_3$  differ from those given by Larsen (U.S. Geol. Surv. Bull. 679, 1921).

CH. ABS. (e)

Raman effect in mixtures of oleum and nitric acid. J. CHÉDIN (Compt. rend., 1936, 202, 220—222; cf. A., 1935, 807).—The mixtures afford evidence of association between  $N_2O_5$  and  $SO_3$ ; the characteristic spectral effects are very different from those accompanying the association of  $SO_3$  and  $H_2SO_4$  in  $H_2S_2O_7$ .

T. G. P.

Magnetic susceptibilities of nitric acid solutions. S. P. RANGANADHAN and M. QURESHI (Current Sci., 1935, 4, 404).—The susceptibility-concn.

curve over the range 4–65%  $\text{HNO}_3$  shows marked departure from linearity. The  $g$ -ionic susceptibility of the  $\text{NO}_2$  ion is  $-20.83 \times 10^{-6}$ . Min. in the curve correspond with  $\text{HNO}_3 + 50\text{H}_2\text{O}$ ,  $+6\text{H}_2\text{O}$ ,  $+4\text{H}_2\text{O}$ , and  $2\text{HNO}_3 + 5\text{H}_2\text{O}$ . N. M. B.

**Constitution of liquid zinc amalgams.** H. A. LIEBHAFSKY (J. Amer. Chem. Soc., 1935, 57, 2657–2662).—Analysis of published e.m.f. data shows that the deviations can be explained on a polymerisation hypothesis which assumes the existence of  $\text{Zn}_2$  and  $\text{Zn}_3$  in equilibrium with monat. Zn. E. S. H.

**Binary mixtures.** IV. L. PIATTI (Angew. Chem., 1936, 49, 77–78; cf. A., 1934, 1301).—The b.p. of binary mixtures (0–100%) of *o*-, *m*-, and *p*-cresol with  $\text{COMe}_2$  and  $\text{C}_6\text{H}_6$ , respectively, have been determined. The vals. are < those calc. from the mixture rule. E. S. H.

**Azeotropic and constant evaporating mixtures.** S. I. SKLJARENKO and M. K. BARANAJEV (Z. physikal. Chem., 1935, 175, 203–213; cf. this vol., 281).—It is deduced that  $v_1/v_2 = (p_1/p_2)\sqrt{(D_1/D_2)}$ , where  $v_1$  and  $v_2$  are the rates of evaporation of the components of a binary liquid mixture having the diffusion coeffs.  $D_1$  and  $D_2$  and partial v.p.  $p_1$  and  $p_2$ . A mixture in which  $x_1$  and  $x_2$  are the mol. fractions of the components will evaporate without change in composition if  $x_1/x_2 = (p_1/p_2)\sqrt{(D_1/D_2)}$ , an equation which has been confirmed by experiment. Mixtures for which the vapour given off at a particular temp. has the same composition as the liquid do not, in general, evaporate without change of composition at that temp. R. C.

**Orthobaric azeotropes. Esters-hydrocarbons.** M. LECAT (Ann. Soc. Sci. Bruxelles, 1935, 55, B, 253–265; cf. A., 1930, 680).—315 binary systems involving 44 hydrocarbons and 72 esters have been studied. The b.p., composition, and heats of formation of the azeotropes are given. R. S.

**B.p. and composition of the vapour phase of the ternary system ethyl acetate-ethyl alcohol-water.** V. A. KIREEV, I. J. KLINOV, and A. N. GRIGOROVITSCH (J. Chem. Ind. Russ., 1935, 12, 936–940).—B.p. data and the composition of the vapour phases are recorded. R. T.

**Viscosity measurements of the ternary system diopside-albite-anorthite at high temperatures.** S. KÔZU and K. KANI (Proc. Imp. Acad. Tokyo, 1935, 11, 383–385).—Data are recorded for the temp. range 1150–1575°. In a homogeneous melt,  $\eta$  varies linearly with the temp. but the slope increases suddenly when the primary phase begins to crystallise. E. S. H.

**X-Ray and electrical investigation of the copper-gold system.** C. H. JOHANSSON and J. O. LINDE (Ann. Physik, 1936, [v], 25, 1–48; cf. A., 1926, 112; 1927, 400).—A new regular structure ( $\text{CuAu II}$ ) in the region 50 at.-% has been identified, and its lattice dimensions are measured.  $\text{CuAu II}$  has rhombic symmetry, and is a modification of the tetragonal form ( $\text{CuAu I}$ ). The unit cell is the 4-atom face-centred cell repeated 10 or 11 times.  $\text{CuAu II}$  is stable at low temp. for the regions 36–47 and 53–

65 at.-% Au; for 47–53% it can be obtained only by quenching from 420°. The relations between the lattice structures, and the influence of heat-treatment, are discussed. In the region 65–80 at.-% Au a cubic structure is found. The sp. resistance for the entire range has been measured. L. J. J.

**Ferromagnetic increment of resistance of copper-nickel alloys.** B. SVENSSON (Ann. Physik, 1936, [v], 25, 263–271).—Data are recorded for the sp. electrical resistance of nine Cu-Ni alloys with 11–90 at.-% Ni between 0° and 500°. The ferromagnetic component of the resistance has a max. val. at approx. 80 at.-% Ni. L. J. J.

**Solid solubility of magnesium in aluminium.** S. KISHINO (J. Chem. Soc. Japan, 1935, 56, 322–324).—The determination of the solubility of Mg in Al by microscopic examination, or by electrical resistance measurements, is difficult for < 5% of Mg. CH. ABS. (e)

**M.p. of eutectics.** Lipowitz alloy and Wood's metal. S. J. FRENCH (Ind. Eng. Chem., 1936, 28, 111–113).—The cooling and melting curves of the Lipowitz alloy (Bi 50, Pb 27, Sn 13, Cd 10%) and Wood's metal (Bi 50, Pb 25, Sn 12.5, Cd 12.5%) coincide approx. over the greater part of the const.-temp. region, giving the same m.p. and f.p., viz., 71.7° and 69.7°. The former approaches the quaternary eutectic more closely than does Wood's metal. Discrepancies in published vals. may be due to undercooling or to Hg as an impurity. It is suggested that names for the alloys should be discarded, and that composition and m.p.—f.p. range should be substituted. R. S. B.

**Ternary diagram of aluminium-copper-silicon system.** K. MATSUYAMA (Kinz.-no-Kenk., 1934, 11, 461–490).—The Al-Cu, Cu-Si, and Al-Si diagrams have been reinvestigated. In the system Al-Cu-Si there are 18 monovariant curves and 8 nonvariant points. The  $\alpha$ ,  $\beta$ ,  $\gamma$ , and  $\delta$  solid solutions of the systems Cu-Al and Cu-Si are contiguous. In the solid state there are 9 monovariant curves and 2 nonvariant points. CH. ABS. (e)

**System iron-cementite-manganese carbide-manganese.** R. VOGEL and W. DÖRING (Arch. Eisenhüttenw., 1935–1936, 9, 247–252).—Contrary to previous statements, Mn and  $\text{Mn}_3\text{C}$  do not form a continuous series of solid solutions, but a complicated series of reactions occurs during cooling. The liquidus curve passes through a min. at 3.5% C, 1160°, and  $\text{Mn}_3\text{C}$  undergoes a transformation at 1050°, the temp. of which is gradually decreased by addition of Mn to 920° at 3.5% C (eutectoidal point). At 740° in alloys with > 1.2% C the  $\gamma$ -Mn solid solution undergoes a eutectoidal transformation into  $\alpha$ -Mn +  $\alpha$ - $\text{Mn}_3\text{C}$ . The  $\gamma$ - $\beta$ -transformation point of Mn is lowered by addition of C from 1140° to 840°, whereas the  $\beta$ - $\alpha$  point is raised from 740° to 840° (0.9% C). The complete diagram and micrographs showing characteristic structures of alloys within the various fields are included. In the ternary system Fe-Mn-C the equilibria resemble those in the Fe-C system up to 60% Mn; in alloys with a higher Mn content complicated reactions occur due to the allotropic changes

in Mn and  $\text{Mn}_3\text{C}$ ; thus the section through 70% Mn contains 17 phase fields. In the Mn corner of the ternary diagram there are 4 planes of four-phase equilibrium, one of which corresponds with a ternary eutectoidal change:  $\gamma\text{-Mn} = \alpha\text{-Mn} + \gamma\text{-Fe} + \alpha\text{-Mn}_3\text{C}$ ; the eutectoid contains Fe 25, Mn 77.95, C 2.05% (640°).  
A. R. P.

Properties of the oxides of nitrogen. II. Binary system  $\text{N}_2\text{O}_3\text{-H}_2\text{O}$ . III. Pseudo-binary system  $\text{N}_2\text{O}_4\text{-H}_2\text{O}$ . T. M. LOWRY and J. T. LEMON. IV. Formation of two liquid layers in mixtures of nitrogen peroxide and water. T. M. LOWRY, E. LLOYD, and W. V. LLOYD (J.C.S., 1936, 1—6, 6—10, 10—17).—II. Two liquid phases are formed over a wide range of mixtures. The limiting mixtures correspond with 42—97 wt.-%  $\text{N}_2\text{O}_3$  at 0° and 48—95% at 20°. A max. temp. of separation was observed at 55° and 65%  $\text{N}_2\text{O}_3$ . Escape of NO into the gaseous phase lowers all the temp. and the crit. solution temp. is possibly 20° > that recorded. A quaternary point, at which the gaseous and two liquid phases are in equilibrium with ice, occurs at -33.3° and 36%  $\text{N}_2\text{O}_3$ , and another, with  $\text{N}_2\text{O}_3$  as the solid phase, may occur below -103° at > 98%  $\text{N}_2\text{O}_3$ .

III. Two liquid phases are formed over a wide range. A max. temp. of separation was observed at 67° and 89%  $\text{N}_2\text{O}_4$ . Escape of NO into the gaseous phase probably lowers the temp. Homogeneous aq. solutions deposit ice down to -50° and up to 33%  $\text{N}_2\text{O}_4$  and a compound of unknown composition over a narrow range down to -56° and up to 44%  $\text{N}_2\text{O}_4$ . Non-homogeneous mixtures containing > 44%  $\text{N}_2\text{O}_4$  deposit  $\text{HNO}_3 \cdot 3\text{H}_2\text{O}$  from the upper aq.-acid layer, at temp. up to a max. of -22.5°. The lower layer of liquefied gas deposits  $\text{N}_2\text{O}_4$ , either in the ordinary stable form or in a metastable form which melts 11° lower.

IV. The composition of the two liquid layers has been determined by analysis. The limits within which two liquid layers are formed in the system  $\text{H}_2\text{O-N}_2\text{O}_3\text{-N}_2\text{O}_5$  at 0° and 20° are shown on triangular diagrams.  
E. E. A.

Solubility of gas mixtures in liquids under pressure. I. Solubility in water of carbon dioxide from admixture with hydrogen at 20° and 30° and under total pressures up to 30 kg. per sq. cm. I. R. KRITSCHESKI, N. M. SHAVORON, and V. A. AEPPELBAUM (Z. physikal. Chem., 1935, 175, 232—238).—A thermodynamic method is described for calculating the solubility of components gas mixtures in liquids in the case where the thermodynamic potential of the dissolved gas is not affected by the presence of other dissolved gases. The experimental results show that if the pressure is not so high the solubility of  $\text{CO}_2$  in  $\text{H}_2\text{O}$  at a given fugacity is the same whether the gas is pure or mixed.  
R. C.

Ratio of rates of evaporation of different gases in moving air. S. I. SKLJARENKO and M. K. BARANAJEV (Z. physikal. Chem., 1935, 175, 195—202).—It is deduced theoretically and confirmed experimentally that for two liquids of v.p.  $p_1$  and  $p_2$  evaporating under the same conditions in a current

of air  $v_1/v_2 = (p_1/p_2) \sqrt{[D_1/(B - \frac{1}{2}p_1)]/[D_2(B - \frac{1}{2}p_2)]}$ , where  $v_1$  and  $v_2$  are the rates of evaporation, and  $D_1$  and  $D_2$  the diffusion coeffs. of the vapours, and  $B$  is the barometric pressure.  
R. C.

Dependence of rate of evaporation on nature of gas flowing over the surface of the evaporating liquid. S. I. SKLJARENKO and M. K. BARANAJEV (Z. physikal. Chem., 1935, 175, 214—218; cf. preceding abstract and this vol., 280).—If the vapour of the liquid is heavier than the gas passing over the surface,  $v_1/v_0 = \sqrt{(D_1/D_2)}$ , where  $v_1$  and  $v_0$  are the rates of evaporation into, and  $D_1$  and  $D_0$  the diffusion coeffs. of the vapour into, the gas and air, respectively. If the vapour is the lighter, as in the evaporation of  $\text{H}_2\text{O}$  into air, allowance must be made for convection currents.  
R. C.

Principles of gas exsorption. III. A. GUYER, B. TOBLER, and H. FARMER (Chem. Fabr., 1936, 9, 5—7; cf. A., 1934, 592, 1065).—The apparent "evaporation coeff." and rate of loss of gas from falling drops of  $\text{H}_2\text{O}$  is independent of the height of fall, and therefore of the velocity of fall. The relative loss of gas increases with increasing height of fall. The relative loss of gas from a  $\text{H}_2\text{O}$  stream falling against an air resistance increases with the height of fall and with decreasing cross-section of the stream. Reduced pressure has only a slight influence on the loss of gas. This is related to the degree of disturbance of the  $\text{H}_2\text{O}$ , which is a function of the air pressure.  
J. W. S.

Diffusion of gases through metals. II. Diffusion of hydrogen through aluminium. C. J. SMITHELLS and C. E. RANSLEY (Proc. Roy. Soc., 1935, A, 152, 706—713; cf. A., 1935, 692).—The rate of diffusion of  $\text{H}_2$  through Al above 400° depends on the state of the surface. The highest rate is given with a surface freshly scraped in  $\text{H}_2$ , but it rapidly falls, and after several hr. reaches a steady val. which is only 0.1 of the initial rate. This low rate is obtained with an anodically oxidised surface. The effects of temp. and pressure are represented by Richardson's equation.  
L. L. B.

Diffusion of water vapour through copper. J. H. DE BOER and J. D. FAST (Rec. trav. chim., 1935, 54, 970—974).—At about 800°  $\text{H}_2\text{O}$  vapour diffuses at the rate of about  $1.9 \times 10^{-12}$  g.-mol. per sq. cm. per sec. through Cu 1 cm. thick, when the pressure difference is 1 atm. The rate of diffusion of  $\text{H}_2$  under similar conditions is  $230 \times 10^{-12}$  g.-mol. per sq. cm. per sec. The diffusion of  $\text{N}_2$  through Cu, if existent, is very slow.  $\text{H}_2\text{O}$  vapour does not diffuse through chrome-Fe, whilst at 900° the rate of diffusion of  $\text{N}_2$  is  $> 6.9 \times 10^{-12}$  g.-mol. per sq. cm. per sec.  
J. W. S.

Diffusion of helium through fused silica. E. O. BRAATEN and G. F. CLARK (J. Amer. Chem. Soc., 1935, 57, 2714—2717).—Measurements at -78° to 562° show that the rate of diffusion  $\propto$  pressure and inversely  $\propto$  the thickness of  $\text{SiO}_2$ . Two vals. for the activation energy have been obtained, depending on the temp. region.  
E. S. H.

Diffusion of silver in glass. O. KUBASCHESKI (Z. Elektrochem., 1936, 42, 5—7).—The rate of diffusion and variation with temp. have been

determined. The amount of Ag taken up depends primarily on the availability of  $O_2$ , showing that it is not a case of simple diffusion of  $Ag^+$ . E. S. H.

**Equilibrium between strontium sulphate and water at various temperatures.** G. GALLO (Annali Chim. Appl., 1935, 25, 628—631).—The solubility of  $SrSO_4$  in  $H_2O$  increases from 0.0121 (g. per 100 c.c. of solution) at  $5^\circ$  to 0.0141 at  $40^\circ$ , then decreases to 0.0113 at  $95^\circ$ ; both pptd.  $SrSO_4$  and calcined celestine give similar vals. The influence of  $NH_4Cl$ ,  $NH_4NO_3$ , and  $(NH_4)_2SO_4$  on the solubility is studied. E. W. W.

**Re-determination of the solubility of chloropentammine cobaltic chloride.** F. J. GARRICK (Nature, 1935, 136, 1027—1028).—The compound purified by an improved method (A., 1935, 1335) gave 0.00925 and 0.0211 g.-mol. per litre at  $0.20^\circ$  and  $25.00^\circ$ , respectively. L. S. T.

**Solubilities and free energies of some metallic sulphides.** S. E. RAVITZ (J. Physical Chem., 1936, 40, 61—70).—The solubility data for the sulphides of Zn, Pb, Cu, Tl, Ag, and Cd have been examined and the solubilities recalcd. with the help of recent activity data. Free energies of formation have also been calc. M. S. B.

**Solubility of oxalic acid and oxalates of the alkaline earths in mineral acids.** I. H. TRAPP (J. pr. Chem., 1936, [ii], 144, 193—210).—The solubility of  $H_2C_2O_4$  in 0—16.46%  $HCl$ , 0—46.96%  $H_2SO_4$ , and 0—29.35%  $H_3PO_4$  at  $20+2^\circ$  is recorded. With  $K_2SO_4$  and  $CaSO_4$  it forms  $KHC_2O_4 \cdot H_2C_2O_4$  and  $CaC_2O_4 \cdot 2H_2O$ , respectively, until the concn. of  $H_2SO_4$  is 12 and 13%, respectively, at  $20+2^\circ$ . Lower concns. of  $H_2SO_4$  suffice to dissolve the salts at higher temp.  $NaCl$  and  $MgSO_4$  form  $Na_2C_2O_4 \cdot H_2C_2O_4 \cdot 2H_2O$  and  $MgC_2O_4 \cdot 2H_2O$ , respectively.  $BaCl_2$  gives  $BaC_2O_4 \cdot H_2C_2O_4 \cdot 2H_2O$  until the concn. of  $HCl$  is 4.5% and above this concn.  $BaC_2O_4 \cdot H_2C_2O_4 \cdot 3H_2O$ . R. S. C.

**Equilibrium in the system lithium phthalate-phthalic acid-water.** S. B. SMITH, W. A. STURM, and E. C. ELY (J. Amer. Chem. Soc., 1935, 57, 2406—2408).—Solubility data at  $0^\circ$ ,  $25^\circ$ , and  $50^\circ$  have been obtained. The compound  $LiHC_8H_4O_4 \cdot 2H_2O$  is formed at these temp. and can be crystallised at temp.  $< 60^\circ$ . E. S. H.

**Solubility of metals in crystals of halides.** G. TAMMANN (Z. anorg. Chem., 1935, 226, 92—96).—Solutions of metals in their solid halides (e.g., Na in  $NaCl$ , Ca in  $CaF_2$ ) are discussed from the point of view of their similarity to solutions of one metal in crystals of another. F. L. U.

**Precipitation processes. I. Connexion between ratio of concentrations of reactants and precipitation of silver thiocyanate and cyanide.** B. TEZAK (Z. physikal. Chem., 1935, 175, 219—231; cf. A., 1934, 593).—The pptn. curve (graph of turbidity 4 min. after mixing the reacting solutions against reactant concn.) exhibits two max. if the stabilising effects of the two reacting ions are large but approx. equal. The max. at the lower concn. is due to the isoelectric point, and the other to the reduction in solubility and stability and to the rapid formation

of pptn. centres. If the stabilising effect of the ion of variable concn. is very great, or there is considerable tendency to complex formation, the first max. only is observed, whilst if both ions have but a slight stabilising effect the second max. only is present. R. C.

**Distribution of thorium-C'' in thallium salt solutions.** J. ZIRKLER (Z. Physik, 1935, 98, 75—76).—The separation of the Tl isotope  $Th-C''$  from a solution containing  $Tl'$  and  $Tl$  does not depend on the total mass of the ions present, but on the amounts of  $Tl^{205}$  and  $Tl^{203}$ . A. B. D. C.

**Adsorption of hydrogen and deuterium on copper at low pressures.** R. A. BEEBE, G. R. LOW jun., E. L. WILDNER, and S. GOLDWASSER (J. Amer. Chem. Soc., 1935, 57, 2527—2532).—At  $-78^\circ$  and 0—2 mm. the rate of adsorption is less for  $D_2$  than for  $H_2$ , but equal amounts are adsorbed at equilibrium. At  $0^\circ$   $H_2$  is more strongly adsorbed, but at  $125^\circ$  it is adsorbed  $< D_2$ . The differential heats of adsorption are identical for  $H_2$  and  $D_2$ . E. S. H.

**Adsorption of hydrogen on tungsten.** J. K. ROBERTS (Proc. Roy. Soc., 1935, A, 152, 445—463).—The method used depends on the fact that the accommodation coeff. of Ne is different for a bare surface and for a surface with an adsorbed film on it. Saturation occurs at a partial pressure of  $H_2$  of the order of  $< 10^{-1}$  mm. and the process is one of chemisorption, which takes place rapidly at these low pressures at  $79^\circ$  abs. The heat of adsorption and amount of gas adsorbed have been measured on a single fine wire. The film is stable at negligibly low pressures at room temp. There is strong evidence for the view that the  $H_2$  is adsorbed as atoms, with one atom for each W atom in the surface. The binding is of the same type as that of  $O_2$  on W. The bearing of the data on the general problem of  $H_2$  adsorption and on that of activated adsorption is considered. L. L. B.

**Composite films of oxygen and hydrogen on tungsten.** J. K. ROBERTS (Proc. Roy. Soc., 1935, A, 152, 477—480).—When an  $O_2$  mol. is adsorbed on a W surface already covered with  $H_2$ , a mol. of  $H_2$  is ejected into the gas phase. The behaviour of  $H_2$  in the presence of a surface partly covered with  $O_2$  is also considered. The data support the theory that activated adsorption of  $H_2$  is connected with the interaction between  $H_2$  and surface  $O_2$ , either adsorbed or forming an integral part of the solid lattice. L. B.

**Adsorbed films of oxygen on tungsten.** J. K. ROBERTS (Proc. Roy. Soc., 1935, A, 152, 464—477; cf. preceding abstract).—Experiments show that a second mol. film of  $O_2$ , which is quite stable at room temp., is formed on top of the well-known stable film (A., 1931, 782). The heats of adsorption and no. of mols. adsorbed in each film have been measured. Consideration of the process of building up an immobile film by the adsorption of the two atoms of diat. mol. on neighbouring solid atoms shows that such a film necessarily has gaps in it. The no. of these gaps has been measured, and the amount of  $O_2$  in the second film found to correspond with adsorption on the gaps in the first. The possible

role of these gaps in the diffusion of  $O_2$  into W is discussed. The accommodation coeffs. for Ne striking the at. and the mol. film are deduced.

L. L. B.

**Sorption of ammonia and other gases by arsenic trisulphide.** N. MORITA (J. Chem. Soc. Japan, 1935, 56, 325—332).—The sorption velocity of  $NH_3$  by  $As_2S_3$  varies with the mode of prep. of the  $As_2S_3$ . The product at room temp. corresponds with  $As_2S_3 \cdot NH_3$ . The behaviour of  $NH_3$  is similar.

CH. ABS. (c)

**Adsorption of gases by virgin salt surfaces.** F. DURAU and A. HORN (Z. Physik, 1935, 98, 198—226).—Observations have been made with NaCl,  $CdCl_2$ , and  $NaNO_3$  which were melted, freed from impurities, and powdered in high vac. A. B. D. C.

**Adsorption on chromite catalysts.** J. C. W. FRAZER and C. G. ALBERT (J. Physical Chem., 1936, 40, 101—112).—The "activated adsorption" of  $O_2$  and CO on Cu chromite (I) at 100—200°, as distinct from the van der Waals adsorption, has been determined in order to see what relation it bears to the catalytic activity of (I) in the oxidation of CO. Activation energies of the adsorption have been calc. The activated adsorption of  $O_2$  increases with rise of temp., but that of CO attains a max. and then falls. This behaviour may be due to entirely separate processes taking place at the surface of (I). The results suggest that it is the activated adsorption of  $O_2$  which determines the catalytic activity of the surface. Possible mechanisms are discussed. M. S. B.

**Adsorption at crystal-solution interfaces.** VIII. Influence of dyes and other organic compounds on the crystal habits of barium and lead nitrates. (Miss) P. P. DAVIS and W. G. FRANCE (J. Physical Chem., 1936, 40, 81—87).—The habit assumed by crystals of  $Pb(NO_3)_2$  and  $Ba(NO_3)_2$ , separating from pure solutions and solutions containing dyes or other org. substances, indicates that they approximate most closely to the distorted  $CaF_2$  structure. The results are in general agreement with the theory previously put forward to account for the adsorption and habit modification (cf. A., 1933, 20). The effect of a mixture of two dyes is approximate. M. S. B.

**Adsorption of dyes on previously ignited gels.** SPILCHAL (Coll. Czech. Chem. Comm., 1935, 7, 536).—Basic dyes, e.g., methylene-blue, Me-are not adsorbed from aq. solution by ignited alumina gel (I). The adsorption of acid dyes, e.g., Congo-red (II), eosin, and Bordeaux-red, is high, but decreases to very low vals. as the drying temp. of (I) is raised to 1200°. Ignited  $Fe(OH)_3$  gels behave similarly. An unstable space lattice of the  $\gamma-Al_2O_3$  is indicated. The adsorption on bauxites (III), which have a smaller internal surface than (I), and of (II) on (I), decreases as the grain size increases. The adsorptive power of (III), heated at 1000°, increases towards basic dyes, probably owing to an increase of the internal surface of the grains.

J. G. A. G.

**aximal adsorption.** I. Maximal adsorption of sparingly soluble acids and bases by

different active charcoals. H. BRINTZINGER, A. SCHALL, and H. G. BEIER (Kolloid-Z., 1936, 74, 29—32).—Max. adsorption is defined as the amount of substance adsorbed at a given temp. by 1 g. of the adsorbent from a saturated solution. Determinations with salicylic acid and quinine are reported.

E. S. H.

**Adsorption of lead nitrate by metastannic acid.** A. G. BOSIN and M. M. SHILKINA (J. Appl. Chem. Russ., 1935, 8, 1287—1290).—When Sn—Pb alloys are dissolved in  $HNO_3$  part of the  $Pb(NO_3)_2$  formed is adsorbed on the  $SnO_2$ ; the amount ( $C_2$ ) of Pb adsorbed by a const. amount of  $SnO_2$  is given by  $C_2 = 4\sqrt{C_1}$ , where  $C_1$  is the amount of Pb found in the solution.

R. T.

**Adsorption at the interface between two fluids.**

I. Adsorption of methylene-blue, methyl-orange, Congo-red, and orange II at benzene-water and chlorobenzene-water interfaces. C. W. GIBBY and C. C. ADDISON (J.C.S., 1936, 119—127).—The adsorption, at various concns. in  $H_2O$ , at  $H_2O$ — $C_6H_6$  and  $H_2O$ —PhCl interfaces and the interfacial tensions have been measured. The results show marked quant. deviations from the predictions of Gibbs' equation in all cases, although this equation gives vals. of approx. the right order and in closer agreement with the observed results than with Lewis' data. Two types of concn.—adsorption curve are found. The type differs according to the adsorbate, but is independent of whether the interface is  $H_2O$ — $C_6H_6$  or  $H_2O$ —PhCl. Curves for Congo-red and Me-orange have the qual. features of a Gibbs curve; those for methylene-blue and orange II have not. The area of the interface occupied by the adsorbed mol., reckoned as monomeric, in the region of max. adsorption is calc. For methylene-blue and orange II, the adsorbed layer, on either interface, is unimol., but for the other two dyes, the surface concn. on  $C_6H_6$  is <, and on PhCl about twice as great as, that which is represented by a unimol. layer. E. E. A.

**Kinetics of adsorption of vapours by highly active adsorbents.** M. V. POLJAKOV, I. E. NEIMARK, and I. M. MALKIN (J. Phys. Chem. U.S.S.R., 1934, 5, 1079—1081).—Data for the adsorption of  $C_6H_6$  and PhMe by a mixture of C and  $SiO_2$  gel at 0—36° are recorded. The change in the character of the isotherm with fall in temp. is attributed to the onset of capillary condensation. CH. ABS. (c)

**Application of Polanyi's potential theory to the van der Waals adsorption of gases on iron synthetic ammonia catalysts.** P. H. EMMETT and S. BRUNAUER (J. Amer. Chem. Soc., 1935, 57, 2732—2733).—Isotherms for the adsorption of A and  $N_2$  by  $Fe_2O_3$ — $Al_2O_3$  catalysts are in accordance with the theory. E. S. H.

**Specific heat and binding conditions of adsorbed argon on charcoal.** H. M. CASSELL (J. Amer. Chem. Soc., 1935, 57, 2724).—Published sp. heat evidence suggests that the adsorbed atoms are capable of one-dimensional vibration only.

E. S. H.

**Temperature dependence of the surface tension of solutions.** R. V. MERTZLIN and N. A.

TRIFONOV (J. Phys. Chem. U.S.S.R., 1934, 5, 1146—1163; cf. A., 1935, 928).—Data are recorded for the systems  $\text{PhMe-Pr}^n\text{CO}_2\text{H}$  (12—100°),  $\text{C}_5\text{H}_5\text{N-NPhEt}_2$  (18—100°), allylthiocarbimide-NPhEt<sub>2</sub> (16—130°), quinoline-Bu<sup>o</sup>OH (0—140°), thymol-EtOAc (15—70°)

CH. ABS. (e)

Effect of light on surface tension of soap solutions. II. L. D. MAHAJAN (Z. Physik, 1935, 98, 388—395; cf. A., 1931, 1228).—Max. lowering by irradiation is observed with  $6.25 \times 10^{-4}$  g. of Na oleate per c.c., and with ultra-violet light.

A. B. D. C.

Electrokinetics. XVI. Streaming potentials in small capillaries. H. B. BULL and L. S. MOYER (J. Physical Chem., 1936, 40, 9—20).—A mathematical treatment is given for the streaming potential in capillaries < those to which Smoluchowski's theory in its simple form applies. The change in the viscosity of H<sub>2</sub>O with capillary size is discussed and an equation is derived to show the relationship between the back pressure produced by electro-osmotic effects and the mechanical pressure. A method for determining the average pore radius is described. For quartz and glass diaphragms, the theoretical crit. pore radius is not the same as that found experimentally. The potential-concn. and flow-concn. curves are anomalous for quartz and glass diaphragms with pores < the crit. size, but normal for cellulose.

M. S. B.

Wetting and spreading properties of aqueous solutions. Oleic acid-sodium carbonate mixtures. H. L. CUPPLES (Ind. Eng. Chem., 1936, 28, 60—62; cf. B., 1935, 1129).—The surface tensions and interfacial tensions against mineral oil have been determined for oleic acid-aq. Na<sub>2</sub>CO<sub>3</sub> mixtures containing approx. 0.1—1% of oleic acid, and approx. 1—4 mols. of Na<sub>2</sub>CO<sub>3</sub> per mol. of oleic acid. The spreading coeff.  $s = \sigma_{\text{oil}} - \sigma_{\text{soap solution}} - \sigma_{\text{interface}}$  varies much less with the ratio of alkali to acid than with oleic acid-NaOH mixtures, especially at high concn. of acid. Unlike the NaOH mixtures, the Na<sub>2</sub>CO<sub>3</sub> mixtures at high acid concn. have excellent wetting properties over the whole range of mol. ratios, and a high val. of  $s$  is easy to maintain.

R. S. B.

Wetting hysteresis caused by dispersity. I. R. KLJATSKO (Kolloid-Z., 1936, 74, 90—97).—Wetting isotherms for several minerals have been determined and the importance of the adsorption of surface-active substances is confirmed. The relation to flotation is discussed.

E. S. H.

Spreading of ovalbumin. (Miss) M. G. TER HORST (Rec. trav. chim., 1936, 55, 33—42).—The area of spreading increases with rise of temp., but the velocity of spreading shows an optimum at 25°. The area of the coherent film is little influenced by temp., but that of the compressed film rapidly increases with rise in temp. until at 50° both films probably become identical and the p.d. between the two films vanishes.

E. E. A.

Ageing of surface of solutions. K. S. G. DOSS (Current Sci., 1935, 4, 405).—A freshly formed surface of 0.002M solution of benzopurpurin, investigated by the surface-pressure method, showed a regular fall of surface tension with time, accompanied by the

formation of a surface film. If overcrowding of the surface mols. is produced by shifting the barrier, the surface tension increases with time. The observed rate of accumulation of solute mols. is far < the calc. collision frequency and is > doubled for 20° temp. rise, in agreement with the view that the adsorption is of the activated type.

N. M. B.

Collapse of unimolecular films of palmitic acid on acid solutions. R. J. MYERS (J. Amer. Chem. Soc., 1935, 57, 2734—2735).—The curve obtained when the collapse pressure vals. are plotted against  $p_H$  is S-shaped. The mid-point of the curve differs from that of the neutralisation curves for fatty acids. This appears to indicate increased activity of palmitic acid when oriented at a H<sub>2</sub>O surface.

E. S. H.

Periodic phenomena in diffusion and adsorption. I. Use of membranes. H. WAELSCH, S. KITTEL, and A. BUSZTIN (Kolloid-Z., 1936, 74, 22—29).—Periodic variations in concn. have been observed in the diffusion of salts in blood corpuscles and plasma. Similar periodicity has been obtained in a colloid model by allowing KCl to diffuse from aq. solution into a gelatin sol, from which it is separated by a membrane.

E. S. H.

Effects of some factors on rhythmic crystallisation. M. J. MACMASTERS, J. E. ABBOTT, and C. A. PETERS (J. Amer. Chem. Soc., 1935, 57, 2504—2508).—The periodic crystallisation of aq. K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, and (NH<sub>4</sub>)<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> has been investigated. Differences in temp. and concn. have little effect, but the phenomenon may be inhibited by foreign anions, the effect increasing in the order  $\text{Cl}^- < \text{SO}_4^{2-} < \text{NO}_3^-$ . The spacing of the periods agrees with that observed in the Liesegang phenomenon and in the crystallisation of periodic structures from melts.

E. S. H.

Structural changes taking place on ageing of freshly-prepared crystalline precipitates. V. Thermal ageing of freshly-prepared lead sulphate. VI. Perfection and ageing of lead sulphate precipitated under various conditions. VII. Kinetics of the distribution of thorium-B through fresh lead sulphate. VIII. Influence of agitation on the ageing and speed of distribution of thorium-B. I. M. KOLTHOFF and C. ROSENBLUM (J. Amer. Chem. Soc., 1935, 57, 2573—2577, 2577—2579; 1936, 58, 116—120, 121—122; cf. A., 1935, 715).—V. Sintering of the particles occurs markedly at 400° and very slowly at 300°. At lower temp. internal thermal ageing occurs, due to the high speed of evaporation of lattice ions on the active surface. At still lower temp. thermal ageing is promoted by adsorbed and occluded H<sub>2</sub>O.

VI. The effects of concn. of Pb(NO<sub>3</sub>)<sub>2</sub> and K<sub>2</sub>SO<sub>4</sub> and of temp. on the nature of PbSO<sub>4</sub> ppts. and their rate of ageing have been studied.

VII. During the initial stages of the ageing of fresh PbSO<sub>4</sub> the recrystallisation is mainly unidirectional and an enrichment of Th-B in the recryst. sulphate occurs; with prolonged shaking, successive recrystallisations occur, ultimately leading to homogeneous distribution.

VIII. The speed of distribution of Th-B when

shaken with freshly-pptd.  $\text{PbSO}_4$  is independent of the speed of agitation so long as the ppt. is prevented from settling. The speed of ageing of  $\text{PbSO}_4$  in aq.  $\text{Pb}(\text{NO}_3)_2$  is independent of the amount of ppt. and the speed of agitation. The recrystallisation is not an Ostwald-ripening process. E. S. H.

**Influence of nature of the membrane and temperature on the osmotic system of water and oxalic acid.** F. A. H. SCHREINEMAKERS, (Miss) J. C. LANZING, and C. L. DE VRIES (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 1067—1074; cf. A., 1931, 1007; 1932, 334, 691).—The system  $\text{H}_2\text{O}$ -membrane-aq.  $\text{H}_2\text{C}_2\text{O}_4$  has been investigated when one of the liquids is maintained invariant. With Cellophane at  $20^\circ$ ,  $\text{H}_2\text{O}$  and  $\text{H}_2\text{C}_2\text{O}_4$  diffuse in opposite directions, with pig's bladder both  $\text{H}_2\text{O}$  and  $\text{H}_2\text{C}_2\text{O}_4$  diffuse to the left at  $0^\circ$ , but at  $20^\circ$  with invariant aq.  $\text{H}_2\text{C}_2\text{O}_4$ ,  $\text{H}_2\text{O}$  and  $\text{H}_2\text{C}_2\text{O}_4$  diffuse to the left until the  $\text{H}_2\text{O}$  contains approx. 5% of  $\text{H}_2\text{C}_2\text{O}_4$  and then  $\text{H}_2\text{O}$  diffuses to the right. The relations at  $0^\circ$  and  $20^\circ$  are discussed. J. G. A. G.

**Osmotic complex with two stationary liquids.** F. A. H. SCHREINEMAKERS and J. P. WERRE (Proc. K. Akad. Wetensch. Amsterdam, 1935, 38, 982—988).—Changes in composition with time have been investigated for the system  $A|B|C|D$ , where  $A$  is  $\text{H}_2\text{O}$ ,  $D$  is a  $\text{NaCl}$  solution of definite concn., and  $B$  and  $C$  represent solutions of  $\text{NaCl}$  and  $\text{Na}_2\text{CO}_3$ . The concn. of  $\text{NaCl}$  in  $B$  passes through a min. J. W. S.

**Osmotic complexes in which one or more liquids proceed along a closed curve during osmosis.** I. F. A. H. SCHREINEMAKERS and C. L. DE VRIES (Rec. trav. chim., 1935, 54, 945—955).—The changes of composition with time in systems consisting of solutions in series contact through semipermeable membranes are discussed, with special reference to aq.  $\text{NaCl}+\text{Na}_2\text{CO}_3$  solutions,  $\text{H}_2\text{O}$  forming one invariant phase. J. W. S.

**Electrodialysis.** G. S. VOZDVISHENSKI (Trans. Butlerov Inst. Chem. Tech. Kazan, 1934, No. 1, 99—111).—If the  $\text{H}_2\text{O}$  in the electrode spaces in electrodialysis is left unchanged, the c.d. and rate of dialysis increase, even if the voltage is kept const. Gluten containing  $\text{NaCl}$  (ash content 1.70%) was electrolysed by this method, using a parchment membrane. It took 5 hr. at 30 volts, or 1 hr. at 100 volts, to obtain a product with 0.14% of ash. CH. ABS. (e)

**Simple lyotropic effects (viscosity).** E. M. DRUINS (Rec. trav. chim., 1936, 55, 13—16).—Different lyotropic formulæ are discussed and the idea of crit. ions is explained. The viscosities of 0.25*N* solutions of electrolytes containing (1, 1)-, (1, 2)-, (2, 1)-, and (2, 2)-valent salts can be calc. from a single formula. E. E. A.

**Optical behaviour of dissolved ions and its significance for the structure of solutions of electrolytes.** I. Influence of temperature and effect of salts on optical absorption of 2:4-dinitrophenoxide ion. G. KORTÜM (Z. physikal. Chem., 1936, B. 30, 317—355).—The extinction coeff,  $\epsilon$ , of the 2:4-dinitrophenoxide ion (I) at 436

$m\mu$  in aq. solution at  $20^\circ$  and  $25^\circ$  remains const., in presence of foreign salts independent of the salt concn.,  $c$ , up to concns. beyond those at which the ionic properties influenced by electrostatic interactions, e.g., conductivity, vary appreciably with  $c$ . At higher salt concns. ( $c > 0.01$ ) the absorption bands of (I) shift, but the magnitude and direction of the shift are an individual property of the foreign salt present. At these concns. there is no parallelism between the change of  $\epsilon$  with  $c$  and the change of the activity coeff. of (I) with  $c$ . The effects cannot be explained by deformation by the cations accumulating in the ionic atmosphere or by ionic association. In general, the salt anion has a sp. effect on  $\epsilon$  commensurate with that of the cation. The effects of salts on the optical properties of an ion seem to depend on the interaction between the ion and the solvent, rather than on direct deformation in the Coulomb field of force of the added ions. Calculation shows that small changes in the field of force due to ion-dipole interaction will have optical effects as large as deformation in the Coulomb field of the ions. The optical effects of non-electrolytes on (I) are similar to those of electrolytes. The effect of temp. on the long-wave absorption band of (I) suggests an electron affinity spectrum. A review of the entire optical data for aq. solutions of electrolytes indicates that at small and moderate concns. the solute is present as isolated solvated ions, the mutual deformation of which is largely negligible compared with their interaction with the  $\text{H}_2\text{O}$  mols. R. C.

**Optical rotation and circular dichroism, and absorption and refraction in solutions.** W. KUHN (Z. physikal. Chem., 1935, B, 30, 356—378).—The non-sp. part of the effect of the solvent results in the circular dichroism,  $D$ , and the optical rotation,  $\alpha$ , each being multiplied by the factor  $(n^2+2)/3$  on passage from the gaseous to the dissolved state, whilst the contribution of an absorption band to the normal absorption and sp. refractive power,  $r_L$ , is multiplied by the factor  $K=[(n^2+2)/3]^2/n$ . Consequently, relations between  $D$  and  $\alpha$  and between  $r_L$  and absorption are not changed by going over from the gaseous to the dissolved state, provided that the magnitudes for the appropriate state are consistently used. This is confirmed by existing experimental data. The anisotropy-activity factor observed with a solution must be multiplied by  $(n^2+2)/3n$  to reduce it to the gaseous state. In calculating  $f$  vals. from the intensity of absorption bands in solutions, allowance must be made for the factor  $K$ . R. C.

**Dielectric constants of strong electrolytes and the Debye-Falkenhagen theory.** M. JEZEWSKI (Physikal. Z., 1936, 37, 52—55).—New measurements of the dielectric consts. of strong electrolytes by a resonance method show that the Debye-Falkenhagen theory is in agreement with experiment for dil. solutions. At higher concns. and higher temp. the change of dielectric const. is  $<$  that given by the theory. A. J. M.

**Form and dielectric behaviour of thread-like molecules in solutions.** W. KUHN (Z. physikal. Chem., 1935, 175, 1—16).—The dipole moment of a zwitterion  $\propto \sqrt{Z}$ , where  $Z$  is the chain length, and

$r^2 \propto Z$ , where  $r^2$  is the mean square distance between the positive and negative charges on the ion.  $r^2$ , the mean square of the distance between the ends of the mol. taking account of the attraction between the two charges, increases slightly more rapidly than  $\propto Z$ , which agrees with the observation that  $dD/dc \propto Z$  ( $D$ —dielectric const.,  $c$ —concn.). Only when  $Z > 25$  does the difference between  $r^2$  and  $r^2$  fall below about 40%. The calc. orientation polarisation on applying a field to a solution containing zwitterions is the same whether the zwitterions are supposed to behave as rigid dipoles capable of rotating, but not of changing in length in the field, or whether the variation in the distance between the charges with the field strength is taken into account. The internal field in aq. solutions of  $\text{NH}_2$ -acids is much weaker than  $(4/3)P$  (cf. A., 1934, 959, 1291). R. C.

**Diffusion of compounds of high mol. wt. IV. Rod-like molecules.** M. TANIGUCHI and I. SAKURADA (J. Soc. Chem. Ind. Japan, 1935, 38, 728—730B; cf. A., 1935, 1072).—The diffusion consts. ( $D$ ) of squalene and fractions crystallised from solid paraffin have been determined in  $\text{C}_6\text{H}_{14}$  and  $\text{Et}_2\text{O}$ .  $D = \eta kT (\log l/d + 0.69)/2\pi l$ , where  $l$  and  $d$  are the mol. length and thickness,  $\eta$ —viscosity of the medium, and  $k$ —gas const. For squalene  $l=31.2$ ,  $d=5.3$  Å., and for the paraffin fractions  $l=29.2$ —39.7,  $d=4.0$  Å. These vals. are in good agreement with those deduced from X-ray measurements.

R. S. B.

**Spierer lens and colloidal structure.** W. SEIFRIZ (Ind. Eng. Chem., 1936, 28, 136—140).—A reply to criticism of the use of the lens (A., 1926, 931) in the study of colloidal structure. R. S. B.

**Preparation of colloid solutions by the silent electric discharge. IV.** S. MIYAMOTO (Kolloid-Z., 1936, 74, 32—35; cf. A., 1935, 932).—The prep. of hydrosols and alcossols of  $\text{Cu}_2\text{O}$  and  $\text{Cu}_2\text{S}$ , and also of hydrosols of Hg and  $\text{HgS}$  from corresponding salt solutions is described. The relative stability of the sols is indicated. E. S. H.

**Water-soluble colloidal lead.** A. F. GERASIMOV and B. M. KOZUIREV (Trans. Butlerov Inst. Chem. Tech. Kazan, 1934, No. 1, 119—125; cf. A., 1930, 1114).—The prep. of a substance containing 16.5% of Pb is described. The properties of a 1% colloidal Pb solution after dialysis are described.

CH. ABS. (e)

**Emulsification of mercury.** L. J. KREMNEV (J. Phys. Chem. U.S.S.R., 1934, 5, 1051—1061; cf. A., 1934, 729).—Suspensions of oxides and certain slightly sol. salts stabilise the Hg globules by forming protecting layers. Results obtained with oxides or hydroxides of Ca, Mg, Ba, Zn, Hg, Pb, Cu, Fe, and Si, and  $\text{Hg}_2\text{Cl}_2$ ,  $\text{HgI}_2$ ,  $\text{HgBr}_2$ ,  $\text{ZnCO}_3$ ,  $\text{PbSO}_4$ ,  $\text{BiONO}_3$ , and  $\text{HgS}$  in association with various electrolytes are described. Stabilisation is also produced by Prussian-blue, Congo-red, night-blue, benzopurpurin-4B, benzopurpurin-10B, and chrysophenin. In presence of oxidising or chlorinating agents,  $\text{HgO}$  or  $\text{Hg}_2\text{Cl}_2$  can act as an emulsifier for Hg.

CH. ABS. (e)

**Application of a simple air-driven spinning-top centrifuge to colloid-chemical problems.**

J. W. MCBAIN and R. F. STUEWER (Kolloid-Z., 1936, 74, 10—16).—Apparatus, technique, and applications are described, with some preliminary results on the sedimentation velocity of agar sols and swelling pressure of the gels. E. S. H.

**Effect of heat-treatment on hydrous chromic oxide sols.** G. H. AYRES (J. Amer. Chem. Soc., 1936, 58, 18—22).—The effect of heating the sols at temp. up to  $260^\circ$  is to decrease  $\eta$  in the lower temp. ranges, but to increase  $\eta$  at the higher temp. At  $250$ — $260^\circ$  conc. sols set to rigid gels and dil. sols are finally pptd. Heat-treatment reduces the stability of the sols towards flocculation by  $\text{K}_2\text{SO}_4$ . E. S. H.

**Electrolytic double layer.** E. J. W. VERWEY (Wis. nat. Tijds., 1934, 7, 89—100; Chem. Zentr., 1935, i, 3640).—The formation of a double layer with AgI sols is discussed. H. J. E.

**Viscosity relationships in emulsions containing milk fat.** A. LEVITON and A. LEIGHTON (J. Physical Chem., 1936, 40, 71—80).—The viscosity  $\eta$  of emulsions containing milk fat does not vary, within the limits of experimental error, with variations in the degree of dispersion of the fat phase, provided that fat clusters enclosing a portion of the continuous medium are not formed. Such formation causes a rise in  $\eta$ . An empirical expression for the relation between  $\eta$  and the fat content of these emulsions has been found. For low concns. of fat it reduces to Taylor's equation (A., 1932, 1195). The apparent vol. of the continuous medium associated with the fat clusters per unit vol. of dispersed fat represents the clumping index of cream and ice-cream mixes. It is determined from  $\eta$  vals. of the mix and the continuous medium. M. S. B.

**Relation between absorption and scattering of light in white sols.** B. TEZAK (Kolloid-Z., 1936, 74, 16—22).—Determinations of absorption and scattering of light in different spectral regions by sols of colophony and cellulose acetate of different concn. are in accordance with the Lambert-Beer law. The influence of  $\lambda$ , particle radius, and polydispersity is discussed. E. S. H.

**Dispersion of the Kerr effect of certain colloidal solutions.** Time of relaxation of the electrokinetic potential. J. ERRERA, J. T. G. OVERBEEK, and H. SACK (J. Chim. phys., 1935, 32, 681—704; cf. A., 1929, 135).—The electrical birefringence of colloidal solutions of  $\text{V}_2\text{O}_5$ , benzopurpurin (I), polystyrene (II), and  $p$ -azoxyanisole (III) has been measured at frequencies  $10^3$ — $6 \times 10^7$  cycles per sec. The birefringence of  $\text{V}_2\text{O}_5$  sols increases with increasing field towards a saturation val., and it also increases with increasing concn. and age. The dispersion suggests that there are two components, one positive and decreasing rapidly at frequencies  $>10^6$  and the other negative and decreasing at frequencies  $>10^7$ . The dispersion of the dielectric const. ( $\epsilon$ ) of these sols is confirmed and the negative part of the birefringence is attributed to high vals. of  $\epsilon$ . The birefringence of (I) is negative and diminishes rapidly at frequencies  $>10^6$ , whilst that of (III) is positive and accompanied by marked dichroism. No bire-

fringence could be detected with (II). The dispersions at  $>10^6$  cycles per sec. can be explained in terms of the time of relaxation of the electro-kinetic potential.

J W S.

**Maxwell effect in colloids.** A. M. TAYLOR (Trans. Faraday Soc., 1936, 32, 307—310).—Methods are suggested for discriminating between theories of streaming double refraction which assume on the one hand optical anisotropy of the particles and on the other hand the production of elastic strain in particles normally isotropic.

F L U

**Constitution of hydrous oxide sols from X-ray diffraction studies.** H. B. WEISER and W. G. MILLIGAN (J. Physical Chem., 1936, 40, 1—7).—X-Ray diffraction photographs of moist  $\text{Al}_2\text{O}_3$ ,  $\text{In}_2\text{O}_3$  gels prepared from the hydrous  $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$  give the patterns for  $\gamma\text{-Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$ ,  $\text{SnO}_2$ , and  $\text{In}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ , respectively. In sols containing chloride this is not present as basic salt, but is adsorbed.

M S B

**Constitution of hydrous oxide gels and sols.** H. WEISER and W. O. MILLIGAN (Trans. Faraday Soc., 1936, 32, 358—374).—A review of evidence leads to the conclusion that gelatinous ppts. of oxides consist of agglomerates of minute crystals of oxide or hydroxide which hold large amounts of  $\text{H}_2\text{O}$  by adsorption and capillary forces. In hydrous oxide sols containing chloride the latter is adsorbed, not bound in the form of basic salts or Werner complexes.

**Colloid-chemical processes at high temperatures.** S. I. DJATSCHKOVSKI (Kolloid-Z., 1936, 74, 51—57).—The effect of heating several hydrosols at high temp. in an autoclave has been investigated. Typical hydrophobic sols undergo coagulation; hydrophilic sols undergo complex changes, involving loss of electrolyte and desolvation.  $\text{Fe}(\text{OH})_3$  is resolvated at the highest temp. used.  $\text{V}_2\text{O}_5$  passes into a mol. form, leading to crystallisation of  $\text{HVO}_3$ .

E. S. H.

**Acclimatisation phenomenon in colloid-chemical processes.** V. N. KRESTINSKAJA (Kolloid-Z., 1936, 74, 45—51).—Published work is discussed.

E. S. H.

**Reaction of organic anions with basic thorium chloride hydrosols. Reversal of charge with salts of the hydroxy-acids and with nitric acid.** A. W. THOMAS and C. B. KREMER (J. Amer. Chem. Soc., 1935, 57, 2538—2541).—Hydroxy-org. anions reverse the charge of the sol, producing anionothorate micelles. Negative sols are also produced by peptising  $\text{ThO}_2 \cdot x\text{H}_2\text{O}$  with K salts of the above anions. Conc.  $\text{HNO}_3$  also reverses the charge of the positive sols. The order of deolation of basic  $\text{TiCl}_4$  sols and subsequent formation of crystalloid solutions with conc. inorg. acids is  $\text{H}_2\text{SO}_4 > \text{HCl} > \text{HNO}_3$ .

E. S. H.

**Ageing and reactivation *in vitro*.** I. Ageing of gum arabic. D. KOTSOVSKY (Kolloid-Z., 1936, 74, 88—90).—Gum arabic sols age at a rate which is inversely  $\propto$  to the vol. of solution. The surface tension-time curves show irregular, periodic variations, the amplitude of which is greater in dil. than in conc.

solutions. The shape of the curve, but not the general rate, is influenced by addition of electrolytes.

E S H

**Heat of imbibition of cellulose in water and in certain technical organic solvents at 25°.** K. P. MISCHTSCHENKO and M. Z. PRONINA (J. Appl. Chem. Russ., 1935, 8, 1164—1169).—The heat of imbibition of cellulose has been measured in an ice calorimeter on  $\text{H}_2\text{O}$ ,  $\text{HCO}_2\text{H}$ ,  $\text{MeOH}$ , and triacetin. Vaseline oil gives no heat effect, whilst the rate of evolution of heat in  $(\text{CH}_2\text{OH})_2$  and glycerol is too slow to permit measurement.

R T

**Interaction of cellulose esters with solvents.** A. I. OKATOV and Z. I. EMMANUILOVA (J. Appl. Chem. Russ., 1935, 8, 1248—1264).—When  $\text{SiO}$  gel is immersed in  $\text{H}_2\text{O}$  or  $\text{C}_6\text{H}_6$ , heat is evolved in two stages which correspond with wetting of the surfaces and with swelling of the gel. When cellulose nitrate is placed in  $\text{EtOH-Et}_2\text{O}$ , the greatest heat effect is obtained for equimol. mixtures, which have also the greatest negative heat of mixing; the evolution of heat in this case involves a third factor, viz. disruption of aggregates to yield sols. Imbibition proceeds most rapidly at low temp. and high pressures, whence it follows that the most homogeneous films would be obtained by cold-pressing the partly solvated product.

P

**Dependence of the swelling power of potato starch in warm water on the kind and amount of cations contained therein.** E. WIEGEL (Kolloid-Z., 1936, 74, 58—66).—The effect of acid treatment on the viscosity ( $\eta$ ) of starch sols has been investigated. After neutralisation with alkalis the sol has relatively greater initial  $\eta$  and a lower end  $\eta$ . Alkaline-earth cations cause a relatively lower initial  $\eta$ , but scarcely change the end val.; the sols are more turbid and less sensitive to electrolytes than those containing alkali ions. The practical significance of the results is discussed.

E. S. H.

**Relation between the chemical and colloidal structure of proteins.** A. FODOR and S. KUK (Kolloid-Z., 1936, 74, 66—87).—Results obtained by non-hydrolytic degradation of gelatin and casein by glycerol at 930—150° are further discussed (cf. A. 1933, 730).

E. S. H.

**Laws of motion of thixotropic plastic liquids.** M. BUNIN (J. Phys. Chem. U.S.S.R., 1934, 5, 996—1003).—A discussion.

CH. ABS. (e)

**Lyophilic colloids. XXVI. Coacervation. III. Complex coacervation of the system gum arabic-gelatin.** II. H. G. B. DE JONG (Kolloid-Beih., 1936, 43, 213—271; cf. A., 1935, 821).—The composition of the two layers formed by mixing aq. gum arabic and gelatin sols has been investigated. Under optimal conditions of coacervation the coacervate contains the components in the same ratio as in the whole system for a series of isohydric mixtures. The  $\text{H}_2\text{O}$  content of such a coacervate is at a min. between  $p_H$  3.3 and 3.5. Addition of a desolvating non-electrolyte (e.g.,  $\text{EtOH}$ ) increases the colloid content of the coacervate, but addition of neutral salts decreases it. The coacervate can take up excess of one of the components. The aq. layer also con-

tains gum arabic and gelatin; the conditions determining the amount of these components are discussed.

E. S. H.

**Silicic acid gels. VI. Influence of temperature and acid on the time of set.** C. B. HURD (J. Physical Chem., 1936, 40, 21—26).—The times of set of silicic acid gels made by mixing aq. Na silicate with aq. AcOH, tartaric, citric, or succinic acids of varying concn. have been determined at 25.1°, 38.4°, and 53.0°. The relation between log (time of set) and  $1/T^\circ$  abs. is shown to be linear and heats of activation have been deduced. The average vals. for the four acids are 17,140, 17,530, 16,940, and 17,190 g.-cal., respectively (cf. A., 1932, 1202).

M. S. B.

**Diffusion coefficient and apparent radius of the cupric ion in silica gels.** W. G. EVERSOLE and E. W. DOUGHTY (J. Physical Chem., 1936, 40, 55—60; cf. A., 1935, 702).—The rate of diffusion of  $\text{CuCl}_2$  into  $\text{SiO}_2$  gels has been determined by a photometric method. The most probable val. of the diffusion coeff. of  $\text{Cu}^{++}$  in  $\text{H}_2\text{O}$  is  $4.6 \times 10^{-6}$  sq. cm. per sec. The effective radius of hydrated  $\text{Cu}^{++}$  appears to be approx.  $5.2 \times 10^{-8}$  cm.

M. S. B.

**Influence of neutral salts on the optical rotation of gelatin. III. Effect of the halides of lithium, sodium, rubidium, and caesium. IV. Rotatory dispersion of gelatin in sodium iodide solutions.** D. C. CARPENTER and F. E. LOVELACE (J. Amer. Chem. Soc., 1935, 57, 2337—2342, 2342—2346).—III. The  $[\alpha]_D$  at 0.5° and 40° of a 0.7% solution of gelatin (calfskin) (I) at  $p_H$  6—7 is lowered (more marked at 0.5°) by the halides in the order  $\text{I} > \text{Br} > \text{Cl}$ ; when the concn. of added salt is fairly high the cation exerts a minor lowering effect, viz.,  $\text{Li} > \text{Cs} > \text{Rb} > \text{Na}$ . For the alkali gelatinates in absence of added salt the magnitude of  $[\alpha]_D$  is in the order  $\text{K} > \text{Rb} > \text{Cs} > \text{Na} > \text{Li}$ .

IV. The  $[\alpha]_D$  of solutions of (I) (0.7704 g. per 100 solution) containing NaI have been measured at 0.5° and 40° for 5 wave-lengths. The rotatory dispersion, which obeys a single-term Drude equation, is governed by an absorption band at 2200 Å., in which region (I) has a high absorption. The "gel"  $\rightarrow$  "sol" transformation is considered to be a process of dissociation or association of the mol. of (I). Application of Lucas' method (A., 1930, 1095) of analysis to the data shows that only two optically active species exist in solutions or gels of (I).

H. B.

**Myoglobin. I. Solubility in ammonium sulphate solutions.**—See this vol., 359.

**Colloid chemistry of edestin. III. Capillary-electric effects produced during the peptisation of edestin by solutions of electrolytes.** K. HOLWERDA (Biochem. Z., 1936, 283, 253—262; cf. this vol., 158).—The shifting of the zone of peptisation towards higher salt concns. on the acid side of the isoelectric point is a consequence of the auto-complex capacity of edestin (I), but diminution or removal of this does not suffice to cause peptisation and the solubility of (I) in neutral salt solutions does not depend on this capacity alone.

W. McC.

**Salting-out and peptisation of edestin by mixtures of two salt solutions.** K. HOLWERDA (Bio-

chem. Z., 1936, 283, 280—291; cf. Büchner *et al.*, A., 1931, 1125).—The effects of small amounts of NaCl, NaI, and NaCNS on the salting-out of edestin by  $\text{Na}_2\text{SO}_4$  are similar to those produced in the case of gelatin, there being no antagonistic effects, but KF has an antagonistic effect on peptisation by NaCl, adsorption of F' being then negative. The antagonism observed between NaCl and multivalent cations probably has another cause (effect of oppositely charged centres, auto-complex action).

W. McC.

**Plant colloids. XLII. Influence of crystalloids on the state of amyloses, with special reference to thread-forming power.** M. SAMEC [with P. BENKOVIČ] (Kolloid-Beih., 1936, 43, 272—286; cf. A., 1935, 165).—The viscosity of dil. amylose solutions is lowered by small amounts of electrolytes, but raised by larger amounts; the spontaneous coagulation by ageing is retarded by electrolytes or org. crystalloids. Conc. amylose solutions (6%) increase in consistency as the concn. of the added crystalloid is increased; at a certain stage the mixtures have good thread-forming properties.

E. S. H.

**Phase rule in colloid chemistry.** W. D. BANCROFT (J. Physical Chem., 1936, 40, 43—45). Theoretical.

M. S. B.

**Exchange reactions with deuterium. I. Deuterium and hydrogen chloride.** P. C. CROSS and P. R. LEIGHTON (J. Chem. Physics, 1936, 4, 28—30).—An apparatus for measuring exchange equilibria and rates of exchange between  $\text{D}_2$  and H-containing compounds is described. Data for the equilibria  $\text{H}_2 + 2\text{DCl} \rightleftharpoons \text{D}_2 + 2\text{HCl}$  and  $\text{H}_2 + \text{DCl} \rightleftharpoons \text{HD} + \text{HCl}$  have been obtained and are in satisfactory agreement with theoretical vals.

M. S. B.

**Thermal equilibrium of the cis-trans-isomerides of dichloroethylene at high temperatures.** W. MARONEY (J. Amer. Chem. Soc., 1935, 57, 239, 2398).—The investigations previously reported (A., 1934, 831) have been extended to 975°.

E. S. H.

**Present state of the problem of electrolytic solutions.** C. A. KRAUS (J. Chem. Educ., 1936, 12, 567—573).—At lower concns. the properties of electrolytes in solvents are satisfactorily accounted for by interaction between ions in accord with the Coulomb law of force. In solvents of high  $\epsilon$ , electrolytes are completely dissociated into ions and only long-range interactions need be considered, but when  $\epsilon$  is low, short-range interactions must be taken into account. As  $\epsilon$  falls, these interactions become of increasing importance and the formation of triple ions as well as ion pairs must be considered. In solvents of very small  $\epsilon$  more complex interactions, which occur at higher concns., lead to the formation of complex neutral, and probably charged aggregates. The present theory adequately accounts for the properties of electrolytic solutions at higher concns. Conductance data for various electrolytes in aq.  $\text{NH}_3$ , and  $\text{C}_2\text{H}_4\text{Cl}_2$ , the f.p. and the  $\epsilon$  of solutions of  $\text{C}_2\text{H}_6$ , are recorded and discussed.

**Statistical treatment of strong electrolytes.** S. LEVINE (Proc. Roy. Soc., 1935, A, 152, 559).—It is shown that Kramer's theory of s

electrolytes (A., 1927, 626) is valid if the ordinary Coulomb forces between the ions are assumed. The deviations from the inverse square law, due to saturation and hydration effects on the  $H_2O$  dipoles, and to the polarisation, van der Waals, and exchange forces between two typical ions are accounted for by means of a correction term in the expression for the energy of interaction. L. L. B.

**Transition cases in the distribution of ions.** R. M. FUOSS (J. Amer. Chem. Soc., 1935, 57, 2604—2607).—A crit. concn. exists, above which free and pair-associated ions become indistinguishable (cf. A., 1935, 488). At higher concns. the simple laws of dil. electrolyte solutions are no longer obeyed

E. S. H.

**Hydration of ions.** O. SCHMITZ-DUMONT (Z. anorg. Chem., 1935, 226, 33—45).—Theoretical. Brntzinger's method (A., 1935, 579, 582, 824) based on the coeff. of dialysis does not enable electrostatically bound  $H_2O$  to be distinguished from that present as an aquo-complex.

F. L. U.

**Sourness of acids.** R. M. BEATTY and L. H. CRAGG (J. Amer. Chem. Soc., 1935, 57, 2347—2351).—Sourness is defined in terms of the normality of aq. HCl of equal sourness. The sourness of unbuffered solutions of some org. acids is given by  $x/K$ , where  $x$  is the vol. of a  $PO_4^{'''}$  buffer required to bring a unit vol. of the acid to  $p_H$  4.4, and  $K$  is a const. characteristic of the buffer used.

E. S. H.

**Monoalkyl phosphites and their hydrolysis.**—See this vol., 312.

**Effect of temperature on the ionisation constants of some dibasic acids.** I. JONES and F. G. COOPER (J.C.S., 1936, 133—137).—When the distance ( $r$ ) between the ionising centres is  $> 4.0$  Å., corrections for anisotropy and compressibility may be ignored without appreciable error, and it has been possible to determine  $r$  for many symmetrical dibasic acids at various temp. The  $p_H$  changes during the neutralisation of *cis*-caronic acid (I) show no marked displacement with temp. change, and with phenolphthalein, contrary to the observation of Baeyer, there is no indication of monobasicity at room temp., although temp. markedly affects the inflexion point at the second neutralisation. The second ionisation const. of (I) is  $0.49 \times 10^{-8}$ , and the disappearance of the ion at higher temp. is attributed to increased hydrolysis of the salt. To obtain a sharp end-point in the titration of such weak acids, titrations should be made at low temp. For a const. val. of  $r$ , the  $K_1/K_2$  ratio or the first and second ionisation consts.  $K_1/K_2$  increases with temp. for all acids studied, except those having *cis*-structures, and possible causes of this are discussed. Values of  $K_1 \times 10^5$  for (I) and *trans*-caronic acid are 459 and 15.2 respect. Caronic acid is compared with other dicarboxylic acids.

E. S. H.

**Effect of certain sugar alcohols and their anhydrides on the dissociation of boric acid.** J. C. KRANTZ, jun., (Miss) M. OAKLEY, and C. J. CARR (J. Physical Chem., 1936, 40, 151—154).—The two polyhydric alcohols, mannitol and dulcitol, have an effect on the titration curve of  $H_3BO_3$  much  $>$  that

of the anhydrides mannitan, mannide, and dulcitan. *iso*Mannide has no effect.

M. S. B.

**Hydrogen-ion dissociation curve of the crystalline albumin of the hen's egg.**—See this vol., 360.

**Physico-chemical properties of mercurous perchlorate solutions.** E. NEWBURY (Electrochem. Soc. Preprint, 1936, 69, 57—73).—The prep. and purification of  $Hg_2(ClO_4)_2$  is described. The existence of the tetrahydrate is confirmed and this is shown to be stable below  $36^\circ$ . From  $36^\circ$  to  $>100^\circ$  the stable hydrate is  $2H_2O$ . The transition point is lowered in strongly acid solution. Hydrolysis occurs in three stages the products being  $Hg_2O, Hg_2(ClO_4)_2$  (I),  $Hg_2(OH) \cdot ClO_4$  (II), and  $HgO$ , respectively. The degree of hydrolysis is 2.5% in 0.1M solution. In more conc. solution the hydrolysis is  $>$  anticipated because (I) is a weaker base than (II). The degree of ionisation ( $\alpha$ ) of the salt appears to increase with the concn. Conductivity data suggest that  $\alpha=128\%$  in the saturated solution (3.93M) at  $25^\circ$ . The view is expressed that in dil. solution the basic salt formed by hydrolysis is non-ionised and that, in very conc. solutions,  $Hg_2^{++}$  is dissociated into  $2Hg^+$  by the action of the negatively charged ions present in large concn.  $Hg^+$  perchlorate may be used for a Hg coulometer, for sp. gr. determinations in mineralogy, for cleaning Hg, for the prep. of pure  $Hg_2Cl_2$  or  $Hg_2SO_4$ , and as a reagent for halogens,  $SO_4^{--}$ ,  $PO_4^{--}$ ,  $AsO_4^{--}$ , and  $CrO_4^{--}$ .

M. S. B.

**Equilibria in solutions of tri-ionic electrolytes.** K. JABECZYNSKI and R. LEGAT (Rocz. Chem., 1935, 15, 351—359).—Cryoscopic and conductivity data are applied in the estimation of the equilibria const. for the ionisation of Ba, Sr, Ca, and Mg chlorides in accordance with the general formula  $MCl_3 \rightleftharpoons M^{++} + 2Cl^-$ .

R. T.

**Carbamate equilibrium.** I. Equilibrium of amino-acids, carbon dioxide, and carbamates in aqueous solution; with a note on the Ferguson-Roughton carbamate method. W. C. STADIE and H. O'BRIEN (J. Biol. Chem., 1936, 112, 723—758).—It is the amphiprotic  $COO^- \cdot R \cdot NH_2$  and not the zwitterion  $COO^- \cdot R \cdot NH_3^+$  of  $NH_2$ -acids which forms carbamates with  $CO_2$ . The ionisation of these, which behave as dibasic salts at  $p_H > 7$ , is discussed. Mass-action equations for the carbamate equilibrium of  $NH_2$ -acids and  $CO_2$  in aq. solution are given, together with const. calc. under various conditions. By the use of carbonic anhydrase, the Ferguson-Roughton carbamate method can be used when much free  $CO_2$  is present.

J. N. A.

**Activity coefficient of ions.** (Mlle.) M. QUINTIN (Compt. rend., 1936, 202, 123—125; cf. A., 1935, 826).—The e.m.f. of the cells Cd (amalgam, two phases) |  $CdCl_2(m)$  | KCl sat. |  $KCl 0.1N$  |  $Hg_2Cl_2$  | Hg and  $Ag | AgCl | CdCl_2(m) | KCl sat. | KCl 0.1N$  |  $Hg_2Cl_2$  | Hg have been measured at  $25^\circ$  for  $m=0.001-0.1$ . From the data the calc. radii (Debye  $a$ ) of  $Cd^{++}$  and  $Cl^-$  are 5.4 and 2 Å., respectively. The former val. agrees with the  $6 \pm 1$  Å. calc. from data using  $CdSO_4$  (A. 1927, 729).

T. G. P.

**Activity coefficients of lead chloride in aqueous solutions of barium nitrate.** H. D. CROCKFORD

and H. O. FARIL, jun. (J. Amer. Chem. Soc., 1936, 58, 87-89).—Activity coeffs. and the  $a$  parameter have been calc. from e.m.f. determinations of the cell  $\text{Pb Hg (2-phase)} | \text{PbCl}_2 (m_1) | \text{Ba(NO}_3)_2 (m_2) | \text{AgCl-Ag}$ .  
E. S. H.

Activity coefficients of sulphuric acid in anhydrous ethyl alcohol from electromotive force data. A. W. SCHOLL, A. W. HUTCHISON, and G. C. CHANDLER (J. Amer. Chem. Soc., 1935, 57, 2542-2544).—The data have been obtained from e.m.f. measurements of the cell  $\text{H}_2 | \text{H}_2\text{SO}_4, \text{Hg}_2\text{SO}_4(s) | \text{Hg}$ .

System stannic chloride-hydrogen chloride. A. CURÉTHEN and G. VARGA (Compt. rend., 1935, 201, 1491-1493).—Thermal data show the formation of  $\text{SnCl}_4 \cdot 5\text{HCl}$ , m.p.  $-94.7^\circ$ , and  $\text{SnCl}_4 \cdot 2\text{HCl}$ , m.p.  $85^\circ$ , and three eutectic points.  
T. G. P.

System antimony iodide sodium iodide-water. F. FRANÇOIS (Compt. rend., 1935, 201, 1489-1491).—Isotherms at 15, 35°, and 60 indicate the formation of  $\text{SbI}_3 \cdot 2\text{NaI} \cdot 8\text{H}_2\text{O}$  and  $\text{SbI}_3 \cdot \text{NaI} \cdot 6\text{H}_2\text{O}$ .  
T. G. P.

Thermal analysis of the systems iodine LiI, KI, RbI, or TlI. J. A. FIALKOV and G. A. KUZMENKO (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 127-139).—Polyiodides are not formed when the iodides are fused with I, indicating that the presence of a solvent is essential for their formation.  
R. T.

Purification and physical properties of organic compounds. X. F.p. diagram for the system acetanilide propionanilide. E. L. SKAT and L. F. ROWE (J. Amer. Chem. Soc., 1935, 57, 2437-2438; cf. A., 1935, 1077).—The Beckmann method is unsatisfactory. A static method shows that the system forms a compound with incongruent m.p.  
E. S. H.

Binary systems of *p*-dichlorobenzene with diphenyl, naphthalene, and triphenylmethane. R. E. MORRIS and W. A. COOK (J. Amer. Chem. Soc., 1935, 57, 2403-2406).—A simple eutectic is shown

in each system. Solubilities, eutectic temp., and compositions are approx. those calc. for ideal solutions.  
E. S. H.

Physical-chemical properties of the chlorohydrin and of the dichloride of  $\Delta^2$ -butene. I. N. BUSCHMAKIN, M. M. GOLIDMAN, and K. I. KUBTSHINSKAJA (Sintet. Kautschuk, 1935, 4, No. 1, 33-35).—Equilibrium data are recorded for the binary and ternary systems formed with  $\text{H}_2\text{O}$ .  
CH. ABS. (e)

Solid-liquid equilibria in ternary systems in which incongruently melting compounds are formed. III. K. HRYNAKOWSKI and M. SZMYT (Z. physikal. Chem., 1935, 175, 83-98).—The systems salicylic acid- $\text{CO}(\text{NH}_2)_2$ -urethane and  $\text{PhOH-CO}(\text{NH}_2)_2$ -urethane each exhibit one eutectic point and two peritectic points.  
R. C.

(A) Lower transition point of the mutual system  $\text{Na}_2\text{SO}_4\text{-NH}_4\text{HCO}_3\text{-H}_2\text{O}$ . (B) Mutual aqueous system  $\text{Na}_2\text{SO}_4\text{-NH}_4\text{HCO}_3\text{-H}_2\text{O}$  at  $-17^\circ$ . A. P. BELOPOLSKI and S. J. SCHUPIT (J. Appl. Chem. Russ., 1935, 8, 1126-1135, 1136-1142).—(A) The transition point, corresponding with the equilibrium  $2\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O} + 2\text{NH}_4\text{HCO}_3 \rightleftharpoons \text{Na}_2\text{SO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 4\text{H}_2\text{O} + 2\text{NaHCO}_3 + 16\text{H}_2\text{O}$ , is shown by solubility measurements to be at  $-17^\circ$ .  
(B) Equilibrium relations have been determined at  $-17^\circ$ . (I), which is unstable at  $< -16^\circ$ , can exist at lower temp. in presence of  $\text{NH}_4\text{HCO}_3$ .  
R. T.

Equilibria in the systems (A)  $\text{MgCO}_3\text{-Na}_2\text{CO}_3\text{-H}_2\text{O}$ , (B)  $\text{Na}_3\text{PO}_4\text{-NaCl-H}_2\text{O}$ . A. P. OBUCHOV (J. Appl. Chem. Russ., 1935, 8, 1143-1148, 1149-1151).—(A) [with E. I. GORDON]. The double salt  $\text{Na}_2\text{CO}_3 \cdot \text{MgCO}_3$  crystallises from an aq. solution of  $\text{Na}_2\text{CO}_3$  which has been saturated with  $\text{MgCO}_3$  at  $35^\circ$ .  
(B) [with M. N. MICHAILOVA]. Equilibrium data are recorded for the systems at 25 and  $105^\circ$ . The solubility of  $\text{Na}_3\text{PO}_4$  falls rapidly with increasing  $\text{NaCl}$ .  
R. T.

System cobalt chloride, ammonium chloride, ammonia, water. M. CHATELET (Compt. rend., 1936, 202, 216-217).—The formation of the ions  $[\text{CoNH}_3]$  and  $[\text{Co}(\text{NH}_3)_3]$  is said to have been detected by calorimetric measurements.  
T. G. P.

Determination of change of free energy in reactions of type  $A(s) + B(s) = AB(s)$  and application to dolomite problem. F. HALLA [with F. RITTER] (Z. physikal. Chem., 1935, 175, 63-81). A method for determining the change in free energy,  $\Delta F$ , in the formation of double compounds by solubility measurements is described. Application the formation of dolomite (I) from its solid components shows that under 1 atm. this occurs spontaneous above  $-34^\circ$  and  $\Delta F^\circ$  is  $590 \pm 50$  g.-cal. at 25 and  $740 - 30$  g.-cal. at  $38.8^\circ$ , and that  $\Delta H$  is  $-2840 \pm 300$  g.-cal. at  $25-32^\circ$ . For dolomitisation,  $2\text{CaCO}_3 + \Delta F = -190 \pm 50 + 1430 \log \frac{[\text{Ca}^+]}{[\text{Mg}^{++}]}$  g.-cal. at  $25^\circ$  and  $120 \pm 30 - 1365 \log \frac{[\text{Ca}^+]}{[\text{Mg}^{++}]}$  g.-cal. at  $38.8^\circ$ . The direction of this process is therefore determined almost entirely the ratio  $[\text{Ca}^+] : [\text{Mg}^{++}]$  in the solution, and under the conditions of temp. and concn. prevailing in t dolomitisation should occur spontaneously.

following solubility products have been obtained:  $\text{MgCO}_3$ ,  $1.8 \times 10^{-8}$  at  $25^\circ$ ,  $1.6 \times 10^{-8}$  at  $38.8^\circ$ ;  $\text{CaCO}_3$ ,  $3.83 \times 10^{-9}$  at  $38.8^\circ$ ; (I),  $3 \times 10^{-17}$  at  $25^\circ$ ,  $1.8 \times 10^{-17}$  at  $38.8^\circ$ . Lewis and Randall's sp. ionic activity coeffs. have been successfully used to calculate solubility product from a single solubility. The variation in solubility of  $\text{MgCO}_3 \cdot 3\text{H}_2\text{O}$  with temp is given by  $m = 0.4344 - 0.0111t + 0.004953t^2$ . Heats of dissolution in  $2N\text{-HCl}$  have been measured.

R. C.

Heats of dissolution of ferric chloride in water and in aqueous hydrochloric acid. W. KANGRO and R. FLÜGGE (Z. physikal. Chem., 1935, 175, 187—194).—Differential and integral heats of dissolution and dilution at  $20^\circ$  have been determined. The heat of dissolution in aq.  $\text{HCl}$  falls rapidly with increasing  $[\text{HCl}]$ . When  $[\text{HCl}]$  is  $\approx 10\%$  the decrease is quantitatively accounted for by fall in the activity of the  $\text{H}_2\text{O}$ , but at higher concns. there are discrepancies, which are probably connected with association. Sp. heats of aq.  $\text{FeCl}_3$  solutions have been determined at  $20^\circ$ .

R. C.

Hydrazine. Heats of dissolution of hydrazonium salts at  $25^\circ$ . II. E. C. GILBERT and V. C. BUSHNELL (J. Amer. Chem. Soc., 1935, 57, 2611—2612, cf. A., 1935, 303).—Data for hydrazonium dibromide (anhyd. and hydrated) and sulphate are recorded. Partial mol. heats of dissolution of solute and solvent ( $\text{H}_2\text{O}$ ) have been calc. for the bromide. The heat capacity of aq. hydrazonium sulphate at  $25^\circ$  has been determined.

E. S. H.

Thermochemistry of azoimide. P. GÜNTHER, R. MEYER, and F. MÜLLER-SKJOLD (Z. physikal. Chem., 1935, 175, 154—169).— $\text{HN}_3$  is conveniently prepared by heating  $\text{NaN}_3$  with stearic acid in vac. and condensing at not below  $-75^\circ$ . When the gas explodes under reduced pressure very little  $\text{NH}_3$  is formed. The heat of formation of the gas at const. is  $-70.9 \pm 0.5$  kg.-cal. per mol. The v.p. of the liquid has been determined from near the triple point to near the b.p. ( $35.7^\circ$ ). At  $12.4^\circ$  the mol. heat of evaporation is  $-7.3 \pm 0.1$  kg.-cal. The total heat of dissolution of the gas to give a  $0.16N$  solution is  $3.1 \pm 0.1$  kg.-cal. per mol. These data confirm the recorded heat of formation (Roth and Müller, A., 1929, 133). For the liquid at  $0-21^\circ$   $d = 1.126/(1 + 0.0013t)$ .

R. C.

Heat of combustion of isobutane. F. D. ROSSINI (J. Res. Nat. Bur. Stand., 1935, 15, 357—361).—The heat of combustion of  $\text{iso-C}_4\text{H}_{10}$  in  $\text{O}_2$  to form  $\text{CO}_2$  (gas) and  $\text{H}_2\text{O}$  (liquid) at  $25^\circ/1$  atm. is  $686.31 \pm 0.13$  kg.-cal. per mol., hence the heat of formation of  $\text{iso-C}_4\text{H}_{10}$  at  $25^\circ$  is  $32.2 \pm 0.43$  and the heat of conversion of the  $n$ - into the  $\text{iso}$ -form is  $1.63 \pm 0.15$  kg.-cal. per mol.

A. R. P.

Direct carboxylation of carbon compounds. III. Free energy of benzoic acid at  $522^\circ$  abs. W. D. BONNER and C. R. KINNEY (J. Amer. Chem. Soc., 1935, 57, 2402—2403; cf. A., 1933, 1159).—Calculation from published data gives  $\Delta F_{522}^\circ = -36.491$  g.-cal.

E. S. H.

Heats of organic reactions. III. Hydrogenation of some higher olefines. IV. Hydrogen-

ation of dienes and of benzene. G. B. KISTIAKOWSKY, J. R. RUHOFF, H. A. SMITH, and W. E. VAUGHAN (J. Amer. Chem. Soc., 1936, 58, 137—145, 146—153; cf. A., 1935, 825).—III. Heats of hydrogenation (in g.-cal. per mol.) are recorded for  $\Delta^2$ -heptene ( $-30,137 \pm 37$ ), *as*-methylethylethylene ( $-28,491 \pm 36$ ),  $\Delta^2$ -pentenes (*cis* and *trans*) ( $-27,954 \pm 28$ ),  $\text{CMePr}^2\text{CH}_2$  ( $-27,997 \pm 24$ ), cyclohexene ( $-28,592 \pm 10$ ),  $\text{CMe}_2\text{CHMe}$  ( $-26,920 \pm 10$ ), and  $\text{CMe}_2\text{CMe}_2$  ( $-26,633 \pm 19$ ). With increasing no. of substituent alkyl groups the heat of hydrogenation is progressively lowered, and the differential effect decreases with increasing no. of substituents. This effect is independent of the chain length of substituent *n*-alkyls, but branched groups have a greater influence.

IV. Heats of hydrogenation are given for allene +  $2\text{H}_2$  ( $-71,280 \pm 103$ ), *zy*-butadiene +  $2\text{H}_2$  ( $-57,067 \pm 28$ ),  $\alpha\delta$ -pentadiene +  $2\text{H}_2$  ( $-60,790 \pm 64$ ),  $\alpha\epsilon$ -hexadiene +  $2\text{H}_2$  ( $-60,525 \pm 43$ ),  $\Delta^{1,3}$ -cyclohexadiene +  $2\text{H}_2$  ( $-55,367 \pm 56$ ),  $\text{C}_6\text{H}_6 + 3\text{H}_2$  ( $-49,802 \pm 44$ ), cyclopentadiene +  $2\text{H}_2$  ( $-50,865 \pm 47$  g.-cal. per mol.). The data are discussed.

E. S. H.

Single linking energies. I. C-C linking in hexaphenylethane. H. E. BENT, G. R. CUTHBERTSON, M. DORFMAN, and R. E. LEARY. II. C-C linking in hexaphenylethane. H. E. BENT and G. R. CUTHBERTSON (J. Amer. Chem. Soc., 1936, 58, 170, 170 1/3).—I. Apparatus and technique for determining heats of reaction, especially for easily oxidised substances, are described. The v.p. of  $\Delta^2$ -heptene (I) has been determined from  $0^\circ$  to  $90^\circ$  and the heat of vaporisation calc. The heat of hydrogenation of (I), the heat of oxidation of  $(\text{CPh}_3)_2$ , and the heats of dissolution of the compounds involved in these reactions have been determined. The dissociation of  $(\text{CPh}_3)_2$  is due to weakening of the C-C linking and the stabilising effect of the resonance energy of  $\text{CPh}_3$ .

II. The heat of hydrogenation of  $(\text{CPh}_3)_2$  to form  $\text{CPh}_2$  is  $-40.5$  kg.-cal. for solids and  $-34.8$  kg.-cal. in  $\text{EtOAc}$  solution. The C-C linking is weaker than a normal linking by about 30 kg.-cal.

E. S. H.

Electrical conductivity of potassium chloride in certain mixed solvents. R. N. AGARWALA and D. C. MANDERVILLE (J. Indian Chem. Soc., 1935, 12, 699—705).—Viscosities and sp. conductivities of  $\text{H}_2\text{O}$ - $\text{MeOH}$ ,  $\text{H}_2\text{O}$ - $\text{EtOH}$ , and  $\text{H}_2\text{O}$ - $\text{COMe}_2$  mixtures have been determined together with equiv. conductivities  $\Lambda$  of the corresponding  $\text{HCl}$  solutions. The plot of  $\Lambda$  against  $[\text{KCl}]^{1/2}$  is linear for  $\text{H}_2\text{O}$  and  $\text{H}_2\text{O}$ - $\text{EtOH}$ , but regularly spaced max. and min. appear in the case of  $\text{H}_2\text{O}$ - $\text{MeOH}$  and  $\text{H}_2\text{O}$ - $\text{COMe}_2$  which bear no relation to the viscosity. An explanation involving "dipole association" chains of hydrated  $\text{COMe}_2$  etc. between the ions has been advanced.

R. S.

Electrical conductivity of solutions of electrolytes in methyl alcohol and acetone at high temperatures. P. C. BLOKKER (Rec. trav. chim., 1935, 54, 975—987).—The conductivities and sp. vols. of solutions of  $\text{LiCl}$ ,  $\text{LiBr}$ ,  $\text{LiI}$ ,  $\text{NaI}$ ,  $\text{KI}$ ,  $\text{CaI}_2$ , and  $(\text{Pr}^n[\text{CH}_2]_2)_4\text{NI}$  in  $\text{MeOH}$  and  $\text{COMe}_2$  have been measured at temp. up to  $218^\circ$  in special soft steel

bombs lined with Pt. The equiv. conductivities of these solutions show max. at temp. which are the lower the higher is the salt concn. It is shown that the max. are caused by decrease in the dielectric const. J. W. S.

Conductivity of calcium, strontium, and barium chlorides in anhydrous glycerol. J. SZFER and Z. GAJEWSKI (J. Chim. phys., 1935, 32, 705—714).—For 1—1/16 molar solutions and at 25—200°, the mol. conductivities of  $\text{CaCl}_2$ ,  $\text{SrCl}_2$ , and  $\text{BaCl}_2$  in anhyd. glycerol follow the Kohlrausch law  $-\Lambda_\infty = k'\sqrt{c}$ . The limiting mol. conductivity is  $3.67 \times 10^{-4}$  at 25° and 35° for all three salts. The mobilities of the cations increase with the mol. wt. The mol. conductivity increases exponentially with temp. at low temp., but above 130° increases linearly. J. W. S.

Electrochemical investigation of the ternary system  $\text{AlBr}_3$ - $\text{AsBr}_3$ -benzene. V. A. PLOTNIKOV and S. I. JAKUBSON (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 99—109).—Thermal analysis does not suggest compound formation, but freshly prepared solutions of the salts in  $\text{C}_6\text{H}_6$  conduct electricity, the conductivity falls rapidly to a const. val. after 23 days. The unstable compound  $\text{AlBr}_3\cdot\text{AsBr}_3$  is postulated. R. T.

Determination of transference numbers in dilute solutions from limiting ionic conductances. B. B. OWEN (J. Amer. Chem. Soc., 1935, 57, 2441).—Theoretical. E. S. H.

Ionic mobility. J. J. HERMANS (Z. Physik, 1935, 97, 681—689).—An equation is obtained for the effect of solvent dipoles on ionic mobility, and is solved for infinite dilution. Extension to finite dilution shows that the mobility  $\propto (\text{concn.})^{1/2}$ . A. B. D. C.

Electrical transport of an active deposit of radium in some organic liquids. Z. KLEMENSIEWICZ and K. PROJEKT (Acta Phys. Polon., 1933, 2, 409—415).—Solutions in  $\text{C}_6\text{H}_{14}$ ,  $\text{C}_6\text{H}_6$ ,  $\text{PhMe}$ ,  $\text{Et}_2\text{O}$ ,  $\text{COMe}_2$ , and  $\text{EtOH}$  have been examined in an electric field. The amount of Ra deposited on the electrodes decreases with rise in the dielectric const. and the viscosity of the liquid. CH. ABS. (e)

Absolute single potential of [calomel] electrode. K. HIROTA and T. MURATA (Bull. Chem. Soc. Japan, 1935, 10, 594—596).—The variation of p.d. with interfacial tension ( $\sigma$ ) of Hg has been studied by forcing the Hg upwards through a fine orifice immersed in  $\text{KNO}_3$ . The height of the jet varies approx. parabolically with the p.d. between jet and the N-calomel electrode, the min. corresponding with the position of max.  $\sigma$ . The mean val. for the N-calomel electrode is  $0.563 \pm 0.004$  volt at 20.6°, in agreement with vals. determined by the dropping Hg electrode. R. S. B.

Unknown property of the calomel half-cell and the determination of bromide-chloride mixtures. F. L. HAHN (J. Amer. Chem. Soc., 1935, 57, 2537).—The potential is strongly influenced by even very small amounts of  $\text{Br}^-$  in the KCl. The effect may be adapted to the determination of  $\text{Br}^-$ . E. S. H.

Mercury-mercuric oxide-saturated barium hydroxide and calcium hydroxide electrodes. G. J. SAMUELSON and D. J. BROWN (J. Amer. Chem. Soc., 1935, 57, 2711—2714).—The potential  $\text{Hg}|\text{HgO}(\text{s}), \text{Ba}(\text{OH})_2(\text{s})$  with reference to the  $\text{N-H}_2$  electrode is  $+0.1462 - 0.00060(t-25) \pm 0.0002$  volt; that of  $\text{Hg}|\text{HgO}(\text{s}), \text{Ca}(\text{OH})_2(\text{s})$  is  $+0.1923 + 0.00010 \times (t-25) \pm 0.0010$  volt. The ease of prep., constancy, reproducibility, and temp. coeff. of the electrodes have been studied. E. S. H.

Potential of the  $\text{Ag}(\text{s})|\text{Ag}_2\text{CrO}_4(\text{s})|\text{CrO}_4^{2-}$  electrode. J. Y. CANN and G. B. MUELLER (J. Amer. Chem. Soc., 1935, 57, 2525—2527).—E.m.f. measurements of the cell  $\text{Ag}(\text{s})|\text{Ag}_2\text{CrO}_4(\text{s})|\text{K}_2\text{CrO}_4(\text{aq.})|\text{KCl}(\text{aq.})|\text{AgCl}(\text{s})|\text{Ag}(\text{s})$  at 25° give  $-0.4463$  volt for the normal electrode potential of  $\text{Ag}(\text{s}), \text{Ag}_2\text{CrO}_4(\text{s}), \text{CrO}_4^{2-}$ ;  $\Delta F^\circ = 20,596$  g.-cal. E. S. H.

Volta effect of electrolytic solutions against water, and characteristics of acidity and basicity. (MILLER) S. VEIL (Compt. rend., 1936, 202, 121—123).—The electrometric potentials of the system  $\text{Pt-H}_2\text{O}$  (gelatin)-salt solution-Pt have been measured (A., 1935, 822). They depend on the concn. and nature of the salt, and are positive at  $p_{\text{H}} < 7$ . T. G. P.

Anomalous redox potentials of thiol-disulphide systems. J. W. H. LUGG (J. Indian Chem. Soc., 1935, 12, 706—711).—A theory involving the formation of an ionisable compound between RS and the electrode surface is suggested. R. S.

Oxidation-reduction potential of reductone. R. WURMSER and N. MAYER (Compt. rend., 1935, 201, 1366—1368; cf. A., 1934, 1072).—The oxidation-reduction potential of the system  $\text{OH}\cdot\text{CH}\cdot\text{C}(\text{OH})\cdot\text{CHO} \rightleftharpoons \text{CO}(\text{CHO})_2$  at 38° has been studied between  $p_{\text{H}}$  2 and 9.  $E_0$  at  $p_{\text{H}}$  0 is  $+0.28$  volt. T. G. P.

Oxidation-reduction potentials. II. Investigation of a coupled oxidation-reduction equilibrium by photo-electric measurement of light extinction. G. HOLST (Z. physikal. Chem., 1935, 175, 99—126; cf. A., 1934, 968).—The mol. extinction coeff.,  $\alpha$ , of methylene-blue (I) at 20° in 0.01N-HCl for  $\lambda = 546$  m $\mu$  increases with the dye concn.  $\text{PhN}\cdot\text{N}\cdot\text{SO}_3\text{K}$  (II), as a result of chemical interaction, depresses  $\alpha$ , whilst  $\text{NHPh}\cdot\text{NH}\cdot\text{SO}_3\text{K}$  (III) does not affect  $\alpha$ . The equilibrium  $(\text{I}) + (\text{III}) \rightleftharpoons \text{leucomethylene-blue (IV)} + (\text{II})$  is reversibly displaced by light. In 0.01N-HCl at 20° the equilibrium const. of the dark reaction is 8.2. Irradiation with blue light shifts the equilibrium towards larger concns. of (I), yellow light has the reverse effect. The  $\alpha$  of the mixture equilibrated in the dark increases during irradiation when the (I) concn. is small and falls when it is large, in either case it attains a limiting val. as irradiation continues. The p.d.,  $\Delta E$ , between the two reaction-reduction-oxidation systems at 20—40° is const. at 0.027 volt, corresponding with an equilibrium const. of 8.5 at 20°. This val. of  $\Delta E$  is  $\ll$  that recorded by Clark *et al.* (U.S. Hyg. Lab. Bull., 19, No. 151), a discrepancy which may be connected with the variation of potential with dye concn. The heat changes for  $(\text{II}) - \text{H}_2 \rightleftharpoons (\text{III})$  and  $(\text{I}) +$

$H_2 \rightleftharpoons$  (IV) (at  $p_H$  2.0) are 30.3 and 31.5 kg.-cal., respectively. R. C.

**Decomposition potential of solutions of bromides of metals in fused cadmium bromide.** V. A. IZBEKOV and G. J. ZACHARTSCHENKO (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 121—126).—The decomp. potentials of a no. of bromides in fused  $CdBr_2$  fall in the order  $Zn < Cd < Pb < Cu < Ag < Sn < Co < Ni < Bi$ ; the same order holds in fused  $AlBr_3$  or  $ZnBr_2$ . Any member of the above series is displaceable from  $CdBr_2$  solution by any of the preceding metals. R. T.

**Nature of the residual current [observed with the moving cathode].** I. ZLOTOWSKI (J. Chim. phys., 1935, 32, 750—753).—Polemical against Thon (A., 1935, 705). J. W. S.

**Nature of the residual current [observed with the moving cathode].** N. THON (J. Chim. phys., 1935, 32, 754).—Polemical against Zlotowski (cf. preceding abstract). J. W. S.

**Simultaneous cathodic and anodic direct-current polarisation of electrodes. II. Anodes of platinum, palladium, and gold.** P. S. TUTUNDZIC (Z. Elektrochem., 1936, 42, 21—27; cf. A., 1935, 1205).—The influence of superimposed d.c. of varying direction, p.d., and c.d. on the potential and decomp. potential of Pt, Pd, and Au anodes in  $2N-H_2SO_4$  at room temp. has been investigated. E. S. H.

**Oxide film on passive iron.** W. D. BANCROFT and J. D. PORTER (J. Physical Chem., 1936, 40, 3, 42).—The data of earlier investigators suggest that the oxide film on passive Fe (I) is  $FeO_3$ . This is confirmed by e.m.f. measurements in  $HNO_3$  ( $d$  1.20) on Fe made passive by adsorption from aq. K ferrate, by anodic polarisation in KOH, and by treatment with  $H_2O_2$ ,  $CrO_3$ , acid  $KMnO_4$ , or  $HNO_3$  ( $d$  1.35—1.47). The activation of (I) by conc.  $H_2O_2$  is due to decomp. of  $FeO_3$  by the heat evolved when the  $H_2O_2$  is catalytically decomposed at the surface of (I) and not by a reducing action of the  $H_2O_2$ . M. S. B.

**Electrometric studies of the precipitation of hydroxides. XIII. Reactions between silver nitrate and methylamine, mono-, di-, and triethylamine, ethylenediamine, aniline, and pyridine in solution.** H. T. S. BRITTON and W. G. WILLIAMS (J.C.S., 1936, 96—100; cf. A., 1935, 936).—The formation of complex Ag cations when various org. bases are added to  $AgNO_3$  has been studied. The extent to which bases ppt.  $Ag_2O$  and the amounts required for redissolution depend on the instability const. of the complex cation, the solubility product of the  $Ag_2O$ , and the dissociation const. of the base. Glass electrode titration curves at 18° of  $AgNO_3$  with solutions of the bases and electro-titration curves are given.  $(CH_3NH_2)_2$  forms the ion  $Ag[(CH_3NH_2)_2]^+$ . The modes of pptn. of  $Ag_2O$  by the org. bases and by  $NH_3$  are compared. Unlike  $NH_3$ , none of the bases causes the  $Ag_2O$  to redissolve when 2 mols. per mol. of  $AgNO_3$  have been added. From  $p_H$  vals. and e.m.f. data, the instability consts.  $K_1$  of  $Ag(NH_2Me)_2^+$  and  $Ag(NH_2Et)_2^+$  have been calc. The relatively large vals. of  $K_1$  for complex cations

from  $NH_2Ph$  and  $C_5H_5N$  show that these are relatively much less stable. E. E. A.

**Energy levels in electrochemistry** W. D. BANCROFT and J. E. MAGOFFIN (J. Amer. Chem. Soc., 1935, 57, 2561—2565).—The oxidation of dil. aq.  $H_2SO_3$  or  $Na_2SO_3$  is irreversible because, for reduction to occur, the system must pass through an energy level which is  $>$  the energy level for nascent H as obtained by electrolysis. The energy level decreases with decreasing concn., rising temp., and activating adsorption. The stabilities of  $NaClO_3$  and  $NaClO_4$  relatively to  $NaOCl$  are related to the intermediate energy levels which must be surmounted for reduction to occur. An irreversible reaction may give a definite c.m.f. E. S. H.

**Homogeneous unimolecular decomposition reactions of gases.** F. PATAT (Z. Elektrochem., 1936, 42, 85—98).—A review.

**Thermal interaction of deuterium and ammonia.** A. FARKAS (J.C.S., 1936, 26—35).—The kinetics of the homogeneous exchange reaction between  $NH_3$  and  $D_2$  have been investigated at 680—790 and at 25—400 mm. total pressure. The apparent energy of activation is 62 kg.-cal. and the reaction mechanism (i)  $D_2 \rightarrow 2D$ , (ii)  $NH_3 + D \rightarrow NH_2D + H$ , and (iii)  $H + D_2 \rightarrow HD + D$  accords with the data assuming that the rate-determining step (ii) is 30—40-fold slower than reaction (iii). The atoms responsible for the exchange reaction are produced by the thermal process (i), the dissociation  $NH_3 \rightarrow NH_2 + H$  being negligible. The lower speed of (ii) is due to the higher activation energy,  $11 \pm 1$  kg.-cal., required, and may be partly due to a lower steric factor. This result is in agreement with preliminary experiments on the Hg-sensitised photochemical exchange reaction between D and  $NH_3$ . J. G. A. G.

**Occurrence of radicals in the thermal decomposition of molecules and the reaction  $Me + H_2$ .** F. PATAT (Naturwiss., 1936, 24, 62—63).—The radical chain theory of Rice and Herzfeld (A., 1934, 369) can be tested by the  $p-H_2$  method of Geib and Harteck (A., 1931, 1252). In the case of the reactions (i)  $Me + H_2 \rightarrow CH_4 + H$  and (ii)  $H + \text{org. substance} \rightarrow H_2 + \text{org. radical}$ ,  $[H]/[Me] = k_1[H_2]/k_2[\text{org. substance}]$ , where  $k_1$  and  $k_2$  are the velocity coeffs. of (i) and (ii), respectively.  $[Me]$  can be determined from  $[H]$  if  $k_1/k_2$  is known. In the photochemical decomp. of  $MeCHO$  and azomethane in  $p-H_2$ , the difference in energy of activation for reactions (i) and (ii) is negligible. The similar reactions involved in the thermal decomp. of  $Me_2O$  etc. give the same result, showing that the radical concn. is  $< 1/1000$  of that expected if the decomp. followed the chain mechanism of Rice and Herzfeld. A. J. M.

**Rate of combination of bromine atoms.** K. HILFERDING and W. STEINER (Z. physikal. Chem., 1935, B, 30, 399—439).—The rate of homogeneous formation of  $HBr$  in light, all wall effects being absent, has been measured, and simultaneously the abs. amount of energy absorbed. For a total pressure of 258—1308 mm. the relation between velocity,  $v$ , and total pressure agrees with Herzfeld's reaction scheme (A., 1919, ii, 503), so that over this pressure

range  $[\text{Br}]$ , which is measured by  $v$ , is determined solely by the rate of energy absorption and the rate of recombination of Br atoms. From the reaction have therefore been deduced the rate of recombination of Br atoms in triple collision with various foreign mols. at  $490^\circ$  abs. A "yield factor,"  $f$ , can be separated from the velocity coeffs. of these reactions, which has the dimension time and measures the sp. energy transfer. From the vals. of  $f$  it appears that the no. of effective triple collisions is practically equal to the total no. of triple collisions calc. by the gas-kinetic theory. For the val. of  $f$  it is immaterial whether the mol. takes up energy solely as translational energy or also as rotational and vibrational energy. The variations in effectiveness between different mol. species are due to perturbation of the potential curve of the pair of atoms by the mol. At pressures  $< 258$  mm. the wall exerts an effect. For the transport to the wall of Br atoms formed by the radiation, convection rather than diffusion is responsible, except in a thin film immediately on the wall. R. C.

Zero-point energy of an activated complex and the reaction  $2\text{NO} + \text{O}_2 \rightarrow 2\text{NO}_2$ . O. K. RICE (J. Chem. Physics, 1936, 4, 53—59).—Theoretical. A reaction of which the rate is determined by a transitory activated complex in the formation of which classical degrees of freedom must be frozen out into vibrations must have, at all temp., a positive activation energy increasing with rise of temp. A negative activation energy means the formation of a more or less stable mol. complex. The theory has been applied to the oxidation of NO to  $\text{NO}_2$ . M. S. B.

Mechanism of reactions of nitric oxide with oxygen, chlorine, and bromine. I. M. BODENSTEIN. II. Rate of formation and equilibrium of nitrosyl bromide. W. KRAUSS (Z. physikal. Chem., 1936, 175, 294, 295—303).—I. Introductory.

II. At  $264$ — $290^\circ$  abs.  $K$  ( $p$  in atm.) for  $2\text{NO} + \text{Br}_2$  is given by  $\log K = -13,100/4.571T' + 8.025$ . The formation of  $\text{NOBr}$  at all temp. and concns. is a termol. reaction with temp. coeff.  $1.10$ ; reported deviations from the termol. law (A., 1918, ii, 162) disappear if the reverse reaction is allowed for.

Kinetics of the oxidation of gaseous hydrocarbons. III. Oxidation of acetylene. E. W. R. STEACIE and R. D. McDONALD (J. Chem. Physics, 1936, 4, 75—81).—Measurements have been made by a static method in an apparatus previously employed (A., 1935, 172). The rate of reaction is variable and depends on the condition of the surface of the reaction vessel. It is approx. expressed by  $-(d/dt)[\text{C}_2\text{H}_2] = k[\text{C}_2\text{H}_2]^{3/2}/[\text{O}_2]^{0.1}$  if  $\text{O}_2$  is in excess. The order diminishes with increase of surface and may fall to  $1.4$  in a packed vessel. In an empty vessel the ratio  $\text{CO}/\text{CO}_2$  is independent of pressure, but it falls in a packed bulb and still further decreases with diminishing pressure. The apparent heat of activation is approx.  $35,000$  g.-cal. Addition of glyoxal causes no change in velocity, but  $\text{CH}_2\text{O}$  decreases it. The oxidation is apparently a chain reaction, the chains being initiated at the walls but not appreciably destroyed there. It is possible that the chain carrier is some

product that precedes glyoxal in the oxidation process. A reaction scheme is suggested. M. S. B.

Explosion waves and shock waves. III. Initiation of detonation in mixtures of ethylene and oxygen and of carbon monoxide and oxygen. W. PAYMAN and H. TITMAN (Proc. Roy. Soc., 1935, A, 152, 418—445; cf. A., 1928, 1099).—The inflammation of mixtures of  $\text{C}_2\text{H}_4$  and  $\text{O}_2$ , which detonate with ease, and of  $\text{CO}$  and  $\text{O}_2$ , which detonate with comparative difficulty, has been studied with a wave-speed camera. The speed of the flame in a tube before shock waves of appreciable intensity are produced depends on the fundamental speed of propagation of flame by the transfer of heat, and on the motion of the gas in which the flame is moving. Detonation may be set up ahead of or within the flame front, due to waves travelling in front of or from behind the flame, to the collision or overtaking of wave and flame or wave and wave, or to the collision of a wave with an obstruction or the closed end of the tube. L. L. B.

Combustion of hydrocarbons. I. Influence of molecular structure on hydrocarbon combustion. II. Absorption spectra and chemical properties of intermediates. A. R. UBBELOHDE (Proc. Roy. Soc., 1935, A, 152, 354—378, 378—402).—I. Theoretical. A review is made of methods which have been adopted to investigate the combustion of hydrocarbons. The chemical identification of intermediates of oxidation, reaction kinetics, chemiluminescence and emission spectra, the induction period and wall effects, the action of positive and negative catalysts, and the behaviour of isomerides and of substituted hydrocarbons are discussed. The probable importance of vibrational energy, particularly at low temp., is verified, using simple mol. models, and a mechanism for the combustion of the longer-chain hydrocarbons is suggested. This involves a mechanism of chain-branching which accounts for special phenomena observed in the low-temp. region of combustion. Evidence in support of this is obtained from the oxidation of hydrocarbon mols. sufficiently long to permit ring-closure.

II. A study has been made of all the compounds with characteristic absorption spectra which might arise in slow combustion, and of the influence of certain catalysts, such as  $\text{NO}_2$ , on the slow combustion of hydrocarbons. The absorption spectra and slow combustion of ring compounds including one O atom have been investigated in an attempt to discover the origin of the band X arising in the slow combustion of the higher hydrocarbons. Since this first appears for  $\text{C}_4\text{H}_{10}$ , it would seem to depend on ring formation of some kind. The conclusion is reached that the formation of O ring compounds is of importance in elucidating the oxidation mechanism of the higher paraffins at low temp. It is suggested that the formation of saturated O rings, such as methyltetrahydrofuran, corresponds with an internal oxidation by the energy-rich peroxide,  $\text{Me}[\text{CH}_2]_4\text{OOH} \rightarrow \text{CHMe} < + \text{H}_2\text{O}$ , and that the formation of unsaturated O rings occurs when a similar process

takes place with an energy-rich peroxide radical,  $\text{Me}[\text{CH}_2]_4\text{O}_2 \rightarrow \text{OH} \cdot \text{CH} \left\langle \begin{array}{c} \text{CH}_2 \cdot \text{CH}_2 \\ \text{O} - \text{CH} \end{array} \right\rangle \text{CH}_2 + \text{H} \cdot$ . These two compounds are the only ones the presence of which has been definitely indicated, but other modes of ring-closure are not excluded. The formation of peroxides which combine the properties of an olefine and an alkoxy-peroxide is probably due to the peroxidation of unsaturated O ring compounds, since the vinyl ether peroxides which would be formed have the required behaviour. The formation of a substance X with intense absorption band is probably due to the decomp. of a peroxide first formed. Its structure may resemble that of ascorbic acid. L. L. B.

**Thermal decomposition of silane.** T. R. HOGNESS, T. L. WILSON, and W. C. JOHNSON (J. Amer. Chem. Soc., 1936, 58, 108—112).—Determinations at 380—490° over a considerable pressure range show the reaction to be of the first order. The  $\text{H}_2$  produced inhibits the decomp.; this does not appear to be due to adsorption of  $\text{H}_2$  by Si, and there is no evidence of reaction between Si and  $\text{H}_2$  to form  $\text{SiH}_4$ . The mechanism of decomp. is discussed. E. S. H.

**Thermal decomposition of *tert.*-butyl and *tert.*-amyl chlorides, gaseous homogeneous unimolecular reactions.** D. BREARLEY, G. B. KISTIAKOWSKY, and C. H. STAUFFER (J. Amer. Chem. Soc., 1936, 58, 43—47).—The reactions have been investigated at 543—645° abs. The activation energies are 45,000±1900 and 46,200±700 g.-cal., respectively; the rate expressions are  $k=1.9 \times 10^{14} e^{-46,000/RT}$  sec.<sup>-1</sup> and  $k=4.5 \times 10^{14} e^{-46,000/RT}$  sec.<sup>-1</sup> if the activation energies are regarded as identical. The data are compared with those for the corresponding alcohols. E. S. H.

**Thermal decomposition of silver oxalate.** J. Y. MACDONALD (Nature, 1936, 137, 152—153).—The rate at which  $\text{Ag}_2\text{C}_2\text{O}_4$  decomposes with a rise in temp.  $\propto$  the concn. of the original solutions and the relative amounts of the reacting substances,  $\text{Ag}_2\text{O}_3$  and  $\text{Na}_2\text{C}_2\text{O}_4$ . A complex mechanism, which disagrees with the conclusions of Benton *et al.* (this vol., 37), is discussed. L. S. T.

**Relative rates of ozonisation of unsaturated compounds.**—See this vol., 313.

**Carbon dioxide cleavage from dibromomalonic acid. II.** (Miss) J. MUUS (J. Physical Chem., 1936, 43, 121—124).—The rate at which  $\text{CBr}_2(\text{CO}_2\text{H})_2$  gives up  $\text{CO}_2$  at 25° (A., 1935, 709) is also the approx. rate at which it can simultaneously take up Br. A fraction only of the acid reacts with Br and this fraction is independent of [Br] within a large range. It is suggested that an intermediate unsaturated compound is formed on  $\text{CO}_2$  cleavage (cf. Pedersen, A., 1934, 737). This may either lead directly to  $\text{CHBr}_2 \cdot \text{CO}_2\text{H}$  or form a compound reacting with Br to give  $\text{CBr}_3 \cdot \text{CO}_2\text{H}$ . M. S. B.

**Highly polymerised compounds. CXXII. Relation between reaction velocity and composition of product of reaction in macropolymerisation processes.** G. V. SCHULZ (Z. physikal. Chem., 1935, B, 30, 379—398).—The distribution of mol. wts. in a mixture of polymeride-homologues

has been calc. statistically, assuming that the homologues are built up by chain reactions. The no. of mols. of the degree of polymerisation  $P \propto \alpha^P$ , where  $\alpha=1-k$  ( $k$ —ratio of the velocity of the chain-breaking reaction to that of the polymerisation reaction) and is  $< 1$ , but the proportion of such mols. by wt.  $\propto P\alpha^P$  and thus passes through a max., the val. of  $P$  at which is equal to the mean degree of polymerisation,  $P$  (1 base-mol. of the mixture contains  $1/P$  g.-mols.). For an unfractionated polymerisate the val. of  $P$  determined from the viscosity by Staudinger's law is twice the true val. The above deductions have been confirmed by fractionation of a mixture of polymerised isobutylenes. R. C.

**Polymerides and polyfunctionality.** W. H. CAROTHERS (Trans. Faraday Soc., 1936, 32, 39—49).—Polymerisations do not conform to a single reaction type (e.g., opening of double linkings), but are to be regarded as intermol. combinations functionally capable of indefinite continuation in one or more dimensions. If  $f$ —no. of reactive functions per monomeric mol., then if  $f=2$ , only linear polymerides can be formed, whereas for any higher val. of  $f$  growth may be in two or three dimensions. In general, the extent of reaction (*i.e.*, fraction of original reactive functions lost)  $= 2/f - 2/xf$ , where  $x$ —average degree of polymerisation. Attention is directed to the importance of the distribution of mol. wt., and not merely its average val., in determining the properties of a polymerisation product. F. L. U.

**Mechanism of polymerisation.** H. DOSTAL and H. MARK (Trans. Faraday Soc., 1936, 32, 54—69).—Polymerisation of unsaturated compounds, not involving condensation, proceeds in two stages, of which the first is the formation of "nuclei," e.g., by collision of two monomeric mols., requires an activation, and may be unimol. or bimol. The second stage, rapid compared with the first, is the growth of chains which may occur and be modified in a variety of ways. Formulæ consistent with the mechanism suggested are derived for the reaction velocity. Quant. agreement with experiment is obtained in the case of  $\text{CHPh} \cdot \text{CH}_2$ . F. L. U.

**Kinetics of long-chain disintegration applied to cellulose and starch.** K. FREUDENBERG (Trans. Faraday Soc., 1936, 32, 74—75).—Velocity coeffs. ( $K$ ) of hydrolysis of cello-biose (I), -triose (II), -tetraose (III), and cellulose (IV), and of maltose and starch are given. The vals. of  $K$  for (II) and (III) lie between those for (I) and (IV), indicating a continuous sequence from biose to polysaccharide. Heats of activation and steric factors are calc. F. L. U.

**Highly polymerised compounds. CXX. Formation of high polymerides of unsaturated substances.** H. STAUDINGER (Trans. Faraday Soc., 1936, 32, 97—115; cf. A., 1935, 1319).—A general review of the conditions of formation and the properties of synthetic polymerides is given. In polymerisations not involving condensation a chain mechanism originating in an activated monomeric mol. is best in accord with experimental observations. The physical and colloidal properties of homopolar

polymerides are determined by chain length and are independent of chemical composition. Measurement of the sp. viscosity of dil. solutions of polymerides as a method of determining chain length is valid even for the most highly polymerised substances, but as a measure of mol. wt. only when the chains are unbranched and cross-linkings are absent.

F. L. U.

**Kinetics of ring formation and polymerisation in solution.** G. SALOMON (Trans. Faraday Soc., 1936, 32, 153—175).—In condensation of substances of the type of  $\text{Br}[\text{CH}_2]_x\text{NH}_2$  intramol. ring-closure is greatly influenced by the chain length but is nearly independent of the concn., whereas intermol. polymerisation, largely independent of chain length, is affected by the solvent which is a sp. factor in the reaction velocity. A theory of ring-closure by the interaction of terminal groups is advanced, and supported by analysis of kinetic measurements in different solvents, for  $x=3-17$ .

F. L. U.

**Kinetics of polymerisation reactions.** C. E. H. BAWN (Trans. Faraday Soc., 1936, 32, 178—183; cf. preceding abstract).—The transition state method, applied to the calculation of reaction velocities, leads to a simple interpretation of the steric factor of bimol. association reactions in terms of the probability of the transition state. Assuming a chain mechanism, the degree of polymerisation is shown to be determined by the magnitude of the steric factor, which is calc. for some simple reactions.

F. L. U.

**Kinetics of polymerisation of  $\Delta^2$ -butadiene in presence of metallic sodium.** A. ABKIN and S. MEDVEDEV (Trans. Faraday Soc., 1936, 32, 286—295).—Polymerisation of  $(\text{CH}_2\cdot\text{CH})_2$  in presence of Na takes place in both the gaseous and the liquid phase. The reaction is heterogeneous and its rate, at a given pressure, is the same in both phases. An initial period of acceleration is followed by reaction at a const. rate, the former being connected with the formation of primary compounds with Na. Polymerisation proceeds by the successive addition of monomeric mols. to the Na compounds. The inhibiting effect of  $\text{O}_2$  has been studied. Experiments were done at  $30-35^\circ$ .

F. L. U.

**Kinetic consequences of complex formation in solution.** E. A. MOELWYN-HUGHES and A. SHERMAN (J.C.S., 1936, 101—110).—Theoretical. The solvent is responsible for differences between kinetics of reaction in the gas phase and in solution, and the effect is, in general, electrostatic in origin. For convenience, reactions in solution involving other than the rupture or formation of homopolar linkings in non-ionised mols. are divided into the following types: (i) ion-ion, (ii) dipole-dipole, (iii) dipole-induced dipole, (iv) ion-induced dipole, and (v) ion-permanent dipole. The Debye-Huckel expression refers only to interionic attractions, whereas the so-called ionic reactions, in the kinetic study of which the expression has been extensively applied, usually involve interaction between an ion and a dipole as well. Interaction between two mols. with permanent dipoles probably accounts for the existence of several intermol. complexes, and the low velocity of certain

bimol. reactions is attributed to interaction of either dipolar reactant with the solvent. Certain catalytic effects, e.g.,  $\text{AlCl}_3$  in the Friedel-Crafts reaction, and the existence of hydrates of  $\text{CH}_4$  and the rare gases are traced to the interaction of a permanent dipole with an induced dipole. The solvation of ions and the formation of cryst. hydrates imply an ion-permanent dipole interaction, the relation of which to the co-ordinate linking is discussed.

J. G. A. G.

**Hydrolysis of aryl sulphuric acids.** I. G. N. BURKHARDT, W. G. K. FORD, and E. SINGLETON. II. **Kinetic considerations.** G. N. BURKHARDT, A. G. EVANS, and E. WARHURST (J.C.S., 1936, 17—25, 25—26).—I. The hydrolysis by aq.  $\text{HCl}$  of  $\text{X}\cdot\text{C}_6\text{H}_4\cdot\text{O}\cdot\text{SO}_3\text{K}$ , where  $\text{X}=\text{o-}, \text{m-}, \text{p-NO}_2, \text{-Cl}, \text{-Br}, \text{-Me}, \text{and } \text{-OMe}$ , at  $48.6^\circ$  and  $78.7^\circ$  is of first order with respect to aryl sulphate and partly autocatalytic owing to the increase of  $[\text{H}^+]$  due to partial dissociation of  $\text{HSO}_4^+$  formed in the hydrolysis. The  $\text{SO}_4$  group is most readily hydrolysed when attached to a position of low electron availability. The logarithms of the velocity coeff. for the *m*- and *p*-compounds give a straight-line relation of the type previously described (A., 1935, 1465). Existing data show that the linear relationship is of wide application in the case of *m*- and *p*-substituted compounds and is valid for some series of *o*-derivatives. In terms of the transition-state conception, the influence of substituents on the free-energy changes associated with the equilibria between the initial and transition states, in the reactions considered in respect of velocity,  $\propto$  their influence on the free-energy changes between the initial and final states in corresponding dissociations.

II. The acid hydrolysis of  $\text{C}_6\text{H}_4\text{Me}\cdot\text{O}\cdot\text{SO}_3\text{K}$  is not catalysed by  $\text{HSO}_4^+$ .

J. G. A. G.

**Elimination of chlorine in the hydrolysis of aqueous solutions of chloroacetic acid and chloroacetates.** H. M. DAWSON and E. R. PYCOCK (J.C.S., 1936, 153—158; cf. A., 1933, 1125; 1934, 848).—Measurements at  $25^\circ$  and  $45^\circ$  of the initial velocity of hydrolysis of the  $\text{CH}_2\text{Cl}\cdot\text{CO}_2$  group, *A*, in solutions containing (i) undissociated mols. only, (ii) ions only, and (iii) mols. and ions, show that the reaction is, in general, the sum of four independent processes represented by  $v=k_1[\text{A}^+]+k_2[\text{A}']^2+k_3[\text{HA}]+k_4[\text{HA}][\text{A}']$ . Collisions involving  $\text{H}^+$  and those between *HA* mols. are not measurably effective. At high  $[\text{HA}]$ , and in presence of much  $\text{HNO}_3$  and  $\text{HClO}_4$ , *v* falls below the calc. val. probably owing to a decrease in  $k_3$ .  $k_1$  and  $k_3$  probably relate to bimol. processes involving the  $\text{H}_2\text{O}$  mol., and the relative bimol. velocity coeffs. of the processes at  $45^\circ$  are: mol- $\text{H}_2\text{O}$  1, ion- $\text{H}_2\text{O}$  1.22, ion-ion 228, mol.-ion 880.

J. G. A. G.

**Kinetics of the reaction between  $\alpha$ -bromopropionate and silver ions.** A. N. KAPPANNA (Proc. Indian Acad. Sci., 1935, 2, A, 512—524).—The hydrolysis of aq.  $\text{C}_2\text{H}_4\text{Br}\cdot\text{CO}_2\text{Na}$  is a very slow reaction. The reaction with aq.  $\text{AgNO}_3$  at  $27^\circ$  occurs at the surface of  $\text{AgBr}$  particles. The rate in dil. solution  $\propto$  the concn. of each of the reactants, showing the latter to be weakly adsorbed on the catalyst surface. In dil. solutions the rate  $\propto$  the amount of suspended  $\text{AgBr}$ .

H. J. E.

**Kinetics of the synthesis of ketones by Friedel and Crafts' method.** S. C. J. OLIVIER (Rec. trav. chim., 1935, **54**, 943—944).—The conclusions of Ulich and Heyne (A., 1935, 1207) were anticipated by the author (A., 1918, i, 228), but no irregularities in the reaction const. were observed. J. W. S.

**Kinetics of gaseous Diels-Alder reactions.** G. B. KISTIAKOWSKY and J. R. LACHER (J. Amer. Chem. Soc., 1936, **58**, 123—133).—Rate coeffs. have been determined as follows: acraldehyde and cyclopentadiene,  $k=1.50 \times 10^9 e^{-15,200/RT}$ ; acraldehyde and isoprene,  $k=1.02 \times 10^9 e^{-18,700/RT}$ ; acraldehyde and butadiene,  $k=1.46 \times 10^9 e^{-19,700/RT}$ ; crotonaldehyde and butadiene,  $k=0.90 \times 10^9 e^{-22,000/RT}$ . The reactions are of the second order, homogeneous, and only slightly complicated by side reactions. The product of the first of the above reactions, endomethylenetetrahydrobenzaldehyde (A., 1928, 1019), is unstable at elevated temp.: the rate of decomp. is given by  $k=2.2 \times 10^{12} e^{-33,600/RT}$ . E. S. H.

**Constitution and reactivity. XV. Kinetics of the nitration of aromatic compounds in sulphuric acid.** K. LAUER and R. ODA (J. pr. Chem., 1936, [ii], 144, 176—192; cf. A., 1935, 1465).—The rate of nitration of anthraquinone (I) by  $\text{HNO}_3$  or  $\text{KNO}_3$ , measured in 87—100%  $\text{H}_2\text{SO}_4$  at 15°, 20°, and 25°, is a max. in 89%  $\text{H}_2\text{SO}_4$ .  $Q$  is about 21,750 g.-cal. for  $\text{HNO}_3$  and 5 nitrates in 87—95.6%  $\text{H}_2\text{SO}_4$ , but only 13,300 for  $\text{KNO}_3$  in 100%  $\text{H}_2\text{SO}_4$ . The "action const." varies with the concn. of the acid, being a min. for 87% acid, and is thus responsible for the variation in  $k$ . The rate of nitration is affected by the nature of the cation in the order,  $\text{H} < \text{NH}_4 < \text{K} < \text{Na} < \text{Ag} < \text{Li}$ , which is also the order of relative ease of formation of pyrosulphates. Cations thus act by removal of free  $\text{SO}_3$  to form pyrosulphate with consequent diminution in  $[\text{H}_2\text{SO}_4]$ . Martensen's data for  $\text{PhNO}_2$  (A., 1905, ii, 149) lead to similar results. Nitration in aq.  $\text{H}_2\text{SO}_4$  is considered to be due to  $\text{OH}\cdot\text{NO}_2$ , but in 100%  $\text{H}_2\text{SO}_4$  mainly to  $[\text{N}(\text{OH})_3]^+$ .  $\text{H}_2\text{SO}_4$  containing 3—5% of  $\text{SO}_3$  causes sulphonation of (I) in presence, but not in absence, of  $\text{KNO}_3$ ; reaction is due to addition of  $[\text{N}(\text{OH})_3]^+$  to the  $\alpha$ -C and of  $[\text{HSO}_4]^-$  to the  $\beta$ -C, with subsequent elimination of  $\text{HNO}_3$  and  $\text{H}_2\text{O}$ .  $m$ -Nitration of  $\text{PhNO}_2$  is due to  $\text{OH}\cdot\text{NO}_2$ , and  $o$ - $p$ -nitration to  $[\text{N}(\text{OH})_3]^+$ , as is shown by increase in the latter from 11.7% in 90%  $\text{H}_2\text{SO}_4$  to 13.8% in 100%  $\text{H}_2\text{SO}_4$ . R. S. C.

**Benzoin reaction. IV. Kinetics of the benzoin reaction in presence of organic solvents.** REGE and T. S. WHEELER (Proc. Indian Acad. Sci., 1935, **2**, A, 483—489; cf. A., 1935, 938, 1084, 1200).— $\text{C}_6\text{H}_6$ ,  $\text{C}_5\text{H}_{12}$ ,  $\text{CCl}_4$  are added to a mixture of solid KCN and  $\text{PhCHO}$  cause pptn. of part of the dissolved KCN, and so retard the homogeneous autocatalytic reaction. They do not affect the heterogeneous reaction. OH-compounds [e.g.,  $\text{MeOH}$ ,  $(\text{CH}_2\cdot\text{OH})_2$ ] accelerate the reaction, the effect increasing with the no. of OH groups in the mol. H. J. E.

**Determination of linear crystallisation velocity.** T. FORSTER (Z. physikal. Chem., 1935, **175**,

177—186).—In the usual method of determining the crystallisation velocity,  $v$ , of a non-metallic substance in a tube the temp. of the solid-liquid interface rises with the distance from the wall. This is responsible for the presence on the graph of  $v$  against amount of supercooling of a portion of const.  $v$ , followed by an abrupt fall, whilst the true curve must exhibit a sharp max. A method of determining the true form of the curve is described. R. C.

**Atmospheric corrosion of metals.** Iron. I, II.—See B., 1936, 150.

**Kinetics of reactions in heterogeneous systems. I. Reaction between carbon disulphide and alkali. II. Reaction between benzoyl chloride and water.** D. KARVE and K. K. DOLE (J. Indian Chem. Soc., 1935, **12**, 719—732, 733—739).—I. The influence of speed of shaking, temp., amount and concn. of alkali solution, and amount and concn. of  $\text{CS}_2$  alone and in petroleum, light petroleum,  $\text{PhMe}$ , xylene,  $\text{PhCl}$ , and  $\text{PhBr}$  has been studied. Reaction occurs chiefly in the homogeneous aq. phase and to a smaller extent heterogeneously. The rate is increased by addition of  $\text{H}_2\text{O}_2$ , but decreases with additions of  $\text{NaCl}$ , and does not follow a simple kinetic law.

II. The reaction is purely heterogeneous and the velocity is increased by shaking. Solutions of  $\text{BzCl}$  in  $\text{CCl}_4$ , xylene,  $\text{CS}_2$ ,  $\text{PhCl}$ ,  $\text{PhBr}$ , and  $\text{CHCl}_3$  react according to a unimol. law and with velocities which decrease in the order named. R. S.

**Hydrolysis rates of some monoacid triglycerides under the influence of pancreas extract. I. Influence of the fineness of division of the triglyceride on the hydrolysis rate.** K. HOLWERDA, P. E. VERKADE, and A. H. A. DE WILLIGEN (Rec. trav. chim., 1936, **55**, 43—57).—Detailed examination of the heterogeneous system triglyceride-pancreas extract has yielded reaction rates which are greatly influenced by the fineness of division of the triglyceride and the relative amounts of the phases. A method for obtaining uniform results has been worked out. E. E. A.

**Theory of proton transfer.** J. HORIUTI and M. POLANYI (Acta Physicochim. U.R.S.S., 1935, **2**, 505—532).—The authors' theory of ionogenic reactions (cf. A., 1934, 1185) is extended to reactions involving proton transfer, viz., electrolytic dissociation of acids (proton donors), prototropy, spontaneous ionisation and separation of H at electrodes, and H-ion catalysis. The order of magnitude of the activation energy of the first three processes, the relation between electrolytic dissociation const. of acids and bases and their catalytic activity, and the Tafel relationship for H overvoltage, are all derived from the theory. The order of magnitude of the catalytic activity of H ions is explained. O. J. W.

**Factors governing the formation of nitric acid in the course of combustion of organic substances under a high pressure of oxygen.** L. KEFFLER (J. Chim. phys., 1935, **32**, 741—749).—The quantity of  $\text{HNO}_3$  produced during org. combustions in the bomb calorimeter  $\propto$  the rise in temp. in the bomb and the pressure. It increases with

increasing  $[N_2] : [O_2]$  ratio in the bomb, but there is evidence that the  $HNO_3$  first formed tends to oppose the further oxidation of  $N_2$ . The results also indicate that there is a negative catalyst for the reaction present in cylinder  $O_2$ , and that its concn. increases as the pressure in the cylinder decreases.

J. W. S.

**Polymerisation of gaseous formaldehyde and acetaldehyde.** J. E. CARRUTHERS and R. G. W. NORRISH (Trans. Faraday Soc., 1936, 32, 195—208).—Polymerisation of gaseous  $CH_2O$  is promoted by  $HCO_2H$  vapour. The reaction occurs only on the walls of the vessel, and is complete at  $18^\circ$ . At higher temp. depolymerisation takes place simultaneously and leads to an equilibrium, whilst if the whole vessel is at  $100^\circ$  only the monomeric form can be detected. Polymerisation is bimol. with reference to the  $CH_2O$ ; that of  $MeCHO$  vapour is also promoted by  $HCO_2H$  but not by  $AcOH$ , and that of  $CH_3O$  is promoted by  $AcOH$ . With  $(-CHO)_2$  and  $HCO_2H$  reaction does not go beyond the formation of an additive compound. The results are explained by a branching chain mechanism in which the  $HCO_2H$  is responsible for both initiation and branching. The ease with which depolymerisation occurs indicates that the simple mols. are linked through O. The results support Staudinger's theory of the catalysis.

F. L. U.

**Acid-catalysed enolisation of sec.-butyl ketones.**—See this vol., 317.

**Kinetics of Friedel-Crafts reaction and activity of mixed catalysts.**—See this vol., 322.

**Enzymic hydrolysis of glucosides in heavy water.**—See this vol., 377.

**Adsorption and heterogeneous catalysis.** E. C. C. BALY (J.S.C.I., 1936, 55, 9—12r).—The equations already developed (A., 1935, 1084) are extended to cases involving supported catalysts. On certain assumptions, the reaction velocity is a function of one half of the total energy of activation of the reaction. A supported catalyst has a max. efficiency when of a sp. composition, e.g., a unimol. layer of  $Al(OH)_3$  on kieselguhr (I), or a termol. layer of  $NiO$  or  $CoO$  on (I) (cf. A., 1935, 1070). The structure of these surfaces is discussed.

J. G. A. G.

**Polymerisation in monolayers.** G. GEE (Trans. Faraday Soc., 1936, 32, 187—195).—Changes occurring during the "drying" of the compound of  $\beta$ -claeostearin with maleic anhydride have been followed by measuring the surface pressures at different areas per mol. of a unimol. film on  $0.01N$ - $H_2SO_4$ . The initial reaction gives rise to an unstable peroxide which may polymerise either directly or after transformation into a more stable form, according to the experimental conditions. The velocity curves indicate that polymerisation proceeds by a chain mechanism in which the chains are terminated by a steric factor. Addition of inert substances like  $Me-[CH_2]_{13}-CO_2Et$  to the film inhibits polymerisation by breaking the chains, but does not affect the oxidation. The polymerisation stage is also accelerated by  $CoSO_4$ , and retarded by quinel. Activation energies are calc.

F. L. U.

**Polymerisation of phosphorus.** H. W. MELVILLE and S. C. GRAY (Trans. Faraday Soc., 1936, 32, 271—285).— $P_4$  mols. dissociate to  $P_2$  when passed through a  $SiO_2$ -glass jet at  $500$ — $800^\circ$ , or by contact with a hot W filament. If  $P_2$  thus formed is condensed under such conditions that it cannot combine to  $P_4$ , the product is red P. The kinetics of dissociation on hot W have been studied in detail. It is shown that only  $P_2$  mols. are in equilibrium with red P, and that discrepancies in the thermal data regarding the interconversion of red and white P are removed by taking into account the thermal change accompanying the dissociation  $P_4 \rightleftharpoons 2P_2$ .

F. L. U.

**Change of magnetic and catalytic properties during the transformation of a mixture of calcium oxide and ferric oxide into calcium ferrite.** G. F. HUTTIG, J. FUNKE, and H. KITTEL (J. Amer. Chem. Soc., 1935, 57, 2470—2477).—Products obtained by heating  $CaO + Fe_2O_3$  and  $CaCO_3 + Fe_2O_3$  in mol. ratio at different high temp. under varying conditions have been investigated with regard to catalytic activity in the decomp. of  $N_2O$ , magnetic susceptibility, powder  $d$ , colour, and  $CO_2$  content. The heat of activation and no. of active centres are given for each product. An "active intermediate," which no longer possesses the properties of the original mixture nor those of the cryst.  $CaFe_2O_4$ , is formed. The most active samples contain up to 60% of the intermediate, which has a magnetic susceptibility of  $51.5 \times 10^{-6}$  and heat of activation (for decomp. of  $N_2O$ ) of 20,000—25,000 g.-cal. The intermediate is formed as a film at the surface of the particles.

**Ternary catalyst  $Cu-ZnO-Cr_2O_3$  as a hydrogenation catalyst.** S. S. BALIASNI (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 175—182).—Reduction of  $COPhMe$  to  $PhEt$  is catalysed more efficiently by Ni than by  $91.8 : 6.5 : 1.7$   $Cu-Zn-Cr_2O_3$  at  $250^\circ$ , whilst at  $284$ — $289^\circ$  the latter catalyst has no hydrogenating activity.

R. T.

**Decompositions of esters and acids by anhydrous zinc chloride.**—See this vol., 313.

**Electrolytic preparation of deuterium and the separation coefficient  $\alpha$ .** M. P. APPLEBEY and G. OGDEN (J.C.S., 1936, 163—168).—The large discrepancy between the observed and the theoretical vals. of  $\alpha$  ( $= [D_2]$  in gas/ $[D_2]$  in liquid phase) is discussed, and the following principles are adopted in the design

of cells for producing  $D_2O$ : (a) the electrode metal must be a poor catalyst for the exchange reactions, (b) the  $H_2$  evolved must be removed rapidly from the electrode surface, and (c) local concn. of  $D_2O$  at the electrode must be avoided. With very low  $[D_2O]$ , vals. of  $\alpha$  the calc. vals. (0.05—0.10) were obtained, but this is not necessarily a proof that quantum-mechanical leakage is an important factor in the difference of reactivity of H and D atoms, since the observed val. of  $\alpha$  is controlled by the uncertain val. of  $[D]$  in standard  $H_2O$ . J. G. A. G.

**Direct introduction of deuterium into benzene by high-frequency current.** J. HORIUTI and T. KOYANO (Bull. Chem. Soc. Japan, 1935, 10, 601).—Pure  $C_6H_6$  in presence of 8%  $D_2O$  and Pt-black after standing on a pole of a Tesla coil for 10 hr. at room temp. acquired a D content of 0.69%; no change in temp. occurred. In a second experiment the pure  $C_6H_6$  was kept between the poles of a high-frequency oscillator of  $\lambda$  4 m., and was cooled, the % of D rising from 0 to 0.41.  $C_6H_6$  similarly treated with ordinary  $H_2O$  gave no change in  $d$  and f.p. No exchange occurred at room temp., even with an oscillator, unless a catalyst was present. R. S. B.

**Preparation of oxygen by electrolysis of baryta.** E. M. STODDART (Proc. Roy. Soc., 1935, A, 152, 273—277).—Electrolysis of  $Ba(OH)_2$ , using Ni electrodes, does not always give pure  $O_2$  at the anode. After some time  $H_2$  is liberated as well, probably owing to the reaction  $OH + OH = H_2 + O_2$ . This can be prevented by coating the anode with a layer of  $Ni(OH)_2$ . L. L. B.

**Influence of small amounts of agar-agar and gelatin on the  $KG_1$  of the anode deposit of silver peroxide.** A. GLAZUNOV and K. VALEČKA (Chem. Listy, 1935, 29, 359—361).—The velocity of crystallisation of  $Ag_2O_2$  at the anode in electrolysis of  $AgNO_3$  falls with increasing concn. of agar-agar or gelatin from 0 to 0.15%. R. T.

**Spectroscopic studies of luminescence at cathode during electrolysis.** I. UHARA (Bull. Chem. Soc. Japan, 1935, 10, 559—563).—The spectrum of the luminescence at a Pt wire cathode on electrolysis of 1—3*N*-salt or -acid solutions shows lines identical with those of the arc, and in some cases the spark spectra of the metals forming cations. The lines of H and  $H_2$  are observed, but anions have no influence on spectra. It is suggested that no luminescence occurs until the c.d. is sufficient to form a film of H on the cathode. The metals which give insol. hydroxide and consequent disappearance of the luminescence with d.c. give prolonged luminescence with 100 volts a.c. R. S. B.

**Electrolytic manufacture of aluminium-magnesium alloys.**—See B., 1936, 151.

**Electrodeposition of bronze.**—See B., 1936, 151.

**Electrodeposition of zinc and cadmium on aluminium and aluminium alloys.**—See B., 1936,

**Electrodeposition of cadmium.**—See B., 1936, 152.

**Hardness of electrolytic chromium.** II.—See B., 1936, 152.

**Effect of imprisonment of resonance radiation in the decomposition of ammonia and of deuterio-ammonia.** H. W. MELVILLE (Proc. Roy. Soc., 1935, A, 152, 325—341; cf. A., 1934, 1078, 1183).—Velocity coeffs. in Hg-photosensitised reactions are usually determined by comparison with the mean life of the Hg atom, which is assumed to be const. At high Hg-vapour pressures, however, at which experiments are usually made, there is appreciable imprisonment of resonance radiation with the result that the effective mean life is much > its actual val. of  $10^{-7}$  sec. A re-examination of the Hg-photosensitised decomp. of  $NH_3$ ,  $ND_3$ ,  $PH_3$ , and  $PD_3$ , under conditions where reabsorption is negligible, leads to lower velocity coeffs., in agreement with expectation. It is suggested that the decomp. of  $NH_3$  and  $ND_3$  are brought about in collisions between  $NH_3$  ( $ND_3$ ) and metastable atoms, derived from quenching collisions between  $3P_1$  atoms and  $NH_3$  ( $ND_3$ ). The former collisions are equally efficient for  $NH_3$  and  $ND_3$ . To account for the greater reactivity of  $NH_3$ , secondary reactions, unconnected with Hg atom processes, are assumed to occur. The suggested mechanism is supported by the fact that in the direct photo-decomp.  $NH_3$  also reacts more quickly, and that the decomp. of  $ND_3$  is more susceptible to inhibition by D than is that of  $NH_3$  by H. L. L. B.

**Mathematical representation of photographic blackening curves deduced from the coagulation theory of latent images and using the fundamental hypothesis of Bose-Einstein statistics.** G. UNGAR (Z. Physik, 1936, 98, 517—533).—The equation deduced permits closer correlation of blackening with properties of the emulsion. A. B. D. C.

**Mercury-photosensitised polymerisation of acetylene.** H. W. MELVILLE (Trans. Faraday Soc., 1936, 32, 258—271).—Kinetic analysis of results obtained in polymerising  $C_2H_2$  by light from a quartz-Hg lamp in presence of Hg vapour (pressure  $\approx 0.0003$  mm.) indicates that excited Hg atoms form with a  $C_2H_2$  mol. a complex which then adds on more  $C_2H_2$  mols. by a chain mechanism. The chain length is independent of the  $C_2H_2$  pressure, of surface, and of the rate at which chains are started, and exhibits a max. (100) at  $250^\circ$ . Cessation of growth is due to collision between a  $C_2H_2$  mol. and the growing polymeride, but of a different kind from that causing propagation. The pressure and temp. ranges were 0.05—10 mm. and  $20$ — $500^\circ$ . Polymerisation of  $C_2H_4$  also occurs under the same conditions, but is preceded by formation of  $C_2H_2$  and  $H_2$ , the final product being partly hydrogenated. F. L. U.

**Explanation of the course of photolysis of fructose in quartz light using long-wave ultra-violet light.** R. CANTENI (Helv. Chim. Acta, 1936, 19, 86—93).—In long-wave ultra-violet light (glass-filtered quartz light) fructose with the ketone structure decomposes with the evolution of CO, whilst, simultaneously, the ring structure in equilibrium gives  $CO_2$ . In long- and short-wave ultra-violet

light (unfiltered quartz light)  $H_2$  is obtained in addition, but polarimetric measurements also indicate that some of the fructose undergoes change without any evolution of gas. M. S. B.

**Connexion between decomposition velocity and concentration of fructose in long-wave ultra-violet light.** It. CANTINI (Helv. Chim. Acta, 1936, 19, 94—96; cf. preceding abstract).—The rate of decomp. of fructose by long-wave ultra-violet light, as measured by gas evolution, reaches a max. for a fructose concn. of 150 g. per 100 c.c. of  $H_2O$ . Above this concn. the rate of decomp. remains const., at least up to 200 g. per 100 c.c. of  $H_2O$ . The gas evolution from such a solution is approx. half that from an equal vol. of solution of concn. 1 : 10 irradiated by unfiltered quartz light.

M. S. B.

**Acidity and yellow coloration of fructose at higher temperatures in quartz light.** R. CANTINI (Helv. Chim. Acta, 1936, 19, 96—98).—The acid formation which takes place in fructose solution under the influence of ultra-violet light, and more rapidly at shorter  $\lambda$ , is probably due to  $HCO_2H$  formed by the oxidation of the  $CH_2O$  proved to be produced by ultra-violet light. The yellow coloration is due to a dark reaction accelerated by the presence of acid and requiring the addition of heat, either directly or by the transformation of light energy into heat.

M. S. B.

**Influence of solvent on the course of chemical reactions.** I. Absorption spectrum of anthracene in various solvents. K. LAUER and M. HORIO. II. Photochemical reaction, anthracene dianthracene, in various solvents. III. Kinetics of bromination of anthracene in various solvents. IV. Changes in energy of activation and action constants in substitution reactions of organic compounds as effect of solvent. K. LAUER and R. ODA (Ber., 1936, 69, [B], 130—137, 137—140, 141—145, 146—148).—I. Examination of the absorption spectrum of anthracene in hexane (I), cyclohexane (II), cyclohexene (III),  $C_6H_6$ , EtOH, and AcOH shows that solvents containing double linkings cause displacement of the absorption max. of dissolved aromatic compounds without dipole character or polar groups towards the region of longer  $\lambda$ . Dipolar solvents have so little effect on these solutes that the displacements are within the limits of experimental error. Solvents with double linkings but without dipole act on polar mols. in such a manner that the spectrum proper to the polar group and that due to the aromatic portion of the solute is displaced towards the longer  $\lambda$ . Dipolar solvents have a greater influence than dipole-free solvents on that part of the spectrum due to the dipole of the solute and a less, though distinct, influence on the aromatic portion of the spectrum. The displacements are always in the same sense as those caused by the linear anellation of  $C_6H_6$  nuclei to  $C_{10}H_8$ .

II. The rate of the photochemical reaction, anthracene dianthracene, has been determined in (I), (II), (III),  $C_6H_6$ , EtOH, and AcOH. Within the limits of experimental error it has the same val. in (I), (II), (III), and EtOH, but is considerably

higher in AcOH and particularly in  $C_6H_6$ . The photo-reaction is parallel to the displacement of the absorption spectra, and double linkings in the solvent have a distinct, accelerating action on the change.

III. Bromination of anthracene in (I) or (II) takes place relatively slowly and at about the same rate in each solvent. In  $C_6H_6$  and EtOH it is equally rapid at  $10^\circ$ , but about twice as fast in EtOH as in  $C_6H_6$  at  $15^\circ$ . In (I), (II), and  $C_6H_6$  (dipole-free solvents) the change occurs with a uniform energy of activation (about 6800 g.-cal.) and the greater rate in  $C_6H_6$  is due to the higher action const. In EtOH and AcOH the energies of activation are 18,600 g.-cal. and 10,850 g.-cal., respectively, and the action consts. are considerably higher, hence the greater rate of change.

IV. The heat of dissolution of Br in (I), AcOH, and EtOH, respectively, is determined at dilutions and temp. similar to those used in the bromination of anthracene. These vals. subtracted from the heats of activation gave a very nearly const. val. which is regarded as the energy val. of the action, anthracene-Br, in the absence of solvent. It is considered that the solvent without dipole exerts an "impact action" which affects the no. of successful collisions of the reacting mols.; whether this is a numerical or spatial action remains undecided. Dipolar solvents, in addition to this action, cause also a change in the heat of activation of the subsequent reaction due to alteration in the energy conditions on dissolution of the reaction partner ("energy action"). H. W.

**Photochemical stability of crotonaldehyde.** F. E. BLACET and J. G. ROOF (J. Amer. Chem. Soc., 1936, 58, 73—75).—Although ultra-violet light is absorbed by the vapour phase, no decomp. or appreciable polymerisation was observed. The concept of a predominating reverse reaction is put forward as an explanation.

E. S. H.

**Photochemical decomposition of nitrated phenols.** J. MOLNAR (Compt. rend., 1935, 201, 1482—1484).—At  $p_H > 13.0$  picric acid is decomposed in ultra-violet light to give picramic and isopurpuric acids,  $HNO_2$ ,  $NH_3$ , and HCN, whilst the usual yellow form existing at  $p_H < 13.0$  is unaffected. An analogous reaction occurs with 2 : 5-OH- $C_6H_3(NO_2)_2$ , *o*- and *p*- $NO_2$ - $C_6H_4$ -OH, 2 : 4- and 2 : 6-OH- $C_6H_3(NO_2)_2$ , and 2 : 4-dinitro-*o*-cresol decompose at  $p_H$  where the red forms exist, the rate of decomp. increasing with  $p_H$ .

T. G. P.

**Catalysed photo-reduction of vat dyes.** K. WEBER (Naturwiss., 1935, 23, 849—850).—If 0.001% aq. solution of thionine (Lauth's violet) (I) containing a small amount of  $FeSO_4$  and  $H_2SO_4$  is cooled to  $10^\circ$  and exposed to the light of a powerful arc lamp, the dye is rapidly bleached. The process is reversible. The bleaching takes the longer the higher is the temp. and the weaker the light. Methylene-blue (II), Nile-blue, phenosafranin, and neutral-red, all of which have negative normal reduction potentials, do not behave similarly. (I) has a positive reduction potential. In the case of (II) photo-reduction takes place if the  $FeSO_4$  is replaced by  $K_4Fe(CN)_6$ , which has a more negative reduction potential. The phenomenon can be explained by

supposing that the photo-excited dye mol.  $F^*$  has a more positive reduction potential than the unexcited mol.  $F$ . The systems  $F$ -leuco-base, and  $F^*$ -leuco-base are both present. In the dark,  $Fe^{++}$  does not react, but in the light the potential of  $F^*$  becomes more positive than that of the  $Fe^{+++}$ - $Fe^{++}$  system, and equilibrium is reached by the formation of leuco-base and  $Fe^{+++}$ . The max. of the absorption band of (I) is at 600  $m\mu$ , corresponding with an absorption of energy  $>$  sufficient for the above change. (II) has a more negative reduction potential than (I) and its absorption max. is at higher  $\lambda$ ; consequently the energy absorbed is in this case insufficient for the reaction to occur. The fact that the photo-reduction does not occur in alkaline solution is explained on similar grounds. A. J. M.

**Radiochemical decomposition of deutero-ammonia.** J. C. JUNGERS (J. Physical Chem., 1936, 40, 155—158).—The rate of decomp. of  $ND_3$  by  $\alpha$ -radiation is  $<$  that of  $NH_3$  and also increases more slowly, relatively, with rise of temp. M. S. B.

**Action of radioactive substances on proteins.** J. LOISELEUR (Compt. rend., 1935, 201, 1511—1513).—Proteins are first hydrolysed; and flocculation follows in the presence of electrolytes. T. G. P.

**Heavy hydrogen and heavy water.** H. MARK and M. WALD (Protoplasma, 1935, 23, 109—127).—A review.

**Production and identification of helium of mass three.** W. BLEAKNEY, G. P. HARNWELL, W. W. LOZIER, P. T. SMITH, and H. D. SMYTH (Physical Rev., 1934, [ii], 46, 81—82; cf. this vol., 130).—Evidence for the production of  $He^3$  from  $D_2$  in a mass spectrograph is advanced. The life of the  $H^3$  and  $He^3$  produced is at least  $10^8$  years. No evidence of the production of  $He^4$  was obtained. Attempts to find  $He^3$  and  $He^5$  in ordinary He were unsuccessful. L. S. T.

**Purification and spectroscopic evidence for  $He^3$ .** G. P. HARNWELL, H. D. SMYTH, and W. D. URRY (Physical Rev., 1934, [ii], 46, 437).—The purification and isolation of small amounts of  $He^3$  from circulating in a canal-ray discharge tube are described (cf. preceding abstract). L. S. T.

**Preparation of calcium chromate in the wet way.** J. MILBAUER and J. DOSKAR (Shorn. Masaryk. Akad. Prace, 1934, 8, 42—59; Chem. Zentr., 1935, i, 3259; cf. B., 1933, 963).—Full details are given. J. S. A.

**Common occurrence of trimercury group ( $HgX_2.Hg_2$ ) in complex compounds of mercury (family of turpeths).** G. DENIGES (Bull. Trav. Soc. Pharm. Bordeaux, 1933, 71, 97—109; Chem. Zentr., 1935, i, 3260).—Basic Hg compounds with 3 atoms of Hg per mol. are referred to a common structural unit  $Hg\langle\begin{smallmatrix} X.Hg \\ X.Hg \end{smallmatrix}\rangle A$ , where  $X=O, S, Se, NH, NR$  or  $NH_2OH, N_2H_4$ , and  $CO(NH_2)_2$  residues;  $A=Cl_2, Br_2$ , or a dibasic acid. The compounds are termed "turpeths" (turpeth mineral,  $A=O, X=SO_3$ ), and the compounds with  $X=O, A=(NO_3)_2, SeO_4, TeO_4, (BrO_3)_2, (IO_3)_2, Cl_2$ , and  $Br_2$ ;  $X=S, A=SO_4, Cl_2$ ,

$Br_2, F_2, (NO_3)_2, (OAc)_2, (O-COEt)_2, (O-COPr)_2$  are described. J. S. A.

**Aluminium carbide,  $Al_4C_3$ , and aluminium carbonitride,  $Al_5C_3N$ .** M. VON STACKELBERG, E. SCHNORRENBERG, R. PAULUS, and K. F. SPIESS (Z. physikal. Chem., 1935, 175, 127—139).—The compound  $Al_4C_3N$ , almost indistinguishable in appearance and properties from  $Al_4C_3$ , is formed by regulated admission of  $N_2$  to a mixture of Al and C at  $1800^\circ$ , being an intermediate product in the nitridation of carbide to nitride,  $5Al_4C_3 \cdot 10N_2 = 4Al_5C_3N + 3C + 8N_2 = 20AlN + 15C$ .  $Al_4C_3$  takes up at high temp. excess of Al, which separates again on cooling, and the supposed carbides  $Al_9C_3$  and  $Al_3C_2$  (A., 1934, 600) are merely finely disperse mixtures of  $Al_4C_3$  and Al, whilst  $Al_8C_9$  is a mixture of Al and  $Al_2C_3$ . "Amorphous"  $Al_4C_3$  (A., 1933, 917) is identical with the cryst. variety. R. C.

**Carbonyl chloride.** A. PERRET and R. PERROT (Bull. Soc. d'Encour., 1935, 134, 552—560).—The reactions of  $COCl_2$  are summarised and its action on the blood is discussed, especially with reference to the analogy between the effects of  $COCl_2$  and of CO. J. W. S.

**Colour reaction between nitroprusside and sulphite (Bodeker's reaction).** G. SCAGLIARINI (Atti R. Accad. Lincei, 1935, [vi], 22, 155—159).—Treatment of equimol. aq. mixtures of Na nitroprusside and  $Na_2SO_3$  with conc. aq. Zn, Cd, or Ni acetate and  $(CH_2)_6N_4$  affords the compounds (Zn or Cd) $_2[Fe^{++}(CN)_5(NO \cdot SO_3)] \cdot 2C_6H_{12}N_4 \cdot 12H_2O$  and  $Ni_2[Fe^{++}(CN)_5(NO \cdot SO_3)] \cdot 2C_6H_{12}N_4 \cdot 8H_2O$  (see A., 1896, i, 197). F. O. H.

**Germanium chlorofluorides.** H. S. BOOTH and W. C. MORRIS (J. Amer. Chem. Soc., 1936, 58, 90—93).—By reaction of  $GeCl_4$  with  $SbCl_3$  in presence of  $SbCl_5$ , there are formed  $GeCl_3F$ , b.p.  $37.5^\circ$ , m.p.  $-49.8^\circ$ ,  $GeCl_2F_2$ , b.p.  $-2.8^\circ$ , m.p.  $-51.8^\circ$ ,  $GeClF_3$ , b.p.  $-20.3^\circ$ , m.p.  $-66.2^\circ$ , and  $GeF_4$ . The chlorofluorides hydrolyse in moist air more readily than does  $GeCl_4$ ; they are unstable, tending to rearrange to  $GeCl_4$  and  $GeF_4$  even at  $-78^\circ$ . Under certain conditions they are reduced explosively by Cu to  $Ge^{II}$  salts. E. S. H.

**Lead ferrites.** L. I. PARAMONOV (Tsvet. Metal., 1934, No. 3, 79—88).—Formation of  $PbO.Fe_2O_3$  (I) by heating PbO with  $Fe_2O_3$  begins at  $665^\circ$ , and is a max. at  $725^\circ$ . Addition of  $SiO_2$  favours the decomp. of (I).  $CaO$  decomposes (I) at  $600$ — $800^\circ$  and combines partly with the PbO. CO begins to reduce PbO from (I) at  $400^\circ$ . The reduction is complete at  $550^\circ$ . CH. ABS. (e)

**Ammonium salts of arsenic, phosphoric, and antimonie acids, and direct determination of heats of oxidation of arsenic.** A. DE PASSILLE (Ann. Chim., 1936, [xi], 5, 83—146).—Full details of the author's prep. of pure As (cf. A., 1934, 742) and work on  $NH_4$  phosphates and arsenates (cf. *ibid.*, 377, 966; 1935, 344, 936) are given. The prep. of  $NH_4SbO_3 \cdot 3H_2O$  (I) is described. (I) readily loses  $H_2O$  and  $NH_3$ , affording probably  $HSbO_3 \cdot 0.5NH_3$  at  $110^\circ$ , and  $Sb_2O_5$  at  $270^\circ$ . When As is burned in  $O_2$  at  $15$ — $40$  atm., the ratio  $As_2O_5 : As_2O_3$  increases with  $[O_2]$ . The heats

of formation from As metal are :  $\text{As}_2\text{O}_3$  (cubic) 154.7 and  $\text{As}_2\text{O}_5$  (cubic) 218.3 kg.-cal. J. G. A. G.

**Dehydrogenating action of sulphur monoxide.** B. S. RAO and M. R. A. RAO (Current Sci., 1935, 4, 406).—On absorption in paraffin or decalin at low temp. SO yielded  $\text{H}_2\text{S}$ .  $\text{C}_2\text{Cl}_4$  gave no result, the SO being comparatively stable in solution, but yielding  $\text{H}_2\text{S}$  on adding paraffin or decalin. SO gave  $\text{H}_2\text{S}$  readily on treatment with MeOH, and more slowly with EtOH. Micro-analysis confirmed the reaction  $2\text{SO} + \text{MeOH} = \text{H}_2\text{S} + \text{CH}_3\text{O} + \text{SO}_2$ . The general dehydrogenation is  $\text{RH}_2 + 2\text{SO} = \text{R} + \text{H}_2\text{S} + \text{SO}_2$ , or possibly in some cases  $\text{RH}_2 + \text{SO} = \text{RO} + \text{H}_2\text{S}$ .

N. M. B.

**Fluorination of sulphuryl chloride : sulphuryl chlorofluoride.** H. S. BOOTH and C. V. HERRMANN (J. Amer. Chem. Soc., 1936, 58, 63—66).— $\text{SO}_2\text{ClF}$ , b.p.  $7.1 \pm 0.1^\circ$ , m.p.  $-124.7 \pm 0.1^\circ$ , has been prepared by the action of  $\text{SbF}_3$  on  $\text{SO}_2\text{Cl}_2$  in presence of  $\text{SbCl}_5$  under pressure. The latent heat of vaporisation at the b.p. is 6338 g.-cal. At  $0^\circ$  the liquid has  $d$  1.623 and surface tension 17.2 dynes per cm. The gas is hydrolysed by  $\text{H}_2\text{O}$  and readily absorbed by aq. NaOH.

E. S. H.

**Preparation of selenic acid.** L. I. GILBERTSON and G. B. KING (J. Amer. Chem. Soc., 1936, 58, 180).— $\text{SeO}_2$  is oxidised by refluxing with aq.  $\text{H}_2\text{O}_2$ .

E. S. H.

**Molybdenum-blue.** F. HEIN, I. BURAWOY, and H. SCHWEDLER (Kolloid-Z., 1936, 75, 35—45).—The reduction of heteromolybdic acids by  $\text{SnCl}_2$  has been studied colorimetrically. This reaction and titration of the Mo-blue with  $\text{KMnO}_4$  indicate that the product is  $\text{Mo}_4\text{O}_{11}$ .

E. S. H.

**Mixed molybdates.** F. GARELLI and A. TETTMANZI (Gazzetta, 1935, 65, 1009—1015; cf. A., 1934, 1208).—The prep. of the following compounds is described :  $(\text{NH}_4)_5\text{NHR}_2\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$ ;

O. J. W.

**Action of chlorine and bromine on chlorites.** G. R. LEVI and M. TABET (Gazzetta, 1935, 65, 1138—1144).—The action of  $\text{Cl}_2$  on aq. solutions of  $\text{Ca}(\text{ClO}_2)_2$  is quant :  $2\text{ClO}_2' + \text{Cl}_2 = 2\text{Cl}' + 2\text{ClO}_2$ . With Br a similar reaction takes place in the initial stages, but is followed by an oxidation-reduction process :  $3\text{ClO}_2' = 2\text{ClO}_3' + \text{Cl}'$ , nearly all the Br remaining in the free state.

O. J. W.

**Residual affinity and co-ordination. XXXVI. Constitution of "ruthenium-red."** G. T. MORGAN and F. H. BURSTALL (J.C.S., 1936, 41—45).—Ru-red (I) is best prepared by treating  $\text{RuCl}_3$  with conc. aq.  $\text{NH}_3$ . The constitution of (I),  $[\text{Ru}(\text{OH})\text{Cl}(\text{NH}_3)_4]\text{Cl} \cdot \text{H}_2\text{O}$ , is supported by the prep. therefrom of the following compounds :

$[\text{RuCl}_2(\text{NH}_3)_4]\text{Cl} \cdot 2\text{H}_2\text{O}$ ,  $[\text{RuCl}(\text{NO}_3)(\text{NH}_3)_4]\text{NO}_3 \cdot 4\text{H}_2\text{O}$ ,  $[\text{Ru}(\text{OH})\text{Br}(\text{NH}_3)_4]\text{Br} \cdot \text{H}_2\text{O}$ ,  $[\text{RuBr}_2(\text{NH}_3)_4]\text{Br} \cdot \text{H}_2\text{O}$ ,  $[\text{Ru}(\text{OH})\text{Cl}(\text{NH}_3)_4]\text{I}$ ,  $[\text{Ru}(\text{OH})\text{I}(\text{NH}_3)_4]\text{I}$ , and  $[\text{RuI}_2(\text{NH}_3)_4]\text{I}$ . The following analogues of (I) and derivatives have been prepared :

$[\text{RuCl}_2(\text{NH}_2\text{Et})_4]\text{Cl}$ , and  $[\text{Ru}(\text{OH})\text{Cl}(\text{NH}_2\text{Et})_4]\text{Cl}$ . The analogues of (I) are less strongly coloured than (I).

J. G. A. G.

**Detection and separation of sparingly soluble compounds by concentrated hydriodic acid.** E. R. CALEY and M. G. BURFORD (Ind. Eng. Chem. [Anal.], 1936, 58, 63—67).—Examples of the use of conc. HI in the detection and separation of compounds that are insol. in HCl,  $\text{HNO}_3$ , or aqua regia are given.

E. S. H.

**Calculating the blank [in volumetric determinations].** B. PARK (Ind. Eng. Chem. [Anal.], 1936, 8, 32).—Arithmetical procedure is described.

E. S. H.

**Theory of titration in stages of mixtures of acids and bases.** S. KILPI (Z. physikal. Chem., 1935, 175, 239—254; cf. A., 1935, 1214).—The conditions for the titratability of such mixtures and of ampholytes have been derived.

R. C.

**Colorimetric chemical analyses by means of photo-electric cells.** F. CARRANZA (Bol. Soc. Quím. Peru, 1935, 1, No. 5, 7—27).—The % of the incident light transmitted by the unknown solution is determined by means of a photo-electric cell and the concn. deduced by comparison with solutions of known concn. The sensitivity may be increased or decreased by the use of filters of complementary or similar colour, respectively, to the solution. Examples are given of the determination of  $\text{KMnO}_4$  in aq. solution, of  $\text{NH}_2$ -acids (glycine) by means of the ninhydrin reaction, and of vitamin-A in cod-liver oil.

D. R. D.

**Volumetric determination of water in liquids and solids.**—See B., 1936, 127.

**Argentometric titration of halide, thiocyanate, selenocyanate, and cyanate with adsorption indicators.** R. RIPAN-TILICI (Z. anal. Chem., 1936, 104, 16—22).— $\text{CN}'$  is titrated with  $\text{AgNO}_3$  by Liebig's method, and the titration of  $\text{Cl}'$ ,  $\text{SCN}'$ ,  $\text{SeCN}'$ ,  $\text{CNO}'$ , etc. continued using fluorescein as indicator.

J. S. A.

**Determination of sulphuric acid in solutions containing aluminium, chromium, and ferric sulphate. III.** S. A. TOLKATSHEV and J. G. TIROVA (J. Appl. Chem. Russ., 1935, 8, 1271—1283).—25 ml. of aq.  $\text{Al}_2(\text{SO}_4)_3$  are titrated with 0.5N-NaOH, an excess of 12 ml. of which is then added; the solution is diluted to 100 ml., and saturated with  $\text{CO}_2$  at the b.p., cooled, and diluted to 250 ml., filtered, and excess of alkali in an aliquot part of the filtrate is titrated with 0.5N- $\text{H}_2\text{SO}_4$  (Me-orange).  $\text{Cr}_2(\text{SO}_4)_3$  is determined analogously, an excess of 10 ml. of 0.5N-NaOH being added per 0.1 g. of  $\text{Cr}_2\text{O}_3$  in the solution. In the case of  $\text{Fe}_2(\text{SO}_4)_3$  treatment with  $\text{CO}_2$  is not necessary; the excess of alkali should be 8 ml. per 0.1 g. of  $\text{Fe}_2\text{O}_3$ . The mean error is  $\pm 0.2$ — $0.3\%$ .

R. T.

**Stabilisation of 0.1N-sodium thiosulphate solution.**—See B., 1936, 144.

**Determination of selenium in sulphur.**—See B., 1936, 101.

**Source of loss of ammonia in Kjeldahl distillations.** Method of eliminating this loss. H. S.

MILLER (Ind. Eng. Chem. [Anal.], 1936, 8, 50—51).—Dilution of  $\text{NH}_3$  with air in the initial stages causes low absorption, giving an average loss of 1.26% N. By using a modified delivery tube, provided with holes which cause the air bubbles to be broken up, this loss can be reduced to 0.06% N. E. S. H.

**Titrimetric determination of phosphoric acid in perchloric acid solution as bismuth phosphate.** J. HARMS and G. JANDER (Angew. Chem., 1936, 49, 106—109).—The conductometric titration of  $\text{H}_3\text{PO}_4$  in  $\text{HClO}_4$  solution with aq.  $\text{BiOClO}_4$  has been investigated in presence of Mg, Ca, Cu, Zn, Ni,  $\text{Fe}^{II}$ , Mn, Al, small amounts of  $\text{Fe}^{III}$ ,  $\text{NO}_3$ , Cl,  $\text{H}_2\text{SiO}_3$ , and in artificial fertilisers. With suitable precautions, the method is rapid (10—15 min.) and satisfactory.

T. G. P.

**Influence of fluorine on precipitation of phosphoric acid with molybdic acid.** H. T. BUCHERER and F. W. MEIER (Z. anal. Chem., 1936, 104, 23—28).—Quant. results for  $\text{P}_2\text{O}_5$  by the molybdate method of Lorenz, or in presence of 8-hydroxyquinoline, cannot be obtained in presence of F, which must first be removed. J. S. A.

**Micro-determination of arsenic in must and wine.**—See B., 1936, 119.

**Determination of silicon in aluminium alloys.**—See B., 1936, 151.

**Determination of free carbonic acid in waters containing humus.** Y. KAUKO (Ann. Acad. Sci. Fenn., 1934, 39, A, No. 2; Chem. Zentr., 1935, i, 3177).—The method previously described (A., 1935, 34; this vol., 159) is applied to soft surface waters. Decomposition of dissolved H carbonates introduces an error if applied to hard waters. J. S. A.

**System of qualitative analysis for the [commoner] anions.** J. T. DOBBINS and H. A. LJUNG (J. Chem. Educ., 1935, 12, 586—588).—The anions are separated into six groups, the detailed analysis of which is described. Group I, containing  $\text{CO}_3^{''}$ ,  $\text{F}'$ ,  $\text{C}_2\text{O}_4^{''}$ ,  $\text{SO}_3^{''}$ ,  $\text{AsO}_3^{'''}$ ,  $\text{AsO}_4^{'''}$ ,  $\text{PO}_4^{'''}$ , and tartrate, is pptd. as the Ca salts in alkaline solution; II,  $\text{SO}_4^{''}$  and  $\text{CrO}_4^{''}$ , as the Ba salts from alkaline solution; III,  $\text{CN}'$ ,  $\text{BO}_3^{'''}$ ,  $\text{Fe}(\text{CN})_6^{'''}$ ,  $\text{S}''$ , and  $\text{Fe}(\text{CN})_6^{''''}$ , as the Zn salts in alkaline solution; IV,  $\text{S}_2\text{O}_3^{''}$ ,  $\text{CNS}'$ ,  $\text{Br}'$ , and  $\text{I}'$ , as the Ag salts from slightly acid ( $\text{HNO}_3$ ) solution; V,  $\text{ClO}_3'$ ,  $\text{NO}_2'$ ,  $\text{OAc}'$  and VI,  $\text{NO}_3'$  are identified without pptn. Sensitivities are recorded. L. S. T.

**Use of formaldehyde for the elimination of ammonia and of ammonium salts in qualitative and quantitative analysis.** II. Application to detection of metals of the sixth group. A. HEMMELER (Annali Chim. Appl., 1935, 25, 610—617).— $\text{NH}_4$  salts, and their disturbing effect on group VI analysis, may readily be removed by adding  $\text{CH}_2\text{O}$ , thus converting them into  $(\text{CH}_2)_6\text{N}_4$  (cf. A., 1934, 1189). The group V filtrate so treated is divided into portions A and B. To A, conc. aq. or solid  $\text{NaOH}$  is added and  $\text{Mg}(\text{OH})_2$  completely pptd.; in half the filtrate  $\text{Li}'$  is detected in the usual way. In the remainder,  $\text{K}'$  is detected by adding  $\text{AcOH}$  to neutralise (phenolphthalein) followed by freshly prepared  $\text{Na}_2\text{Co}(\text{NO})_6$ ; if there is no ppt., or one of  $(\text{CH}_2)_6\text{N}_4$

*cobaltinitrite* which dissolves completely when treated with conc.  $\text{NaOH}$  followed by  $\text{AcOH}$ ,  $\text{K}'$  is absent, whilst if a yellow ppt. remains,  $\text{K}'$  is present. In portion B,  $\text{Na}'$  is detected as  $\text{Na}_2\text{H}_2\text{Sb}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$ .  $(\text{CH}_2)_6\text{N}_4$  interferes with other qual. tests for  $\text{K}'$ .

E. W. W.

**Methyl-red as an adsorption indicator.** D. M. MUKHERJEE (J. Indian Chem. Soc., 1935, 12, 748—749).—The  $p_H$  and the sp. conductivity of the solution have been determined after pptn. of  $\text{AgCl}$  in presence and in absence of Me-red. R. S.

**Determination of the radium content of rocks.** W. D. URRY (J. Chem. Physics, 1936, 4, 40—48).—The differential method for determining Ra has been applied to rock analysis. The apparatus has an observational limit of  $5.5 \times 10^{-14} \times n^{-0.5}$  g. Ra for  $n$  hourly readings. He, Ra, U, and Th, and age data are given for Keweenaw trap rocks from different levels, and also data for a geological time scale.

M. S. B.

**Detection of cadmium.** F. I. TRISCHIN (J. Appl. Chem. Russ., 1935, 8, 1269—1270).—Ag, Pb, Hg, Bi, Fe, Al, Cr, Mn, and Sn are pptd. by adding dil. aq. KI, conc. aq.  $\text{NH}_3$ , and 5—6 drops of  $\text{H}_2\text{O}_2$  to 1 c.c. of solution, the solution is filtered, and excess of KCN and a few drops of aq.  $\text{Na}_2\text{S}$  are added to the filtrate (containing Zn, Co, Ni, Cu, and Cd), when a yellow ppt. is obtained in presence of  $< 0.00056$  mg. of Cd. R. T.

**Salts of thiolbenzthiazole.**—See this vol., 215.

**Direct detection of lead with diphenylthiocarbazone.** M. KASAHARA and T. KASAHARA (Klin. Woch., 1934, 13, 1857—1858; Chem. Zentr., 1935, i, 3320).—A colorimetric variation of the method of Bohnenkamp and Linneweh (A., 1934, 1030) is described. H. N. R.

**Use of the iodine monochloride end-point in volumetric analysis.** III. Titration of thallos salts with permanganate, iodate, and ceric sulphate. E. H. SWIFT and C. S. GARNER (J. Amer. Chem. Soc., 1936, 58, 113—115; cf. A., 1930, 561).— $\text{KMnO}_4$  and  $\text{Ce}(\text{SO}_4)_2$  are unsatisfactory. The use of  $\text{KIO}_3$  is recommended. E. S. H.

**Iodometric determination of copper.** Adjustment of hydrogen-ion concentration. W. R. CROWELL, T. E. HILLIS, S. C. RITTENBERG, and R. F. EVENSON (Ind. Eng. Chem. [Anal.], 1936, 8, 9—11).—Park's procedure (A., 1931, 454) is modified. K H phthalate has no material effect on  $p_H$  of the solution and may be omitted. E. S. H.

**Spectrophotometric determination of copper in ores and mattes.**—See B., 1936, 105.

**Separation of precipitated mercuric sulphide and sulphur in the gravimetric determination of mercury.** E. R. CALEY and M. G. BURFORD (Ind. Eng. Chem. [Anal.], 1936, 8, 43).—The  $\text{HgS-S}$  mixed ppt. is dried and weighed;  $\text{HgS}$  is dissolved by treatment with cold, conc.  $\text{HI}$ , and the residual S weighed.

**Gravimetric determination of cerous salts.** P. SPACU (Z. anal. Chem., 1936, 104, 28—30).  $\text{Ce}^{III}$  salts give with  $\text{K}_4\text{Fe}(\text{CN})_6$  at room temp. a

ppt. of  $\text{CeK}[\text{Fe}(\text{CN})_6] \cdot 4\text{H}_2\text{O}$  which may be weighed as such or dried to the trihydrate at  $100^\circ$ . J. S. A.

**Volumetric determination of indium.** H. B. HOPE, M. ROSS, and J. F. SKELLY (Ind. Eng. Chem. [Anal.], 1936, 8, 51—52).—In acetate is titrated with  $\text{K}_4\text{Fe}(\text{CN})_6$ , using diphenylbenzidine as internal indicator.  $\text{Cl}^-$  must be absent. E. S. H.

**Determination of rhenium. I. Qualitative.** L. C. HURD (Ind. Eng. Chem. [Anal.], 1936, 8, 11—15).—In the Prescott and Johnson system of analysis Re concentrates with As. Confirmatory tests for Re are described. E. S. H.

**Standardisation of permanganate solutions with sodium oxalate.** R. M. FOWLER and H. A. BRIGHT (J. Res. Nat. Bur. Stand., 1935, 15, 493—501).—Titration of  $\text{Na}_2\text{C}_2\text{O}_4$  with  $\text{KMnO}_4$  at  $60-90^\circ$  gives vals. for the normality of the latter which may be 0.4% high. 90—95% of the  $\text{KMnO}_4$  solution should be added to the aq.  $\text{Na}_2\text{C}_2\text{O}_4$  (+5% of  $\text{H}_2\text{SO}_4$ ) at  $25-30^\circ$ , the solution warmed to  $55-60^\circ$ , and the titration completed as usual. H. J. E.

**Colorimetric determination of manganese [in soils] in presence of titanium.**—See B., 1936, 114.

**Determination of manganese and magnesium in soils and silicate rocks.**—See B., 1936, 114.
